Publish'd as the Act directs Jan.y 3.d 1778.

CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS AND SCIENCES.

CONTAINING
An EXPLANATION of the TERMS, and an ACCOUNT
OF THE SEVERAL SUBJECTS,

IN THE

LIBERAL AND MECHANICAL ARTS,

AND THE

SCIENCES, HUMAN and DIVINE.

Intended as a COURSE of ANCIENT and MODERN LEARNING.

K

By E. CHAMBERS, F.R.S.

> *Floriferis ut apes in ſaltibus omnia libant,*
> *Omnia nos*— LUCRET.

WITH THE

SUPPLEMENT,

AND

MODERN IMPROVEMENTS,

Incorporated in one ALPHABET.

By ABRAHAM REES, D.D.

IN FOUR VOLUMES.

VOLUME THE FIRST.

CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

A.

A May be conſidered, I. as a LETTER; II. as a WORD; and III. as an ABBREVIATION.

I. A, as a LETTER, or the mark of a vocal ſound, is the moſt ſimple, and that which the dumb are moſt eaſily taught to utter.

To pronounce it clearly, we need only open the mouth wider than for any other ſound, and then emit the air from our lungs. It is the firſt letter of the alphabet in all the known languages of the world, except in that of the Ethiopians; in which, according to Ludolfus, it is the thirteenth.

We muſt ſeek the origin of this, and the reſt of our letters, in the Oriental languages. See ALPHABET and LETTERS.

In the Engliſh language the character A is the mark of three different ſounds, which are termed by our grammarians, the *broad* A, the *open* A, and the *ſlender* A.

1. Our *broad* A reſembles the ſound marked by the German A, and is found in many of our monoſyllables, as *all*, *wall*, *malt*, *ſalt*, where it is pronounced as *au* in *cauſe*, and *fault*, or as *aw* in *law*. It is probable that this *broad* ſound was that which our Saxon anceſtors expreſſed by the character A, as it is ſtill, almoſt uniformly, retained in the ruſtic pronunciation and northern dialects of our language; as *taulk* for *talk*, *maun* for *man*, *haund* for *hand*, &c.

2. The *open* A of the Engliſh, is not unlike the A of the Italians, and is the ſound marked by this letter in *father*, *rather*, &c.

3. The ſlender ſound marked by the character A, is peculiar to the Engliſh language, and reſembles the ſound of the French *e* maſculine, or of their diphthong *ai* in *païs*; perhaps it is a middle ſound between them, or between the *a* and *e*. Such we have in the words, *place*, *face*, *waſte*, and in all thoſe that terminate in *ation*; as *ſalvation*, *preſervation*, &c.

The ſounds of which A is the character in our language are ſometimes ſhort; as in the words *glaſs*, *graſs*, *braſs*, &c. at other times long; as in *glaze*, *graze*, &c. Their length is commonly denoted by an *i* immediately ſubjoined to the *a*; as in *plain*, *rain*, &c. or by an *e* added at the end of the word; as in *plane*, *crane*, &c.

Some contend that there are four, others, that there are five diſtinct ſounds, denoted by the character A in the Engliſh language. There are, perhaps, little variations and diſtinctions in the ſounds marked by the character A, as well as by the other vowel letters in our alphabet; but they are ſo local or arbitrary, or, after all, ſo nice and ſubtle, that they entirely eſcape the notice of foreigners, and are hardly diſtinguiſhable by the natives.

Thoſe who deſire to enter more deeply into the firſt formation of ſounds, and to ſee the elementary principles of ſpeech treated with philoſophical accuracy, will find ſatisfaction in the ingenious treatiſes of Wallis and Holder.

In burleſque poetry, the letter A is ſometimes added after words; it lengthens them a ſyllable, without altering their ſenſe; as *line-a*, for *line*, in Dryden, &c. It is ſometimes redundant, when prefixed to words, as *ariſe*, *awake*; the ſame with *riſe*, *wake*, &c.

In our calendar, A is the firſt of the DOMINICAL letters, which were introduced in imitation of the eight NUNDINAL letters of the Romans, of which their A was one.

II. A is a WORD. This firſt ſimple ſound is uſed in our language to expreſs moſt of the vehement emotions of the ſoul. We naturally uſe it on all ſudden occaſions of admiration, joy, anguiſh, apprehenſion of danger, &c. and where the emotion is very great, the A is enforced by adding an aſpirate to it, as *ah!*

It is ſometimes a noun; for we ſay great A and little *a*; but it is moſt commonly a definite, or an indefinite article. It is *definite*, and denotes the number *one*, as, *a* man is coming, that is, *no more than one*. It is alſo uſed as an *indefinite* article; ſo we ſay, *a* man may come this way; that is, *any* man.

A, uſed as an article, has no plural ſignification; before a word beginning with a vowel, *y* and *w* excepted, and before a ſilent *h* preceding a vowel, it is written *an*, of which *a* is the contraction, as *an* arbour, *an* ox, *an* hour, &c.

A ſeems to be a true and genuine prepoſition, in the three following caſes. 1. When it is put before a participle or participial noun, denoting ſome action not yet accompliſhed; as I am *a* writing. 2. When it is placed before local ſurnames; as Thomas *à* Becket. 3. When it is uſed in compoſition; e. g. *a*foot, *a*ſleep, &c. Dr. Wallis ſuppoſes it to be a contraction of *at*; but Dr. Lowth thinks, that it is the prepoſition *on*, and ſometimes *of*. *At*, he ſays, has relation chiefly to *place*; *on* has a more general relation, and may be applied to *action*, and many other things, as well as *place*.

In ſome inſtances, A has a peculiar ſignification, denoting the proportion of one thing to another; as ſuch income *a* year; ſo many hours *a* day; ſo much *a* man, &c.

III. A is alſo an ABBREVIATION. A put to bills of exchange, is in England an abbreviation for *accepted*, and in France for the word *accepté*. It is likewiſe uſual among merchants to mark their ſets of books with the letters A, B, C, &c. inſtead of the numbers 1, 2, 3, &c.

In the Roman inſcriptions, the ſenſe of the A is to be collected chiefly from the connection of the words, and the ſcope of the inſcription. A ſingly ſtands for *Aulus*, *Auguſtus*, *ager*, *aiunt*, *ante*, *ære*, *ædes*, *ædilis*, *ædilitas*, *ærarium*, *aula*, *anima*, *amicus*, *amica*, *albo*, *alia*, *acta*, &c. and by a more modern abbreviation for *artium*. Thus A. M. ſtands for *Artium Magiſter*, *Maſter of Arts*, and A. B. for *Artium Baccalaureus*, *Bachelor of Arts*. AA. ſignifies *Auguſti*, and AAA. ſtands for *auro*, *argento*, *ære*. AB ſtands for *alia bona*, and AC for *actâ cauſâ*,

&c. On Greek and Roman medals A denotes commonly the name of the place where they were ſtruck; as Athens, Argos, Antioch, Aquileia. On French coins A is the mark of the mint of Paris, and AA ſignifies their coinage at Metz.

The Romans in their trials uſed their A to denote abſolution; whence Cicero calls it *litera ſalutaris*, the ſaving letter. Their manner was this. Three ballots were given to each judge, marked one with an A for *abſolvo, I abſolve*; a ſecond with a C for *condemno, I condemn*; and the third with N. L. which ſtood for *non liquet, is not clear*. One or other of theſe, each judge, according to his judgment, put into an urn; and the prætor acquitted or condemned the criminal, as the one or the other of theſe letters were the moſt numerous. If the ſuffrages for acquitting and condemning were equal, the accuſed was always acquitted.

The Romans alſo made uſe of the letter A, in collecting their ſuffrages in caſes of legiſlation. When a new law was propoſed, or an amendment of an old one was in agitation, each voter had two ballots put into his hand, the one marked A, ſignifying *antiquo*, q. d. *antiquam volo, I like the old way*; and the other was marked U. R. for *uti rogas, as you deſire*; and his ſuffrage was given, by putting the one, or the other, into the urn.

A, in the days of Roman barbariſm, was one of the numeral letters, and ſignified five hundred; when written with a daſh over it, thus, Ā, it denoted five thouſand.

The letter A is alſo uſed by chronologers and hiſtorians as an abbreviation for *anno*; ſo they put A. M. for *anno mundi*, A. D. for *anno Domini*, &c.

The Romans dated from the building of Rome; and in their writings A. U. C. ſtands for *anno ab urbe condita*.

Among logicians, A denotes an univerſal affirmative propoſition.

In Algebra, A or *a*, and the firſt letters of the alphabet, repreſent *known* quantities; and the laſt letters repreſent quantities that are *unknown*.

In the preſcriptions of phyſicians, A, or ā, or āā, denotes equal parts of the ingredients ſpecified, and is a contraction of the prepoſition *ανα*, which is uſed in the ſame ſenſe by medicinal writers in the Greek tongue.

Among chemiſts, AAA ſignifies an AMALGAMA, or the operation of amalgamating.

AABAM. Some of the French alchymiſts have uſed this word to ſignify *Lead*.

AAM, or HAAM, is a liquid meaſure generally uſed by the Dutch; it contains 128 mingles, each mingle weighing about 36 ounces avoirdupoiſe; and conſequently the *Aam* is equal to 148⅘ pints of Paris, or to 288 pints of Engliſh meaſure; the Paris pint weighing 31 ounces, and that of England 16 ounces.

AAVORA, in *Natural Hiſtory*, the fruit of a ſort of large palm-tree in the Weſt Indies, and in Africa. It is of the ſize of a hen's egg, and included, with ſeveral more, in a large ſhell. In the middle of the fruit there is a hard nut, about the ſize of a peach-ſtone, which contains a white almond, very aſtringent, and proper to check a DIARRHÆA.

AB, in the Hebrew chronology, the eleventh month of the civil year, and the fifth of the eccleſiaſtical year, which begins with *Niſan*. The month *Ab* anſwers to the moon of July, and contained thirty days.

AB, in the Syriac Calendar, is the name of the laſt ſummer month.

AB, prefixed to the names of places, generally denotes that they belonged to ſome abbey.

ABACA, a kind of flax or hemp, gathered in ſome of the Manillas or Philippine Iſlands. This plant is ſown every year; being gathered, it is ſteeped in water, and beaten as hemp is. It is of two kinds, the white and the grey. The white *Abaca* is uſed for making very fine linen; but the grey is employed for nothing but cordage.

ABACATUAIA, in *Zoology*, the name of an American fiſh, of the ſhape of the European doree or faber. It is much of the ſhape, ſize, and figure of the common plaiſe. Its mouth is ſmall and toothleſs, and its eyes have a black pupil, and a ſilvery iris. It has five fins, one on the back, and another on the belly, each running to the tail; and two at the gills. The tail makes the fifth, and is conſiderably forked. It is caught about the ſhores of the Braſils, and is commonly eaten there. This fiſh is a ſpecies of *zeus*, according to Artedi, and belongs to the thoracic order of Linnæus.

ABACAY, in *Natural Hiſtory*, a name given by the people of the Philippine Iſlands to a ſpecies of parrot, called alſo CALANGAY.

ABACINARE, or ABBACINARE, in writers of the middle age, a ſpecies of puniſhment, conſiſting in the blinding of the criminal, by holding a red-hot baſon, or bow, before his eyes.

ABACK, in *Sea-language*, ſignifies the ſituation of the ſails, when their ſurfaces are flatted againſt the maſts by the force of the wind. They may be brought *aback*, either by a ſudden change of the wind, or an alteration in the ſhip's courſe. They are laid *aback* to effect an immediate retreat, without turning either to the right or left, in order to avoid ſome imminent danger.

ABACOT, a cap of ſtate, wrought up in the form of two crowns, worn by our ancient Britiſh kings.

ABACTOR (called by the Roman lawyers *Abigeus*, or *Abigevus*), one who drives off cattle in herds; in contradiſtinction to one who ſteals a ſingle ſheep, &c. only, who is called a thief. *Nam qui ovem unam ſurripuerit, ut fur coercetur, qui gregem ut Abactor*. The puniſhment of *Abigeat* was more ſevere than that of *Furtum*; viz. condemnation to the mines, baniſhment, or even death itſelf, according to the quality of the offender. But ſometimes in Spain the puniſhment was more ſevere than elſewhere, the people there being moſt addicted to it.

The word is compounded of *ab, from*; and *actor*, a driver; from *agere, to drive*.

ABACTUS, or ABIGEATUS, among the ancient phyſicians, was uſed for a miſcarriage procured by art, or force of medicines, in contradiſtinction to *aborſus*, which is natural. But the moderns know no ſuch diſtinction. See ABORTION.

ABACUS, among the ancients, was a kind of cupboard, or buffet. See BEAUFET.

The word is formed from the Greek αϐαξ, which, among that people, ſignified the ſame thing.

ABACUS, among the mathematicians, was a little table ſtrewed over with duſt, on which they drew their ſchemes and figures.

In this ſenſe, the word ſeems formed from the Phœnician אבק, *abak, auſt*.

ABACUS *Pythagoricus*, a table of numbers, contrived for the ready learning of the principles of arithmetic; ſo denominated from its inventor, Pythagoras.

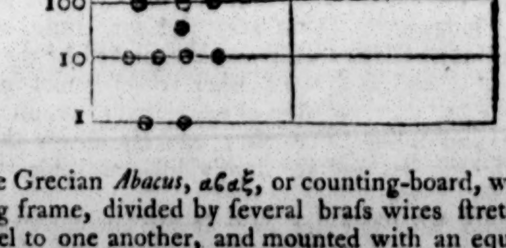
Hence alſo, from an agreement in point of uſe, the names *Abacus* and *Abaco*, are uſed, among Latin and Italian writers, for an alphabet, or A B C, *&c.*

The *Abacus Pythagoricus* was, in all probability, no other than what we call a multiplication-table.

Ludolfus and Wolfius give us methods of performing multiplication without the help of the *Abacus*; but they are too operoſe in ordinary caſes for practice. See MULTIPLICATION.

The *Abacus* for facilitating the operation of arithmetic, is an inſtrument almoſt as ancient, and extenſive, as the art of arithmetic itſelf: if it be later than the methods of computing by the fingers, and by *lapilli*, or ſtones (which obtained among the Egyptians), it is at leaſt much prior to the uſe of numeral letters or figures, wrought with the pen. We find it in uſe, under ſome variations, among the Greeks, Romans, Chineſe, Germans, French, &c. It excels in point of facility, and cleanlineſs of operation, as working without any ſtrokes or blots of the pen, or waſte of paper; ſome alſo give it the preference in point of expedition.

The *Abacus* is variouſly contrived; that chiefly uſed in European countries is made by drawing any number of parallel lines, at pleaſure, at a diſtance from each other, equal to twice the diameter of a *calculus*, or counter. Here a counter placed on the firſt or lowermoſt line ſignifies 1; on the ſecond 10; on the third, 100; on the fourth, 1000; on the fifth 10000; and ſo on. In the ſpaces between the lines, the ſame counters ſignify half of what they ſignify on the next ſuperior line; *viz.* in the ſpace between the firſt and the ſecond lines, 5; between the ſecond and third, 50; between the third and fourth, 500; and ſo on. Thus the counters on the *Abacus*, in the figure here ſubjoined, make the ſum of 37392. —The *Abacus* is alſo divided croſs-wiſe into *areolæ*, by means whereof ſubtractions are made. Wolf. Lex. Math. p. 171. ſeq.



The Grecian *Abacus*, αϐαξ, or counting-board, was an oblong frame, divided by ſeveral braſs wires ſtretched parallel to one another, and mounted with an equal number of little ivory balls, like the beads of a necklace. By the arrangement of theſe balls, diſtinguiſhing the numbers into different claſſes, and obſerving the relations of the lower to the upper, all kinds of computations were eaſily performed. Mahudel, in Hiſt. Acad. R. Inſcr. t. iii. p. 390.

The Roman *Abacus* was much the ſame with the Grecian, except that inſtead of ſtrings, or wires, and beads in the Roman, we find pins and grooves for them to ſlide in. It is deſcribed by ſeveral authors; but notwithſtanding all theſe deſcriptions, we ſhould have had a very obſcure idea of the ancient manner of reckoning, had there not been figures of it found among the ancient marbles. Phil. Tranſ. N° 180.

The Chineſe *Abacus* conſiſts, like the Grecian, of ſeveral ſeries of beads ſtrung on braſs wires, extended from the top to the bottom of the inſtrument, and divided in the middle by a croſs piece from ſide to ſide; ſo that in the upper row each ſtring has two beads, which are each reckoned for five; and in the lower row, each ſtring has five beads of different values; the firſt being reckoned as 1; the ſecond, as 10; the third, as 100, &c. as among us. Add, that inſtead of four pins for digits, or units, in the Roman *Abacus*, the Chineſe has five beads.

We have two different figures, and deſcriptions, of the Chineſe *Abacus*, one given by F. Martinius, who had lived many years in China; the other by Dr. Hook, who copied it from a Chineſe dictionary of the court-language. See SHWAN-PAN.

ABACUS *logiſticus* is a rectangled triangle, whoſe ſides, forming the right angle, contain the numbers from 1 to 60; and its area, the products of each two of the oppoſite numbers. This is alſo called a *canon of* SEXAGESIMALS.

ABACUS & *palmulæ*, in the *Ancient Muſic*, denote the machinery, whereby the ſtrings of the polyplectra, or inſtruments of many ſtrings, were ſtruck, with a plectrum made of quills.

ABACUS *harmonicus* is uſed by Kircher for the ſtructure and diſpoſition of the keys of a muſical inſtrument, whether to be touched with the hands or the feet.

ABACUS *Major*. A trough uſed in the mines, wherein the ore is waſhed.

ABACUS, or ABACISCUS, in *Architecture*, is the uppermoſt member of the capital of a column; ſerving as a kind of crowning, both to the capital and the whole column.

Many of our dictionary writers very erroneouſly make the *Abacus* to be the capital itſelf.

Vitruvius, and others after him, who give the hiſtory of the orders, tell us, the *Abacus* was originally intended to repreſent a ſquare tile laid over an urn, or rather over a baſket.—An Athenian old woman happening to place a baſket thus, covered over the root of an acanthus; that plant ſhooting up the following ſpring, encompaſſed the baſket all around, till meeting with the tile, it curled back in a kind of ſcroll. Calimachus, an ingenious ſculptor, paſſing by, took the hint, and immediately executed a capital on this plan; repreſenting the tile by the *Abacus*, the leaves by the volutes, and the baſket by the vaſe, or body of the capital.—See *Tab. Archit. fig.* 21.

There is ſome difference in the form of the *Abacus* in different orders. In the Tuſcan, Doric, and ancient Ionic, it is a flat, ſquare member, well enough repreſenting its original tile; whence the French call it *tailloir, trencher*. See *fig.* 24. *lit.* l. & *fig.* 28. *lit.* o. & *fig.* 32. *lit.* k. See alſo TUSCAN, DORIC, and IONIC.

In the richer orders it loſes its native form; its four ſides, or faces, being arched, or cut inwards, with ſome ornament, as a roſe, or other flower, or a fiſh's tail, in the middle of each arch.—See *fig.* 26. *lit.* d. & *fig.* 20. See CORINTHIAN, and COMPOSITE.

But ſome architects take other liberties in the *Abacus*, both in reſpect of its name, place, and office. Thus, in the Tuſcan order, where it is the largeſt and moſt maſſive, as taking up one third of the height of the whole capital, it is ſometimes called the dye of the capital.—In the Doric it is not always the uppermoſt member of the capital; a *cymatium* being frequently placed over it.—In the Ionic, ſome make it a perfect ogee, and crown it with a fillet.

The proportion of the *Abacus*, as preſcribed by Vitruvius, is, that its diagonal (from corner to corner) be twice its height. A rule which the moderns make no difficulty of diſpenſing with.

ABACUS is alſo uſed by Scamozzi for a concave moulding in the capital of the Tuſcan pedeſtal.

ABACUS likewiſe, in the *Ancient Architecture*, is uſed to denote certain compartments in the incruſtation or lining of the walls of ſtate-rooms, MOSAIC pavements, and the like. There were *Abaci* of marble, porphyry, jaſper, alabaſter, and even glaſs; ſhaped variouſly, ſquare, triangular, and the like.

ABADIR, in the Roman *Theology*, the ſtone which Saturn ſwallowed, believing it his new-born ſon Jupiter, and which at length became deified, and the object of religious worſhip.

ABAFT, in the *Sea Language*, is uſed in ſpeaking of things placed or done, toward the ſtern, or hinder-part of a veſſel; called alſo *aft*, and ſtands oppoſite to *fore*.—Thus they ſay a thing is *abaft* the fore-maſt, when it is behind it, or nearer the ſtern than the fore-maſt is. The poſt of the maſter, captain, and other officers, is *abaft* the main-maſt.

The ſtern, ſtrictly ſpeaking, is only the outſide; *abaft* includes both inſide and out.

ABAGI, the ſame thing with ABASSI, although of different value; it is worth at Teflis, and throughout all Georgia, about 36 ſols French money; four chaouris, which are alſo called ſains, make one *Abagi*.

ABALIENATION, in the Roman *Law*, denotes a ſpecies of alienation; whereby thoſe goods called *res mancipi*, ſuch as cattle, ſlaves, lands, and poſſeſſions, within the territory of Italy, were transferred to perſons legally capable thereof, either by a *formula*, called *traditio nexu*, or a ſurrender in open court.

ABALIENATUS, alienated from, a medical term, which, when applied to the body, ſignifies that the part ſo ſpoken of, is in a ſtate that requires amputation; and when applied to the ſenſes, denotes their total deſtruction.

ABANGA, the name which the inhabitants of the iſland of St. Thomas give to the fruit of their palm-tree, which is about the ſize of a citron, to which it bears great reſemblance; as it alſo does to the lemon externally; its kernels are uſed as reſtoratives. See ADY.

ABAPTISTON, or ABAPTISTA, is uſed by ſome authors to expreſs the ſaw, *terebella*, or perforating part of the inſtrument, called the trepan; becauſe it is generally contrived in ſuch a manner as to prevent its ſinking ſuddenly into the ſkull, and wounding the brain, when the bone is cut through.

It is derived from the negative α, and βαπτω, *I immerge*. See TREPAN.

ABARCA, an ancient kind of ſhoe uſed in Spain to paſs the mountains, made of raw hides, and bound with cords, which ſecured them againſt the ſnow.

ABARNAHAS, is a term uſed by ſome of the alchemiſts, particularly Zadith, in the Theatrum Chym. who tells us that it is the ſame as the full moon, or MAGNESIA.

ABARTAMEN, lead.

ABARTICULATION, in *Anatomy*. See DIARTHROSIS.

ABAS, a weight uſed in Perſia for weighing pearls; being an eighth part lighter than the European CARAT.

ABAS, ſometimes ſignifies the EPILEPSY. See TINEA.

ABASED, ABAISSE, in *Heraldry*, is applied to the vol, or wings of eagles, &c. when the tip, or angle, looks downward toward the point of the ſhield; or when the wings are ſhut: the natural way of bearing them being ſpread, with the tip pointing to the chief, or the angles.

A chevron, a pale, bend, &c. are alſo ſaid to be *abaſed*, when their points terminate in, or below the centre of the ſhield.

Again, an ordinary is ſaid to be *abaſed*, when below its due ſituation.

ABASSI, a ſilver coin current in Perſia, worth two mammoudis, or four chayes: the chaye being eſtimated at nine ſols, ſix deniers, of French money, makes the *Abaſſi* worth thirty-eight ſols; ſeventeen ſols of Holland, or near eighteen pence Engliſh. It derives its name from Schaw Abbas II. king of Perſia, under whom it was ſtruck.

ABAT-CHAUVEE, a name given in Poitou, Angoumois, Saintonge, La Marche, and Limoſin, in France, to a ſort of very ordinary wool; much like that called by the French, *paignons*, and *plures*.

ABATE, in *Law*, ſignifies to throw down; as, to *abate* a nuiſance.

It is likewiſe uſed to denote the act of one who ſteps into an eſtate void by the death of the laſt poſſeſſor, before the heir can enter; and by that means keeps him out.

ABATE alſo means to defeat or overthrow, on account of ſome error or exception. See ABATEMENT.

ABATE, in the *Manege*. A horſe is ſaid to *abate*, or take down his CURVETS, when he puts both his hinder legs to the ground at once, and obſerves the ſame exactneſs in all the times.

ABATELEMENT, in *Commerce*, (from the French *abattre*) a term uſed for a prohibition of trade to all French merchants in the ports of the Levant, who will not ſtand to their bargains, or who refuſe to pay their debts. It is a ſentence of the French conſul, which muſt be taken off, before they can ſue any perſon for the payment of their debts.

ABATEMENT, in *Heraldry*, ſomething added to a coat-armour, to diminiſh its proper value and dignity, and note ſome diſhonourable action, or ſtain, in the character of the perſon who bears it. It may be made by reverſion or diminution.

Reverſion is either turning the whole eſcutcheon upſide-down; or the adding another eſcutcheon, inverted, in the former.

Diminution is the blemiſhing any part by adding a ſtain, or mark of diminution: ſuch are the delf, a point dexter, a point champaign, a plain point, a gore ſiniſter, and a guſſet. See each under its proper article.

It may be added, that theſe marks muſt always be either tawney or murrey; otherwiſe, inſtead of diminutions, they become additions of honour.

The laſt editor of Guillim diſcards the whole notion of *Abatements*, as a chimæra. He alledges that no one inſtance is to be met with of ſuch bearing; and that it implies a contradiction to ſuppoſe it. Arms, being *inſignia nobilitatis & honoris*, cannot admit any mark of infamy, without ceaſing to be arms, and becoming badges of diſgrace, which all would covet to lay aſide. Add, that as no hereditary honour can be actually diminiſhed; ſo neither can the marks thereof. Both indeed may be forfeited; as in the caſe of treaſon, where the eſcutcheon is totally reverſed, to intimate a total ſuppreſſion of the honour.

Some inſtances, however, are produced to the contrary by Columbiere and others. But theſe, though they may ſhew ſome extraordinary reſentments of princes for offences committed in their preſence, do not amount to a proof of ſuch cuſtom or practice; much leſs authorize the being of particular badges in the hands of inferior officers, as kings at arms.

In a word, as arms are rather the titles of the dead, than of the living, it would ſeem, that they can neither ſuffer diminution nor *Abatement*; for thus an equal indignity would be put upon the anceſtor and the deſcendant. Diminution therefore and *Abatement*, can only effect arms lately granted, and ſolely when the perſon who obtained them is yet alive, and has tarniſhed his former glory by his after miſbehaviour. Even in this caſe, where *Abatement* may properly take place, it can only be made by the ſuppreſſion of ſome honourable badge, and not by the introduction of any degrading emblem.

ABATEMENT, in *Law*, is the fruſtrating, or ſetting aſide a ſuit, on account of ſome fault, either in the matter, or proceeding thereof. Thus, *Plea in*

ABATEMENT, is ſome exception alledged, either againſt the plaintiff's writ, as wanting due form, or againſt his count or declaration, as being inſufficient, or varying from the writ, ſpeciality, or record; or againſt the matter of either, as inſufficient, or being before another court; or againſt the allegations, as being uncertain, on account of ſome miſnomer, or the death of one of the parties, or the marriage of the plaintiff, being a woman: to which ſome add diſability.—Upon any of theſe, the defendant prays, that the plaintiff's writ or plaint may *abate*, i. e. that his ſuit may ceaſe for that time: if it be granted, all writs and proceſſes muſt begin *de novo*.

The death of a plaintiff did in all caſes *abate* the writ before judgment, until the ſtatute 8 and 9 W. III. c. 11. by which neither the death of the plaintiff or defendant ſhall *abate* it, if the action might be originally proſecuted by and againſt the executors or adminiſtrators of the parties; and if there are two or more plaintiffs or defendants, and one, or more, die; the writ or action ſhall not *abate*, if the cauſe, or action, ſurvives to the ſurviving plaintiff, againſt the ſurviving defendant, &c. It alſo denotes an irregular entry upon lands.

ABATEMENT, in *Commerce*. See DISCOUNT and REBATEMENT.

ABATEMENT, in the *Cuſtoms*, is an allowance made upon the duty of goods, when the quantum damaged is determined by the judgment of two merchants upon oath, and aſcertained by a certificate from the ſurveyor and land-waiter.

ABATIS, or **ABBATIS**, in *Writers of the Barbarous Age*, denotes an officer in the ſtables, who had the care and diſtribution of the provender. The name is derived from *Batum*, the name of an ancient meaſure of corn.

ABATOR, in *Law*. See ABATE.

ABAVI, **ABAVO**, or **ABAVUM**; a large tree in Ethiopia, which bears a fruit like a gourd.

ABB, among *Clothiers*, denotes the yarn of a weaver's warp, whence the wool of which it is made is called *Abb-wool*.

ABBA, in the Syriac and Chaldee languages, literally ſignifies a *father*; and figuratively, a ſuperior, reputed as a father in reſpect of age, dignity, or affection.

It was alſo anciently uſed as a title of honour, which ſome great men, it is ſaid, ſtill retain in the Pyrenean mountains.

ABBA, **ABA**, or **ANBA**, is more particularly uſed in the Syriac, Coptic, and Ethiopic churches, as a title which the people give their biſhops.

The biſhops themſelves beſtow the title *Abba*, more eminently on the patriarch of Alexandria; which occaſioned the people to give him that of *Baba*, or *Papa*, that is, *grandfather*; a title which he bore before the biſhop of Rome. It is a Jewiſh title of honour, given to certain of that claſs of Rabbins, called Tanaites; and it is alſo particularly uſed by ſome writers of the middle age, for the ſuperior of a monaſtery, uſually called ABBOT.

ABAISSEUR, in *Anatomy*, a name given by Winſlow, and other French writers, to one of the muſcles of the eye, called by others the *deprimens* and *humilis*; and by Fabricius, the *rectus inferior*: Cowper, and Albinus, call it the *depreſſor oculi*; and it is one of the *quatuor recti oculi* of the laſt author.

ABBESS, the ſuperior of an ABBEY, or convent of NUNS

The *Abbeſs* has the ſame rights, and authority over the nuns, that the ABBOTS regular have over their monks. Her ſex, indeed, does not allow her to perform the ſpiritual functions annexed to the prieſthood.

F. Martene, in his treatiſe on the rights of the church, obſerves, that ſome *abbeſſes* have formerly confeſſed their nuns. But he adds, that their exceſſive curioſity carried them ſuch lengths, that there aroſe a neceſſity of checking it.

St. Baſil, in his rule, allows the *abbeſs* to be preſent with the prieſt, at the confeſſion of her nuns.

ABBEY, or **ABBY**, a monaſtery, or religious houſe, governed by a ſuperior under the title of ABBOT, or ABBESS.

In our ancient ſtatutes the word is ſometimes alſo written *Abbathy*. By 31 H. VIII. c. 13. *Abbathies* are given to the king.

ABBEYS differ from PRIORIES, in that the one are under the direction of an abbot, and the other of a prior; but abbot and prior (we mean a prior conventual) are much the ſame thing, and differ in little but the name.

One third of the beſt benefices in England were anciently, by the pope's grant, appropriated to *Abbeys*, and other religious houſes; which, upon their diſſolution under king Henry VIII. became lay-fees. For an eſtimate of the number and value of religious houſes, aboliſhed and ſurrendered in this reign, ſee MONASTERY.

ABBOT, or **ABBAT**, originally derived from the Hebrew *Ab*, *father*, ſignifies the ſuperior of a monaſtery of monks erected into an abbey, or prelacy.

Abbots were really diſtinguiſhed from the clergy, though frequently confounded with them, becauſe a degree above laymen. St. Jerom, writing to Heliodorus, ſays expreſly, *alia monachorum eſt cauſa, alia clericorum*.

In thoſe early days the *Abbots* were ſubject to the biſhops, and the ordinary paſtors. Their monaſteries being remote from cities, and built in the fartheſt ſolitudes, they had no ſhare in eccleſiaſtical affairs. They went on Sundays to the pariſh-church with the reſt of the people; or, if they were too remote, a prieſt was ſent them, to adminiſter the ſacraments, till, at length, they were allowed to have prieſts of their own body. The *Abbot*, or archimandrite, himſelf was uſually the prieſt; but his function extended no farther than to the ſpiritual aſſiſtance of his monaſtery, and he remained ſtill in obedience to the biſhop.

The *Abbots* ſoon wore off their former plainneſs and ſimplicity, and endeavoured to be independent of the biſhops, which occaſioned ſome ſevere laws to be made againſt them at the council of Chalcedon: notwithſtanding this, in time, many of them carried the point of independency, and got the appellation of *lord*, with other badges of the epiſcopate, particularly of the mitre.

Hence aroſe new ſpecies and diſtinctions of *Abbots*: *mitred*, and *not mitred*; *croziered*, and *not croziered*; *œcumenical Abbots*, *cardinal Abbots*, *&c.*

ABBOTS, *Mitred*, were thoſe privileged to wear the *mitre*; and allowed, withal, a full epiſcopal authority within their ſeveral precincts.—Among us, theſe were alſo called *Abbots ſovereign*, and *Abbots general*; and they were lords of parliament. Of theſe Sir Edward Coke reckons twenty-ſeven in England, beſide two *mitred* priors.

The reſt, who were *not mitred*, were ſubject to the DIOCESAN.

ABBOTS, *Croziered*, are thoſe who bear the CROZIER, or paſtoral ſtaff.

ABBOTS were likewiſe diſtinguiſhed into *Abbots elective*, and *Abbots preſentative*; but are now chiefly diſtinguiſhed into *regular* and *commendatory*.

ABBOTS, *Regular*, are real monks, or religious, who have taken the VOWS, and wear the habit, of the ORDER.

Such are all *Abbots* preſumed to be; it being expreſly provided by the canons, that none but a monk have the command over monks.—But, in fact, it is found far otherwiſe; in France, as it is ſaid, there are now but ſix regular abbeys.

ABBOTS *in commendam*, are ſeculars; though they have undergone the tonſure, and are obliged, by their bulls, to take orders when they come of age.

Though the term *commendam* inſinuates, that they have only the adminiſtration of their abbeys for a time; yet do they hold, and reap the fruits of them for ever, as well as the regular *Abbots*.

Their BULLS give them a full power *tam in ſpiritualibus quam in temporalibus*; and yet it is true that the commendatory *Abbots* do not perform any ſpiritual offices; nor have they any ſpiritual juriſdiction over their monks. So that the phraſe *in ſpiritualibus*, is rather ſomething of the Roman ſtyle, than a reality.

The ceremony whereby *Abbots* are created, is properly called benediction; or ſometimes, though abuſively, conſecration.

It anciently conſiſted in cloathing him with the habit called *cucullo*, a cowl; putting the paſtoral ſtaff in his hand, and the ſhoes called *pedales*, or *pedules*, on his feet. Theſe particularities we learn from the *Ordo Romanus* of Theodore, archbiſhop of Canterbury.

ABBOT is alſo a title, which has been given to certain biſhops, becauſe their ſees had originally been abbeys; and they were even elected by the monks: ſuch are thoſe of Catanea and Montreal in Sicily.

ABBOT is alſo an appellation ſometimes given to the ſuperiors or generals of ſome congregations of regular CANONS; as that of S. Genevieve at Paris.

ABBOT is alſo a title borne by ſeveral magiſtrates, and other lay-perſons.—Among the Genoeſe, one of their principal magiſtrates was called the *Abbot* of the people.

In France, particularly about the time of Charlemagne, there were ſeveral lords and courtiers, who having the ſuperintendency of certain abbeys committed to them, were ſtyled *Abbacomites*, or abbey-counts.

ABBREVIATION, or ABBREVIATURE, a contraction of a word, or paſſage; made by dropping ſome of the letters, or by ſubſtituting certain marks, or characters, in their place.

Lawyers, phyſicians, &c. uſe abundance of *Abbreviatures*; partly for the ſake of expedition, and partly for that of myſtery.—A liſt of the principal *Abbreviatures*, in the ſeveral arts and faculties, ſee under CHARACTER.

Of all people, the Rabbins are the moſt remarkable for this practice: ſo that their writings are unintelligible, without an explication of the Hebrew *Abbreviatures*. The Jewiſh authors and copyiſts do not content themſelves to *abbreviate* words, like the Greeks and Latins, by retrenching ſome of the letters, or ſyllables thereof; but they frequently take away all but the initial letters. Thus, ר ſtands for *rabbi*, and א for אל, אדני or אמר according to the place it is found in.

But ſtill farther, they frequently take the initial letters of ſeveral ſucceeding words, join them together, and adding vowels to them, make a barbarous ſort of word, repreſentative of all the words thus abridged. Thus, *Rabbi Schelemoh Jarchi*, in the jargon of Hebrew *Abbreviatures*, is called *Raſi*; and *Rabbi Moſes ben Maiemon*, is *Rambam*. Mercerus, David de Pomis, Schindler, Buxtorf, &c. have given explications of ſuch *Abbreviatures*.—The moſt copious collection of Roman *Abbreviatures*, is that of Sertorius Urſatus: *Sertorii Urſati, equitis, de notis Romanorum commentarius.*

ABBREVIATOR is more particularly uſed for an officer in the court of Rome, appointed as aſſiſtant to the vice-chancellor, for drawing up the pope's briefs, and reducing petitions, when granted by the pontiff, into proper form, for being converted into bulls.

The *Abbreviators* are ſuppoſed by Ciampini, to be the ſucceſſors either of the *cancellarii* in the imperial houſhold, or of the ſeven *notarii*, ſaid to have been placed by pope Clement I. in the ſeven quarters of Rome, to write down the acts of the martyrs within their ſeveral diſtricts. They are ſaid to have taken the name, either from their writing the *brevia*, briefs, or ſhorter epiſtles of the popes; or from their making uſe of *notæ*, or abbreviations in writing. The latter opinion may ſeem the more probable, in that the name is ſometimes uſed by writers of the ſixth age, as ſynonymous with *notarii* or *breviatores*.

The *Abbreviators* at preſent make a college of ſeventy-two perſons, divided into two ranks; one called *Abbreviatores de parco majore*, who are twelve in number, all prelates; the other, *Abbreviatores de parco minore*, called alſo *examinatores*, who may be laymen. Ciampini has two volumes on the inſtitution, office, privileges, ceremonies, &c. of the *Abbreviators*.

ABBREVIATORS is alſo a name given by ſome authors to an ancient literary academy, ſuppoſed to have been at Rome, in the fifteenth century, and compoſed of the chief men of letters of the age, as Pomp. Lætus, Platina, Pontanus, Sannazarius, Sabellicus, &c. who, by the rules of the ſociety, changed their names at their admiſſion, for thoſe of ſome ancient Greek or Roman; but the exiſtence of ſuch an academy is very doubtful.

ABBREUVOIR, in maſonry, the joint, or juncture of two ſtones; or the interſtice or ſpace left between them, and filled up with mortar.

The word is French, and literally denotes a watering-place.

ABCEDARY, ABCEDARIAN, or ABECEDARIAN, is ſometimes applied to compoſitions whoſe parts are diſpoſed in the order of the letters of the alphabet.

In this ſenſe *Abcedarian* is ſynonymous with *alphabetical*.—Thus we meet with *Abcedarian* pſalms, lamentations, prayers, and the like; chiefly among Hebrew writers; which makes it probable they were the inventors of this ſpecies of wit.

ABDALS, in the Eaſtern countries, a kind of ſaints ſuppoſed to be inſpired to a degree of madneſs. The word comes, perhaps, from the Arabic, *abdallah*, the ſervant of God.—The Perſians call them *devanch khoda*, agreeable to the Latins way of ſpeaking of their prophets and ſibyls, *q. d. furentes Deo*, raging with the God.

The *Abdals* are often carried by exceſs of zeal, eſpecially in the Indies, to run about the ſtreets, and kill all they meet of a different religion. The Engliſh ſailors call this *running a muk*, from the name of the inſtrument, a ſort of poignard, employed on this occaſion.

ABDELAVI, an Egyptian plant very like a melon, except that the fruit is more oblong, and acute at the extremities.

ABDEST, among the *Mahometans*, a peculiar manner of waſhing, before prayer, entering the moſque, or reading the Alcoran; practiſed with ſome difference both by Turks and Perſians. The word is compounded of the Perſian *ab*, *water*, and *deſt*, *hand*.

ABDICARIA *propoſitio*, in *Logic*, is uſed for a negative propoſition.

ABDICATION, ABDICATIO, the act whereby a magiſtrate, or perſon in office, renounces, and gives up the ſame, before the legal term of ſervice is expired.

The word is derived from *abdicare*; which is compounded of *ab*, *from*; and *dicere*, *to declare*.

Abdication is frequently confounded with *reſignation*; but, ſtrictly ſpeaking, there is a difference: *Abdication* being done purely and ſimply; whereas *reſignation* is done in favour of ſome third perſon.

In this ſenſe, Diocleſian, and Charles V. are ſaid to have *abdicated* the crown: but Philip IV. of Spain *reſigned* it. The parliament of England voted King James's violation of the laws, and his quitting the kingdom, without providing for the due adminiſtration of affairs in his abſence, to import an *Abdication* of the crown. The Lords would have had the word *deſertion* made uſe of; but the Commons thought it was not comprehenſive enough, becauſe the king might then have the liberty of returning.

The Scots called it a *forſeiture* of the crown, from the verb *foris-facio*.

ABDICATION, among Roman writers, is more particularly uſed for the act whereby a father diſcarded or diſclaimed his ſon, and expelled him the family.

In this ſenſe the word is ſynonymous with the Greek αποκηρυξις, and the Latin *a familia alienatio*, or ſometimes *ablegatio*, and *negatio*; and ſtands oppoſed to *adoption*.—It is diſtinguiſhed from EXHÆREDATIO, or diſinheriting, in that the former was done in the father's life-time, the latter by will at his death: ſo that whoever was *abdicated*, was alſo diſinherited, but not *vice verſa*.

ABDITÆ *Cauſæ*, are the ſecret or remote cauſes of diſtempers, which phyſicians of the dogmatic, or rational ſect, affirmed, were neceſſary to be known, in order to eſtabliſh a right method of cure.

ABDOMEN, in *Anatomy*, the belly, or lower *venter*; or that part of the body comprehended between the *thorax* and the hips.

The word is derived from *abdere*, *to hide*.

Anatomiſts uſually divide the BODY into three regions, or venters: the head, the *thorax* or breaſt, and the *Abdomen*, which makes the loweſt part of the trunk; being terminated by the diaphragm above, and by the *inguen* or *pubis* below.

The *Abdomen* is lined internally with a thin, ſoft membrane, which, inveſting all the *viſcera* above mentioned, contains and keeps them in their place: this is called the PERITONÆUM: upon a rupture or dilatation whereof, they are apt to fall, and form thoſe tumours called HERNIÆ.

It is covered and defended with five pair of muſcles; which not only defend the *viſcera*, but, by their alternate relaxations, and contractions in reſpiration, promote the action of digeſtion, and the extruſion of the *fæces* and urine. By their contraction, the cavity of the *Abdomen* is ſtraitened, and the deſcent of the contents of the *viſcera* through the inteſtines is promoted. They are the proper antagoniſts to the ſphincters of the *anus* and bladder, and forcibly expel the excrements of thoſe parts, as alſo the *fœtus* in parturition.

Theſe muſcles are the OBLIQUI *deſcendentes* and *aſcendentes*, the RECTUS *tranſverſalis* and PYRAMIDALIS. See deſcriptions of the veins, arteries, and muſcles, &c. of the *Abdomen*, under their reſpective names.

The *Abdomen* is ſubdivided into leſſer regions or cavities; of which three are anterior; the uppermoſt, called the epigaſtric, commences from the diaphragm and *cartilago enſiformis*, and terminates two fingers breadth above the navel; the ſecond, called the umbilical, begins where the former ends, and terminates two fingers breadth below the navel; the third, called the hypogaſtric, deſcends as low as the *os pubis*. Each of theſe ſubdiviſions the more accurate writers divide farther into three parts; a middle and two lateral ones, called the HYPOCHONDRIA. The middle part of the umbilical is called the *umbilicus*, or navel; and its lateral parts the *lumbi*, or loins: the middle of the hypogaſtric is called the HYPOGASTRIUM; and its ſides the ILIA, or flanks. To which may be added the PUBES, GROIN, ISCHIATIC region, and PERINÆUM, ſometimes called the lumbar region.

There is but one poſterior region, called *regio lumbaris*, which is the poſterior part of the *Abdomen*, comprehending all that ſpace which reaches from the loweſt ribs on each ſide, and the laſt *vertebra* of the back to the *os ſacrum*, and the neighbouring parts of the *os ilium*. Authors however are not agreed whether the hind part be properly included in the *Abdomen*, which ſome reſtrain to the anterior, or fore-part only.

Diſeaſes of the ABDOMEN are inflammations, abſceſſes, *ſchirri*, indurations, inflations, ſpaſms, *&c.* Hence the *Abdomen* becomes the ſeat of divers operations; as perforations, ſutures, ſections, *&c.*

Wounds of the ABDOMEN, may be conſidered as of four kinds:

1. Such as affect the integuments only.
2. Such as affect the muſcles, together with the integuments, without penetrating the *peritonæum*.
3. Such as with the integuments penetrate into the cavity, without wounding any of its contents.
4. Such as penetrating into the cavity, wound ſome or other of its contents.

The firſt ſort, or ſuperficial wounds of the *Abdomen*, are not eſteemed dangerous, and require no treatment different from other wounds. However Arcæus (lib. ii. cap. 4.) and Vigo (lib. iii. cap. 11.) agree in pronouncing thoſe more liable to bad accidents, which are received within two or three fingers breadth of the navel.

The ſecond ſort are diſtinguiſhed from the two laſt by the probe; for if the patient is carefully placed in the ſituation he was in when the wound was given, and the probe be introduced, it will generally paſs into the cavity of the *Abdomen*, if the *peritonæum* is perforated. Another way of diſtinguiſhing theſe wounds is by injecting warm water into them; and if it returns immediately, there is reaſon to believe the wound to be only muſcular; but if any conſiderable quantity remain in the wound, the cavity is certainly penetrated. If the wound is large, great ſkill is required in the ſurgeon, eſpecially if it is made in a tranſverſe, or oblique direction, for in this caſe the ſuture is neceſſary, to keep the gaping lips of the wound together. Having taken theſe precautions, to preſerve the inteſtines and *peritonæum* in their natural ſituation, the wound is to be dreſſed with vulnerary balſams, and an adheſive plaſter; the patient muſt alſo be enjoined abſtinence, muſt have reſt, and his bowels muſt be kept open.

In wounds of the *Abdomen*, that penetrate into its cavity, the ſurgeon is firſt to examine very carefully, whether any of its contents partake of the injury. It will be found that this is not the caſe, if there is no great degree of weakneſs, hæmorrhage, pain, fever, *&c.* if on laying the patient upon the wounded ſide, there is no diſcharge of chyle, gall, excrement, or urine; if milk being injected warm, returns without any alteration in its colour; if the inflicting inſtrument has not been very ſharp; and laſtly, if there is no vomiting or diſcharge of blood by the mouth, ſtool, or urine, nor ſwelling or hardneſs of the belly.

We have ſome very valuable remarks on the hydropical tumours of the *Abdomen*, in the Medical Eſſays of Edinburgh, vol. v. art. 59.

There is a *ſinus* on each ſide of the *cartilago xiphoides*, between the muſcles called *recti* and *tranſverſalis*, into which on the left ſide, by violent vomiting, the ſtomach is ſometimes ruptured. This occaſions exceſſive pain, which is greater when the patient is up, and ſuſpended by his lying in a horizontal poſture; this circumſtance is the pathognomic ſign of the diſeaſe, to remove which, in caſe of its continuing obſtinate, the place muſt be laid open, and the rupture reduced in the ordinary manner.

ABDUCENS *labiorum*, in *Anatomy*, a name given by Spigelius to a muſcle, which he alſo calls the *ſecundus ad latera trahens*. This is the *levator anguli oris* of Albinus, and the *caninus* or *elevator labiorum communis* of others.

ABDUCENT, in *Anatomy*. See ABDUCTOR.

ABDUCTION, in *Logic*, a kind of argumentation, by the Greeks called *apagoge*; wherein the greater extreme is evidently contained in the medium, but the medium not ſo evidently in the leſſer extreme as not to require ſome farther medium, or proof, to make it appear.

It is called *Abduction*, from *ab*, *from*; and *ducere*, *to draw*; becauſe, from the concluſion, it draws us on to prove the propoſition aſſumed.

Thus, in the ſyllogiſm, ‘All whom God abſolves are ‘free of ſin; but God abſolves all who are in Chriſt: ‘therefore, all who are in Chriſt are free of ſin.’ The major is evident; but the minor, or aſſumption, is not ſo, without ſome other propoſition to prove it; as, ‘God ‘received ſatisfaction for ſin by the ſuffering of Jeſus ‘Chriſt.’

ABDUCTION, in *Surgery*, denotes a ſpecies of FRACTURE, wherein the bone near the joint is ſo divided tranſverſely, that the extremities recede from each other.

ABDUCTOR, or **ABDUCENT**, in *Anatomy*, a name common to ſeveral muſcles, whoſe action is the withdrawing, opening, or pulling back, the parts they are fixed to.

The name is compounded of *ab*, *from*; and *ducere*, *to draw*.—Their antagoniſts are called ADDUCTORES.

ABDUCTOR *auricularis*, or of the little finger, ariſes from the annular ligament, and the third and fourth bones of the *carpus* in the ſecond rank; and is inſerted externally into the firſt bone of the little finger: it ſerves to draw that finger from the reſt, and alſo to bend it a little.—See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 23.

In ſome ſubjects it appears divided into two or three muſcles, conſiſting of ſo many different ſeries of fibres.

ABDUCTOR *indicis*, or of the fore-finger, ariſes from the inſide of the bone of the thumb, and is inſerted into the firſt bone of the fore-finger, which it draws from the reſt towards the thumb.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 32. *&* *fig.* 6. *n.* 24. *&* *fig.* 7. *n.* 8.

ABDUCTOR *minimi digiti manus*. See ABDUCTOR *auricularis*.

ABDUCTOR *minimi digiti pedis*, or of the little-toe, ariſes from the outſide of the *os calcis*, near the exterior bone of the *metatarſus*, and is inſerted laterally into the outſide of the ſecond bone of that toe, which it pulls from the reſt.—See *fig.* 1. *n.* 74. *&* *fig.* 6. *n.* 45.

ABDUCTOR *oculi*, or of the eye, is one of the four *recti*, or ſtraight muſcles, ariſing from the bottom of the orbit, and ſpread over the firſt proper tunic; ſerving to draw the eye towards the outer CANTHUS.

ABDUCTOR *pollicis manus*, called alſo *thenar*, ſprings from the annular ligament, and firſt bone of the *carpus*; from whence paſſing to the thumb, it makes that fleſhy body called *mons lunæ*: it draws the thumb from the fingers. —See *fig.* 1. *n.* 31. *&* *fig.* 2. *n.* 21. *&* *fig.* 6. *n.* 25. *&* *fig.* 7.

ABDUCTOR *longus pollicis*, in *Anatomy*, a name given by Albinus to a muſcle of the hand called by Winſlow, Cowper and others, EXTENSOR *primus pollicis*.

ABDUCTOR *oſſis metacarpi digiti minimi*, in *Anatomy*, a name given by Albinus to a muſcle of the hand called by Winſlow, and ſome others, the *metacarpialis*, and by the generality of writers, by names but badly expreſſing its nature or uſes. Riolanus calls it *pars hypothenaris parvi digiti*; and Spigelius, *interoſſeus ultimo oſſi metacarpii, parte manus externa, adherens*. Cowper calls it the *abductor minimi digiti*; and Douglas, the *flexor primi internodii minimi digiti*.

ABDUCTOR *pollicis pedis*, or of the great toe, ſprings from the inſide of the *os calcis*, and the greater *os cuneiforme*; and is inſerted into the outſide of the exterior *os ſeſamoideum pollicis*; it ſerves to draw the great TOE from the reſt.—See *fig.* 1. *n.* 72. *&* *fig.* 2. *n.* 52.

Some anatomiſts likewiſe reckon four *Abductors* of the thigh. ABDUCTOR FEMORIS, *primus*, *ſecundus*, *tertius*, *et quartus*. The uſe of theſe four muſcles is to adduce, or move the thigh-bone, according to their different directions.

ABECEDARIAN. See ABECEDARY.

ABEL-TREE, or ABELE-TREE, a ſpecies of poplar, with large leaves. This tree may be propagated by layers or cuttings, and alſo by ſuckers. Many advantages might be derived from planting it in boggy ſoils, where few other trees will thrive. The wood of it is uſeful for flooring or wainſcoting rooms; and it is preferred for turnery-ware to any other, on account of its peculiar whiteneſs. The quickneſs of its growth, inſomuch that it will yield ſhoots of eighteen or twenty feet long in a year, renders it eligible in plantations that are deſigned for ſhade or ſhelter.

ABELIANS, ABELONIANS, or ABELOITES, a ſect in Africa, not far from *Hippo*, whoſe diſtinguiſhing tenet and practice was to marry, and yet live with their wives in a profeſſed abſtinence, without having any carnal commerce together. The learned have taken great pains to aſcertain the principle they went upon, and the reaſon of their denomination, to very little purpoſe. But, in effect, it is more than probable, they took their name from Abel for no other reaſon, but becauſe like that patriarch they had no iſſue; not that he lived in continence after marriage; but becauſe he was killed before he had married.

ABELICEA, the name of a very tall tree, growing principally in Crete, called alſo Santalus *adulterina*, and Pseudosantalum.

ABELMOLUCH, a ſpecies of the Ricinus, or *Palma Chriſti*.

ABELMOSCH, or Abelmusk, the muſk-ſeed; a ſmall odoriferous ſeed brought from Egypt, chiefly uſed in perfumes. The beſt comes from Martinico.

ABELOITES, } See Abelians.
ABELONIANS, }

ABENEL Gauby, a fixed ſtar of the ſecond or third magnitude, in the ſouth ſcale of the conſtellation Libra. Its latitude is 22′ 51″ N. its longitude ♏ 10°, 46′, 40″.

ABEREMURDER, AbererMurdrum, in ancient lawbooks, denotes murder that has been proved, or made appear by judiciary proceſs.

The word is Anglo-Saxon; compound of Ebeꞃe, *proved* or *clear*; and moꞃð, *killing*, or *homicide*.

In this ſenſe *Aberemurder*, called alſo *Eberemurder*, amounts to the ſame with *probatum murdrum*, or *murder which needed proof*; and ſtands oppoſed to open murder, which was murder ſufficiently known by the notoriety of the fact.

Lambard explains *Aberemurder* by *manifeſtum murdrum*; and Spelman, by *cædes manifeſta*: others by *apertum murdrum*.

Aberemurdrum was one of thoſe crimes which could not be expiated by money, as moſt others might be.

ABERRATION, in *Aſtronomy*, an apparent motion in the fixed ſtars, occaſioned by the progreſſive motion of light: the theory of which is explained by Dr. Bradley. See Light.

Aberration, in *Medicine*, ſignifies a deviation from the ordinary courſe of nature.

Aberration, in *Optics*, is uſed to denote that error or deviation of the rays of light, when inflected by a lens or ſpeculum, whereby they are hindered from meeting or uniting in the ſame point, called the *geometrical focus*: it is either lateral or longitudinal. The lateral *Aberration* is meaſured by a perpendicular to the axis of the ſpeculum, produced from the focus, to meet the reflected or refracted ray: the longitudinal *Aberration* is the diſtance of the focus from the point in which the ſame ray interſects the axis. If the focal diſtance of any lenſes be given, their apertures be ſmall, and the incident rays homogeneous and parallel, the longitudinal *Aberrations* will be as the ſquares, and the lateral *Aberrations* as the cubes of the linear apertures.

There are two ſpecies of *Aberration*, diſtinguiſhed by their different cauſes: one ariſing from the figure of the glaſs or ſpeculum; the other from the unequal refrangibility of the rays of light. The ſecond ſpecies of *Aberration* is ſometimes called the Newtonian, from the name of its inventor. The former ſpecies of *Aberration* is altogether inconſiderable, compared with the latter; inſomuch that if the object-glaſs of a teleſcope be planoconvex, and the plane ſide be turned toward the object, and the diameter of the ſphere, to which the convex ſide of the glaſs is ground, be 100 feet, the ſemidiameter of the aperture be two inches, and the ratio of the ſine of incidence out of glaſs into air be to that of refraction as 20 to 31; the diameter of the circle of *Aberrations* will in this caſe be only $\frac{961}{72000000}$ parts of an inch. But the diameter of the little circle, through which the ſame rays are ſcattered by unequal refrangibility, will be about the 55th part of the breadth of the aperture of the object-glaſs, which is here four inches; and therefore the error ariſing from the ſpherical figure of the glaſs is to the error ariſing from the different refrangibility of the rays, as $\frac{961}{72000000}$ to $\frac{4}{55}$, that is, as 1 to 5449. See Newton's Optics, p. 83, or Smith's Optics, book ii. cap. 6, where this propoſition is demonſtrated.

In conſequence of this diſcovery, and of the apprehenſion, that equal refractions muſt produce equal divergencies in every ſort of medium, it was imagined, that all ſpherical object-glaſſes of teleſcopes would be equally affected by the different refrangibility of light, in proportion to their aperture, of whatever materials they were conſtructed; and therefore, that the only improvement of which refracting teleſcopes were capable, was that of increaſing their length. On this account Sir Iſaac Newton, and others after him, deſpairing of ſucceſs in the manufacture and uſe of refracting lenſes, directed their chief attention to the conſtruction of reflecting teleſcopes. However, in 1747, M. Euler applied himſelf to the ſubject of refraction, and, purſuing a hint ſuggeſted by Sir Iſaac Newton, formed a ſcheme of making object-glaſſes with two lenſes of glaſs, incloſing water between them; hoping, that by conſtructing them of different materials, the refractions would balance one another, and prevent the uſual *Aberration*. Mr. Dollond examined this ſcheme, and found, that M. Euler's principles were unſatisfactory. M. Clairaut likewiſe concurred in opinion, that his ſpeculations were more ingenious than uſeful.

This controverſy, which promiſed to be of great importance in the ſcience of optics, engaged the attention of M. Klingenſtierna of Sweden, and induced him carefully to examine the eighth experiment in the ſecond part of Newton's Optics, with the concluſions which he draws from it. He found, that the rays of light, in the circumſtances there ſuppoſed, did not loſe their colour, as Sir Iſaac Newton imagined. This hint of the Swediſh philoſopher led Mr. Dollond to re-examine the ſame experiment; and it appeared, after accurate trials, that different ſubſtances made the light to diverge very differently, in proportion to their general refractive power: therefore in the year 1757 he procured wedges of different kinds of glaſs, and applied them together, ſo that the refractions might be made in contrary directions, in order to diſcover, whether the refraction and divergency of colours would vaniſh together. The reſult of his firſt trials encouraged him to perſevere; for he diſcovered a difference far beyond his hopes in the refractive qualities of different kinds of glaſs, with reſpect to their divergency of colours. The Venice glaſs, and the Engliſh crown glaſs, were found to be nearly allied in this reſpect; the common Engliſh plate glaſs made the light diverge more, and the Engliſh flint glaſs moſt of all. Without inquiring into the cauſe of this difference, he proceeded to adapt wedges of crown glaſs, and of white flint glaſs, ground to different angles, to each other, ſo as to refract in contrary directions; and the refracted light was intirely free from colours. Having meaſured the refractions of each wedge, he found that of the white glaſs to be to that of the crown-glaſs nearly as *two* to *three*: and he deduced this general concluſion, that any two wedges, made in this proportion, and applied together ſo as to refract in contrary directions, would refract the light without any *Aberration* of the rays.

Mr. Dollond's next object was to make ſimilar trials with ſpherical glaſſes of different materials; and, in order to obtain a refraction of light in contrary ray directions, one muſt be concave, and the other convex: the latter, which was to refract the moſt, that the rays might converge to a real focus, was made of crown glaſs, and the former of white flint glaſs: and, the refractions of ſpherical glaſſes being in an inverſe ratio of their focal diſtances, it was neceſſary, that the focal diſtances of the two glaſſes ſhould be inverſely as the ratios of the refractions of the wedges; for, being thus proportioned, every ray of light that paſſes through this combined glaſs, at any diſtance from its axis, will conſtantly be refracted, by the difference between two contrary refractions, in the proportion required; and therefore the different refrangibility of the light will be intirely removed.

But in the application of this admirable diſcovery to practice, many difficulties occurred. At length, however, by repeated trials, and reſolute perſeverance, Mr. Dollond ſucceeded ſo far, as to conſtruct refracting teleſcopes much ſuperior to any that had before been uſed, repreſenting objects with great diſtinctneſs, and in their true colours.

M. Clairaut, who intereſted himſelf betimes in this diſcovery, endeavoured to aſcertain the principles of Mr. Dollond's theory, and to lay down rules for facilitating the conſtruction of theſe new teleſcopes. With this view he made ſeveral experiments, in order to determine the refractive powers of different kinds of glaſs, and the proportion in which they ſeparated the rays of light; and from theſe experiments he deduced ſeveral theorems and problems of general uſe. M. D'Alembert likewiſe made a great variety of calculations to the ſame purpoſe; and ſhewed how to correct the errors to which theſe teleſcopes are ſubject, by placing the object-glaſſes, in ſome caſes, at a ſmall diſtance from one another, and ſometimes by uſing eye-glaſſes of different refractive powers. But though foreigners were hereby ſupplied with the moſt accurate calculations, they were very defective in practice. The Engliſh teleſcopes, made, as they imagined, without any exact rule, were greatly ſuperior to the beſt of their conſtruction.

Mr. Euler, who firſt gave occaſion to this important and uſeful inquiry, was very reluctant in admitting Mr. Dollond's lond's improvements, becauſe they militated againſt a preconceived theory of his own. At laſt, however, convinced of their reality and importance by M. Clairaut, he aſſented; and ſoon after received farther ſatisfaction from the experiments of M. Zeiher, of Peterſburgh.

M. Zeiher demonſtrated, that it is the *lead*, in the compoſition of glaſs, which gives it this remarkable property; that, while the refraction of the mean rays is nearly the ſame, that of the extreme rays conſiderably differs; and by increaſing the lead, he produced a kind of glaſs, which occaſioned a much greater ſeparation of the extreme rays, than the flint glaſs which Mr. Dollond had made uſe of, and at the ſame time conſiderably increaſed the mean refraction. M. Zeiher, in the courſe of his experiments, made glaſs of minium and flint, with a mixture of alkaline ſalts; and found, that this mixture greatly diminiſhed the mean refraction, without making hardly any change in the diſperſion; and at length obtained a kind of glaſs greatly ſuperior to the flint glaſs of Mr. Dollond for the conſtruction of teleſcopes; ſince it occaſioned *three* times as great a diſperſion of the rays as the common glaſs, whilſt the mean refraction was only as 1.61 to 1.

In 1748, Mr. Dollond made a farther improvement in teleſcopes, by introducing *two* object-glaſſes of crown glaſs, and one of flint. See Phil. Tranſ. vol. L. p. 735, 743; and vol. LV. p. 56. Hiſt. Ac. Par. 1756, p. 183, 624. Ditto, 1767, p. 107. Swed. Mem. vol. XVI p. 300. Ac. Berl. 1762, and 1766.

For a farther account of Mr. Dollond's new refracting, or achromatic teleſcopes, ſee the article TELESCOPE.

ABERRATION, *Crown of*, is a luminous circle ſurrounding the real diſk of the ſun, and depending on the *Aberration* of the ſolar rays, whereby his apparent diameter is enlarged.

ABESAMOM, dirt or clay.

ABESSI, the ſame as REBIS; they ſignify the matter that remains of the aliment, after the chyle is ſeparated from it; that is, excrement.

ABESTA, or AVESTA, the name of one of the ſacred books of the Perſian Magi; which they attribute to their great founder Zoroaſter, or Zerduſht.

The *Abeſta* is a commentary or expoſition of two other of their religious books, called Zend and Pazend; the three together include the whole ſyſtem of the *ignicolæ*, or worſhippers of fire. D'Herbel. Bibl. Orient. p. 11. Hyde, de Rel. Vet. Perſ. c. 2.

According to Du Perron, the *Aveſta* ſignifies the language of the original text of Zoroaſter's works. Hiſt. Ac. Sc. Par. 1762.

ABESTON. See ABESTUS.

ABESUM, unſlacked or quick lime. See CALX.

ABETTOR, or ABBETTOR, in *Law*, one who incites or encourages another to perform ſomething criminal; or by ſome way aſſiſts him in the performance itſelf.

Thus thoſe who procure others to ſue out falſe appeals of felony, or murder againſt men, to render them infamous, are particularly denominated *Abettors*.

So *Abettors* in MURDER, are ſuch as adviſe or procure a murder to be committed, or are acceſſary thereto.

There are *Abettors* in FELONY, but not in TREASON; the law looking on all thoſe concerned in treaſon as principals.

ABEVACUATION, in *Medicine*, denotes a partial evacuation of the peccant humours, either by nature or art.

ABEYANCE, ABEIANCE, or ABBAYANCE, in *Law* books; ſomething that only exiſts in expectation, or in the intendment, or remembrance of the law.

Abeyance in our law, amounts to much the ſame with *hæreditas jacens*, among the Romans, and κληρος αδεσποτος, or διαλειπων, among the Greeks; *i. e. hæreditas ſperata* or *expectata*, or rather *novum dominium expectans*. As civilians ſay land and goods do *jacere*; ſo common lawyers ſay, that things in like condition are in *Abeyance*.

It is a maxim in law, that of every land, either there is a fee ſimple in ſomebody, or it is in *Abeyance*—If a church become vacant by the death of a parſon, the freehold is ſaid to be in *Abeyance*, till a new parſon be inducted: for the patron has not the fee, but only the right of preſenting to it, the freehold itſelf being in the incumbent thus preſented, and therefore till ſuch preſentation, in nobody.

ABHEL, in *Botany*, a name given by ſome to ſavin, an ever-green garden ſhrub, well known in phyſic in many intentions.

ABIB, in the Hebrew *Chronology*, the name of the firſt month of their eccleſiaſtical year. This month was afterwards called Niſan, and anſwers to part of our March and April.

ABIES, in *Botany*. See FIR-TREE.

ABIGA *Herba*, the *Ground* PINE or CHAMÆPITYS.

ABIGEATUS, ſee ABACTUS.

ABIGEUS, ſee ABACTOR.

ABILITY is uſed, in *Law*, for a capacity of doing certain things, relating either to the acquiſition of property, or the transferring of it.

Ability in this ſenſe coincides with *capacity*, and ſtands oppoſed to *diſability*, or *non-ability*.

Every perſon is ſuppoſed to be *able*, i. e. to have the power of taking and diſpoſing of effects, whom the law does not diſable.

The king's iſſue are of *Ability* to inherit in England whereſoever born; and children of ſubjects born beyond ſea, may inherit, if their birth were within the allegiance of the king.

AB-INTESTATE, AB-INTESTATO, in the *Civil Law*, is applied to a perſon who inherits from one who died inteſtate.

ABISHERING, an ancient *Law* term, denoting a being free, or exempt, from all AMERCIAMENTS for tranſgreſſions of any kind.

The word in a charter or grant, is ſaid not only to give the proprietor the forfeitures and amerciaments of all others for tranſgreſſions committed within his fee; but alſo to exempt him from all ſuch controul by any within that compaſs.

ABIT, or ABOIT, Ceruſs.

ABJURATION, in a general ſenſe, the act of denying, or renouncing a thing in a ſolemn manner, and even with an oath.

The word is compounded of *ab*, *from* or *againſt*; and *jurare*, *to ſwear*.

Among the Romans, *Abjuration* ſignified the denying a debt, pledge, depoſit, or the like truſt, by a falſe oath.

In which ſenſe, *Abjuration* coincides with *perjuration*; and ſtands diſtinguiſhed from *ejuration*, where the oath is ſuppoſed juſt.

ABJURATION, more particularly, is uſed for a ſolemn recantation, or renunciation of ſome doctrine, or opinion, as falſe and pernicious.

In our own laws, to *abjure* a perſon, is to renounce all authority or dominion of ſuch a perſon.—By the *oath of Abjuration*, a perſon binds himſelf not to own any regal authority in the perſon called the Pretender, or ever to pay him the obedience of a ſubject. 1 W. and M. 13 W. III. 1 Geo. I. The refuſers of the oath enjoined by theſe ſtatutes are liable to ſundry penalties, forfeitures, &c. The oath of *Abjuration*, by the 6 G. III. cap. 53. I A. B. do truly and ſincerely acknowledge, profeſs, teſtify, and declare in my conſcience, before God and the world, that our ſovereign lord king George is lawful and rightful king of this realm, and all other his majeſty's dominions thereunto belonging. And I do ſolemnly and ſincerely declare, that I do believe in my conſcience, that not any of the deſcendants of the perſon who pretended to be prince of Wales during the life of the late king James the ſecond, and ſince his deceaſe pretended to be, and took upon himſelf the ſtyle and title of king of England, by the name of James the third, or of Scotland, by the name of James the eighth, or the ſtyle and title of king of Great Britain, hath any right or title whatſoever, to the crown of this realm, or any other the dominions thereunto belonging. And I do renounce, refuſe, and abjure any allegiance or obedience to any of them. And I do ſwear, that I will bear faith and true allegiance to his majeſty king George, and him will defend, to the utmoſt of my power, againſt all traiterous conſpiracies and attempts whatſoever, which ſhall be made againſt his perſon, crown, or dignity. And I will do my utmoſt endeavour to diſcloſe and make known to his majeſty, and his ſucceſſors, all treaſons and traiterous conſpiracies which I ſhall know to be againſt him or any of them. And I do faithfully promiſe, to the utmoſt of my power, to ſupport, maintain, and defend the ſucceſſion of the crown againſt the deſcendants of the ſaid James, and againſt all other perſons whatſoever; which ſucceſſion, by an act, intitled, *An act for the further limitation of the crown, and better ſecuring the rights and liberties of the ſubject*, is and ſtands limited to the princeſs Sophia, electreſs and ducheſs dowager of Hanover, and the heirs of her body, being proteſtants. And all theſe things I do plainly and ſincerely acknowledge and ſwear, according to theſe expreſs words by me ſpoken, and according to the plain and common ſenſe and underſtanding of the ſame words, without any equivocation, mental evaſion, or ſecret reſervation whatſoever. And I do make this recognition, acknowledgment, abjuration, renunciation, and promiſe heartily, willingly, and truly, upon the true faith of a Chriſtian. So help me God.

ABJURATION is alſo uſed in our *Ancient Cuſtoms*, for an oath taken by a perſon guilty of felony; who, flying to a place of ſanctuary, would ſwear to forſake the realm for ever in lieu of other puniſhment.—We alſo find inſtances of temporary *Abjuration*, *viz.* for three years, for one year and a day, and the like. This, in ſome caſe, was admitted from criminals in lieu of death. The devotion for the church was ſo warm, from the time of Edward the Confeſſor to the Reformation, that if a man, having committed felony, could recover a church or church-yard before he were apprehended, it was an aſylum from which he could not be brought to take his trial at law; but confeſſing his crime to the juſtices, or coroner, and *abjuring* the kingdom, he was at liberty.

By Stat. 21 Jac. I. all uſe of ſanctuaries, and conſequently of *Abjuration*, is taken away.

ABLACTATION. The weaning of a child from the breaſt. See Weaning.

Ablactation, in the ancient *Agriculture*, is a method of engrafting; wherein the cyon of one tree, being united for ſome time to the ſtock of another, is afterwards cut off, and, as it were, weaned from its mother-tree.

Among the modern writers, *Ablactation* is more uſually called INARCHING, or GRAFTING *by approach*.

Ablactation is only practicable where the ſtock to be grafted on, and the tree from which the graft is to be taken, ſtand ſo near, that the branch or cyon may be applied, without cutting off. Hence, it is chiefly uſed on plants that grow in caſes; as orange, lemon, and pomegranate trees; vines, jaſmins, *&c.* The ſeaſon is April or May. To perform it, the uſual method is, to take the branch, intended for the graft, and pare it away, both the rind and wood, the length of three inches; then, paring likewiſe the ſtock, ſo that they may join cloſely to each other, they are bound together, and covered over with clay, or grafting-wax. As ſoon as they are found well incorporated together, the head of the ſtock is to be cut off four inches above the binding; and the ſpring following, the graft, leaving the ſtock to ſubſiſt by itſelf. Or the operation may be done by cutting off the head of the ſtock at firſt, and leaving the top a little ſloped, and applying the graft thereto, as in *ſhoulder*-GRAFTING. But this method is not found equally ſucceſsful.

ABLAQUEATION, a name uſed by the ancient writers of *Agriculture* for an operation in gardening, whereby the earth is dug from about a vine, or other fruit-tree, and its roots are laid bare, to expoſe them more to the ſun, rain, and air, in order to promote its fecundity.—The proper ſeaſon for *Ablaqueation* is autumn, for the benefit of the winter rain, and ſnow water. Bradley fixes it in January. But experience having ſhewn the practice to be dangerous, it is now generally laid aſide.

ABLATIVE, in *Grammar*, the ſixth caſe of Latin nouns. The word is formed from *auferre*, *to take away*. Priſcian alſo calls it the *comparative caſe*; as ſerving, among the Latins, for comparing, as well as taking away.

The ABLATIVE is oppoſite to the DATIVE; the firſt expreſſing the action of taking away, and the latter that of giving.

The *Ablative* hardly anſwers to the juſt idea of a caſe; at leaſt it is the moſt vague of all others. It will be ſhewn, in its place, that the Engliſh, and other modern tongues, have properly no ſuch thing as CASES. But even in the ancient languages, from which the notion of caſes is borrowed, it is ſuggeſted, that the *Ablative* is only a ſort of ſupernumerary, or ſupplement to the reſt. The five proper caſes not being found ſufficient to expreſs all the relations of things to each other, recourſe was had to an expedient; *viz.* the putting a prepoſition before ſome of the other caſes; and this made the *Ablative*.

It may be added, that in the plural number the *Ablative* is ſtill more obſcure, as being only the DATIVE repeated. In Engliſh, French, *&c.* there is no preciſe mark whereby to diſtinguiſh the *Ablative* from other caſes; and we only uſe the term in analogy to the Latin. Thus, in the two phraſes, *the magnitude of the city*, and *he ſpoke much of the city*; we ſay, that *of the city* in the firſt is genitive, and in the latter *Ablative*; becauſe it would be ſo, if the two phraſes were expreſſed in Latin.

The queſtion concerning the Greek *ablative* has been the ſubject of a famous literary war between two great grammarians, Friſchlin and Cruſius; the former of whom maintained, and the latter oppoſed the reality of it.

The diſpute is not decided to this day. Sanctius, and the Port-royaliſts ſtill maintain the affirmative; Perizonius the negative. The chief reaſon alledged by Sanctius is, that the Roman writers often joined Greek words with the Latin prepoſitions, which govern *ablative* caſes, as well as with nouns of the ſame caſe. To which Perizonius anſwers, that the Latins anciently had no *ablative* themſelves; but inſtead thereof, made uſe, like the Greeks, of the dative caſe; till at length they formed an *ablative*, governed by prepoſitions, which were not put before the dative: that, at firſt, the two caſes had always the ſame termination, as they ſtill have in many inſtances: but that this was afterwards changed in certain words. It is no wonder then, that the Latins ſometimes join prepoſitions which govern an *ablative* caſe, or nouns in the *ablative* caſe, with Greek datives, ſince they were originally the ſame; and that the Greek dative has the ſame effect as the Latin *ablative*. See Cases.

Ablative Absolute, in *Grammar*, is a word or phraſe detached, and independent of the reſt of the diſcourſe; neither governing, nor being governed of any other thing. This is frequent among the Latins; in imitation of whom, the modern languages have likewiſe adopted it.

ABLECTI, in *Antiquity*, a choice or ſelect part of the ſoldiery in the Roman armies, picked out of thoſe called *extraordinarii*.

ABLEGMINA, in *Antiquity*, thoſe choice parts of the entrails of victims, which were offered in ſacrifice to the gods. The *ablegmina* were otherwiſe called *proſiciæ*, *porriciæ*, *proſecta*, and *proſegmina*: they ſeem to have differed from *ſtrebula*, which were the like morſels of the fleſhy parts; and from *augmentum*, which particularly denoted a part of the liver.

Some authors make *ablegmina* to denote all thoſe parts of the victims which were offered to the deities; contrary to the authority of Feſtus, who reſtrains *ablegmina* to the *exta*, or entrails only.

The *exta* being found good, were to be proſected, or parted; *i. e.* the extremes or prominent parts cut off, as *ablegmina*, to be ſprinkled with flour, and burnt by the prieſts on the altar, pouring wine on them.——Tertullian rallies the heathens for thus ſerving their gods with ſcraps and offals.

ABLET, or Alblen, in *Zoology*, a name given by ſome to the common *bleak*, a ſmall freſh-water fiſh, called in Latin *alburnus*.

The *ablet* is truly and properly a ſpecies of *cyprinus*, and is diſtinguiſhed by Artedi by the name of the five-inch cyprinus, with twenty rays in the *pinna ani*. See Alburnus and Cyprinus.

ABLUENTS, Abluentia, in *Medicine*, a name which ſome authors give to a ſort of diluting remedies, better known by the name of ABSTERGENTS.

ABLUTION, in *Antiquity*, a religious ceremony in uſe among the Romans; being a ſort of purification, performed by waſhing the body, before they entered on ſacrifice.

Sometimes they waſhed their hands and feet, ſometimes the head, and oftentimes the whole body: for which purpoſe, at the entrance into their temples, were placed marble veſſels filled with water.

Ablutions appear to be as old as any ceremonies, and external worſhip itſelf. Moſes enjoined them; the heathens adopted them, and Mahomet and his followers have continued them: thus they have got footing among moſt nations, and make a conſiderable part of moſt eſtabliſhed religions.—The Egyptian prieſts had their diurnal and nocturnal *ablutions*: the Grecians, their ſprinklings: the Romans, their luſtrations and lavations: the Jews, their waſhings of hands and feet, beſide their baptiſms: the ancient Chriſtians had their *ablutions* before communion, which the Romiſh church ſtill retain before their maſs, ſometimes after: the Syrians, Cophts, &c. have their ſolemn waſhings on Good Friday: the Turks, their greater and leſſer *ablutions*; their gaſt and wodon; their aman, tabarut, guſul, and abdeſt, &c.

Ablution is particularly uſed, in the Romiſh church, for a ſup of wine and water, which the communicants anciently took after the hoſt, to waſh it down, and help to digeſt it.

The ſame term alſo ſignifies the water which ſerves to waſh the hands of the prieſt who conſecrated it.

Ablution, in *Pharmacy*, is a preparation which divers remedies undergo, by waſhing them in water, or ſome other fluid, proper to cleanſe and free them of their impurities, and ſo to exhalt their powers.

The uſual way of doing this is by COHOBATION, or pouring the liquor diſtilled from the body, upon it again: and repeating this as often as it is neceſſary.

Ablution is ſometimes alſo uſed, though with leſs propriety, for the waſhing or infuſing certain medicines in water, to freſhen them, and diſſolve their ſalts.

ABOLITION, Abolishing, in a general ſenſe, the act of deſtroying a thing, or reducing it to nothing.

In our laws, the *Abolition* of a law, ſtatute, or cuſtom, is the abrogating or repealing it.

The leave given by a prince, or judge, to a criminal accuſer, to deſiſt from farther proſecution of the accuſed, is peculiarly called *Abolition*. *V.* 25 *H.* 8. *c.* 21.

Abolition is particularly uſed among civilians, for remitting the puniſhment of a crime.

In this ſenſe *abolition* is a lower ſpecies of amneſty, which takes off the puniſhment, but not the infamy: *liberat, ſed notat.*

Abolition is alſo particularly uſed, among Roman lawyers, for the annulling a proſecution, or legal accuſation.

Abolition in this ſenſe differs from amneſty, and oblivion; becauſe in the former, the accuſation might be renewed, even by the ſame proſecutor, which in the latter was extinguiſhed for ever.

Within thirty days after a public *abolition*, the ſame accuſer, by the prince's licence, was allowed to renew the charge; after a private *abolition*, another accuſer might renew it, but the ſame could not.

This kind of *abolition* is either granted in favour of the accuſed, or of the accuſer; and is either public, granted by the prince or ſenate, on occaſions of public rejoicing, victory, and congratulation; or private, ſued for to the preſident or judge, by one of the parties; frequently by the accuſer himſelf, who after having imbarked in the proſecution, by ſubſcribing his name to the charge, could not by the Turpilian ſenatus-conſult otherwiſe deſiſt, without incurring infamy. On ſuch occaſions therefore the accuſer would *petere ablitionem*; that is, move for an *abolition:* which was only granted, on his ſhewing fair and honeſt motives for withdrawing the charge; viz. inadvertency, youth, warmth, or the like: nor was it granted without the conſent of the accuſed; or if the accuſation appeared to have been utterly falſe, or malicious, &c.

For the accuſed, the charge againſt him was alſo *aboliſhed* by the death of the accuſer, or his being incapacitated from proſecuting by reaſon of ſickneſs, or the like. ——An action of injury was *aboliſhed* by diſſimulation: a ſentence of condemnation, by indulgence.

Abolition was alſo uſed for expunging a perſon's name out of the public liſt of the accuſed, hung up in the treaſury.

This was called *abolere nomen*; and, like the former, was either public, as that under Auguſtus, when all the names, which had long hung up, were expunged at once, or private, done at the motion of one of the parties.

By ſeveral laws in the Theodoſian code it appears, that an *abolition* of debts was ſometimes granted the debtors to the fiſcus. We have a medal of the emperor Adrian, wherein that prince is repreſented ſtanding with a ſcepter in his left hand, and a lighted torch in his right; with which he ſets fire to ſeveral papers in preſence of the people, who teſtify their joy and gratitude by lifting up their hands towards heaven. The legend is, *Reliqua vetera* H. S. *nummis abolita.*

ABOLLA, in *Antiquity*, a warm kind of garment, lined or doubled, uſed by the Greeks and Romans; chiefly out of the city, in following the camp.

The word is Latin, formed, as ſome imagine, from *bulla*, on a ſuppoſition that this veſtment was garniſhed with thoſe ornaments called *bullæ*. Others, denying this circumſtance, derive it from the Greek *αμϐολη*, of *αναϐολη*, *amictus*, *cloathing*.

Critics and antiquaries are greatly divided as to the form, uſe, kinds, &c. of this garment. Papias makes it a ſpecies of the *toga*, or gown; but Nonius, and the generality, a ſpecies of the *pallium*, or cloak.

The *abolla* ſeems rather to have ſtood oppoſed to *toga*, which was a garment of peace, as the *abolla* was of war; at leaſt Varro and Martial place them in this oppoſite light.

Some, after Nonius, hold it to have been a military garb alone; others, after Papias, a ſenatorial; and Salmaſius particularly, to have been worn by the preſidents in the provinces, and even by the præfecti of the city, when they adminiſtered juſtice; which Pitiſcus endeavours to refute. Others will alſo have the *abolla* to have been uſed by the philoſophers, particularly the Stoics, Cynics, &c. Laſtly, others reconcile all theſe variances, by making divers kinds of *abollæ*, accommodated to different occaſions and profeſſions. Even kings appear to have uſed the *abolla:* Caligula was affronted at king Ptolemy for appearing at the ſhews in a purple *abolla*, and by the eclat thereof turning the eyes of the ſpectators from the emperor upon himſelf.

ABOMASUS, Abomasum, or Abomasium, in *comparative Anatomy*, one of the ſtomachs or ventricles of animals of the ruminating kind. See Ruminant and Rumination.

Beaſts that chew the cud are found to have four ſtomachs; viz. the *rumen*, or *magnus venter*, or ſtomach, properly ſo called; the *reticulum*, *omaſus*, and *abomaſus*. The *abomaſus*, properly called the *maw*, is the laſt of the four; being the place wherein the chyle is formed, and from which the food deſcends immediately into the inteſtines.

It is full of a ſort of leaves, like the *omaſus*; but its leaves have this peculiarity, that beſide the membranes they conſiſt of, they contain a great number of glands, not found in any of the firſt.

It is in the *abomaſus* of calves and lambs that the runnet, or earning, is formed, wherewith houſewives curdle their milk.

ABORIGINES, or Aborigenes, in *Geography*, a name ſometimes given to the primitive inhabitants of a country, or thoſe who had their original therein; in contradiſtinction to colonies, or new races of inhabitants, derived from elſewhere.

The term *Aborigines* is famous in antiquity.—Though now an appellative, it was originally a proper name, given only to a certain people of Italy; and both the reaſon and origin of it are greatly diſputed among the learned.

Aborigines then denoted a nation in Italy, which inhabited the ancient Latium, or country now called Romania or Campagna di Roma.

In which ſenſe, the *Aborigines* are diſtinguiſhed from the Janigenæ, who, according to the falſe Beroſus, inhabited the country before them; from the Siculi, whom they expelled; from the Grecians, whom they deſcended from; from the Latins, whoſe name they aſſumed, after their union with Æneas and the Trojans; and, laſtly, from the Auſonii, Volſci, Oenotrii, &c. neighbouring nations in other parts of the country.

Whence this people came by the appellation, whether (1) as belonging to any of the ſpecies of *Aborigines*, above recited; or (2) from their having been *aberrigines*, *i. e.* wanderers; or (3) from their inhabiting the mountains; or on what other account, is much diſputed.

(1) S. Jerom ſays, they were ſo called, as being, *abſque origine*, the primitive planters of the country after the flood. Dion Halicarnaſſ. accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them ſo called as being originally Arcadians, who claimed to be earth-born, and not deſcended from any people.

(2) Aurelius Victor ſuggeſts another opinion, viz. that they were called *Aborigines*, *q. d. Aberrigines*, from *ab*, *from*; and *errare*, *to wander*; as having been before a wandering people, to which opinion Feſtus gives ſome credit. It is added, that Pelaſgians, another name ſometimes given them, is of the ſame import, and denotes vagabonds, like cranes.

(3) Pauſanias rather thinks they were thus called, *απο ορεων*, *from mountains*; which opinion ſeems confirmed by Virgil, who ſpeaking of Saturn, the legiſlator of his people, ſays:

> *Is genus indocile, ac diſperſum montibus altis*
> *Compoſuit, legeſque dedit.*—

The *Aborigines* were either the original inhabitants of the country, ſettled there by Janus, as ſome imagine, or by Saturn, or Cham, as others, not long after the diſperſion; or even, as ſome think, before it: or they were a colony ſent from ſome other nation; who, expelling the ancient inhabitants the Siculi, ſettled in their place.

ABORTION, is uſed, in *Medicine*, for the unſeaſonable excluſion of an imperfect human *fœtus*, either alive, or dead, before the natural time of delivery.

In this ſenſe, *abortion* amounts to the ſame with what we popularly call *miſcarriage*; the Latins *abortus*, and ſometimes *abactus*.

This may happen at any time of pregnancy; but if before the ſecond month after conception, it is properly called a *falſe conception*, or effluxion.

The cauſes of *abortion* are very various. The moſt uſual are, diſtempers, either acute or chronical; immoderate evacuations, all ſtrong paſſions, violent exerciſes, frights, lifting of weights, weakneſs from any cauſe whatever, fulneſs of blood, ſtimulating medicines, offenſive ſmells, exceſſive uſe of venery, and, in general, any thing which tends to promote the *menſes*. But the moſt frequent cauſes of abortion are either too great ſtricture, or laxity of the *uterus*, which are more particularly pointed out by Hippocrates.

The ancient Greek legiſlators, Solon and Lycurgus, prohibited the practice of creating *abortion*. Whether or no it was permitted among the Romans, has been much diſputed, between two learned modern civilians. It is certain the practice, which was by them called *viſceribus vim inferre*, was frequent enough: but whether there was any penalty on it, before the emperors Severus and Antonine, is the queſtion. Noodt maintains the negative; and farther, that thoſe princes only made it criminal in one particular caſe; viz. of a married woman's practiſing it out of reſentment againſt her huſband, in order to defraud him of the comfort of children; this was ordered to be puniſhed by a temporary exile: *ſiqua prægnans vim viſceribus ſuis intulerit ne inimico marito filium procrearet, temporali exilio coerceatur*. He adds, that there was no general prohibition of the practice before Gratian and Valens. It is true we find in Cicero an earlier inſtance, of a woman puniſhed for this fact; but it was in Mileſia, a country not ſubject to the Roman laws.

Bynkerſhoeck however denies, that a woman was allowed to drink the *poculum abortionis*, *impune*; and the reaſon he gives, is, that the womb was the huſband's property, who was declared, by the laws, the ſole *cuſtos* of it; to prevent his being impoſed on in the children he was to bring up. But then this does not affect women, who had been impregnated by others than their huſbands.

The foundation on which the practice is ſaid to have been allowed, was, that the *fœtus*, while *in utero*, was reputed as a part of the mother, ranked as one of her own viſcera, over which ſhe had the ſame power as over the reſt: beſides, that it was not reputed as a man, *homo*; nor to be alive, otherwiſe than as a vegetable: conſequently, the crime amounted to little more than that of plucking unripe fruit from the tree. V. Juven. Sat. 6. v. 500. Senec. Conſolat. ad Helviam Matrem, c. 16.

This laſt cited author repreſents it as a peculiar glory of Helvia, that ſhe had never, like other women, whoſe chief ſtudy is their beauty and ſhape, deſtroyed the *fœtus* in her womb. *Nunquam te fœcunditatis tuæ quaſi exprobraret ætatem, puduit: nunquam more alienarum quibus omnis commendatio ex forma petitur, tumeſcentem uterum abſcondiſti quaſi indecens onus, nec inter viſcera tua conceptas ſpes liberorum eliſiſti.*

The primitive fathers, Athenagoras, Tertullian, Minutius Felix, Auguſtin, &c. declaimed loudly againſt the practice, as virtual murder: *Homicidii feſtinatio eſt, prohibere naſci; nec refert, natam quis eripiat animam, an naſcentem diſturbet.* Several councils have declared againſt it. Yet we are told that the modern Romiſh eccleſiaſtical laws allow of diſpenſations for it. Egane mentions the rates at which a diſpenſation for it may be had.

The practice of artificial *abortion* is chiefly in the hands of women and nurſes, rarely in that of phyſicians; who, in ſome countries, are not admitted to the profeſſion without abjuring it. Hippocrates, in the oath he would have enjoined on all phyſicians, includes their not giving the *peſſus abortivus*; though elſewhere he gives the formal proceſs, whereby he himſelf procured a maid to miſcarry. The time for it is preſently after impregnation; at leaſt within the third or fourth month of geſtation. The manner of effecting it is chiefly by medicines of the purgative, and deobſtruent kind: Roman authors ſpeak of the *poculum abortionis*, or *abortive* draught, frequent among them. External violences are alſo ſometimes had recourſe to; as leaping from a ſtool, preſcribed by Hippocrates: obſtinate faſtings, and vehement evacuations, have been frequently practiſed for the ſame end.—Yet all the powers of medicine often fail to procure *abortion*, by reaſon of the naturally cloſe contraction of the orifice of the uterus; which has been known to hold out againſt the moſt malignant fevers, dyſenteries, ſalivations, and the like; againſt the ſtrongeſt aperients and evacuants; againſt diſtilled oils of juniper, ſavin, ſuccinum; againſt large quantities of crocus metallorum, artemiſia, myrrh, mercury, the farina of muſcus terreſtris, &c.

The moſt fatal method is by punctures of the uterus, with a pointed inſtrument for the purpoſe; too often uſed among us, and not unknown to the ancients.—Patin mentions a midwife hanged at Paris, for killing a *fœtus* in the womb, by running a ſtilletto, or kind of bodkin, up the vagina, through the orifice of the uterus; by which a miſcarriage was procured, but with ſuch ill ſucceſs, that the mother was ſeized with convulſions, and died miſerably. The criminal confeſſed ſhe had treated many before in the ſame manner, with good effect. Our own age and country afford a parallel inſtance, a woman having been a few years ago executed among us for the like fact. Tertullian has a paſſage, which ſhews the ſame was practiſed in thoſe days; *eſt etiam æneum ſpiculum, quo jugulatio ipſa dirigitur cæco latrocinio* εμϐρυοσφακτην *appellant, utique viventis infantis peremptorium.* The operation, conſidering the tenderneſs of the part, muſt be of the utmoſt danger. Brendelius gives an account of what he obſerved in diſſecting a girl at Norimberg, in 1714, who died of the operation, which ſhe had performed on herſelf; the neck of the uterus appeared exceedingly diſtended, the veſſels lacerated and mortified, the uterus itſelf inflamed and putrefied, &c.

Abortion may be produced by whatever immediately affects the child, the placenta, the membrane, or the mother. When the time of miſcarriage is juſt at hand, the pains are much the ſame as thoſe in labour.

Abortion is dangerous where the time of pregnancy is far advanced, ſo that the *fœtus* muſt be large, where the cauſe is very violent, or the patient ſtrongly convulſed, and where a large hæmorrhage precedes, or enſues, or the *fœtus* is putrefied, &c. Under other circumſtances it rarely proves mortal.

Abortion is alſo uſed, ſomewhat abuſively, for a *fœtus*, which, dying in the womb, continues there beyond the natural term; ſometimes ſeveral years, and even during the whole life of the mother.

To prevent Abortion. See Miscarriage.

ABORTIVE, ſomething come before its due time, or before it has arrived at its maturity and perfection.

Abortive *Flux, fluxus abortivus*, is ſometimes uſed, among the ancients, as ſynonymous with abortion or effluxion; viz. where the embryo loſes its hold, and ſlips away. In this ſenſe, the eagle-ſtone is celebrated for ſtopping *abortive fluxes*; for which end it was to be hung to the arm, *ſubnexus ſpem uteri defendit a fluxibus abortivis.* See Ætites.

Among modern phyſicians, *abortive fluxes* are chiefly underſtood of a kind of hæmorrhages, which ſometimes precede, and bring on abortion; at other times, burſt forth in the act of excluſion.

The cauſe is a violent ſeparation of the ſecundines from the uterus; which may ariſe from a vehement fit of paſſion, or motion of the body, a fall, fright, or the like. Thunder, lightning, hot liquor, too liberal uſe of deobſtruents, or the navel-ſtring being too ſhort, ſometimes occaſion an *abortive* hæmorrhage.

Abortive *Corn*, a diſtemper of corn mentioned by M. Tillet, and ſuſpected to be occaſioned by inſects. It appears long before harveſt, and may be known by a deformity of the ſtalk, the leaves, the ear, and even the grain.

Abortive *Vellum* is made of the ſkin of an *abortive* calf.

ABRA, a ſilver coin in Poland, nearly equivalent to the Engliſh ſhilling. It is current through all the dominions of the Grand Signior, at the value of one fourth of the Holland's dollar, or *aſlani*.

ABRACADABRA, a magic word, recommended by Serenus Sammonicus, ſuppoſed to have the virtue of a charm or amulet, in curing agues, and preventing other diſeaſes, particularly the fever called by the phyſicians *hæmitratæus*.

To have this effect, the word muſt be wrote on paper, and repeated, omitting each time the laſt letter in the former, ſo that the whole may form a kind of inverted cone: in which there is this property, that which way ſoever the letters be taken, beginning from the *apex*, and aſcending either to the right or left, they make the ſame word, or, as ſome will have it, the ſame ſentiment, as is found in the firſt whole line.—According to Julius Africanus, another ancient writer, the pronouncing of the word in the ſame manner will do as well.

ABRAHAMIANS, or Abrahamites, a ſect of heretics, who renewed the error of the Paulicians.

They took their name from that of their leader Abraham, a native of Antioch, by the Arabs called Ibrahim; whence alſo the name Ibrahimiah, given by them to this ſect. The *Abrahamians* aroſe about the cloſe of the eighth century, and were ſuppreſſed by the vigilance of Cyriacus, patriarch of Antioch.

Abrahamites is alſo uſed, in church-hiſtory, for a party of monks, who ſuffered death for the worſhip of images under Theophilus.

ABRAMIS, in *Ichthyology*, a name given by Bellonius and others, to the *cyprinus latus*, or bream.

ABRASA, ulcers attended with abraſion of part of the ſubſtance; or ulcers, where the ſkin is ſo tender and lax, as to be ſubject to abraſion.

ABRASAXAS, an amulet in the form of a circle. See Abraxas.

ABRASION, is ſometimes uſed, among *Medicinal* writers, for the act of wearing away the natural *mucus* which covers the membranes, and particularly thoſe of the ſtomach and inteſtines, by ſharp corroſive medicines, or humours.

The word is compoſed of the Latin *ab*, and *rado*, *to ſhave*, or *ſcrape off*.

ABRAUM, in *Natural Hiſtory*, a name given by ſome writers, to a ſpecies of red clay, uſed in England by the cabinet-makers, &c. to give a red colour to new mahogany wood; we have it from the Iſle of Wight, but it is alſo found in Germany and Italy.

ABRAXAS, a barbarous word, denoting a power which preſides over three hundred and ſixty-five others, the number of days in the year.

Abraxas is a word of obſcure origin, framed by ancient heretics as ſhould ſeem for quaintneſs ſake: it is ſuppoſed to be technically compounded of the Greek letters, conſidered as numeral characters; according to the cuſtom of the Grecians, who expreſſed their numbers by letters of the alphabet; the values of which in the preſent word ſtand thus: Α 1, Β 2, Ρ 100, Α 1, Ξ 60, Α 1, Σ 200; which added together make the number 365.

The word is uſually written, among modern authors, *abraxas*, though, as ſome hold, by a corrupt tranſpoſition of the letters Σ and Ξ, for *abraſax*, as it is found in all the Greek fathers, as well as on ancient ſtones. Irenæus indeed has *abraxas*, but the reaſon may be, that the chapter in which the word occurs is only extant in

Latin; ſo that though it be in Greek characters, the orthography is of Latin copyiſts or tranſlators.—In ſtrictneſs the word ought to be written in Greek characters, ΑΒΡΑCΑΞ; ſince, beſides that the inventors of it ſpoke that language, the word does not contain the number 365, when written in the Latin character. Hence a farther error in moſt books, wherein the word occurs in the ſmaller or running character, on account of the Greek ſigma; which having in ancient inſcriptions the ſame figure with the Latin C, is often rendered by a Roman C inſtead of S; whence *abracax* for *abraſax*.

ABRAXAS is more particularly uſed, in the Baſilidian theology, for the ſupreme God, as ſuppoſed to contain the values or powers of 365 dependent deities.

Abraxas was properly the principle of the Gnoſtic hierarchy; the ſpring from whence their plurality of æons aroſe. From *abraxas* proceeded the primigenial mind; from the primigenial mind the logos, or word; from the word, phroneſis or prudence; from prudence, ſophia and dynamis, or wiſdom and ſtrength; and from theſe two proceeded principalities, and powers, and angels; and from theſe, other angels, to the number of 365, the regents or intelligences of ſo many celeſtial orbs.

The Baſilidians, who paſs for the authors of the *diſciplina arcani*, and the Platonic trinity, are ſuſpected among Chriſtians of ſome meaning ſtill deeper, and more myſterious, in their *abraxas*. Several have even ſuſpected ſomething of the goſpel trinity concealed in this word; which they explain, by ſuppoſing it compounded of the initial letters of the Hebrew words *Ab ben rouah*, *q. d.* father, ſon, and ſpirit. Wendelin, canon of Tournay, and father Hardouin, have given more preciſe explications of the word, according to this ſyſtem. The former makes it ſtand for *pater*, *filius*, *ſpiritus ſanctus*, *ſalus a ligno*: the latter, improving ſomewhat on the explication, makes it repreſent as hereunder.

A	A	Pater	A	1
B	Ben	Filius	B	2
P	Rouah-hakadoſh	Spir. Sanctus	P	100
A	ανθρώπες	homines	A	1
C	σαζων	ſalvans	C	200
A	αγιω	per ſacrum	A	1
Ξ	ξυλω	lignum	Ξ	60
				365

ABRAXAS is alſo uſed, among *Antiquaries*, for a ſpecies of graven gem, on which the word *abraxas* is uſually inſcribed; ſuppoſed to have been worn by the ancient Gnoſtics, Baſilidians, and Carpocratians, as an amulet or taliſman againſt diſeaſes.

Abraxas, in this ſenſe, is ſynonymous with Baſilidian ſtone, a name by which ſome authors call theſe antiques; or *abraxean ſtone*, as they are denominated by others.

Abraxaſes are of divers figures and ſizes: ſometimes in that of rings to be worn on the finger; in which form they were ſuppoſed of great efficacy for driving away flies.

Abraxaſes are frequent in the cabinets of the curious: a collection of them, as complete as poſſible, has been much deſired by ſeveral. There is a fine one in the abbey of S. Genevieve, which has occaſioned much inquiry. They are chiefly of the third century; moſt of them ſeem to have come from Egypt, whence they become of conſiderable uſe for explaining the antiquities of that country.

Macarius, Chifflet, and Capello, have written expreſly on *abraxaſes*: the two former have given explications of a great number of theſe ſtones; the laſt, figures only, without explications. The former are reproached with exceſs of conjectures and erudition; the latter, with puzling the reader with mere riddles: there is ſtill room for ſomething better on the ſubject.

Abraxaſes have ſometimes no other inſcription beſide the word; but more uſually ſome ſymbol of the Baſilidian god. Beſide which, we ſometimes find other marks and words adjoined; as the names of ſaints, angels, Baſilidian virtues, apoſtles, and the ineffable name Jehovah itſelf, either at length, or in the abbreviature ΙΑΩ; ſometimes the words σαϐαωθ Ἀδοναι, or the names of other gods; as Mithras, or Mithraξ; שמש, Semes, Sol; Ανουϐις; εις Ζευς Ζεραπις; and the like. Sometimes Iſis ſitting on a lotus, or Apis ſurrounded with ſtars; ſometimes monſtrous compoſitions of animals, obſcene images, Phalli, and Ithyphalli. The graving of *abraxaſes* is not uniform, rarely good; the reverſe, on which is the word, is ſaid to be ſometimes of a lower and a more modern taſte than the face. The characters are uſually Greek, ſometimes Hebrew, Coptic, or Hetrurian; and ſometimes of a mongrel kind, forged as ſhould ſeem on purpoſe to make their import impenetrable. It is diſputed, whether or no the Veronica of Montreuil, or the Granite obeliſk, mentioned by Gori, be *abraxaſes*.

ABREAST, a *Marine* term, expreſſing the ſituation of two or more ſhips, that lie with their ſides parallel to each other, and their heads equally advanced. When the line of battle at ſea is formed *abreaſt*, the whole ſquadron advances uniformly, the ſhips being equally diſtant from, and parallel to each other; ſo that the length of each ſhip forms a right angle with the extent of the ſquadron, or line *abreaſt*. See LINE.

ABRIC, ſulphur.

ABRIDGING, in *Algebra*, is the reducing a compound problem, or equation, to its more ſimple expreſſion. See PROBLEM, EQUATION, and EXPRESSION.

To prevent the mind's being diſtracted with attending to known quantities, concerning which nothing farther is required, and to keep the attention entire for the reſt, mathematicians uſe to *abridge* their equations, by expreſſing all the known qualities of the ſame term, by a ſingle letter.—For an inſtance: to *abridge* the equation

$$\begin{array}{llll} x^3 & -axx & +abx & -abc=0 \\ & -b & +ac & \\ & -c & +bc & \end{array}$$

All the known quantities $-a-b-c$ of the ſecond term are ſuppoſed equal to one ſingle letter $-n$: all the known quantities $+ab+ac+bc$ of the third term, equal to another letter $+p$: and all the known quantities $-abc$ of the fourth term, equal to a ſingle letter $-q$. By which means we have $x^3-nxx+px-q=0$, inſtead of the equation propoſed.

An equation thus abridged, is called a formula. See FORMULA.

ABRIDGMENT, a ſummary, or contraction of a diſcourſe; wherein the leſs material things being more briefly inſiſted on, the whole is brought into a leſſer compaſs.

Abridgments of books are numerous. They are uſually ſaid to have had their riſe in the times of ignorance; to have been one of the firſt fruits of that barbariſm which enſued on the decline of the Roman empire; and to have been unknown in thoſe happy days, when letters flouriſhed among the Greeks and Romans: yet we have ſome traces of them in thoſe times.

ABRIDGMENT, in *Law*, is particularly uſed for the ſhortening a count or declaration, by ſubtracting ſome of the ſubſtance of it.

A man is ſaid to *abridge his plaint* in aſſize, or a woman her demand in an action of dower, when, having put any lands therein which are not in the tenure of the tenant or defendant; and non-tenure, or the like, is pleaded to that land in abatement of the writ; they are brought to *abridge*, *i. e.* to deſiſt from and leave that parcel out of the demand; and pray that the tenant may anſwer to the reſt, to which he has not yet pleaded any thing.—Though the demandant has *abridged* his plaint, or demand; yet the writ ſtill remains good for the reſt. The reaſon is, that ſuch writs run in general, and do not ſpecify particulars. See 21 H. 8. c. 3.

ABROCHMENT, or ABBROCHMENT, ABBROCAMENTUM, in ſome ancient *Law*-writers, denotes the act of ingroſſing or buying up commodities by wholeſale, before they come into the open market; in order to ſell them off dear by retail, otherwiſe called *foreſtalling*.

ABROGATION, the act of aboliſhing a law, by authority of the maker.

In which ſenſe, the word is ſynonymous with abolition, repealing, and revocation.

Abrogation ſtands oppoſed to *rogation*: it is diſtinguiſhed from *derogation*, which implies the taking away only ſome part of a law; from *ſubrogation*, which denotes the adding a clauſe to it; from *obrogation*, which implies the limiting or reſtraining it; from *diſpenſation*, which only ſets it aſide in a particular inſtance; and from *antiquation*, which is the refuſing to paſs a law.

ABROHANI, or MALLEMOLLI, the name of a kind of muſlin, or clear white fine cotton cloth, brought from the Eaſt Indies, particularly from Bengal; being in length ſixteen French ells and three quarters, and in breadth five eighths.

ABROKUS, in *Botany*, a name uſed by ſome of the Latin writers, for the *bromus*, or *avena ſterilis*, the wild oat; and by others, for the *orobus*, or bitter vetch. The Greeks originally uſed the word, and that not only for theſe two vegetables, but in a much larger ſenſe, underſtanding by it any herb reſembling the plants cultivated for the uſe of the table, but not-eſculent. The Greeks and Romans had a way of expreſſing the boiling of pulſe, or herbs, by words ſignifying the wetting them: thus the Greeks expreſſed boiled things by *brocha*, βροχα, and the Romans by *madida*. Virgil uſes this word for the peaſe, and Plautus for all eſculent things that were boiled: hence theſe baſtard peas and oats were called *abrocha*, *non madida*, not fit for boiling or eating.

ABRONO, in *Botany*, a name given by Serapion, and others, to the heart-peaſe; called alſo *abrugi*.

ABROTANUM, or Abrotonum. See Southernwood.

ABRUGI. See Abrono.

ABRUS, in the *Materia Medica*, the name of a ſeed produced by one of the phaſeole, or kidney-beans, and commonly called Angola-ſeeds.

ABSCESS, in *Medicine*, a kind of inflammatory TUMOUR, containing purulent matter, pent up in a fleſhy part, and corrupting and conſuming the fibres, and other ſubſtance thereof.

Abſceſs is the ſame with what the Greeks call *apoſtema*, and the Engliſh, *impoſthume*, or *impoſthumation*.

Almoſt all *abſceſſes* are the conſequences of inflammation.—The ripening of *abſceſſes* is promoted by poultices, &c.—*Abſceſſes* are opened either by cauſtic, or inciſion; but the latter way is in moſt caſes preferable.

Abſceſſes ariſe often in women after delivery; and though dangerous in themſelves, yet they often appear to be the *criſis* of the diſeaſe, that gave riſe to them.—For the cure, if they cannot be diſcuſſed, i. e. carried off by proper artificial evacuations, as phlebotomy, purging, &c. with the occaſional uſe of calomel, and gentle perſpirative fotuſes, liniments, and cataplaſms; recourſe is to be had to the contrary method, and they muſt be brought to ſuppuration.

ABSCISSE, Abscissa, in *Conics*, a part of the diameter or tranſverſe *axis*, of a conic ſection, intercepted between the *vertex*, or ſome other fixed point, and a ſemiordinate. See Conic *Section*.

Such are the lines AP, AP, &c. (*Tab. Conics*, *fig.* 20.) intercepted between the *vertex* A and the ſemiordinates PM, PM, &c. which are called *abſciſſes*, of the Latin *abſcindere*, *to cut off*; as being parts cut off from the *axis*.—Others call them *ſagittæ*, *q. d.* arrows.

In the *parabola* the *abſciſſe* is a third proportional to the *parameter* and ſemiordinate; and the *parameter* a third proportional to the *abſciſſe* and ſemiordinate.

In the *ellipſis*, the ſquare of the ſemiordinate is equal to the rectangle of the *parameter* into the *abſciſſe*, ſubtracting another rectangle of the ſame *abſciſſe*, into a fourth proportional to the *axis*, *parameter*, and *abſciſſe*.

In the *hyperbola*, the ſquares of the ſemiordinates are to each other as the rectangles of the *abſciſſe* into another line, compoſed of the *abſciſſe* and the tranſverſe *axis*.

ABSCISSION, in *Rhetoric*, is a figure of ſpeech, when beginning to ſay a thing, we break off ſhort, as ſuppoſing the matter ſufficiently ſignified, by what has been already ſaid.

For an inſtance: One of her ſex, age, and beauty, to be ſeen alone, at ſuch an hour, with a man of his character.—I need ſay no more.

Abſciſſion is a ſpecies of ellipſis, or ſuppreſſion.—Scaliger diſtinguiſhes it from præciſion, and ſuſpenſion.

Aſtrologers alſo ſpeak of an *abſciſſion* of the light of a planet, by another planet's outſtripping it, and joining a third before it. *Abſciſſion* is held a deterioration.

Abscission, in *Surgery*, denotes the act of taking away ſome morbid or ſuperfluous part by an edged inſtrument.

In this ſenſe, *abſciſſion* amounts to the ſame with the Greek αποκοπη. Cowper ſpeaks of the *abſciſſion* of a leg; which is more properly called amputation. The *abſciſſion* of the *præpuce* makes what we call circumciſion. *Abſciſſion* of the ears is a kind of legal puniſhment, inflicted on perjury. In ſome countries they alſo practiſe *abſciſſion* of the noſe on traitors in an army, as a puniſhment reputed worſe than death.

Abscission is more properly uſed for the operation of cutting away ſome ſoft part of the body, when depraved, or grown hurtful.

In which ſenſe, *abſciſſion* differs from amputation, in that the latter is of a ſolid or bony part, the former of a fleſhy or membranous one; yet they are ſometimes confounded.

We ſay, the *abſciſſion* of a nerve, lip, cheek, or the like: Mr. Shipton gives an inſtance of the *abſciſſion* of a portion of the inteſtines not being mortal.

ABSINTHITES, Absinthiac, or Absinthiated, ſomething tinged or impregnated with the virtues of *abſinthium*, or WORMWOOD.

Bartholin mentions a woman whoſe milk was become *abſinthiated*, and rendered bitter as gall, by the too liberal uſe of wormwood.

Vinum abſinthites, or *poculum abſinthiatum*, wormwood wine, is much ſpoke of among the ancients, as a wholeſome agreeable drink, and even an antidote againſt drunkenneſs; though ſome have charged it with being offenſive to the head, and liable to cauſe fevers, cephalalgias, vomitings, uterine fluxes, &c. Ray alſo makes it a preventive of venery. The preparation is given by many. According to the common account, it is made by infuſing the leaves of the plant in a quantity of wine. But Fehr ſhews that it ſhould rather be prepared by fermentation, in order to correct the crudities of the plant, and call forth its volatile ſalt. Paulli prepares it even without *abſinthium*. Dr. Bowle prefers the *aqua abſinthites*, or wormwood-water, taken in a ſmall quantity after meals, to the wine; as being leſs liable to affect the head, and fill it with vapours.

ABSINTHIUM, in *Botany*. See Wormwood.

Absinthium is alſo a name given to other plants, by different authors; as to dwarf *ptarmica*, with leaves divided after the manner of wormwood; alſo to the alpine *chamæmile*, with ſouthernwood-leaves.

ABSIS. See Apsis.

ABSOLUTE, in a general ſenſe, ſomething that ſtands free or independent.

Absolute, in *Metaphyſics*, denotes a being whoſe whole eſſence does not conſiſt in a mere habitude or relation to another.

In which ſenſe *abſolute* ſtands oppoſed to *relative* or *reſpective*.

Absolute is more particularly underſtood of a thing which does not proceed from any cauſe, or does not ſubſiſt by virtue of any other being, conſidered as its cauſe.

In which ſenſe, God alone is *abſolute*.

Abſolute, in this ſenſe, is ſynonymous with *independent*, and ſtands oppoſed to *dependent*.

Absolute alſo denotes a thing's being free from conditions, or limitations.

In this ſenſe, the word is ſynonymous with *unconditional*.

We ſay, an *abſolute* decree, *abſolute* promiſe, *abſolute* obedience. The covenant with Noah was *abſolute*, and without conditions; that under the goſpel, on condition of faith and obedience. The Antinomians alſo hold the goſpel-covenant *abſolute*, and that Chriſt has purchaſed our ſalvation, without any conditions to be performed on our ſide.

Absolute *Government*, that wherein the prince is left ſolely to his own will, being not limited to the obſervance of any laws except thoſe of his own diſcretion.

When the Danes made their king *abſolute*, in 1670, they declared him abſolved from his coronation oath.

Absolute *Number*, in *Algebra*, is the known quantity or number which poſſeſſes one intire ſide, or part of an EQUATION; being the rectangle or ſolid whoſe root or value is to be found.

Thus, in the equation $aa+16a=36$, the *abſolute number* is 36; which is equal to *a* multiplied by itſelf, and added to 16 times *a*.

This is what Vieta calls *homogeneum comparationis*.

Absolute *Equation*, in *Aſtronomy*, is the ſum of the optic and eccentric equations.

Absolute *Ablative*. See Ablative.

Absolute *Motion*, *Place*, *Space*. See the reſpective ſubſtantives.

ABSOLUTELY, in a general ſenſe, ſtands oppoſed to *relatively*. See Relative.

Thus the terms of a propoſition are ſaid to be taken *abſolutely*, that is, without relation to each other.—Man, conſidered *abſolutely*, and in himſelf, is a reaſonable creature.

Absolutely is alſo uſed for *unlimitedly* or *unconditionally*.

In which ſenſe, the ſchoolmen oppoſe it to *ſecundum quid*.

Thus a thing is ſaid to be *abſolutely*, and ſimply, good.

Absolutely is alſo uſed, by *Divines*, in oppoſition to *declaratively*.

The church of Rome holds, that a prieſt can forgive ſins *abſolutely*; the proteſtants ſay, only *declaratively* and miniſterially.

Absolutely, in *Grammar*: we ſay, a word is taken *abſolutely*, *abſolute ſumptus*, when it has no *regimen*, or government. Thus, in the phraſe, We ſhould pray without ceaſing, the word *pray* is taken *abſolutely*, as it governs nothing.

Absolutely, in *Geometry*, is taken for entirely, or completely. Thus we ſay, ſuch a thing is *abſolutely* round; in contradiſtinction from that which is only partly ſo; as a ſpheroid, cycloid, &c.

ABSOLUTION, Absolutio, in the *Civil Law*, &c. a definitive ſentence, whereby a perſon, accuſed of any crime, is acquitted, and declared innocent.

Among the Romans, the ordinary method of pronouncing judgment was this: after the cauſe had been pleaded on both ſides, the Præco uſed the word *dixerunt*, *q. d.* they have ſaid what they had to ſay; then three ballots were diſtributed to each judge, marked as mentioned under the article A; and as the majority fell of either mark, the accuſed was *abſolved* or condemned, &c. If he were *abſolved*, the Prætor diſmiſſed him with *videtur non feciſſe*, or *jure videtur feciſſe*.

Absolution, in the *Canon Law*, is a juridical act, whereby a prieſt, as a judge, remits the ſins of ſuch as, upon confeſſion, appear to have the conditions requiſite thereto.

The Romaniſts hold *abſolution* a part of the ſacrament of penance: the council of Trent, ſeſſ. xiv. cap. iii. and that of Florence, in the decree *ad Armenos*, declare the form or eſſence of the ſacrament to lie in the words of *abſolution*, I abſolve thee of thy ſins.

The *formula* of *abſolution*, in the Romiſh church, is abſolute: in the Greek church, it is deprecatory; and in the churches of the reformed, declarative.

In the church of Rome there are divers other political *abſolutions*; as,

Absolutio *a ſævis*, which is neceſſary where a perſon has been witneſs to the execution of ſentence of death on a criminal, or has any other way diſqualified himſelf for the holding of a benefice.

Absolutio *ad cantelam*, is that granted to a perſon who has lodged an appeal againſt a ſentence of excommunication, by which the force of the cenſure is ſuſpended.

It being a maxim, in the papal juriſprudence, that the ſentence ſtands good, notwithſtanding any appeal; this ſort of *abſolution* is ſometimes granted until the iſſue of his appeal be known: by means hereof, ſome articles, at leaſt, of his excommunication, are taken off; inſomuch that perſons may converſe with him without danger: and, beſide, in caſe of death, this ſentence is ſuppoſed to be of ſome avail to him.

ABSOLUTISM, the *dogma* of God's acting abſolutely in the affair of ſalvation, and not being guided in his willing, or nilling, by any reaſon; maintained by the Calvinists, for which, among other doctrines, the Lutherans refuſe all union with them.

ABSORBENTS, in a general ſenſe, is uſed for ſuch things as have the faculty of *abſorbing*, or ſwallowing up others.

Absorbents, in *Medicine*, remedies which, by the ſoftneſs or poroſity of their component parts, become proper to ſheath the aſperities of ſharp pungent humours; or to imbibe or dry away, as with a ſponge, ſuperfluous moiſtures; and are of divers kinds; ſimple, compound, ſaline, cinnabarine, marine, fixed, earthy, acid, alcaline, &c. In the *Pharmacopœias*, we meet with ſeveral forms of *abſorbents*; ſuch are the teſtaceous powders, hartſhorn, coral, crabs eyes and claws, calcined bones, burnt ivory, *terra ſigillata*, and even iron itſelf: alſo divers woods; as ſanders, maſtic, *guaiacum*, ſaſſafras: and divers roots; as china, *ſarſaparilla*, &c.

Abſorbents conſume the humours without fuſing them, and have ſometimes the effect of ſtrengtheners, ſometimes of purgatives, oftener of calmers, to allay fermentations. They are of uſe for tempering acrimonies, and after emollients and attenuants, for healing tumours; ſome hold them neceſſary for preventing the ill effects of bitters; they are good in cardialgias or heats of the ſtomach, and hiccups; are alſo given in hectics, and other chronical caſes, as coughs, though with great caution and reſerve. *Abſorbents* have alſo their ill effects; eſpecially if too laviſhly given, being liable to make congeſtions in the *viſcera:* they are hurtful in the itch, bilious fevers, dyſenteries, hypochondriacal and hyſteric caſes, quartans, &c. according to ſome.

They are generally preſcribed as the only remedy for the acute diſeaſes of infants, though held by others rather hurtful to children, by loading their tender *viſcera*, and creating obſtructions in the capillaries.

Particular kinds of *abſorbents* have their particular effects; old oyſter-ſhells are preferred for children; magiſteries and precipitates are leaſt ſuitable, as being already ſurcharged with acids. *Abſorbents* ſaturated with acid juices, as of citrons, are good in coughs and catarrhs; prepared with cinnabar, in iſchurias; with aſtringents, in the diabetes; ſaline, in the itch; marine, in chronical diſeaſes of the breaſt; in which laſt caſe, the earthy are hurtful.

They are ſometimes applied to ulcers; but it is to be obſerved, that the inſipid terreſtreous *abſorbents*, ſuch as coral, &c. put into an ulcer, where a bone is carious, can have little other effect than to imbibe the matter of the ulcer; if they fall into any *cavernulæ* of the corrupted bone, they may remain ſo long there, that the matter they imbibe may become acrid. Lint is an *abſorbent*, which has not this diſadvantage. Monro, in Med. Eſſ. Edinb. vol. V. art. 24.

The taking an immoderate quantity of crabs eyes, and other *abſorbents* for the heart-burn, has ſometimes been attended with fatal conſequences. See Phil. Tranſ. N°. 459. ſect. 2.

Van Swieten, in his comment on Boerhaave's Aphoriſms, obſerves, that theſe *abſorbent* powders ought not to be ground too fine, but rather left ſomewhat coarſe, as they will be leſs apt to concrete and prove dangerous.

It is a neceſſary caution to drink diluting liquors with them; alſo to take gentle purges; as well for ſome time after they are left off, as during the uſe of them.

Abſorbents are much the ſame with what we otherwiſe call driers and ſweeteners. Latin writers alſo uſe the word as ſynonymous with *Imbibentia*, and *Saturantia*.

The term *abſorbent* is frequently confounded with *alcali*; alcalies having, really, the effect of *abſorbents*, with reſpect to acids.

Aſhes are an *abſorbent* in reſpect of water; though not in the degree ſuppoſed by Ariſtotle, from whom we derive a vulgar error, that a pot full of aſhes will ſtill *abſorb* as much water as if empty. Cloves are ſo violent an *abſorbent* of moiſture, that we are told, if care be not taken in the importing, to keep all water, wine, and the like, at a good diſtance from them, a certain quantity of cloves will, in two days time, drain a whole hogſhead of wine. M. Homberg has a diſcourſe on the quantity of acids *abſorbed* by terreſtrial alcalis; wherein he ſhews, how much acid any known alcali will retain. M. de la Hire gives an experiment for aſcertaining the quantity of water *abſorbed* by plants. Mem. Acad. R. Scien. an. 1700, p. 81.

Absorbent *Veſſels*, a minute kind of veſſels, found in animal bodies, which attract, and imbibe the nutritious, and other matters brought near their mouths.

Theſe are ſometimes alſo called *reſorbent veſſels*, and ſometimes *abſorbent pores*.

Abſorbent veſſels are found in all parts of the body, eſpecially where the membranes lie open to cavities, as in the mouth, œſophagus, ſtomach, inteſtines, &c. A late author computes no leſs than 7,000,000,000 in one ſquare foot of the ſurface of the ſtomach: by theſe, mercury, plaſters, and the like medicines externally applied, enter the habit of the body: to theſe are alſo owing the inſtantaneous effects of ſpirits, drams, water, &c. upon the body. The like veſſels are alſo numerous in the ſkin; where they are ſuppoſed to imbibe the fluid matters floating in the ambient air, and convey them into the body.

It has been ſaid that there are no *abſorbent* veins, and that *abſorption* is performed entirely by the vaſcular *lymphatics*. But if this were the caſe, we ſhould be continually ſubject to a *hydrocephalus*; becauſe in the head no vaſcular *lymphatics* are found. It is plain that there are abſorbent veins that open into the cavities of the body, becauſe in the aſcites the extravaſated blood is frequently received into the circulation, and diſcharged by urine or ſtool. Dr. Hunter aſcertains it by the following experiment on a living dog; an opening was made in the cavity of his belly, and three quarts of warm water injected and ſecured; ſix hours after, he was examined, and not above four ounces of the water remained.

For farther ſatisfaction on this ſubject, conſult Hunter's Commentaries, and Dr. Garner's Obſervations on them, in the Medic. Muſ. vol. ii. p. 229; and alſo Dr. Wilkinſon, ibid. p. 117, &c.

Abſorbent veſſels are more particularly uſed for thoſe lacteals which open into the ſides of the inteſtinal tube, to imbibe the chyle in its deſcent from the ſtomach, and convey it into the meſenteric veins.

Naturaliſts ſpeak of the like *abſorbents* in plants; the fibrous or hairy roots of which are conſidered as a kind of *vaſa abſorbentia*, which attract and imbibe the nutritious juices from the earth.

ABSORBING, the act of ſucking up, or imbibing another body. Sir Iſaac Newton ſhews that black bodies *abſorb* all the rays they receive, and that thoſe rays of light which impinge againſt the ſolid particles of bodies are *abſorbed* and loſt: but it appears from ſome later experiments and obſervations of M. Bouguer, that this effect is to be attributed, not to the impact of light on the ſolid parts of bodies, but to the action of ſome power diffuſed over their ſurfaces. He found by repeated trials on the reflection of light, from the ſurface of water, and of different pieces of cryſtal, that a conſiderable quantity of light, when the angles of incidence were ſmall, was actually extinguiſhed. This effect, he obſerved, was diminiſhed by increaſing the incidence; ſo that, at an inclination to cryſtal of above 49° 49′, a very ſmall part of the rays was *abſorbed*; though ſome few were loſt, when they fell perpendicularly on the reflecting ſurface. See his Traité d'Optique. Paris. 1760.

ABSORPTION, in the *Animal Oeconomy*, is uſed for that power whereby the ſmall open orifices of veſſels, imbibe liquors lodged in the cavities of the animal bodies. This, according to Dr. Monro, is obſerved to increaſe or diminiſh, proportionally to the ſtrength or weakneſs of the creature.

Absorptions *of the earth*, a term uſed by Kircher and others, for the ſinking in of large tracts of land, by means of ſubterranean commotions, and many other accidents.

Pliny tells us, that in his time the mountain Cymbotus, with the town of Eurites, which ſtood on its ſide, were wholly *abſorbed* into the earth, ſo that not the leaſt trace of either remained; and he records the like fate of the city Tantalis in Magneſia, and after it of the mountain Sypelus, both thus *abſorbed* by a violent opening of the earth. Galanis and Garnatus, towns once famous in Phœnicia, are recorded to have met the ſame fate; and the vaſt promontory, called Phlegium, in Æthiopia, after a violent earthquake in the night-time, was not to be ſeen in the morning, the whole having diſappeared, and the earth cloſed over it. Theſe and many other hiſtories, atteſted by the authors of greateſt credit among the ancients, abundantly prove the fact in the earlier ages; and there have not been wanting too many inſtances of more modern date. Kircher's Mund. Subter. p. 77.

The mountain Picus, in one of the Molucca iſles, was ſo lofty, that it appeared at great diſtances as an immenſe column reared erect in the air, and ſerved as a land-mark to ſailors; an earthquake in this iſland deſtroyed it; at one inſtant the whole mountain was *abſorbed* into the bowels of the earth, and no mark of its place remained but a vaſt lake of water, exactly anſwering to the ſhape of the baſe of the mountain. A like accident, but of a more terrible kind, happened in China, in the year 1556, when a whole province of the mountainous parts of that kingdom was in one moment *abſorbed* into the earth, and all the towns buried, the whole number of the inhabitants ſinking with it, and an immenſe lake of water remaining in its place to this time. Of much later date is the deſtruction of a city in the confines of Swiſſerland; but this, though generally ſaid to have been ſwallowed up into the earth, was not properly an *abſorption*, for the whole city was buried by the fall of a mountain upon it.

The burning mountains, Veſuvius and Strongylus, both once very high, have in length of time loſt half their height, the upper part having been undermined by the burning, and having fallen into, and been *abſorbed* by the under part. And in the year 1646, during the terrible earthquake in the kingdom of Chili, ſeveral whole mountains of the Andes diſappeared, and were one after another wholly *abſorbed* in the earth.

Theſe, and a thouſand other accidents of the like kind, prove the truth of *abſorptions* in general; ſome of them leaving level ground in the place of the things *abſorbed*, ſome immenſe chaſms and cracks, and ſome lakes of freſh or ſalt water; and it may be, that many immenſe lakes were formed in ages, of which we have no hiſtories, by the like *abſorptions*.

Pliny gives many accounts of the reſtoring of places thus *abſorbed*, but later obſervations do not give an equal credit to theſe parts of his hiſtory.

There are inſtances however of iſlands being produced, though we cannot affirm them to have appeared in the place of any which have been *abſorbed*.

In the year 1638, an iſland was raiſed near St. Michael's, in the Atlantic ocean, by ſubterranean fires, which threw up ſtones, and other ſubterranean productions, in ſuch quantities, that they formed an iſland of five miles in length. The mountain raiſed in one night, in the ſea near Puzzoli, is another inſtance of this ſudden production of theſe mountains: this appeared after one night's violent ſubterranean conflict, and ſtill keeps its place, and is known under the name of the Mons Sanctus.

ABSTEMIOUS, is properly underſtood of a perſon who refrains abſolutely from all uſe of wine.

It is compounded of *abs*, *from*, and *timetum*, *wine*.

The hiſtory of Mr. Wood, in the Medic. Tranſ. vol. ii. p. 261, art. 18, is a very remarkable exemplification of the very beneficial alterations which may be effected on the human body, by a ſtrict courſe of abſtemiouſneſs.

The Roman ladies, in the firſt ages of the republic, were all enjoined to be *abſtemious*; and that it might appear, by their breath, whether or no they kept up to the injunction, it was one of the laws of the Roman civility, that they ſhould kiſs their friends and relations whenever they accoſted them.

ABSTENTUS, among *Civilians*, is underſtood of an heir with-held by his tutor from taking on him an inheritance.

Among *Eccleſiaſtical Writers*, the word is alſo uſed for a perſon excommunicated.

ABSTERGENTS, or ABSTERSIVE *Medicines*, more uſual, called among phyſicians DETERGENTS; they are cleanſing *medicines* of a ſaponaceous nature, capable of diſſolving concretions formed of earth and oil, which water ſimply, as an abluent, cannot effect.

ABSTINENCE, in a general ſenſe, the act or habit of refraining from ſomething which we have a propenſity to, or find pleaſure in.

The word is derived from *abſtinere*; formed of *abs*, *from*, and *tenere*, *to hold*.

The Jews were obliged to abſtain from their wives at certain ſeaſons.—The ſame is enjoined, in the Apoſtolical Conſtitutions, on all faſt and meagre days: the church of England recommends certain days of faſting, and *abſtinence*.—*Abſtinence from fleſh* has been enjoined by ſtatute even ſince the Reformation, particularly on Fridays and Saturdays, and on vigils, and all commonly called fiſh-days, 2 and 3 Ed. 6. c. 19.—The like injunctions were renewed under queen Elizabeth, but at the ſame time it was declared, that this was done not out of motives of religion, as if there were any difference in meats, but in favour of the conſumption of ſea-fiſh, and to multiply the number of fiſhermen and mariners, as well as ſpare the ſtock of ſheep, 5 Eliz. c. 15.—The great faſt, ſays St. Auguſtin, is to *abſtain* from ſin.

The ancient athletæ lived in a perpetual *abſtinence* from all kind of ſenſible pleaſure, to render their bodies more robuſt, and hardy.

ABSTINENCE is more particularly uſed for a ſpare DIET, or a ſlender parſimonious uſe of FOOD.

The phyſicians relate wonders of the effects of *abſtinence* in the cure of many diſorders, and in protracting the term of life.—The noble Venetian, Cornaro, after all imaginable means had proved vain, ſo that his life was deſpaired of at forty, recovered, and lived to near an hundred, by mere dint of *abſtinence*, as he himſelf gives the account.

Moſt of the chronical diſeaſes, the infirmities of old age, and the ſhort lives of Engliſhmen, are owing, according to Dr. Cheyne, to repletion; and may be either cured, prevented, or remedied, by *abſtinence*.

Among the brute creation, we ſee extraordinary inſtances of long *abſtinence*.—It is the natural courſe of divers ſpecies to paſs four, five, or ſix months, every year, without either eating or drinking: accordingly the tortoiſe, dormouſe, ſerpent, &c. are obſerved regularly to retire, at certain ſeaſons, to their reſpective cells, and hide themſelves; ſome get into the caverns of rocks, or ruins; others dig holes under ground; others get into the woods, and lay themſelves up in the clefts of trees; others bury themſelves under water, &c.

The ſerpent kind bear *abſtinence* to a very great degree. We have ſeen rattle-ſnakes that had ſubſiſted many months without any food, yet ſtill retained their vigour and fierceneſs.—Dr. Shaw ſpeaks of a couple of *Ceraſtes* (a ſort of Egyptian ſerpents), which had been kept five years in a bottle cloſe corked, without any ſort of food, unleſs a ſmall quantity of ſand, wherein they coiled themſelves up in the bottom of the veſſel, may be reckoned as ſuch: yet, when he ſaw them, they had juſt caſt their ſkins, and were as briſk, and as lively, as if juſt taken.

In effect, ſeveral ſpecies of birds, the whole tribe almoſt of inſects, and many among the other tribes, are able to ſubſiſt all winter, not only without food, but many of them without reſpiration too.—This furniſhes an admirable inſtance of the wiſdom of the Creator: the proper food of theſe creatures, eſpecially the inſect tribe, being then wanting, there is a proviſion for them to live without it. When the fields are diveſted of their flowery furniture, and the trees and plants are ſtripped of their fruits, what would become of ſuch animals as are ſubſiſted only by the produce of the ſpring and ſummer, and of others which are incapable of bearing ſevere cold? To prevent the total deſtruction and extirpation of many ſpecies of animals, the Author of nature has provided, that creatures, thus bereaved of their food, ſhould be likewiſe impatient of cold; to lead them thus to ſhelter themſelves out of the way of danger; and that, when there arrived, the natural texture and viſcidity of their blood ſhould diſpoſe it, by a farther degree of cold, to lag and ſtagnate in the veſſels: ſo that, the circulation ſtopping, and the animal functions being, in a great meaſure, ſuſpended, there is no ſenſible waſte or conſumption of parts, but they remain in a kind of drowſy neutral ſtate, between life and death, till the warm ſun revive both them and their food together, by thawing the congealed juices, both of ſuch animals and vegetables. The fact, however, is queſtionable; and will be more particularly conſidered hereafter.

It is more than probable, that all motion of the animal juices is extinct in flies, and other inſects, when thus aſleep; in that, though cut in pieces, they do not awake, nor does any fluid ooze out at the wound, unleſs ſome extraordinary degree of warmth have been firſt applied to unbind the congelation.—The ſleep of ſuch animals is little elſe than death, and their waking a reſurrection.—For if life does not conſiſt in a circulation of the blood, we do not know what it conſiſts in.

Hence it is no wonder that tortoiſes, dormice, &c. are found as fat and fleſhy, after ſome months *abſtinence*, as before.—Sir G. Ent weighed his tortoiſe ſeveral years ſucceſſively, at its going to earth in October, and coming out again in March; and found, that of four pounds four ounces, it only uſed to loſe about one ounce. V. Philoſoph. Tranſact. N° 194.

It is to be added, that in moſt of the inſtances of long *abſtinence* related by *Naturaliſts*, there were apparent marks of a texture of blood and humours, much like that of ſummer-beaſts and inſects.—Though it is no improbable opinion, that the air itſelf may furniſh ſomething for nutrition. It is certain, there are ſubſtances of all kinds; animal, vegetable, &c. floating in the atmoſphere; which muſt be continually taken in by reſpiration: and that an animal body may be nouriſhed thereby, is evident, in the inſtance of vipers; which, if taken when firſt brought forth, and kept from every thing but air, will yet grow very conſiderably in a few days. So the eggs of lizards are alſo obſerved to increaſe in bulk, after they are produced, though there be nothing to furniſh the increment but air alone; after the like manner as the eggs or ſpawn of fiſhes grow, and are nouriſhed with the water.—And hence, ſome ſay, it is, that cooks, turn-ſpit dogs, &c. though they eat but little, yet are uſually fat.

ABSTINENCE is alſo uſed ſometimes to ſignify a *ſuppreſſion.* Thus in Cœlius Aurelianus, *abſtinentia ſudoris*, ſignifies a ſuppreſſion of ſweat. Sometimes in this author it means a *Compreſſion*; as *Spiritus ob abſtinentiam clauſus*, means the wind ſhut up in the inteſtines by compreſſion, thereby cauſing the *Iliac* PASSION.

ABSTINENTES, in *Eccleſiaſtical Hiſtory*, a ſort of people in the ancient church, who carried *abſtinence* and mortification ſo far, that they have been put in the catalogue of heretics; though wherein their error conſiſted, is little agreed on.

Some repreſent the *Abſtinentes* as the ſame with thoſe otherwiſe called *Continentes*, and that they particularly enjoined *abſtinence* from the uſe of marriage; others ſay, from fleſh; and others, from wine. Others will have them a branch of the GNOSTICS, and that their hereſy conſiſted in holding fleſh evil in itſelf, and created by the devil. Some make them the ſame with the *Hieracites*; others, with the *Encratites*. They are ſaid to have ariſen in Spain and the Gauls in the third century.

ABSTRACT, ABSTRACTUM, in *Philoſophy*. See ABSTRACTION.

ABSTRACT *Idea*, among *Logicians*, denotes an idea formed in the mind, when we conſider a thing ſimply in itſelf, without reſpect to the ſubject wherein it reſides; or it is a ſimple idea, detached and ſeparated from any particular ſubject or complex idea, for the ſake of viewing and conſidering it more diſtinctly.

Thus, magnitude and humanity are *abſtracts*, or *abſtract* ideas, when conſidered in themſelves, and without being attached to any particular body, or perſon; though they cannot have any real ſubſiſtence without ſuch ſubjects, nor the ſubjects without them.

Whiteneſs is an *abſtract*, inaſmuch as it does not denote any one white object, but that colour, or idea in the general, wherever found.

Abſtract ideas are oppoſed to thoſe which are concrete: the concrete denoting a general or *abſtract* idea's being attached to ſome particular ſubject, or conſidered as combined with ſome other ideas; as, *great houſe*, *white wall.*

All our ſimple ideas, ſays Mr. Locke, have *abſtract*, as well as *concrete* names; as, *whiteneſs*, *white*; *ſweetneſs*, *ſweet*, &c. The like alſo holds in our ideas of modes, and relations; as, *juſtice*, *juſt*; *equality*, *equal*, &c.

But as to our ideas of ſubſtances, we have very few *abſtract* names at all.—Thoſe few that the ſchools have forged, as *Animalitas*, *Humanitas*, &c. bear no proportion to the infinite number of names of ſubſtances; and could never get admittance into common uſe, or obtain the licence of public approbation: which ſeems to intimate a confeſſion of mankind, that they have no ideas of the real eſſences of ſubſtances; ſince they have not names for ſuch ideas.

Indeed the reality and exiſtence of all *abſtract* ideas, and of any ſuch faculty in the mind as *abſtraction*, has of late been controverted.

ABSTRACT *Terms*, are thoſe made uſe of to denote abſtract ideas. In which ſenſe, the words *whiteneſs*, *paternity*, *animality*, *juſtice*, *crookedneſs*, &c. are *abſtracts*, or *abſtract terms.*

ABSTRACT is alſo extended to divers other things, in reſpect of their purity, ſimplicity, ſubtility, &c.—In which ſenſe, we ſay,

ABSTRACT *Numbers* are aſſemblages of units, conſidered in themſelves, and not applied to denote any collections of particular ſorts of things.

ABSTRACT *Mathematics* are thoſe branches employed about quantity conſidered abſolutely, or in the general; without reſtriction to any certain kind, or ſpecies of it.

Such are, *Geometry* and *Arithmetic.*

In this ſenſe, *abſtract* mathematics ſtand oppoſed to mixed mathematics; where the ſimple and *abſtracted* properties and relations of quantity delivered in the former, are applied to ſenſible objects; and by that means become intermixed with phyſical conſiderations.—Such are *Hydroſtatics*, *Optics*, *Navigation*, &c.

ABSTRACT is alſo uſed in matters of *Literature*, for a compendious view, or EPITOME of a larger work.

An *abſtract* is ſuppoſed to be a degree ſhorter, and more ſuperficial than an abridgment.

ABSTRACTION, an operation of the mind, whereby we ſeparate things naturally conjunct, or exiſting together; and form, and conſider, ideas of things thus ſeparated.

The faculty of *abſtracting* ſtands directly oppoſite to that of compounding—By compoſition we conſider thoſe things together, which in reality are not joined together in one exiſtence. And by *abſtraction* we conſider thoſe things ſeparately and apart, which in reality do not exiſt apart.

Abſtraction is chiefly employed theſe three ways.—Firſt, when the mind conſiders any one part of a thing, in ſome reſpect diſtinct from the whole; as a man's arm without the conſideration of the reſt of his body.

Secondly, when we conſider the MODE of any ſubſtance, omitting the ſubſtance itſelf, or when we ſeparately conſider ſeveral modes which ſubſiſt together in one ſubject. This *abſtraction* the *Geometricians* make uſe of, when they conſider the length of a body ſeparately, which they call a LINE; omitting the conſideration of its breadth and depth.

Thirdly, it is by *abſtraction*, that the mind frames general, or univerſal ideas; omitting the modes and relations of the particular objects whence they are formed.—Thus, when we would underſtand a thinking being in general, we gather from our ſelf-conſciouſneſs what it is to think; and omitting the conſideration of thoſe things which have a peculiar relation to our own mind, or to the human mind, we conceive of a thinking being in general.

Ideas framed thus, which are what we properly call *abſtract ideas*, become general repreſentatives of all objects of the ſame kind; and their names applicable to whatever exiſts conformable to ſuch ideas.—Thus, the colour that we receive from chalk, ſnow, milk, &c. is a repreſentative of all of that kind; and has a name given it, *whiteneſs*, which ſignifies the ſame quality, wherever found or imagined.

It is this laſt faculty, or power of *abſtracting*, according to Mr. Locke, that makes the great difference between men and brutes; even thoſe latter muſt be allowed to have ſome ſhare of reaſon: that they really reaſon in ſome caſes, ſeems almoſt as evident as that they have ſenſe; but it is only in particular ideas. They are tied up to thoſe narrow bounds; and do not ſeem to have any faculty of enlarging them by *abſtraction.* Eſſay on Human Underſtanding, lib. ii. cap. 11. lib. iii. cap. 3.

Such is the doctrine of *abſtract* ideas, under the improvements of that excellent author.—In effect, it is the ſtanding opinion, that the mind has ſuch a power or faculty of framing *abſtract* ideas or notions of things; and on ſuch very ideas do a great part of the writings of philoſophers turn. Theſe are ſuppoſed in all their ſyſtems; and without them there would be nothing done.—They are more eſpecially reputed the object of logic, mathematics, and metaphyſics, and all that paſſes under the notion of the moſt *abſtracted* and ſublime learning.

Yet has a late eminent and ingenious author, Dr. Berkeley, conteſted the reality of any ſuch ideas; and gone a good way towards overturning the whole ſyſtem, and conſequently towards ſetting philoſophy on a new foundation. See a Treatiſe concerning the Principles of Human Knowledge, firſt printed in 1710.

The qualities or modes of things, it is on all hands agreed, do never really exiſt apart, and ſeparated each from all others; but are conſtantly mixed and combined together, ſeveral in the ſame object.—But, ſay the philoſophers, the mind being able to conſider each quality, ſingly or *abſtracted* from other qualities with which it is united, does by that means frame to itſelf *abſtract* ideas, of a different nature and kind from the ſenſible ones.

For an example hereof: the eye perceiving an object extended, coloured, and moved, reſolves this compound idea into its ſimple conſtituent ones; and viewing each by itſelf, excluſive of the reſt, frames *abſtract* ideas of extenſion, colour, and motion themſelves, or in their own nature.—Not that it is poſſible for ſuch colour and motion to exiſt without extenſion; but only that the mind can frame to itſelf, by *abſtraction*, the idea of colour excluſive of extenſion; and of motion, excluſive both of colour and extenſion.

Again, ſay the ſame philoſophers, the mind having obſerved that in the particular extenſions perceived by ſenſe, there is ſomething common, and alike in all; and ſome other things peculiar; as, this, or that figure, or magnitude, which diſtinguiſh them one from another; it can conſider apart, or ſingle out by itſelf, what is common; making thereof a general *abſtract* idea of extenſion, which is neither line, ſurface, nor ſolid, nor has any figure or magnitude, but is an idea entirely preſcinded from them all.—So, likewiſe, by leaving out of the ſeveral colours perceived by ſenſe, that which diſtinguiſhes them one from another, and only retaining what is common to all, it makes an idea of colour in the *abſtract*, which is neither red, nor blue, nor white, &c.—After the ſame manner, by conſidering motion *abſtractedly*, both from the body moved, and from the figure it deſcribes, and all particular directions and velocities; an *abſtract* idea of motion is framed, which equally correſponds to all motions whatever.

They add, that as the mind frames *abſtract* ideas of qualities or modes; ſo does it, by the ſame faculty, attain *abſtract* ideas of the more compound beings, which include many coexiſtent qualities.—For an example—Having obſerved that Peter, James, John, &c. reſemble each other in ſhape, and other qualities; we can leave out of the complex idea we had of Peter, James, &c. that which is peculiar to each, retaining only what is common to all, and ſo make an *abſtract* idea, wherein all the particulars equally partake.—And thus it is we are ſuppoſed to obtain the *abſtract* idea of man, or of humanity, or human nature; wherein there is indeed included colour, becauſe no man but has ſome colour; but it is neither white, nor black, nor brown; becauſe there is no one particular colour wherein all men partake. So likewiſe there is included ſtature, but then it is neither tall, nor low, nor yet middle ſtature, but ſomething *abſtracted* from all theſe; and ſo of the reſt.

Farther yet, there being a general variety of other creatures, which partake in ſome parts, but not all, of the complex idea of man; the mind leaving out thoſe parts which are peculiar to men, and retaining only thoſe which are common to all living creatures, frames the idea of animal; which *abſtracts* or participates not only of all men, but all birds, beaſts, fiſhes, and inſects.

The conſtituent parts of ſuch *abſtract* idea of animal, are body, life, ſenſe, and ſpontaneous motion.—By body, is meant, body without any particular ſhape, or figure; there being no one common to all animals; without covering, either of hair, or feathers, or ſcales: nor yet naked; hair, feathers, ſcales, and nakedneſs, being the diſtinguiſhing properties of particular animals, and for that reaſon left out of the *abſtract* idea. Upon the ſame account, the ſpontaneous motion muſt be neither walking, nor flying, nor creeping; it is nevertheleſs a motion.—But what that motion is, it is not eaſy to conceive. ‘I will not affirm, ſays Dr. Berkeley, that other ‘people have not this wonderful faculty of *abſtracting* ‘their ideas; but I am confident I have it not myſelf.—I ‘have, indeed, a faculty of imagining, or repreſenting ‘to myſelf the ideas of things I have perceived, or of va‘riouſly compounding or dividing them: I can imagine ‘a man with two heads, or the upper parts of a man ‘joined to the body of a horſe. I can conſider the hand, ‘the eyes, the noſe, each by itſelf, *abſtracted* or ſeparated ‘from the reſt of the body.—But then, whatever hand or ‘eye I imagine, it muſt have ſome particular ſhape and ‘colour.—So again, the idea of a man I frame to my‘ſelf, muſt be either of a white, or a black, or a tawny, ‘a ſtrait, or a crooked, a tall, or a low, or a middle‘ſized man.

‘I cannot by any effort of thought conceive the *abſtract* ‘idea above deſcribed; and it is equally impoſſible for ‘me to form the *abſtract* idea of motion, diſtinct from ‘the body moving, and which is neither ſwift nor ſlow, ‘curvilinear nor rectilinear.—And the like may be ſaid ‘of all other *abſtract* general ideas whatever.’

Since all things that exiſt are only particulars, ‘Whence, ‘ſays Mr. Locke, is it, that we come by general words, ‘expreſſive of a thouſand individuals?’ His anſwer is, terms only become general, by being made the ſigns of *abſtract* and general ideas; ſo that the reality of *abſtract* ideas ſhould follow from the reality of general words.—But, according to Dr. Berkeley, a word becomes general, by being made the ſign, not of an *abſtract* general idea, but of ſeveral particular ones, any one of which it indifferently ſuggeſts to the mind.—For an example, when I ſay, that Whatever has extenſion is diviſible; the propoſition is to be underſtood of extenſion in general: not that I muſt conceive any *abſtract* general idea of extenſion, which is neither line, ſurface, nor ſolid, neither great nor ſmall, &c. To make this more evident, ſuppoſe a geometrician to be demonſtrating a method of dividing a line into two equal parts: in order hereto, he draws, for inſtance, a black line, an inch long; and this, which in itſelf is a particular line, is, nevertheleſs, with reſpect to its ſignification, general: ſince it repreſents all lines whatever: ſo that what is demonſtrated of this one, will hold of all others.—And as that particular line becomes general by being made a ſign; ſo does the name *line*; and as the former owes its generality, not to its being the ſign of an *abſtract* or general line, but of any or all particular right lines that may poſſibly exiſt; ſo muſt the latter derive its generality from the ſame cauſe.

But to this reaſoning it has been replied, that the univerſality conſiſts in the idea; and not merely in the name as uſed to ſignify, and recall into the mind, a variety of particular things, reſembling that which is the immediate object of reflection; becauſe had we no previous fixed notion what the name ſignifies, we could not know what particular things to apply it to, or aſſign any reaſon for applying it to one thing, rather than another. All that can be pictured in the imagination, as well as all that we take notice of by our ſenſes, is indeed particular. And whenever any general notions are preſent in the mind, the imagination, at the ſame time, is commonly engaged in repreſenting to itſelf ſome of the particulars comprehended under them. But it would be a very ſtrange inference from hence, that we have none but particular ideas. As well almoſt might we conclude, that we have no other notion of any thing than of its name, becauſe they are ſo aſſociated in our minds, that we cannot ſeparate them; or of the ſun, than as a white, bright circle, ſuch as we ſee in the heavens, becauſe this idea or phantaſm is apt to accompany all our thoughts of it. See Dr. Price's Review of the principal Queſtions and Difficulties in Morals, p. 43.

Dr. Cudworth obſerves, that *abſtract* ideas are implied in the cognoſcitive power of the mind; and he pronounces the opinion, that they are only ſingular ideas annexed to a common term; or, in other words, names without any meaning; to be ſo ridiculouſly falſe, as to deſerve no confutation. See Eternal and Immutable Morality, book iv.

Mr. Locke, ſpeaking of the difficulty of forming *abſtract* ideas, ſays: ‘And does it not require ſome pains and ‘ſkill to form the general idea of a triangle, which yet ‘is none of the moſt *abſtract* and comprehenſive; for it ‘muſt neither be oblique, nor rectangular; neither equi‘lateral, iſoſceles, nor ſcalenous; but all, and none of ‘theſe, at once.’—Now, let any man look into his thoughts, and try whether he has, or can attain to an idea of a triangle, correſpondent to this deſcription.

Dr. Campbell, in his Philoſophy of Rhetorick, vol. ii. p. 115, expreſſes his apprehenſion, that the bare mention of this hypotheſis is equivalent to a confutation of it, ſince it really confutes itſelf. He adopts the ſentiments of Berkeley on this ſubject, and will allow to the mind no other power of *abſtraction*, if the term be retained, beſide that, by which a particular idea is regarded, as repreſenting a whole order. Mr. Locke, he ſays, has, on ſome occaſions, evidently inclined to the ſame opinion: in proof of which he refers to his Eſſay, book iii. cap. 3. § 11.

From the notion of *abſtract* ideas, Dr. Berkeley endeavours to ſhew, it was, that bodies firſt came to be ſuppoſed to have an exiſtence of their own, excluſively and independent of the mind perceiving them.—Can there be a greater ſtrain of *abſtraction*, ſays he, than to diſtinguiſh the exiſtence of ſenſible objects from their being perceived, ſo as to conceive them exiſting unperceived?

If there were external bodies, he ſays, it is impoſſible we ſhould ever come to know it; and if there were not, we might have the very ſame reaſons to think there were that we have now. His principal argument may be reduced to the following ſyllogiſm: Whatever is immediately perceived by ſenſe, is an idea. Senſible things are immediately perceived by ſenſe; for the proof of which he appeals to experience: therefore ſenſible things are ideas; and conſequently exiſt only in the mind. See his Dialogues between Hylas and Philonous.

The late lord Bolingbroke likewiſe controverted the exiſtence of *abſtract* ideas; and Mr. Hume, in his Eſſays, aſſerts, that it is unintelligible and abſurd to conclude, that the ideas of primary qualities are attained by *abſtraction*; and he has purſued Berkeley's reaſoning to an extent, which he himſelf never intended, and repreſented all his arguments as merely ſceptical, ‘becauſe they admit of no ‘anſwer, and produce no conviction.’ He concurs with Dr. Berkeley in denying the exiſtence of matter; and advances a ſtep farther, maintaining, that the ſoul is merely a bundle of perceptions, and that there is nothing in the univerſe but impreſſions and ideas.

Some late Scotch writers, Drs. Reid, Beattie, and Oſwald, with a view of obviating thoſe ſceptical inferences, which had been deduced from the principles of Mr. Locke, have, in oppoſition to theſe, offered a new ſyſtem reſpecting the nature and origin of our ideas, the outlines of which, with remarks, the editor propoſes to inſert, under their proper heads, in the courſe of this work. See Ideas, Intuition, *Common* Sense.

We ſhall only add, that *abſtracting*, on the common ſyſtem, is no more than generalizing: it is making one thing ſtand for an hundred, by omitting the conſideration of the differences between them: it is taking ſeveral differents, i. e. different combinations, ſetting aſide the peculiarities in each, and conſidering only what is found alike in all.—Thus it is that I ſay, I love my friend, love my miſtreſs, love myſelf, my bottle, my book, my eaſe, &c. —Not that it is poſſible I ſhould have the ſame perception with reſpect to ſo many different ſorts of things, things that ſtand in ſuch different relations to me; but only that there appearing ſomething in them all that bears a reſemblance to the reſt, in ſome circumſtance or other, I chuſe to expreſs all by one name, *love.* For if I conſider the tendency and effects of them all, I ſhall find they lead me very different ways, to very different actions; all the analogy there is between them, is a ſort of pleaſure or ſatisfaction, ariſing upon the application of the particular object to its proper organ, or ſenſe.-- The *abſtract* idea of love, then, will terminate in the idea of pleaſure: but it is certain, there can be no idea of pleaſure, without a thing pleaſant to excite it. Any other *abſtract* idea of pleaſure, will amount to no more than a view or perception of the circumſtances wherewith our pleaſures have been attended: but theſe are mere externals, foreign to the pleaſurable ſenſation itſelf; which nothing but an object applied in ſuch and ſuch a manner, can excite.—To ſuppoſe an idea of pleaſure produced indirectly, by any other than the proper cauſe, is as abſurd as to ſuppoſe an idea of ſound, produced without a ſonorous object. The mind has no power of making any ideas, call them what you will, whether *abſtract* or *concrete*; or *general*, or *particular*: its activity goes no farther than to the perceiving of ſuch as are preſented to it: ſo that its action is really no other than a degree of paſſion.

ABSTRACTION, in *Chemiſtry*, denotes the drawing off, or exhaling away, a menſtruum from the ſubject it had been put to diſſolve.

Some alſo uſe the word as ſynonymous with DISTILLATION, or even COHOBATION.

ABSTRACTITIOUS, or ABSTRACTIVE, is applied by ſome modern *Chemiſts*, to a ſpirit drawn from vegetables without fermentation.

In which ſenſe *abſtractitious* ſpirits are ſynonymous with natural ſpirits, and ſtand oppoſed to fermentative or artificial ones.

Such ſpirits are chiefly procured from plants which abound in volatile ſalt. The *abſtractitious* ſpirit of ſcurvygraſs is preferred to that procured by fermentation. All the native ſpirits of aromatic plants are called *abſtractitious.*

ABSTRUSE, denotes ſomething deep, hidden, or far removed from the common apprehenſions, and ways of conceiving; in oppoſition to what is obvious and palpable.

The word is of Latin original, *abſtruſus*; formed of *abs, from*; and *trudo, I thruſt.*

In this ſenſe, *Metaphyſics* is an *abſtruſe* ſcience; and many ſpeculations of mathematics are likewiſe *abſtruſe.*

ABSURD, ABSURDUM, a term applied to any action or ſentiment that thwarts, or goes contrary to ſome evident truth.

Thus, a propoſition would be *abſurd*, that ſhould affirm, that two and two make five; or that ſhould deny them to make four.

The *Logicians* and *Mathematicians* have a way of proving the truth of a propoſition, by ſhewing that the contrary is *abſurd.*

This they call

Reductio ad ABSURDUM, or *arguing ex abſurdo.*

Abſurd, when applied to actions, is ſynonymous with *ridiculous.*

ABSURDITY, a kind of error or offence againſt ſome evident, and generally allowed truth, or principle.

The greateſt of all *abſurdities* is CONTRADICTION.

The ſchoolmen make two ſpecies of *abſurdities*—The one, *abſolute*, απλως, which contradicts the common ſenſe of mankind: the other *relative*, τινι, which gives the lye to ſome one, or more philoſophers; or perſons of great weight and authority.

In this ſenſe, the doctrine of a *vacuum* is an abſurdity; as being contrary to Ariſtotle: and that of a *plenum*, as being contrary to Sir Iſaac Newton.—In effect, there is ſcarce one truth of any moment, that is not an *abſurdity* in this ſenſe; as being repugnant to the ſyſtem of ſome ſect, or party.

As reaſon conſiſts in the due uſe of names and words, *abſurdity* conſiſts in the abuſe of them. The higheſt of all our faculties, and our failings, take their riſe from the ſame thing, language; and are as it were coupled together, to temper each other, and reduce human nature to a kind of mediocrity.

Hobbes aſſigns *abſurdity* as a privilege peculiar to man, and which no other creature is capable of: he adds, that of all men, thoſe called philoſophers, are moſt expoſed to it. Whence the ſaying of Cicero, there is nothing ſo *abſurd* but has been ſaid by a philoſopher, *nihil tam abſurde dici poteſt, quod non dicatur a philoſopho.* The reaſon ſeems to be, that of all men they reaſon, and diſcourſe moſt. Yet a nearer and more appoſite cauſe may be aſſigned, viz. their neglect, at ſetting out, to define the terms they make uſe of, i. e. to aſſign the preciſe idea each is made to repreſent: which is much like a man's undertaking to number, without knowing the value of the numeral figures; reaſoning, according to the author firſt cited, being no other than computing. Divers *abſurdities* alſo ariſe from the wrong connecting names into propoſitions; as firſt, when the names of bodies are applied to accidents; or the names of accidents to bodies: as in that propoſition, 'faith is infuſed, or inſpired;' ſince nothing is either fuſible, or inſpirable, but body: and the ſame *abſurdity* the Carteſians fall into, when they make extenſion to conſtitute body, &c. Secondly, when the names of accidents inherent in external bodies are attributed to accidents of our own bodies; as when it is ſaid that colour is in the object, ſound in the air, &c. Thirdly, when the names of bodies are attributed to words, or conceptions; as is done by thoſe who aſſert that there are univerſal things, that animal is a genus, &c. Fourthly, when the names of accidents are given to words, and propoſitions; as when it is ſaid that the definition is the nature of the thing, or a perſon's command is his will. Fifthly, when in lieu of proper words, metaphors and tropes are made uſe of; as, the way leads to ſuch a place, the proverb ſays this or that: which though allowable on ordinary occaſions, yet is of miſchievous conſequence in reaſoning and ſearching after truth. Laſtly, when names are taken at random, and uſed without meaning, as tranſubſtantiation, conſubſtantiation, *entelechia*, &c.

He that can avoid theſe rocks will not eaſily fall into an *abſurdity*, except in a very long chain of reaſoning, when he may be apt to forget ſome propoſition before laid down.

ABSUS, the Egyptian LOTUS. Ray.

ABSYNTHIUM, or ABSINTHIUM, a medicinal plant, of conſiderable efficacy in quality of a bitter, and ſtomachic; popularly called WORMWOOD.

The word ſeems compounded of the primitive particle *α*, and ψινθος, *delectatio, pleaſure*; alluding to the diſagreeable taſte of this plant.

ABSYNTHUS, in *Natural Hiſtory*, the name of a ſtone, deſcribed by ſome old authors as being of a black colour, variegated with ſpots and veins of red. They ſay that, when once heated, it retains the warmth for ſeven days. The account ſeems ſuperſtitious and imaginary, and the deſcriptions they give ſo ſhort, that it is not eaſy to gueſs what ſtone, if any in nature, was meant to be pointed out by them. Probably the word is only a corruption of the ASIICTOS, or ASYCTOS, of Pliny.

ABUCCO, ABOCCO, or ABOCCHI, a weight uſed in the kingdom of Pegu. One *abucco* is twelve teccalis and a half; two *abuccos* make an agiro, which is alſo called giro; two giri make half a biza; and the biza weighs a hundred teccalis; that is to ſay two pounds and five ounces the heavy weight, or three pounds nine ounces light weight of Venice.

ABUKESB. See ASLANI.

ABUNA, among the Chriſtian Arabs, is the title or appellation of a religious character.

The word, which is Arabic, is ſometimes alſo written *abouna*, ſometimes *abana*, and by ſome *abbuna*, or *abunna*; it literally denotes *father*, and is more particularly uſed for the archbiſhop, or metropolitan of the Abyſſinian church.

ABUNDANT *Numbers*, are thoſe whoſe quota-parts, added together, exceed the NUMBER itſelf whereof they are parts.

Thus, the number 12 is *abundant*, its quota-parts, 1, 2, 3, 4, and 6, amounting to 16.—In oppoſition to *abundant* numbers ſtand DEFECTIVE ones.

ABUNDANT *Notion*, in *Logic*, is that which includes more marks and characteriſtics than are neceſſary to diſtinguiſh it from others.

Thus, we may be ſaid to give an *abundant* notion of a rectilinear triangle, when we deſcribe it as a ſpace terminated by three right lines, and containing three angles. Inaſmuch as the number of its angles is determined by that of its ſides; ſo that the bare mention of its three ſides was ſufficient to have defined it.

ABUSE; an irregular uſe of a thing, or the introducing ſomething contrary to the true intention thereof.

The word is compounded of *ab, from*; and *uſus, uſe.*

In *Grammar*, to apply a word *abuſively*, or in an *abuſive* ſenſe, is to miſapply, or pervert its meaning.

A permutation of benefices, without the conſent of the biſhop, is deemed *abuſive*, and conſequently is null.

ABUTILON, in *Botany*, the name of a genus of plants, allied to the mallow kind. Dr. Linnæus calls it *Sida*, and ranges it in the claſs of monadelphia.

The characters are theſe: the flower wholly reſembles that of the mallow; but the fruit reſembles a ſort of head compoſed of ſeveral capſules, ſo diſpoſed round an axis, that every *ſtria* of that receives one of theſe. Theſe capſules are bivalve, and uſually contain kidney-ſhaped ſeeds.

Miller enumerates ſixteen ſpecies of this plant; which is aſperient and vulnerary. The leaves externally applied cleanſe ulcers; the ſeed provokes urine, and expels gravel.

ABUTTALS, Abbutals, Abutals, among *Law*-writers, denote the buttings or boundings of a piece of land; expreſſing on what other lands, highways, or the like, the ſeveral extremes thereof do *abut*, or terminate. See Boundary.

In this ſenſe, the word is ſometimes alſo written corruptly *abuttals*, or *abutals.*—In old ſurveys, we often find them called *headlands.*—*Abuttals* amount to the ſame with what Latin writers call *capita*; Marculfus, *frontes*; the French, *bouts.*—In Coke, the plaintiff is ſaid to fail in his *Abuttals*, that is, in ſetting forth how the land is bounded.

ABYSS, in a general ſenſe, denotes ſomething profound, and, as it were, bottomleſs.

The word is originally Greek, αϐυσσος; compounded of the privative α, and βυσσος, *bottom*; q. d. without a bottom.

We ſay, the *abyſs* of a mountain, an *abyſs* of waters, the great *abyſs*, the Moſaic *abyſs*, an unfathomable *abyſs*, &c.

Abyss, in a more particular ſenſe, denotes a deep maſs, or fund of waters.

In this ſenſe, the word is particularly uſed, in the Septuagint, for the water which God created at the beginning with the earth, which encompaſſed it round, and which our tranſlators render by the *deep.*—Thus it is that darkneſs is ſaid to have been on the face of the *abyſs*.

Abyss is alſo uſed for an immenſe cavern in the earth, where God collected all thoſe waters on the third day; which, in our verſion, is rendered the *deep*, and elſewhere, the *great deep*.

Dr. Woodward has made ſeveral obſervations and conjectures with reference to this great *abyſs*, in his Natural Hiſtory of the Earth.—He aſſerts, that there is a mighty collection of waters incloſed in the bowels of the earth; conſtituting a huge orb in the interior or central parts of it; and over the ſurface of this water he ſuppoſes the terreſtrial ſtrata to be expanded.—This, according to him, is what Moſes calls the *great deep*, and what moſt authors render the *great abyſs*.

That there is ſuch an aſſemblage of waters lodged in the depths of the earth, is confirmed by abundance of obſervations. See Earth and Deluge.

The water of this vaſt *abyſs*, he aſſerts, does communicate with that of the ocean, by means of certain hiatuſes, or chaſms paſſing betwixt it and the bottom of the ocean: and this and the *abyſs* he ſuppoſes to have one common centre, around which the water of both is placed; but ſo that the ordinary ſurface of the *abyſs* is not level with that of the ocean, nor at ſo great a diſtance from the centre as the other, it being, for the moſt part, reſtrained and depreſſed by the ſtrata of earth lying upon it; but wherever thoſe ſtrata are broken, or are ſo lax and porous, that water can pervade them, there the water of the *abyſs* aſcends, fills up all the clefts and fiſſures into which it can get admittance; and ſaturates all the interſtices and pores of the earth, ſtone, or other matter, all round the globe, quite up to the level of the ocean.

The exiſtence of an *abyſs*, or receptacle of ſubterraneous waters, is controverted by Camerarius, and defended by Dr. Woodward, chiefly by two arguments; the firſt, drawn from the vaſt quantity of water, which covered the earth in the time of the deluge; the ſecond, from the conſideration of earthquakes, which he endeavours to ſhew are occaſioned by the violence of the waters in this *abyſs*.—A great part of the terreſtrial globe has been frequently ſhaken at the ſame moment; which argues, that the waters, which were the occaſion hereof, were co-extended with that part of the globe. There are even inſtances of univerſal earthquakes; which ſhew that the whole *abyſs* muſt have been agitated: for ſo general an effect muſt have been produced by as general a cauſe; and that cauſe can be nothing but the ſubterraneous *abyſs*. For the true cauſe of earthquakes, ſee Earthquake.

This *abyſs* is no uſeleſs thing; when once eſtabliſhed, it ſerves to ſolve ſeveral difficult phænomena; as the origin of ſprings and rivers; the level maintained in the ſurface of different ſeas, and their not overflowing their banks. To the effluvia emitted from this *abyſs* ſome even attribute all the diverſities of weather, and changes in our atmoſphere; and what is more, the origin of every thing in the earth, or on its ſurface. Dr. Woodward has an epiſtle on the œconomy of the great *abyſs* hid in the bowels of the earth, and the perpetual communication between it and the atmoſphere. Ray, and other authors, ancient as well as modern, ſuppoſe a communication between the Caſpian ſea and the ocean, by means of a ſubterranean *abyſs*: and to this they attribute it, that the Caſpian does not overflow, notwithſtanding the great number of large rivers it receives; of which Kempfer reckons above fifty, in the compaſs of ſixty miles. But the daily evaporation may be ſufficient for this purpoſe. See Evaporation, Seas, Springs.

Abyss is alſo uſed to denote the cavernous belly of a hollow mountain.

In which ſenſe Mr. Tournefort deſcribes the *abyſs* of mount Arrarat, a horrible ſpectacle.

Abyss is alſo uſed to denote *Hell*. In which ſenſe the word is ſynonymous with what is otherwiſe called Barathrum, Erebus, and Tartarus; in the Engliſh Bible, the *bottomleſs pit*.

Abyss is more particularly uſed, in *Antiquity*, to denote the temple of Proſerpine.

It was thus called, on account of the immenſe fund of gold and riches depoſited there; ſome ſay hid under ground.

Abyss is alſo uſed, in *Heraldry*, to denote the center of an *Eſcutcheon*.

In which ſenſe, a thing is ſaid to be borne in *abyſs*, *en abyſme*, when placed in the middle of the ſhield, clear from any other bearing: he bears azure, a fleur de lys, in *abyſs*.

Abyss is alſo uſed, by ſome *Alchemiſts*, for the immediate receptacle of ſeminal matter; by others for the firſt matter itſelf.

Abyss is alſo uſed metaphorically for a thing not to be known or comprehended, on account of its immenſe extent, or profundity.

In which ſenſe it coincides with ſecret, inſcrutable, incomprehenſible, &c.—The judgments of God are called a great *abyſs*.

Abyss, in *Hydrography*, is ſynonymous with gulph.

ABYSSINIAN is uſed as the name of a ſect, in the Chriſtian church, eſtabliſhed in the empire of Abyſſinia.

The *Abyſſinians* are a branch of the Cophts, or Jacobites; with whom they agree in admitting only one nature in Jeſus Chriſt, and rejecting the council of Chalcedon: whence they are alſo called monophysites, and eutychians.

The *Abyſſinian* church is governed by a biſhop, or metropolitan, ſtyled abuna, ſent them by the Cophtic patriarch of Alexandria reſiding at Cairo, who is the only perſon that ordains prieſts.

They have canons alſo, and monks; the former of whom marry, the latter at their admiſſion vow celibacy, but with a reſervation. Le Grand ſays, they make a promiſe aloud, before their ſuperior, to keep chaſtity, but add in a low voice, *as you keep it*. The emperor has a kind of ſupremacy in eccleſiaſtical matters.

The *Abyſſinians* have divers times expreſſed an inclination to be reconciled to the ſee of Rome; but rather out of intereſt of ſtate than any other motive.

Meneſis, and other miſſionaries, accuſe the *Abyſſinians* of Judaiſm, in regard to the many Jewiſh obſervances ſtill in uſe among them: ſome have even doubted, whether they are more Chriſtians, or Jews? Lobo ſays expreſly they are only Chriſtians in name: they practiſe circumciſion on females, as well as males.—They eat no meats prohibited by the law of Moſes.—Women are obliged to the legal purifications.—Brothers marry their brothers wives, &c. They abſtain from hog's fleſh, blood, meats ſtrangled, &c. and obſerve both Saturday and Sunday ſabbath, according to the cuſtom of the primitive church: all of them marks of Judaiſm; though by ſome reſolved into mere human inſtitution, and uſage. They celebrate the Epiphany with peculiar feſtivity, in memory of Chriſt's baptiſm; when they plunge and ſport in ponds and rivers, which has occaſioned ſome to affirm that they were baptized a-new every year. Among the ſaints-days is one conſecrated to Pilate and his wife; becauſe Pilate waſhed his hands before he pronounced ſentence on Chriſt; and his wife deſired him to have nothing to do with the blood of that juſt perſon. They have four lents: the great one commences ten days earlier than ours, and is obſerved with much ſeverity, many abſtaining therein even from fiſh, becauſe St. Paul ſays there is one kind of fleſh of men, and another of fiſhes. They allow of divorce, which is eaſily granted among them, and by the civil judge: nor do their civil laws prohibit polymagy. They have at leaſt as many miracles, and legends of ſaints, as the Romiſh church; which proved no ſmall embarraſſment to the Jeſuit miſſionaries, to whom they produced ſo many miracles, wrought by their ſaints, in proof of their religion, and thoſe ſo well circumſtantiated and atteſted, that the Jeſuits were obliged to deny miracles to be any proof of a true religion; and in proof hereof to alledge the ſame arguments againſt the *Abyſſinians*, which proteſtants in Europe alledge againſt the papiſts. Ludolf allows that they believe the real preſence after the Lutheran manner, but denies that they hold tranſubſtantiation; though Renaudot aſſerts, that they maintain it. They pray for the dead, and invoke ſaints and angels; have ſo great a veneration for the Virgin, that they charged the Jeſuits with not rendering her honour enough. Images in painting they venerate, but abhor all thoſe in relievo, except the croſs. They hold that the ſoul of man is not created, becauſe, ſay they, God finiſhed all his work on the ſixth day. They admit the apocryphal books, and the canons of the apoſtles, as well as the Apoſtolical Conſtitutions, for genuine. Their liturgy is given by Alvarez, and in Engliſh by Pagit; their calendar by Ludolf; the anſwers of abba Gregory to certain queſtions, propoſed by the author laſt cited, are publiſhed by Fabricius, under the title of Theologia Æthiopica.

ACACALIS, in the *Materia Medica*, the name given by ſome authors to the *ſiliqua ſylveſtris*, or wild *carob*.

ACACALOTL, in *Zoology*, the name of an American bird, called by ſome CORVUS *aquaticus*, or the water raven. The male is four ſpans long from his beak to the end of his tail, and is moderately fleſhy; his legs are a ſpan and a half long. Its beak is two hands breadth long, is bent like a bow, and of a blue colour; its head is ſmall; it is of a mixt brown and red colour on the breaſt and belly, and of a finely variegated hue on the back, made up of a ſhining purple, black, and green; its wings are of a fine green, which looks very bright and gloſſy in the ſun. It is a native of Mexico, and is common about lakes and rivers, feeding on fiſh; it is eaten, but is coarſe, and of a rank fiſhy taſte.

ACACIA, in *Botany*, the name of a genus of trees, the characters of which are theſe: the flower conſiſts only of one leaf, and is of the funnel-faſhioned kind, and uſually contains a great number of ſtamina, and the flowers are commonly collected in cluſters, or little heads; the piſtil ariſes from the bottom of the flower, and finally becomes a ſiliquoſe fruit divided into ſeveral hollows, and containing a number of roundiſh ſeeds. The *acacias* belong to the polyandria monogynia claſs of Linnæus.

The ſpecies of *acacia* enumerated by Mr. Tournefort are twelve; and by Miller twenty-two.

The Æthiopian pepper of Matthiolus ſeems to belong to this genus of plants.

The flowers of the *acacia* are uſed by the Chineſe in making that yellow, which, we ſee, bears waſhing in their ſilks and ſtuffs; and appears with ſo much elegance in their painting on paper. The method is this:

They gather the flowers before they are fully open; theſe they put into a clean earthen veſſel over a gentle heat, and ſtir them continually about, as they do the tea-leaves, till they become dryiſh and of a yellow colour; then to half a pound of the flowers they add three ſpoonfuls of fair water, and after that a little more, till there is juſt enough to hold the flowers incorporated together: they boil this for ſome time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and ſtrain it through a piece of coarſe ſilk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyſter-ſhells reduced to a fine powder. All is then well mixed together; and this is the fine laſting yellow they have ſo long uſed.

The dyers of large pieces uſe the flowers and ſeeds of the *acacia* for dying three different ſorts of yellow. They roaſt the flowers, as before obſerved; and then mixing the ſeeds with them, which muſt be gathered for this purpoſe when full ripe: by different admixtures of theſe, they give the different ſhades of colour, only for the deepeſt of all, they give a ſmall mixture of Braſil wood.

Mr. Geoffroy, with great probability, attributes the origin of bezoar to the ſeeds of this plant; which being brouſed by certain animals, and vellicating the ſtomach by their great ſourneſs and aſtringency, cauſe a condenſation of the juices, till at length they become coated over with a ſtony matter, which we call BEZOAR, or BEZOARD.

ACACIA *Indiana*, ſignifies TAMARIND.

ACACIA; *baſtard* or *falſe* ACACIA, *robinia*, in *Botany*; Lin. Gen. Plant. 775. Its characters are theſe: the empalement of the flower is ſmall, and divided into four parts, the three under ſegments being narrow, but the upper one broad. The flower is of the PEA-*bloom* kind; the ſtandard is large, roundiſh, obtuſe, and ſpreads open. The two wings are oval, and have ſhort appendices, which are obtuſe. The heel is roundiſh, compreſſed, obtuſe, and is extended the length of the wings. In the center is ſituated ten ſtamina, nine joined together, and the other ſtanding ſingle, terminated by roundiſh ſummits. It hath an oblong cylindrical germen, ſupporting a ſlender ſtyle, crowned by a hairy ſtigma. The germen afterward becomes an oblong, compreſſed pod, incloſing kidney-ſhaped ſeeds. There are ten ſpecies.

ACACIA *Zeylanica*, ſignifies LOGWOOD.

ACACIA, in *Medicine*, an inſpiſſated juice of a ſhrub of the thorn kind, uſed as an aſtringent.

It is prepared by inſpiſſating, to a due conſiſtence, the juice expreſſed from the unripe pods of a large prickly tree of this name.

There are two kinds, the *vera*, and *germanica*.

The ACACIA *vera* is brought from the Levant in round balls, of different ſizes, in fine bladders; and ſuppoſed to be the juice of the pods of a large thorny tree, growing in Egypt and Arabia.—Some naturaliſts will have it the ſame tree that yields the gum arabic.

This is very auſtere, and binding; and, on that account, good againſt fluxes.—Chuſe that of a tan-colour, ſmooth, and ſhining; and of an aſtringent diſagreeable taſte.—It is, or ſhould be, an ingredient in the *Theriaca Andromachi*.

The *German* ACACIA is a counterfeit of the former; being made of the juice of unripe ſloes, boiled to the conſiſtence of a ſolid extract, and put up in bladders like the former.—It is diſtinguiſhed from it chiefly by its colour, which is as black as that of Spaniſh liquorice.—It is uſed as a ſubſtitute to the true *acacia*.

ACACIA, among *Antiquaries*, denotes ſomething reſembling a kind of roll, or bag, ſeen on medals in the hands of ſeveral of the conſuls, and emperors, from the time of Anaſtaſius.

According to Du Cange, the *ακακια*, properly ſo called, was a purple bag, filled with earth, or ſand, and bore by the prince in his left hand, to remind him of his frailty and mortality; to prevent his being too much elated with his ſtation.

But authors are not agreed, either about the uſe of this roll, or about the ſubſtance whereof it conſiſts; ſome taking it for a handkerchief rolled up, which the perſon who preſided at the games threw out as a ſignal for their beginning; whilſt others rather imagine it intended to repreſent a roll of memoirs, or petitions.

ACACIANS, in *Church Hiſtory*, the followers of Acacius, biſhop of Cæſarea, who flouriſhed about the middle of the fourth century. Some of them maintained, that the Son was not of the ſame, but of a ſimilar ſubſtance with the Father: others held that he was of a different ſubſtance from the Father. This was likewiſe the denomination of another ſect, derived from the name of their leader, a patriarch of Conſtantinople, in the fifth century, who favoured the opinion of Eutyches. See EUTYCHIANS.

ACADEMICS, a ſect of philoſophers, who followed the doctrine of Socrates and Plato, as to the uncertainty of knowledge, and the incomprehenſibility of truth.

Academic, in this ſenſe, amounts to much the ſame with Platoniſt; the difference between them being only in point of time. They who embraced the ſyſtem of Plato, among the ancients, were called *academici*; whereas thoſe who did the ſame ſince the reſtoration of learning, have aſſumed the denomination of Platoniſts.

We uſually reckon three ſects of *academics*; though ſome make five.—The ancient *academy* was that whereof Plato was the chief. See PLATONISM.

Arceſilas, one of his ſucceſſors, introducing ſome alterations into the philoſophy of this ſect, founded what they call the *ſecond academy*.

The eſtabliſhment of the third, called alſo the *new academy*, is attributed to Lacydes, or rather to Carneades.

Some authors add a fourth, founded by Philo; and a fifth by Antiochus, called the *Antiochan*, which tempered the ancient *academy* with STOICISM.

The ancient *academy* doubted of every thing; and went ſo far as to make it a doubt, whether or no they ought to doubt.—It was a ſort of principle with them, never to be certain, or ſatisfied of any thing; never to affirm, or deny any thing, either for true or falſe.—In effect, they aſſerted an abſolute ACATALEPSIA.

The *new academy* was ſomewhat more reaſonable; they owned ſeveral things for truths, but without attaching themſelves to any with entire aſſurance.—Theſe philoſophers had found, that the ordinary commerce of life and ſociety was inconſiſtent with the abſolute and univerſal doubtfulneſs of the ancient *academy*: and yet, it is evident, they looked upon things rather as probable, than as true and certain: by this amendment, thinking to ſecure themſelves from thoſe abſurdities into which the ancient *academy* had fallen. See the *academical* queſtions of Cicero; where that philoſopher explains, and unravels the ſentiments of thoſe who in his days called themſelves followers of the new and old *academy*, with great clearneſs and addreſs.

ACADEMICS, or rather **ACADEMISTS**, is alſo uſed among us for the members of the modern *academies*, or inſtituted ſocieties of learned perſons.

ACADEMY, ACADEMIA, in *Antiquity*, a fine villa, or pleaſure-houſe, ſituate in one of the ſuburbs of Athens, about a mile from the city; where Plato, and the wiſe men who followed him, held aſſemblies for diſpute and philoſophical conference; and which gave the denomination to the ſect of ACADEMICS.

It took its name, *academy*, from one Academus, or Ecademus, a citizen of Athens, to whom it originally belonged; and who uſed to have gymnaſtic ſports or exerciſes therein.—He lived in the time of Theſeus.

Some, miſtakenly, derive its name and origin from Cadmus the Phœnician, as being the firſt who introduced learning, and the uſe of letters, among the Greeks.

The *academy* was farther improved and adorned by Cimon, with fountains, trees, ſhady walks, &c. for the convenience of the philoſophers, and men of learning, who here met to confer, diſpute, &c.—Hipparchus, the ſon of Piſiſtratus, built a wall round it; and in order to defray the charges, laid ſo heavy a tax on the people, that ever after Ἱππαρχȣ τειχιον, was uſed proverbially for any expenſive buſineſs.—It was alſo the burying-place of illuſtrious perſons, who had deſerved well of the republic.

Here it was that Plato taught his philoſophy; and from him all public places, deſtined for the aſſemblies of the learned and ingenious, have been ſince called ACADEMIES.

Sylla ſacrificed the delicious groves and walks of the *academy*, planted by Cimon, to the laws of war; and employed thoſe very trees to make machines wherewith to batter the city. Cicero alſo had a villa, or country retirement, near Puzzuoli, which he called by the ſame name, *academia*; where he uſed to entertain his philoſophical friends.—It was here he compoſed his Academical Queſtions, and his books De Natura Deorum.

ACADEMY is more frequently uſed among the moderns, for a regular ſociety, or company of learned perſons; inſtituted under the protection of a prince, for the cultivation and improvement of arts or ſciences.

Some authors confound *academy* with univerſity; but though much the ſame in Latin, they are very different things in Engliſh.—An univerſity is, properly, a body compoſed of graduates in the ſeveral faculties; of profeſſors, who teach in the public ſchools; of regents or tutors, and ſtudents who learn under them, and aſpire likewiſe to degrees. Whereas, an *academy* is not intended to teach, or profeſs any art, ſuch as it is, but to improve it: it is not for novices to be inſtructed in, but for thoſe that are more knowing; for perſons of diſtinguiſhed abilities to confer in, and communicate their lights and diſcoveries to each other, for their mutual benefit and improvement.

The firſt *academy* we read of, was eſtabliſhed by Charlemagne at the motion of Alcuin: it was compoſed of the chief wits of the court, the emperor himſelf being a member.—In their *academical* conferences, every perſon was to give an account of what ancient authors he had read; and each of them aſſumed the name of ſome ancient author, who pleaſed him moſt, or ſome celebrated perſon of antiquity. Alcuin, from whoſe letters we learn theſe particulars, took that of Flaccus, the ſurname of Horace: a young lord, named Augilbert, took that of Homer: Adelard, biſhop of Corbie, was called Auguſtin: Riculfe, biſhop of Mentz, was Dametas; and the king himſelf, David.

Moſt nations have now their *academies*, Ruſſia not excepted.

Of theſe uſeful inſtitutions we ſhall give an account in the following order.

ACADEMIES *of Antiquities*; as

The *academy* at Cortona, lately eſtabliſhed for the ſtudy of the Hetrurian antiquities, and conſequently, by right of conqueſt, the antiquities of the whole world. Their head is called Lucumon, a name taken from the ancient governors of Hetruria. One of their laws is, to give audience to poets only one day in the year: another is, to fix their ſeſſions, and impoſe a tax of a diſſertation on each member in his turn.

The *academy of Antiquities* at Upſal, owes its riſe to queen Chriſtina, but its eſtabliſhment chiefly to Charles Guſtavus her ſucceſſor. Its deſign is for illuſtrating the northern languages, and the antiquities of the country, as ſtones, coins, and the like monuments; in which notable diſcoveries have been made by it. The more eminent of its members have been Verelius, Loccenius, Scheffer, Rudbecks, Keder, Salin, Perinſkiold, &c.

ACADEMY, *Royal, of Arts*, was inſtituted in London for the encouragement of *Deſigning, Painting, Sculpture*, &c. &c. in the year 1768. This *academy* is under the immediate patronage of the king, and under the direction of *forty* artiſts of the firſt rank in their ſeveral profeſſions. It furniſhes, in winter, living models of different characters to draw after, and in ſummer, models of the ſame kind to paint after. Nine of the ableſt *academicians* are annually elected out of the forty, whoſe buſineſs is to attend by rotation, to ſet the figures, to examine the performances of the ſtudents, and to give them neceſſary inſtruction. There are likewiſe *four* profeſſors, of *Painting*, of *Architecture*, of *Anatomy*, and of *Perſpective*, who annually read public lectures on the ſubjects of their ſeveral departments; beſide a preſident, a council, and other officers. The profeſſors and *academicians* have ſalaries annexed to their employments; and the *academy* is provided, by the munificence of his majeſty, with a conſiderable ſum, which is annually diſtributed for the relief of indigent artiſts, and their diſtreſſed families. The admiſſion to this *academy* is free to all ſtudents properly qualified to reap advantage from the ſtudies cultivated in it; and there is an annual exhibition of paintings, ſculptures, and deſigns, open to all artiſts of diſtinguiſhed merit.

ACADEMIES *of Belles Lettres*, thoſe wherein eloquence and poetry are chiefly cultivated. Italy is full of theſe; and France has its ſhare; ſuch are

The *academy of Umidi* at Florence, called afterwards La Fiorentina, in honour of the grand duke Coſmo I. who declared himſelf its protector in 1549, is illuſtrious both for the works it has produced, and its members; which for theſe two laſt ages have included moſt of the eminent men, not only in Tuſcany, but in all Italy. Their chief attention is to the Italian poetry.

ACADEMY *of Humoriſts, Umoriſti*, had its origin at Rome, from the marriage of Lorenzo Mancini, a Roman gentleman, at which ſeveral perſons of condition were gueſts; and it being carnival-time, to give the ladies ſome diverſion, they took themſelves to the reciting of verſes, ſonnets, ſpeeches, and comedies, firſt *ex tempore*, and afterwards premeditatedly; which gave them the denomination of *Belli humori*. After ſome experience, coming more and more into the taſte of theſe exerciſes, they reſolved to form an *academy* of *Belles Lettres*; and changed the title of *Belli Humori* for that of *Humoriſti*; chooſing for their device a cloud, which after being formed of the ſaline exhalations of the ſea, returns in a gentle ſweet ſhower, with the motto from Lucretius, *redit agmine dulci*.

ACADEMY *of Arcadi* was eſtabliſhed at Rome in 1690, for reviving the ſtudy of poetry, and the *Belles Lettres*; and comprehends moſt of the politer wits in Italy, of both ſexes; many princes, cardinals, and other eccleſiaſtics: to avoid all diſputes among whom, about pre-eminence, it is wiſely provided, that all appear maſked, after the manner of ſhepherds of Arcadia. Within ten years from its firſt eſtabliſhment, the number of *academiſts* amounted to ſix hundred. They hold aſſemblies ſeven times a year in a mead, or grove; of late in the gardens of the duke of Salviati. Six of theſe meetings are employed in the recitation of poems, and verſes of the *Arcadi* reſiding at Rome, who read their own compoſitions; except ladies and cardinals, who are allowed to make uſe of other ſhepherds for this office. The ſeventh meeting is ſet apart for the compoſitions of foreign, or abſent members; in which there is more entertainment than in all the reſt; becauſe the pieces produced here are written in all the different ſtyles and dialects of Italy. The government of this *academy* is wholly democratical, allowing of no prince, or protector, but only a *cuſtos*, who repreſents the whole ſociety, choſen each olympiad, that is, every four years; with a power of electing twelve others yearly, to aſſiſt him in the adminiſtration. Under theſe are two *ſubcuſtodes*, one vicar or *procuſtos*, and four deputies, or ſuperintendants, annually choſen. There are five ways of electing members; the firſt called *acclamation*, uſed when ſovereign princes, cardinals, and ambaſſadors of kings, deſire to be admitted; in which caſe the votes are given *viva voce*: the ſecond *annumeration*, introduced in favour of ladies and academical colonies; where the votes are taken privately: the third *repreſentation*, eſtabliſhed in favour of colleges and univerſities, where the young gentry are bred; who have each a privilege of recommending one, or two members privately, to be ballotted for: the fourth *ſurrogation*, whereby new ſhepherds are ſubſtituted in the room of thoſe dead, or expelled: the laſt, *deſtination*, whereby, when there is no vacancy of members, perſons of poetical merit have the title *Arcadi* conferred on them, till ſuch time as a vacancy ſhall happen. All the members of this body, at their admiſſion, aſſume new paſtoral names, in imitation of thoſe of ancient Arcadians.

The *academy* has divers colonies of *Arcadi* eſtabliſhed in other cities in Italy, all regulated after the ſame manner.

Academy, *Royal*, at Caën, was eſtabliſhed by letters patent in 1705; it had its riſe fifty years earlier in private conferences, held firſt in the houſe of M. de Brieux. M. de Segrais retiring to this city, to ſpend the reſt of his days, reſtored and gave new luſtre to their meetings. In 1707, M. Foucault, intendant of the generality of Caën, procured the king's letters patent for erecting them into a perpetual *academy*, of which M. Foucault was to be protector for the time, and the choice afterwards left to the members, the number of whom was fixed to thirty, and the choice of them, for this time, left to M. Foucault. Beſide the thirty, leave is given to add ſome ſupernumerary members, not exceeding ſix, from the eccleſiaſtical communities in that city.

An aſſembly of men of letters at Lyons, are ſaid only to want letters patent to form a royal *academy*, inferior to few in France. It conſiſts of twenty *academiſts*, with a director at their head, and a ſecretary who is perpetual. F. Lombard, a jeſuit, one of the members, here read a learned diſſertation on infinity.

Academies, *Chirurgical*; as that firſt inſtituted at Paris in 1731; and finally eſtabliſhed by letters patent from the king in 1751; the members of which are not only to publiſh their own and correſpondents obſervations and improvements, but to give an account of all that is publiſhed in ſurgery, and to compoſe a complete hiſtory of this art, by their extracts from all the authors, ancient and modern, who have wrote on it. A queſtion in ſurgery is to be propoſed by the *academy* yearly; and a prize of a gold medal of two hundred livres value to be given to him, who furniſhes the moſt ſatisfactory anſwer.

Academies, *Coſmographical*; as that of the Argonauts at Venice, inſtituted at the ſolicitation of F. Coronelli, for the improvement of *Geography*. The deſign of the *accademia coſmografica* is to procure exact maps, geographical, topographical, hydrographical, and ichnographical, of the celeſtial as well as terreſtrial globe, and the ſeveral regions and parts thereof, together with geographical, hiſtorical, and aſtronomical deſcriptions accommodated thereto, to be made and publiſhed: in order to which, the ſeveral members oblige themſelves, by their ſubſcription, to take one or more copies of each piece, publiſhed under the direction of the *academy*; and to advance the money, or part of it, in order to defray the charge of publication. To this end, there are three ſocieties ſettled, at Venice, Paris, and Rome; the firſt under F. Moro, provincial of the Minorites of Hungary; the ſecond, under the abbot Laurence au Rue Payenne au Marais; the third, under F. Ant. Baldigiani, jeſuit, profeſſor of mathematics in the Roman college; to whom thoſe addreſs themſelves, who are willing to engage in this deſign. The Argonauts number 196 members in the ſeveral countries of Europe: their device is the terraqueous globe, with the motto, *plus ultra*. At the expence of this *academy*, all the globes, maps, and geographical writings of F. Coronelli have been publiſhed.

Academy *of Dancing*. One of this kind was inſtituted by Louis XIV. with extraordinary privileges.

Academies, *Eccleſiaſtical*; as that at Bologna, employed in the examination of the doctrine, diſcipline, and hiſtory of each age of the church.

Academies, *Hiſtorical*; as the *Royal Academy of Portugueſe Hiſtory* at Liſbon, was inſtituted by king John V. in 1720; as appears by a medal ſtruck by the *academy*, on the front whereof is that prince's effigy, with the inſcription *Johannes* V. *Luſitanorum Rex*; and on the reverſe, the ſame prince ſtanding is repreſented ſupporting and raiſing Hiſtory, almoſt proſtrate before him, with the legend *Hiſtoria Reſurges:* underneath are the following words in abbreviature, REGia ACADemia HISToriæ LUSITanæ INSTITuta VI. Idus Decembris MDCCXX. This *academy* conſiſts of a director, four cenſors, a ſecretary, and fifty members; to each of whom is aſſigned ſome part, either of the eccleſiaſtical, or civil hiſtory of the nation; which he is to treat either in Latin, or Portugueſe.

Academy *of Suabian Hiſtory* at Tubingen, was lately eſtabliſhed by ſome learned men, for publiſhing the beſt hiſtorical writings, the lives of the chief hiſtorians, and compiling new memoirs, on the ſeveral points and periods thereof.

Academies *of Languages*, are called by ſome, *Grammatical Academies*; as

The *Academy della Cruſca* at Florence, famous for its vocabulary of the Italian tongue, was formed in 1582, but ſcarce heard of before the year 1584, when it became noted for a diſpute between Taſſo and ſeveral of its members. Many authors of note confound this with the Florentine *academy*.

Academy *of Fructiferi* had its riſe in 1617, at an aſſembly of ſeveral princes and nobility of the country, who met with a deſign to refine and perfect the German tongue. It flouriſhed long under the direction of princes of the empire, who were always choſen preſidents. In 1668, the number of members aroſe to upwards of nine hundred.

Academy, *French*, had its riſe in a private meeting of men of letters, in the houſe of Mr. Conrart, in the year 1628. Cardinal Richlieu, in 1635, at the inſtance of Mr. Chapelain, erected it into an *academy* for refining and aſcertaining the French language and ſtyle. The number of the members was limited to forty, out of whom, a director, a chancellor, and ſecretary, are to be choſen; the two former hold their poſt for two months, the ſecretary is perpetual. Several privileges and immunities were conferred on the new *academy*, particularly the *droit de committimus*, or a privilege of not appearing to anſwer before any court, but that of the king's houſhold. Their firſt aſſemblies were held in the cardinal's apartment; after his death, in that of the chancellor Seguier. At laſt an apartment was given them in the Louvre, now called *l'Academie Françoiſe*. They meet three times a week in the Louvre; at breaking up, forty ſilver medals are diſtributed among them, having on one ſide the king of France's head, and on the reverſe, *protecteur de l'academie*, with a laurel and this motto, *à l'immortalité*. By this diſtribution, the attention of the *academiſts* is ſecured: thoſe who are preſent receiving the ſurplus, otherwiſe intended for the abſent.

As to the employment of the *academy*; its deſign being not only to give rules, but examples of good writing: they began with making ſpeeches on ſubjects taken at pleaſure, each member in his turn: twenty of theſe have been printed. Their next work was a critique of the Cid of M. Corneille, a taſk enjoined them by the cardinal. They next ſet about a Dictionary of the French tongue, which, after about fifty years ſpent in it, in order to ſettle the words and phraſes to be uſed in writing, &c. was publiſhed in 1694; having in the mean while given occaſion to ſome ſmart diſputes with M. l'Abbe Furetiere, one of their own members.

Their hiſtory is written with great elegancy to the year 1652, by M. Peliſſon: improved and continued to the year 1700, by M. l'Abbe d'Olivet: the ſame is given rhetorically, by F. le Camus.

Academy, *Royal Spaniſh*, is an *academy* for cultivating the Caſtilian tongue, eſtabliſhed at Madrid, on the model of the French *academy*.—The deſign of this was laid by the duke d'Eſcalona; and approved of by the king in 1714, who declared himſelf protector thereof.—It conſiſts of twenty-four *academiſts*; including the director and ſecretary.

Its device is a crucible on the fire, with this motto, *Limpia, fija, y da eſplendor:* i. e. it purifies, fixes, and gives brightneſs; which ſome have criticized. Their object, as marked out by the royal declaration, is to cultivate and improve the national language: in order to which, they are to begin with chooſing carefully ſuch words and phraſes, as have been uſed by the beſt Spaniſh writers; noting the low, barbarous, or obſolete ones, and compoſing a dictionary, wherein theſe may be diſtinguiſhed from the former, &c. by which means, adds that prince, it will clearly appear, that the Caſtilian tongue is inferior to none of theſe moſt eſteemed in the world; and may be employed with advantage either in teaching the arts and ſciences, or in expreſſing the moſt perfect Latin or Greek originals in exact tranſlations. The number of members is limited to twenty-four; the duke d'Eſcalona to be director for life; but his ſucceſſors choſen yearly. The ſecretary to be perpetual. The *academy* to have its own printer; yet not to put any thing to preſs without the permiſſion of the council. For farther encouragement, all privileges and immunities enjoyed by the domeſtic officers, actually in the king's ſervice, and the royal palace, are granted the *academiſts*.

Academies *of Law*; as that famous one at Beryta, and that of the Sitientes at Bologna.

Academy *of Medals and Inſcriptions*, was erected for the ſtudy, and explanation of ancient monuments; and to conſecrate great and memorable events to poſterity, by ſimilar monuments; as medals, relievos, inſcriptions, &c. The *academy of medals and inſcriptions* at Paris, was ſet on foot by M. Colbert in 1663, for the ſtudy and explanation of ancient monuments, and perpetuating of great and memorable events, eſpecially thoſe of the French monarchy, by coins, relievos, inſcriptions, &c. The number of members at firſt was confined to four or five, but in 1701 was increaſed to forty; whereof ten to be honoraries, ten penſionaries, ten aſſociates, and the ſame number of novices or eleves. The king nominates their preſident and vice-preſident yearly; but their ſecretary and treaſurer are perpetual. The reſt are choſen by the members themſelves, agreeably to the conſtitutions given them on that behalf. Their chief work is a kind of medallic hiſtory of the reign of Louis XIV. Beſide which we have ſeveral volumes of their eſſays, under the title of memoirs; and their hiſtory, written and continued by their ſecretaries. Their motto is *Vetat mori*.

Academies, *Medical*; as that of the Naturæ Curioſi in Germany; that founded at Palermo, in 1645; another at Venice, in 1701, which meets weekly in a hall near the grand hoſpital; another at Geneva, in 1715, in the houſe of M. le Clerc. The college of phyſicians at London is alſo by ſome ranked in the number of medical *academies*.

Academy, *Muſical*; this conſiſts of the managers, and directors of the opera.

The French have alſo conſiderable *academies* in moſt of their great cities; as, at Montpelier, a royal *academy* of ſciences, on the like footing as that at Paris; being as it were a counterpart thereof: at Thoulouſe an *academy* under the denomination of Lanterniſts: others at Niſmes, Arles, &c.

Academy *of Naturæ Curioſorum*, in Germany, was firſt founded in 1652, by M. Bauſch, a phyſician; and taken in 1670 under the protection of the emperor Leopold.

This *academy* differs from all others, in that it has no fixed reſidence, or regular aſſemblies; inſtead whereof is a kind of bureau, or office, firſt eſtabliſhed at Breſlaw, afterwards removed to Nuremberg, where letters, obſervations, &c. from members and correſpondents are taken in. The *academy* conſiſts of a preſident, two adjuncts, or ſecretaries, and colleagues or members. The colleagues, at their admiſſion, oblige themſelves to two things; firſt, to chooſe ſome ſubject out of the animal, vegetable, or mineral kingdom to handle, provided it had not been treated of by any colleague before; the ſecond, to apply themſelves to furniſh materials for the annual Ephemerides. Each member to bear a ſymbol of the *academy*, viz. a gold ring, whereon, inſtead of a ſtone, is a book open, and on the face thereof an eye; on the other ſide the motto of the academy, *nunquam otioſus*, i. e. *never idle*. See the hiſtory, laws, &c. of this *academy*, with the names of its members, and the titles of its pieces, in Ephem. Germ. dec. 1. an. 1, & 2. Pref. and the continuation of the ſame in the prefaces and appendices to the enſuing volumes.

Academy, *Naval*; as that at Peterſburgh.

Academies *of Painting*, *Sculpture*, and *Architecture*; as thoſe celebrated ones anciently at Florence and Milan, called alſo *ſchools*; and that other at Bologna, lately incorporated into the new inſtitute; to which may be added the *academy* of painting and ſculpture at Paris and Vienna; another of deſigning at Rome.

Academy *of Painting and Sculpture* at Paris was eſtabliſhed fifty years ago, under the cardinal Mazarine, firſt protector thereof; and the chancellor Seguier, vice-protector.

It conſiſts of a director, a chancellor, four rectors, a treaſurer, twelve profeſſors; adjuncts to the rectors and profeſſors; counſellors; a ſecretary; a profeſſor for anatomy, and another for geometry and perſpective.

Perſons are here admitted either in quality of painters or ſculptors.—The painters are admitted according to their reſpective talents; there being a diſtinction made between thoſe who work in hiſtory, and thoſe who only paint portraits, or landſkips, or beaſts, or fruits, or flowers, or paint in miniature; or only deſign, or engrave, or carve, &c. An account of it has been publiſhed by Guerin, under the following title, Deſcript. de l'Acad. Roy. de Peinture & Sculpt.

There is alſo a French *academy* of painting, ſculpture, &c. at Rome, eſtabliſhed by Lewis XIV. wherein thoſe who have won the annual prizes in the like *academy* at Paris, are received and entertained for three years, to give them an opportunity for perfecting themſelves.

Academy, *Political*, is compoſed of ſix perſons, who meet on certain days each week at the Louvre, in the chamber where the papers relating to foreign affairs are lodged. Here they peruſe ſuch papers as are put in their hands, by order of the ſecretary for foreign affairs, who acquaints the king with the progreſs they make, and the capacities of each, that his majeſty may employ them accordingly.

Academies *of Sciences* chiefly denote thoſe erected for improving natural and mathematical knowledge, otherwiſe called philoſophical and phyſical *academies*: ſuch as the *academy ſecretorum naturæ*, formed at Naples, in the houſe of Baptiſta Porta, about the year 1560, the firſt *academy* of the philoſophical kind. It was ſucceeded by the

Academy *of Lyncei*, founded at Rome by prince Frederic Ceſi, towards the cloſe of the ſame century; ſeveral of whoſe members rendered it famous by their diſcoveries: the celebrated Galileo Galilei was of the number.

Divers other *academies* contributed alſo to the advancement of theſe ſciences; but it was by ſpeculations, rather than by repeated experiments on the phænomena of nature: ſuch were the *academy* of Beſſarian at Rome, and that of Laurence de Medicis at Florence, in the fifteenth century; in the ſixteenth, that of Infiammati at Padua, of Vegna Juoli at Rome, of Ortolani at Placentia, and of Umidi at Florence. The firſt of theſe ſtudied fire and pyrotechnia, the ſecond wine and vineyards, the third gardens and pot-herbs, the fourth water and hydraulics. Add to theſe, that of Venice, called La Veneta, founded by Frederic Badoara, a noble Venetian; another in the ſame city, whereof Campegio, biſhop of Feltro, appears to have been the chief; and that of Coſenza, or la Conſentina, whereof Bernadin Teleſio, Sertorio Quatromanni, Paulus Aquinas, Julio Cavalcanti, and Fabio Cicali, celebrated philoſophers, were the chief members.

The compoſitions of all theſe *academies* of the ſixteenth century were good in their kind, but none of them comparable to thoſe of the Lyncei.

Academy *del Cimento* made its appearance at Florence, ſome years after the death of Torricelli, under the protection of prince Leopold, afterwards cardinal de Medicis. Redi was one of its chief members. Count Laurence Magalotti, ſecretary of this *academy*, publiſhed a volume of curious experiments in 1677, under the title of Saggi di Naturali Eſperienze; a copy of which being preſented to the Royal Society, was tranſlated into Engliſh by Mr. Waller, and publiſhed at London, in 4to.

Academy *degl' inquieti* at Bologna, incorporated afterwards into that *della traccia* in the ſame city, followed the example of that *del Cimento*: their meetings were at the houſe of the abbot Antonio Sampieri. Here Geminiano Montanari, one of the chief members, made excellent diſcourſes on phyſical and mathematical ſubjects, part whereof was publiſhed in 1667, under the title of Penſieri Fiſico-Matematici. This *academy* afterwards met in an apartment of Euſtachio Manfredi; and afterwards in that of Jacob Sandri, but arrived at a higher luſtre, when its aſſemblies were held in the palace Marſilli.

Academy *of Roſſano*, in the kingdom of Naples, called *La Societa Scientifica Roſſaneſe degl' Incurioſi*, was founded about the year 1540, under the name of *naviganti*, and renewed under that of *ſpenſierati* by Camillo Tuſcano, about the year 1600. It was transformed from an *academy* of Belles Lettres into an *academy* of ſciences, at the ſolicitation of the learned abbot Don Giacinto Gimma; who being made preſident under the title of promoter-general thereof, in 1695, gave a new ſet of regulations. He divided the *academiſts* into ſeveral claſſes, viz. grammarians, rhetoricians, poets, hiſtorians, philoſophers, phyſicians, mathematicians, lawyers, and divines, with a claſs apart for cardinals and perſons of quality. To be admitted a member, a man muſt have degrees in ſome faculty. The members are not allowed to take the title of *academiſt*, in the beginning of their books, without a written permiſſion from the preſident, which is not granted till the work has been examined by the cenſors of the *academy*. This permiſſion is the greateſt honour the *academy* can confer; ſince hereby they, as it were, adopt the work; and are anſwerable for it againſt all critiques which may be made of it. The preſident or promoter himſelf is ſubject to this law. Add, that no *academiſt* is allowed to publiſh any thing againſt the writings of another, without leave from the ſociety.

There have been ſeveral other *academies* of ſciences in Italy, which have not ſubſiſted long, for want of being ſupported by the princes. Such were at Naples that of the *Inveſtiganti*, founded about the year 1679, by the Marqueſs d'Arena, Don Andrea Concubletto; and that which met in 1698, in the palace of the Duke de Medina, Don Lewis della Cerda, viceroy of Naples. At Rome, that of *Fiſico-Matematici*, which met in 1686, in the houſe of Sig. Ciampini: at Verona, that of *Aletofili*, founded the ſame year by Sig. Joſeph Gazola, which met in the houſe of the count Serenghi della Cucca: at Breſcia, that of *Fileſotici*, founded the ſame year for the cultivation of phyſics and mathematics, and ended the year following: that of F. Franciſco Lana, a Jeſuit of great ſkill in thoſe ſciences: laſtly, that of *Fiſico-Critici* at Sienna, founded in 1691, by Sig. Peter Maria Gabrielli.

Some other *academies* ſtill ſubſiſting in Italy, repair with advantage the loſs of the former. One of the principal is the *academy* of *Filarmonici* at Verona, ſupported by the Marquis Scipio Maffei, one of the moſt learned men in Italy. Though the members of this body apply themſelves to the Belles Lettres, they do not neglect the ſciences. The *academy* of *Ricovrati* at Padua ſtill ſubſiſts with reputation; in it, learned diſcourſes are held from time to time on phyſical ſubjects; ſuch for inſtance is that, which the celebrated Sig. Antonio Valliſnieri, firſt profeſſor of phyſic in the univerſity of that city, delivered here on the origin of ſprings, ſince printed. The like may be ſaid of the *academy* of the *Muti di Reggio*, at Modena; to which the ſame Sig. Valliſnieri, a native of that city, preſented an excellent diſcourſe on the ſcale of created beings, ſince inſerted in his Hiſtory of the Generation of Man and Animals; printed at Venice in 1721. In the number of theſe *academies* may alſo be ranked the aſſembly of learned men, which of late years met at Venice in the houſe of Sig. Criſtino Martinelli, a noble Venetian, and great patron of learning.

Among the new *academies*, the firſt place, after the inſtitute of Bologna, is given to that of the counteſs Donna Clelia Grillo Borromeo, one of the moſt learned ladies of the age, to whom Sig. Gimma dedicates his literary hiſtory of Italy. She had lately eſtabliſhed an *academy* of experimental philoſophy in her palace at Milan; of which Sig. Valliſnieri was nominated preſident, and had already drawn up the regulations of it, though we do not find it has yet taken place. There are likewiſe many other *academies* of leſs note in Italy; Jarchius enumerates 550, of which the names are very curious.

F. Merſenne is ſaid to have given the firſt idea of a philoſophical *academy* in France, towards the beginning of the ſeventeenth century, by the conferences of naturaliſts and mathematicians, occaſionally held at his lodgings; at which Gaſſendi, Des Cartes, Hobbes, Roberval, Paſcal, Blondel, and others, aſſiſted. F. Merſenne propoſed to each, certain problems to examine, or certain experiments to be made. Theſe private aſſemblies were ſucceeded by more public ones, formed by Mr. Montmort and Mr. Thevenot, the celebrated traveller. The French example animated ſeveral Engliſhmen of diſtinction and learning to erect a kind of philoſophical *academy* at Oxford, towards the cloſe of Cromwell's adminiſtration; which, after the Reſtoration, was erected by authority into a Royal Society. The Engliſh example in its turn animated the French. Lewis XIV. in 1666, aſſiſted by the counſels of M. Colbert, founded an *academy* of ſciences at Paris, called the

ACADEMY, *Royal, of Sciences*, for the improvement of phyſicks, mathematicks, and chemiſtry. In the year 1699, it had as it were a ſecond birth; the ſame prince, by a regulation dated the 26th of January, giving it a new form, and putting it on a new and more ſolemn footing.

In virtue of that regulation, the *academy* was to be compoſed of four kinds of members, viz. *honorary*, *penſionary*, *aſſociates*, and *eleves*.—The firſt claſs to conſiſt of ten perſons; and the reſt of twenty each.—The honorary *academiſts* to be all inhabitants of France; the penſionaries all to reſide at Paris; eight of the aſſociates allowed to conſiſt of foreigners; and the eleves all to live at Paris.—The officers, to be a preſident, named every year by the king, out of the claſs of honorary *academiſts*; and a ſecretary and treaſurer, to be perpetual.

Of the penſionaries, three to be geometricians, three aſtronomers, three mechanics, three anatomiſts, three chemiſts, three botaniſts; the remaining two, ſecretary and treaſurer.—Of the twelve aſſociates, two to apply themſelves to geometry, two to botany, and two to chemiſtry.—The eleves to apply themſelves to the ſame kind of ſcience with the penſionaries they are attached to; and not to ſpeak, except when called thereto by the preſident.—No regular or religious to be admitted, except into the claſs of honorary *academiſts*; nor any perſon to be admitted, either for aſſociate or penſionary, unleſs known by ſome conſiderable printed work, ſome machine, or other diſcovery.—Farther, no perſon to be allowed to make uſe of his quality of *academiſt*, in the title of any of his books, unleſs ſuch book have been read to, and approved by the *academy*.

In the year 1716, the duke of Orleans, then regent, made an alteration in their conſtitution; augmenting the number of honoraries, and of aſſociates capable of being foreigners, to twelve; admitting regulars among ſuch aſſociates; ſuppreſſing the claſs of eleves, and eſtabliſhing, in lieu thereof, a new claſs of twelve adjuncts, to the ſix ſeveral kinds of ſciences cultivated by the *academy*; and, laſtly, appointing a vice-preſident, to be choſen yearly by the king, out of the honorary members; and a director, and ſub-director, out of the penſionaries.

This *academy* has done great things for the ſervice of learning; by the continuation of the MERIDIAN, by the ſending perſons to different parts of the world for making obſervations; but eſpecially by the excellent writings they have publiſhed, either in a ſeparate, or a joint capacity; particularly their MEMOIRS. Indeed they have an advantage over moſt *academies*, in being defrayed their expences, and even paid for time and attendance. Nevertheleſs they have undergone ſome imputations; particularly that of plagiariſm, in borrowing their neighbours inventions: with what juſtice, we do not ſay. They have the diſtribution of annual prizes. Their hiſtory to the year 1697 was written by Mr. Du Hamel; and ſince that time continued from year to year by Mr. Fontenelle, under the following titles. Du Hamel Hiſtoria Regiæ Academiæ Scientiarum, Paris, 4to. Hiſtorie de l'Academie Royale des Sciences, avec les Memoires de Mathematique & de Phyſique tirez des Regiſtres de l'Academie, Paris, 4to. Hiſt. de l'Acad. Roy. des Sciences depuis ſon Etabliſſement en 1666, juſqu'en 1699, en 13 tomes, 4to.

A new hiſtory, from the inſtitution of the *academy*, to the period from whence Mr. de Fontenelle commences, has been formed; with a ſeries of the works publiſhed under the name of this *academy*, during that firſt interval.—Their motto, *Invenit & perfecit.*

ACADEMY; the *Royal Society at Berlin* was founded by the late king Frederic of Pruſſia in 1700, on the model of that of England, excepting that beſides natural knowledge it likewiſe comprehends the Belles Lettres. A new form, and a new ſet of ſtatutes were given it in 1710; by which it is ordained, that the preſident ſhall be one of the counſellors of ſtate, and nominated by the king. The members to be divided into four claſſes; the firſt, for proſecuting phyſics, medicine, and chemiſtry; the ſecond, for mathematics, aſtronomy, and mechanics; the third, for the German language, and the hiſtory of the country; the fourth, for oriental learning, particularly as it may concern the propagation of the Goſpel among infidels. Each claſs to elect a director for themſelves, who ſhall hold his poſt for life. Their meeting to be in the caſtle called New Marſhal; one claſs to meet every week in their turns. The members of any of the claſſes to have free admiſſion into the aſſemblies of any of the reſt. The great promoter of this inſtitution was the celebrated M. Leibnitz, who accordingly was made the firſt director. The *academy* has publiſhed ſeveral volumes of its lucubrations in Latin, under the title of Miſcellanea Berolinenſia. This *academy* has ſince been renewed; and ſeveral volumes of its tranſactions publiſhed in French, under the title of Hiſtoire de l'Academie Royale des Sciences & Belles Lettres, à Berlin.

There are other *academical* inſtitutions at Berlin, and other parts of the north; ſeveral of which having diſtinguiſhed themſelves by their journals, ephemerides, &c. the reader will find ſome account of them under the article JOURNAL.

ACADEMY *of Peterſburgh* was founded, or rather projected, by the late czar, Peter the Great, and happily executed by the munificence of the czarina, Catherine, his wife, and ſucceſſor, on the model nearly of the *academy* of Paris, whereof the czar was a member. Hither that prince invited learned men, from all parts of Europe.

The *academy* held its firſt public meeting in December, 1725, in the preſence of the duke of Holſtein, and a large appearance of perſons of diſtinction. The ordinary aſſemblies are held twice a week, and public or ſolemn ones thrice in the year; wherein an account is given of what has been done in the private ones. The building, apparatus, &c. of this *academy* are extraordinary. They have a fine library, an obſervatory, &c. In effect, it partakes much of what we call an UNIVERSITY; having regular profeſſors in the ſeveral faculties, who read lectures as in our ſchools. Several volumes of the works of this *academy*, under the title of Commentarii Academieæ Scientiarum Imperial. Petropolit. have been publiſhed; beſide ſeveral mathematical pieces, compoſed by particular members of it. Their motto is, *Paulatim.*

ACADEMY *of Sciences*, called *The Inſtitute of Bologna*, was founded by count Marſigli, in 1712, for the cultivating of phyſics, mathematics, medicine, chemiſtry, and natural hiſtory. Its hiſtory is written by M. de Limiers, from memoirs furniſhed by the founder himſelf.

For a farther account of ſimiliar inſtitutions, ſee SOCIETY.

ACADEMY, is alſo uſed among us for a kind of collegiate ſchool or ſeminary; where youth are inſtructed in the liberal arts and ſciences in a private way; now indeed it is uſed for all kinds of ſchools.

Frederic I. king of Pruſſia, eſtabliſhed an *academy* in Berlin in 1703, for the education of the young nobility of the court, ſuitable to their extraction. The expence of the ſtudents was very moderate, the king having undertaken to pay the extraordinaries. This illuſtrious ſchool, which was then called the *Academy of Princes*, has now loſt much of its ancient ſplendor.

We have two royal *academies* of this kind; one at Portſmouth, for teaching navigation, drawing, &c. which may be ſtyled a naval or maritime *academy*; and another at Woolwich, where youth are taught fortification, gunnery, and ſuch branches of the mathematics, as are neceſſary to qualify them for engineers.

The nonconformiſt miniſters, &c. are bred up in private *academies*; as not approving the common univerſity education. The principal of their *academies* are thoſe at Hoxton, Daventry, and Warrington.

ACADEMY is likewiſe a name given to a riding ſchool, where young gentlemen are taught the great horſe, and other ſuitable exerciſes, as fencing, &c. See MANEGE.

ACADEMY is alſo uſed in ſpeaking of the ſchools of the Jews; i. e. thoſe ſeminaries where the rabbins, or doctors, inſtruct the youth of their nation in the Hebrew tongue; explain to them the Talmud; teach them the Cabbala, &c.

ACADEMY, or ACADEMY-*Figure*, in painting, is a drawing, or DESIGN made after a model, with a crayon, or pencil.—Or the copy of ſuch a draught.

ACÆNA, *ακαινα*, in *Antiquity*, a Grecian decemped, or ten-foot rod, uſed in meaſuring of their lands.

ACAIAIBA, in *Botany*, a name by which ſome authors have called the tree which produces the caſhew nuts: the acajou of other writers.

ACAJOU, in *Botany*, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of the funnel-faſhioned kind, and divided into many ſegments at the edges. From the cup of this there ariſes a piſtil, which is ſurrounded with a multitude of ſtamina, and is fixed, in the manner of a nail, to the hinder part of the flower; this finally becomes a ſoft turbinated fruit, to which there is affixed a capſule of the ſhape of a kidney, containing a ſeed, or a kernel, of the ſame figure.

There is only one known ſpecies of this genus, viz. the tree which produces the caſhew-nut, or Weſt-Indian anacardium.

Of the juice of this fruit they make a drink, which, duly fermented, enebriates like wine. The Indians eat the nuts, ſlightly roaſted, dipped in water or wine, and ſprinkled with ſalt, as a provocative to venery. The juice is ſaid to ſtop a diarrhœa, and cure a diabetes. From the ſweetiſh liquor contained in the two ſhells, the Indians extract an oil, uſed by painters, to give their colour a laſting black; and to preſerve wood from putrefaction.

ACALEPHE, a nettle. It alſo ſignifies a certain fiſh, the fleſh of which is very tender. Likewiſe a ſea-fowl mentioned by Nicander, and a ſea-animal, mentioned by Gellius.

ACALYPHA, in *Botany*, the name of a genus of plants, called by Boerhaave, and others, RICINOCARPOS. The characters are theſe: the male and female flowers are diſtinct, but they are produced on the ſame plants, the male ones uſually ſtanding immediately over the female ones.

ACALCUM, tin.

ACAMATOS, among *Phyſicians*, means that diſpoſition of a limb, which is equally diſtant from flexion and extenſion.

ACANACEOUS, ſee ACANTHACEOUS.

ACANAPHORA, in *Botany*, a name given by ſome to the common knapweed, or jacea, a common wild plant.

ACANOR, a particular ſort of chemical furnace. See ATHANOR.

ACANTHA, in a general ſenſe, a ſpine or prickle, chiefly of plants of the thorny kind.

The word is formed from *ακη*, *mucro*, *point*, and *ανθος*, *flower*.

ACANTHA, in a more particular ſenſe, denotes a ſpine, or quill, of certain fiſhes, as the echinus marinus, or ſea-hedge-hog. Hence the thorn-back, a ſpecies of the galeus, is peculiarly called *acanthias*, from the two prickles on its back.

ACANTHA, among ſome *Anatomiſts*, is applied to the hind or poſterior protuberances of the VERTEBRÆ of the back; forming what we call the SPINA *dorſi*.

ACANTHABOLUS, a ſurgeon's inſtrument, wherewith to extract foreign bodies, which by the ſharpneſs of the points have penetrated, and entered the parts of the body.

The word is compounded of *ακανθα*, *a thorn*; and *βαλλω*, *to caſt away*.

The *acanthabolus* is the ſame with the inſtrument which is otherwiſe called *volſella*.—Its chief uſe is for extracting fiſh-bones, or the like, ſticking in the œſophagus; as alſo the fragments of weapons, bones, hair, &c. remaining in wounds.—Its figure reſembles that of a pair of pincers; ſometimes it is alſo made crooked, for more commodious application to the fauces.

ACANTHABOLUS is alſo ſometimes uſed for an inſtrument, wherewith people pull out the hairs from their eye-brows.

ACANTHACEOUS, among *Botaniſts*, a term applied to a claſs of plants, popularly known under the name of the THISTLE *kind*.

ACANTHALZUCA, the ſame as *echenopus*, or *glove* THISTLE.

ACANTHE, in the *Materia Medica* of the ancients, a name given to the plant we now call the ARTICHOAK.

ACANTHE *Arabica*, in *Botany*, a name given by ſome of the Greek writers to a plant called alſo *leucacanthe*, and by the Arabian phyſicians *bunkon*. It was a prickly plant, whoſe roots were ſomewhat like thoſe of the cyperus, and compoſed of ſeveral knobs or joints, and of a bitter taſte. It was brought for medicinal uſe from the Eaſt Indies, and ſome parts of Arabia, and was the root of the *amgaila* of Aviſenna and others.

ACANTHIAS, in *Zoology*, a name given by ſome authors to the fiſh, the ſkin of which is uſed by our artificers in poliſhing, and called by them ſimply fiſh-ſkin. See GALEUS.

ACANTHICE, *maſtich*, among ancient *Naturaliſts*, a kind of gum, yielded by the herb helxine. Gaza explains it by *ſpinalis* MASTICHA.

ACANTHINE, *acanthinus*, denotes a thing relating to, or reſembling the herb ACANTHUS.

In this ſenſe, we read of *acanthina veſtimenta*, *acanthine garments*, of which we have two different explications. Some underſtand by it a kind of embroidery, wrought in imitation of the Egyptian *acanthus* or thorn, whoſe ſmall ſprigs are much interlaced. Others will have it a peculiar kind of ſilken ſtuff, made of the lanugo, or down of a plant of the thiſtle kind, growing in Sicily and the Eaſt.

ACANTHINUM *lignum* is uſed by ſome writers for BRASIL wood.

ACANTHION, among *Naturaliſts*, a plant of the thorn, or rather of the thiſtle kind; whoſe down being cleanſed from the prickles, was manufactured into a kind of ſtuff, not unlike ſilk.

ACANTHIS, in *Ornithology*, ſee GOLDFINCH.

ACANTHOPTERYGII, in *Natural Hiſtory*, a term uſed to expreſs one of the general claſſes or families of fiſhes; the character of which is, that the rays of the fins are bony, and ſome of them prickly at the extremities.

The word is derived from *ακανθα*, a *thorn*, or *prickle*, and *πτερυγιον*, *a fin*.

Under this claſs are contained ſeventeen GENERA; viz. the *gaſtereſteus*, *chætodon*, *zeus*, *cottus*, *triglia*, *ſcorpæna*, *trachinus*, *perca*, *ſciæna*, *ſparus*, *labrus*, *mugil*, *ſchomber*, *xiphias*, *gobius*, *blennius*, and *ophidion*.

ACANTHUS, in *Botany*. See BEARS-BREECH.

The ancients have not only called the herb bears-breech by this name, but alſo a thorny tree growing in Egypt.

An accurate examination of the ancient writers will, however, ſhew very plainly, that they meant two very different vegetables under this name; the *acanthus* of Virgil, and the Egyptian *acanthus* of Theophraſtus, being two wholly different plants. Virgil mentions the *acanthus* as being an ever-green plant, and producing berries, or a ſmall round fruit, *baccas ſemper frondentis acanthi*, are his words; and Theophraſtus tells us, that his Egyptian *acanthus* is a prickly tree, and bears pods like thoſe of beans. The Greek ſculptors adorned their works with the figure of the latter; as the Gothic did with that of the former, which they repreſented not only in their capitals, but alſo in other ornaments. It is plain, that the *acanthus* of Theophraſtus, is the *acacia*, a tree, from ſome ſpecies of which we have the gum arabic now in uſe; and the *acanthus* of Virgil, mentioned in this place, ſeems to be the Cyrenian *lotus*, which Herodotus ſays is like the Egyptian ACANTHUS.

ACANTHUS, in *Architecture*, an ornament in the Corinthian and Compoſite ORDERS; being the repreſentation of the leaves of an acanthaceous plant, in the capitals thereof.—See *Tab. Archit. fig.* 21. *litt.* bb.

ACANUS, a ſpecies of thiſtle, called *Acanus Theophraſti*. See CARDUUS.

ACAPATLI, in *Botany*, a name uſed by ſome authors for the plant which produces the long pepper, uſed in medicine.

ACAPNON, *ακαπνον*, a name of the SAMPSUCHUM, or MARJORAM; alſo of dry wood.

ACARA, in *Zoology*, the name of a fiſh caught in the freſh waters of the Braſils, and eſteemed a very delicate and well-taſted one. It ſeldom exceeds three or four inches in length, and has a high back like the PEARCH. Its mouth is ſmall, and its jaws rough like a file. It has one long back fin, which is ſupported by a great number of rigid and prickly rays, and reaches to the tail. Its ſcales are large; its back is of a gloſſy brown; its ſides and belly white; its tail is not forked. It has a large black ſpot on the middle of each ſide, and another near the tail. Its fins are all brown.

ACARAAYA, in *Zoology*, the name of a fiſh caught on the Braſilian ſhores, and by ſome called alſo GARANHA. It grows to three feet in length, and is of the ſhape of our carp. Its lower jaw is furniſhed with an even range of ſharp teeth, like little needles. Its upper jaw has two very long ones, and beſide theſe, a multitude of other very ſhort ones. Its eyes are large, and their iris red. Its tail is broad, and a little forked. Its ſcales are of a moderate ſize, and of a ſilver hue, with an admixture of purple. Its belly, and the under part of its head, are wholly white; and its fins all of a fine pale red, except thoſe under the belly, which are white, with a ſlight edge of red. It is eaten in Braſil, both freſh and ſalted.

ACARAMUCU, in *Zoology*, the name of a fiſh found in the weſtern ocean, and in ſome other parts of the world. It is a very ſingular and remarkable animal. It is of a flatted, but long body, and not thick. It is uſually of about eight or ten fingers breadth long, and about four broad. Its mouth is round, but very ſmall, ſcarce admitting the end of one's little finger. In the fore-part of the mouth, both above and below, there are triangular and ſharp teeth. On each ſide, juſt below the eyes, there are two ſquariſh fiſſures, which ſerve in the place of gills; and on the ridge of the back, directly behind the eyes, there is placed a fine ſlender pointed horn, which ſtands nearly erect, but bending a little backward; this is of a cylindrical ſhape, and four fingers breadth long. It has no ſcales, but a ſmooth ſkin, and is of a mixed greyiſh and browniſh colour. It feeds on ſea-weeds; and its fleſh is not eatable.

ACARAPEBA, in *Zoology*, the name of an American fiſh, called alſo by ſome BROSEME. It has a ſomewhat broad and flat body, covered with large ſcales of a fine ſilver whiteneſs. It grows to a foot in length, and to four or five fingers in breadth. It has a large mouth, but without teeth; and its tail is forked. It has one long black fin, the anterior rays, or naves of which are rigid and prickly, the hind naves ſoft and flexile. The fins are all like the reſt of the body, of a pure white. The fiſh ſeems a kind of SMARIS.

ACARAPINIMA, in *Zoology*, the name of a Braſilian fiſh, of the CANTHARUS kind, and ſeeming of the ſame ſpecies with the *cantharus* of the Mediterranean.

ACARAPITAMBA, in *Zoology*, the name of a fiſh caught in the Braſilian ſeas, of an oblong figure, reſembling the MULLET, and growing to two feet or more in length. Its mouth and teeth are very ſmall. It has one long fin on the back, running very nearly to the tail, which is ſupported by rigid and prickly rays. Its tail terminates in two oblique horns. Its ſcales are large, and of a purpliſh colour, with a fine admixture of blue; and along the middle of each ſide there runs from the gills to the tail, a very broad and beautiful gold-coloured line. Its back, down to this line, is variegated alſo with ſmall gold-coloured ſpots; and the ſides under the line are very beautifully variegated with ſmall and fine longitudinal, but ſhort gold-coloured lines, of a ſomewhat paler colour than the broad one. Its belly is white, and its fins yellow.

ACARAPUCU, in *Zoology*, the name of a Braſilian fiſh, caught in the freſh waters, and growing to eighteen inches in length. It is of a rounded body; and its mouth is ſmall and not prominent. It has lips, which it can hide, or ſuffer to appear at pleaſure, and has no teeth. Its tail is long and forked; its ſcales are all of a ſilvery hue. On the back it has a fine golden gloſs, ſhining among the whiteneſs; and on the ſides five or ſix large blue ſpots. Its back and ſide fins are of a pale blue, as is alſo the tail: the belly fins are yellowiſh. It is a well-taſted fiſh.

ACARAUNA, in *Zoology*, an American fiſh, of which there are two ſpecies; the one called *acarauna*, without any addition; and the other the *acarauna quadrata*, or ſquare *acarauna*; and by our ſailors, the *old-wife*.

The *acarauna*, ſimply ſo called, grows to about four or five inches long, and is conſiderably broad and flat. It is covered with ſmall blackiſh ſcales; its tail is large and forked. It has two fins under the gills, two more under the belly, and a long one running all along the back, and another anſwering it from the anus to the tail. Its mouth is ſmall and narrow, and its teeth very ſmall. Its eyes are but ſmall; and on each ſide near the tail, it has an extremely ſharp thorn, or prickle: theſe it can draw in at pleaſure into its ſides, and occaſionally throw them out, to annoy other fiſhes.

The *acarauna quadrata*, or ſquare *acarauna*, or old wife, is much of the ſame ſize with the former ſpecies. It is frequently preſerved in the cabinets of the curious, and is found there, of a pale brown, with its tail and the fore-part of the body of a pale yellow, or ſtraw colour. It is covered with ſcales, furrowed with ſlight parallel lines, except that the anterior parts of its head is covered with a naked, but rough ſkin. The top of the head riſes into an acute angle; the forehead is flat; and the eyes round and large, and placed high. Its mouth is very ſmall; and its teeth are very ſlender, and ſtand cloſe together. The upper jaw has on each ſide four ſharp thorns growing from it, and the lower two very large and ſharp ones, bending downward, and in ſhape and ſtructure reſembling a cock's ſpur; and from theſe there runs up a row of ſmall thorns to the eye.

ACARI, or ACARIS, in *Natural Hiſtory*, an animalcule bred in wax; ſaid by Ariſtotle to be the leaſt object of human ſight.

ACARI, or ACARUS, is alſo uſed for a kind of vermin lodged under the cutis, where preying on the parts, it excites an itching, and raiſes pimples.

A German phyſician has traced their origin; he finds the *acari* ariſe from milk-meats turning ſtale and ſour. Their ſeat is chiefly in the hands or feet, rarely in the arms or legs. See ITCH.

ACARUS is alſo uſed by ſome *Naturaliſts* as the claſſical name of the lice of animals, which are indeed of as many various genera as the animals on which they breed.

ACARNA, in *Botany*, a name by which Theophraſtus, and ſome other writers, expreſs the common ARTICHOAK.

Monſ. Vaillant gives the name *acarna* to one of the genera of the *cynarocephalous*, or artichoak-headed claſs of plants.

ACARNAN, in *Zoology*, the name of a ſmall ſea-fiſh, very common in the Mediterranean, and brought to market among the RUBELLIOS, or ERYTHRINI, and called by the fiſhermen by the name, *fravolino*, or *phragolino*. It very much reſembles the erythrinus in ſhape; but as that is of a fine red, this, on the contrary, is of a ſilvery white. Its mouth is moderately large; its teeth ſlender and pointed; and its eyes large, having fine yellow iriſes. Its fins are white, but have each a black ſpot at their origin. It ſeems doubtful whether this be really any way different from the erythrinus, except in colour, which alone is not diſtinction ſufficient to make a ſpecies.

ACARON, the wild MYRTLE.

ACARTUM, red lead; called alſo AZEMAFOR.

ACARUS. See ACARI.

ACATALECTIC, ACATALECTICUS, in the ancient poetry, a term applicable to ſuch VERSES as have all their FEET and ſyllables; and are in no wiſe lame or defective at the end.

The word comes from κατα, and ληγω, *to ceaſe or end*; whence καταληκτικος, *which wants ſomething at the end*; and the privative α being prefixed ακαταληκτικος, *which wants nothing at the end.*

On the contrary, *catalectic* verſes are thoſe which end too haſtily, and with a ſyllable too little.

In the following ſtrophe of Horace, the two firſt verſes are *acatalectic*, and the laſt *catalectic*.

> *Solvitur acris hyems, grata vice*
> *Veris & Favoni:*
> *Trahuntque ſiccas machinæ carinas*——

ACATALEPSIA, ACATALEPSY, in *Philoſophy*, an impoſſibility of a thing's being conceived or comprehended.

The word is compounded of the privative α, and καταλαμβανω, *deprehendo, to find out.*

Acatalepſia is ſynonymous with incomprehenſibility.

ACATALUS, a JUNIPER *berry.*

ACATASTATOS, *inconſtant*, is a phyſical term, applied to irregular fevers, whoſe paroxyſms are uncertain, and which are indicated by frequent changes in the urine. It is likewiſe applied to thoſe ſhivering fits in fevers, which have no conſtant return, and to turbid urine, that depoſits no regular ſediment.

ACATERY, ACCATRY, in the king's houſhold, a kind of check betwixt the CLERKS of the kitchen, and the PURVEYORS.

ACATHISTUS, ακαθιςος, in an *Eccleſiaſtical* ſenſe, a ſolemn hymn, or vigil, anciently ſung in the Greek church, on the Saturday of the fifth week of Lent, in honour of the Virgin, for having thrice delivered Conſtantinople from the invaſions of barbarous nations.

It was called ακαθιςος, i. e. *without ſitting*, becauſe it was celebrated ſtanding: the people ſtood all night, ſinging the praiſes of their delivereſs.

The ſame name is alſo given to the day whereon it was performed, which is called the feaſt τȣ ακαθιςȣ.

ACATIUM, in the ancient *Navigation*, a kind of boat or pinnace uſed for military purpoſes.

The *acatium* was a ſpecies of thoſe called *actuariæ naves*, i. e. ſuch as were wrought with oars. It was ſometimes made uſe of in battle: Strabo repreſents it as a kind of privateer, or pirate ſloop.

ACAULIS, in *Botany*, a term applied to certain plants, the flowers of which have no ſtalk or pedicle to ſupport them, but reſt immediately on the ground: of this kind are the carline thiſtle, and ſome others.

ACAULOSE, or ACAULOUS, is applied, by *Botaniſts*, to thoſe plants which have no proper ſtem, or CAULIS.

ACBAB, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands, to a bird, very like our common hen, which is very frequently wild among them. It lives on rice, and other vegetables, and does a great deal of miſchief; but is ſhort-winded, and does not fly well, ſo that it is eaſily deſtroyed.

ACBAR, the name of an idol of enormous ſize, which the Arabians are ſaid formerly to have worſhipped. It was with difficulty that Mahomet reſtrained them from this ſpecies of idolatry. Hyde's Diſſ. vol. i. p. 257.

ACCADEMIA, among *Muſicians*, ſignifies a concert.

ACCALIA, in *Antiquity*, ſolemn feaſts, held in honour of Acca Laurentia, nurſe, or foſter-mother of Romulus.

Theſe were otherwiſe called *Larentalia*.—To the ſame Acca is alſo attributed the inſtitution of the FRATRES ARVALES.

ACCAPITARE, ACCAPTARE, ACAPTARE, in ancient *Law*-books and records, the act of becoming vaſſal of a lord, or of yielding homage and obedience to him.

The word is compounded of the Latin *ad*, *to*; and *caput*, *head*; by reaſon vaſſals own their lords for their head. Whence alſo the lords are ſometimes called *domini capitales*: as thoſe who command in an army are called *capitanei*, *captains*; and in old French, *chevetaines*, *chieftains*, in reſpect of their ſoldiers.

ACCAPITUM, a ſum of money paid to a vaſſal, upon his admiſſion to a FEUD.

The word is alſo written *acapitum*, *accapitamentum*, *acaptio*, *acaptatio*, and *acaptagium*.

ACCAPITUM, in our ancient *Law*-books, ſignifies RELIEF due to the chief lord.

ACCATRY. See ACATERY.

ACCATUM, the ſame as *accatem*, or AURICHALCUM.

ACCAZDIR, denotes tin.

ACCEDAS *ad Curiam*, an original writ, which lies for removing ſuits in any court baron, except the county court, into the king's court; upon apprehenſion of partiality or falſe judgment in the other.

A like writ lies for him who has received falſe judgment in the county court; where it is called *de falſo judicio*.

An *Accedas ad Curiam* lies alſo for juſtice delayed, as well as falſly given; and is a ſpecies of the writ RECORDARI.

ACCEDAS *ad Vicecomitem*, is a writ directed to the coroner, commanding him to deliver a writ to the ſheriff, who having a PONE delivered to him, ſuppreſſes it.

ACCELERATION, in *Mechanics*, the increaſe of velocity in a moving body.

Accelerated motion is that which continually receives freſh acceſſions of velocity.

Acceleration ſtands directly oppoſed to *retardation*, which denotes a diminution of velocity.

ACCELERATION is chiefly uſed in *Phyſics*, in reſpect of falling bodies, i. e. of heavy bodies tending towards the CENTRE of the earth by the force of GRAVITY.

That natural bodies are *accelerated* in their deſcent, is evident from various conſiderations, both *à priori* and *poſteriori*.—Thus, we actually find, that the greater height a body falls from, the greater impreſſion it makes, and the more vehemently does it ſtrike the ſubject plane, or other obſtacle.

Various are the ſyſtems and opinions which philoſophers have produced to account for this *acceleration*. Some attribute it to the preſſure of the air: the farther, ſay they, a body falls, the greater load of atmoſphere is of conſequence incumbent on it: and the preſſure of a fluid is in proportion to the perpendicular altitude of the column thereof.—Add, that the whole body of the fluid preſſing in innumerable right lines, which all meet in a point, viz. the centre; that point, by the meeting of thoſe lines, ſuſtains, as it were, the preſſure of the whole maſs: conſequently, the nearer a body approaches thereto, the effect or preſſure of more united lines muſt it ſuſtain.

But what overturns this account, is, that as the preſſure of the air downwards increaſes; ſo, by the known laws of ſtatics, does the reſiſtance, or the force wherewith the ſame fluid tends to repel, or drive the body upwards again.

Others inſiſt, that the incumbent air is the groſſer and more vaporous, the nearer the earth; and filled with more heterogeneous particles, which are not true elaſtic air: and hence, ſay they, a deſcending body, meeting continually with leſs reſiſtance from the elaſticity of the air, and having the ſame force of gravity ſtill acting on it, muſt neceſſarily be *accelerated*. Hobbes (Philoſ. Probl. c. 1. p. 3.) attributes *acceleration* to a new impreſſion of the cauſe which makes bodies fall; which on his principles, is alſo the air. As part of this mounts, part alſo muſt deſcend; for reaſons drawn from the motion of the earth, which is compounded of two motions, one circular, the other progreſſive; conſequently the air aſcends, and circulates at once. As the body, in its fall, receives a new preſſure in every point of its deſcent, its motion, he ſays, muſt needs be accelerated.

But what overturns all accounts where the air or atmoſphere is concerned, is, that the *acceleration* holds *in vacuo*, and even more regularly than in air. See VACUUM.

The Peripatetic account is worſe than this: the motion of heavy bodies downwards, ſay they, ariſes from an intrinſic principle, which makes them tend to the centre, as their proper ſeat, or element, where they would be at reſt: hence, add they, the nearer bodies approach thereto, the more is their motion *accelerated*.

The Gaſſendiſts, on the other hand, hold that the earth emits a ſort of attractive effluvia, innumerable threads whereof continually aſcend and deſcend; which threads, proceeding like radii from a common centre, divaricate the more, the farther they go: ſo that the nearer a heavy body is to the centre, the more of theſe magnetic threads it receives; and hence the more is its motion *accelerated*.

But this is refuted by an eaſy experiment: for if a ball be let fall out of the loweſt window of a high tower, and alſo out of the higheſt; the *acceleration* will be the ſame in both caſes, notwithſtanding the greater vicinity to the centre in the one, than in the other caſe.

The Carteſians account for the *acceleration*, from the repeated pulſes of a ſubtil etherial matter, which is continually acting on the falling body, and impelling it downwards.

After all, the cauſe of *acceleration* is nothing myſterious; the principle of GRAVITATION, which determines the body to deſcend, determining it to be *accelerated* by a neceſſary conſeqence.

Suppoſe a body let fall from on high: the primary cauſe of its beginning to deſcend, is doubtleſs the power of gravity; but when once the deſcent is commenced, that ſtate becomes in ſome meaſure natural to the body; ſo that if left to itſelf, it would perſevere in it for ever, even though the firſt cauſe ſhould ceaſe: as we ſee in a ſtone caſt with the hand, which continues to move, after it is left by the cauſe that gave it motion.

But, beſide the propenſity to deſcend impreſſed by the firſt cauſe, and which of itſelf were ſufficient to continue the ſame degree of motion once begun, *in infinitum*; there is a conſtant acceſſion of ſubſequent efforts of the ſame principle, gravity, which continues to act on the body already in motion, in the ſame manner as if it were at reſt.

Here, then, being a double cauſe of motion; and both acting in the ſame direction, viz. directly towards the centre of the earth; the motion they jointly produce muſt neceſſarily be greater than that of any one of them.—And the velocity thus increaſed having the ſame cauſe of increaſe ſtill perſiſting, the deſcent muſt neceſſarily be continually *accelerated*.

For, ſuppoſing gravity, whatever it be, to act uniformly on all bodies, at equal diſtances from the earth's centre; and that the time in which a heavy body falls on the earth, be divided into equal parts infinitely ſmall: let this gravity incline the body towards the earth's centre, while it moves in the firſt infinitely ſmall part of the time of its deſcent; if, after this, the action of gravity be ſuppoſed to ceaſe, the body would proceed uniformly on towards the earth's centre, with a velocity equal to the force of the firſt impreſſion.

But now, ſince the action of gravity is here ſuppoſed ſtill to continue; in the ſecond moment of time, the body will receive a new impulſe downwards, equal to what it received at firſt; and thus its velocity will be double of what it was in the firſt moment; in the third moment it will be triple; in the fourth quadruple, and ſo on continually: for the impreſſion made in one moment, is not at all altered by what is made in another; but the two are, as it were, aggregated, or brought into one ſum.

Wherefore, ſince the particles of time are ſuppoſed infinitely ſmall, and all equal to one another; the *impetus* acquired by the falling body will be every-where, as the times from the beginning of the deſcent.—And hence, ſince the quantity of matter in the body given, continues the ſame; the velocity will be as the time in which it is acquired.

Farther, the ſpace paſſed over by a moving body in a given time, and with a given velocity, may be conſidered as a rectangle made by the time and the velocity.—Suppoſe A (*Tab. Mechan. fig.* 64.) a heavy body deſcending, and let AB repreſent the time of its deſcent; which line ſuppoſe divided into any number of equal parts, AC, CE, EG, &c. repreſenting the intervals, or moments of the given time.—Let the body deſcend through the firſt of thoſe diviſions, AC, with a certain equable velocity ariſing from the propoſed degree of gravity: this velocity will be repreſented by AD; and the ſpace paſſed over, by the rectangle CAD.

Now, as the action of gravity in the firſt moment produced the velocity AD, in the body before at reſt; in the ſecond moment, the ſame will produce, in the body ſo moving, a double velocity, CF; in the third moment, to the velocity CF will be added a farther degree, which, together therewith will make the velocity EH, which is triple of the firſt, and ſo of the reſt. So that in the whole time AB, the body will have acquired a velocity

BK.—Again, taking the diviſions of the line, e. g. AC, CE, &c. for the times, the ſpaces gone through will be the areas or rectangles, CD, EF, &c. So that in the whole time AB, the ſpace deſcribed by the moveable, will be equal to all the rectangles, i. e. to the dented figure ABK.

Such would be the caſe, if the acceſſions of velocity only happened in certain given points of time, e. g. in C, in E, &c. So that the degree of motion ſhould continue the ſame till the next period of *acceleration* come up.—If the diviſions or intervals of time were ſuppoſed leſs, e. g. by half; then the dentures of the figure would be proportionably ſmaller; and it would approach ſo much the nearer to a triangle.—If they were infinitely ſmall, i. e. if the acceſſions of velocity were ſuppoſed to be made continually, and in every point of time, as is really the caſe; the rectangles thus ſucceſſively produced will make a juſt triangle, e. g. ABE (*fig.* 65.)—Here, the whole time AB conſiſting of the little portions of time A 1, A 2, &c. and the area of the triangle ABE, of the ſum of all the little triangular ſurfaces anſwering to the diviſions of the time; the whole area or triangle expreſſes the ſpace moved through in the whole time AB; and the little triangles A 1 *f*, &c. the ſpaces gone thro' in the diviſions of time *a* 1, &c.

But theſe triangles being ſimilar, their areas are to one another, as the ſquares of their homologous ſides AB, A 1, &c. and conſequently, the ſpaces moved, are to each other as the ſquares of the times.

Hence we may eaſily infer the great law of *acceleration*, viz. "That a deſcending body, uniformly *accelerated*, deſcribes, in the whole time of its deſcent, a ſpace which is juſt half of what it would have deſcribed in the ſame time, with the *accelerated* velocity it has acquired at the end of its fall." For, the whole ſpace the falling body has moved through in the time AB, we have already ſhewn, will be repreſented by the triangle ABE; and the ſpace the ſame body would move through in the ſame time, with the velocity BE, will be repreſented by the rectangle ABEF.—But the triangle is known to be equal to juſt half the rectangle.—Therefore, the ſpace moved, is juſt half of what the body would have moved with the velocity acquired at the end of the fall.

Hence, 1. we gather, that the ſpace moved with the laſt acquired velocity BE, in half the time AB, is equal to that really moved by the falling body in the whole time AB.

2. If a falling body deſcribe any given length in a given time, in double that time it will deſcribe four times that length; in thrice the time, nine times, &c. and univerſally, if the times be in arithmetical proportion, 1, 2, 3, 4, &c. the ſpaces deſcribed will be, 1, 4, 9, 16, &c.

3. The ſpaces deſcribed by a falling body, in a ſeries of equal moments or intervals of time, will be as the unequal numbers 1, 3, 5, 7, 9, &c.—And ſince the velocities acquired in falling are as the times; the ſpaces will alſo be as the ſquares of the velocities; and both times and velocities in a ſubduplicate ratio of the ſpaces.

The motion of a body aſcending, or impelled upwards, is diminiſhed or retarded from the ſame principle of gravity acting in a contrary direction, in the ſame manner as a falling body is *accelerated*. See RETARDATION.

A body thus projected upwards, riſes till it has loſt all its motion: which it does in the ſame time that a body falling would have acquired a velocity equal to that wherewith the body was thrown up.

Hence, the ſame body thrown up, will riſe to the ſame height from which falling, it would have acquired the velocity wherewith it was thrown up.

And hence, the heights which bodies thrown up with different velocities do aſcend to, are to one another as the ſquares of thoſe velocities.

ACCELERATION *of bodies on inclined planes.*—The ſame general law obtains here, as in bodies falling perpendicularly: the effect of the plane is, to make the motion ſlower; but the inclination being every where equal, the retardation riſing therefrom will proceed equally in all parts, at the beginning and the ending of the motion.—The particular laws, ſee under *Inclined* PLANE.

ACCELERATION *of the motion of pendulums.*—The motion of pendulous bodies is *accelerated* in their deſcent; but in a leſs ratio than that of bodies falling perpendicularly. See the laws of this under PENDULUM.

ACCELERATION *of the motion of projectiles.* See PROJECTILE.

ACCELERATION *of the motion of compreſſed bodies*, in expanding or reſtoring themſelves. See DILATATION.

That the motion of compreſſed air, expanding itſelf by its elaſticity to its former dimenſions, is *accelerated*, is evident from various conſiderations.

ACCELERATION is alſo applied in the ancient aſtronomy, in reſpect of the fixed ſtars.—This *acceleration* was the difference between the revolution of the *primum mobile*, and the ſolar revolution; which was computed at 3 minutes, and 56 ſeconds.

ACCELERATION *of the Moon*, is a term uſed to expreſs the increaſe of the moon's mean motion from the ſun, compared with the diurnal motion of the earth; ſo that it is now a little ſwifter than it was formerly. Dr. Halley was the firſt who made this diſcovery; and he was led to it by comparing the ancient eclipſes obſerved at Babylon, with thoſe obſerved by Albatennius in the ninth century, and ſome of his own time. He was not able to aſcertain the quantity of this *acceleration*, becauſe the longitudes of Bagdat, Alexandria, and Aleppo, where the obſervations were made, had not been accurately determined. But ſince his time the longitude of Alexandria has been aſcertained by Chazelles; and Babylon, according to Ptolemy's account, lies 50′ eaſt from Alexandria. From theſe *data*, Mr. Dunthorne compared ſeveral ancient and modern eclipſes, with the calculations of them by his own tables, and hereby verified Dr. Halley's opinion; for he found, that the ſame tables repreſent the moon's place more backward than her true place in ancient eclipſes, and more forward than her true place in later eclipſes; and thence juſtly inferred, that her motion in ancient times was ſlower; in later times quicker than the tables give it. But he did not content himſelf with merely aſcertaining the fact; he proceeded to determine the quantity of the *acceleration*; and by means of the moſt ancient eclipſe, of which any authentic account remains, obſerved at Babylon in the year before Chriſt 721, he concluded, that the obſerved beginning of this eclipſe was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could precede her place by computation but little more than 50′ of a degree at that time. Admitting the *acceleration* to be uniform, and the aggregate of it as the ſquare of the time, it will be at the rate of about 10 in 100 years. Phil. Tranſ. n. 218, n. 492, or vol. xlvi. p. 162.

Dr. Long attributes the *acceleration* above deſcribed, to one or more of theſe cauſes; either, 1. the annual and diurnal motion of the earth continuing the ſame, the moon is really carried round the earth with a greater velocity than heretofore: or, 2. the diurnal motion of the earth, and the periodical revolution of the moon continuing the ſame, the annual motion of the earth round the ſun is a little retarded; which makes the ſun's apparent motion in the ecliptic a little ſlower than formerly, and, conſequently, the moon in paſſing from any conjunction with the ſun, ſpends leſs time before ſhe again overtakes the ſun, and forms a ſubſequent conjunction: in both theſe caſes, the motion of the moon from the ſun is really *accelerated*, and the ſynodical month actually ſhortened: or, 3. the annual motion of the earth, and the periodical revolution of the moon continuing the ſame, the rotation of the earth round its axis is a little retarded; in this caſe, days, hours, minutes, ſeconds, &c. by which all periods of time muſt be meaſured, are of a longer duration; and conſequently the ſynodical month will appear to be ſhortened, though it really contains the ſame quantity of abſolute time as it always did. If the quantity of matter in the body of the ſun be leſſened by the particles of light continually ſtreaming from it, the motion of the earth round the ſun may become ſlower: if the earth increaſes in bulk, the motion of the moon round the earth may be quickened thereby. Aſtronomy, vol. ii. p. 436.

ACCELERATOR, in *Anatomy*, a muſcle of the penis, whoſe office is to expedite the diſcharge of the urine, and the ſemen.

This is more peculiarly called *accelerator urinæ*: ſome make two muſcles of it, and give them the denomination *acceleratores*, or *acceleratory muſcles*.

It ariſes tendinous from the upper and fore-part of the urethra, but ſoon grows fleſhy, paſſes under the os pubis, and encompaſſes the bulb of the cavernous body of the urethra.—Both ſides of this muſcle meet in a middle line, correſponding to the ſeam in the ſkin over it; and continue ſo united, the ſpace of two inches; after which, it detaches two fleſhy elongations, which become thin tendons at their terminations on the cavernous bodies of the penis.

Its upper part covering the bulb, when in action, ſtraitens the veins which paſs through it from the corpus cavernoſum of the urethra, and hinders the reflux of the blood in an erection. By the repeated contractions of this upper part, the blood in the bulb is alſo driven towards the glans; and thereby aſſiſts the erection.

The two elongations compreſs the channel of the urethra, and ſo force out the contained ſeed, or urine; whence the muſcle takes its name.

ACCENDENTES, or ACCENSORES, in *Eccleſiaſtical Writers*, a lower order of miniſters in the church of Rome, whoſe office is to light, ſnuff, and trim the candles or tapers.

The *accendentes* are much the ſame with thoſe otherwiſe called *acolythi* and *ceroferarii*.

ACCENDONES, or ACCEDONES, in *Roman Antiquity*, a kind of gladiators, whoſe office was to excite and animate the combatants, during the engagement.

ACCENSI, in *Antiquity*, denote an inferior order of officers, appointed to attend the Roman magiſtrates, ſomewhat in the manner of uſhers, ſerjeants, or tip-ſtaves, among us.

They were thus called from *accire*, *to ſend for*; one part of their office being to call aſſemblies of the people, ſummon parties to appear before the judges, &c.

ACCENSI alſo denote a kind of ſupernumerary ſoldiers in the Roman armies; whoſe office was to attend the motions of their principals, and ſupply the places of thoſe who were killed, or diſabled by their wounds.

They were thus denominated, *quia accenſebantur*, or *ad cenſum adjiciebantur*: Vegetius calls them *ſupernumerarii legionum*: Cato calls them *ferentarii*, becauſe they furniſhed thoſe engaged in battle with weapons, drink, &c. Though Nonius ſuggeſts another reaſon of that appellation, viz. becauſe they fought with ſtones, ſlings, and weapons, *quæ ferrentur*, ſuch as are thrown, not carried in the hand. They were ſometimes alſo called *velites*, and *velati*, becauſe they fought clothed, but not in armour; ſometimes *adſcriptitii*, and *adſcriptivi*; ſometimes *rorarii*. The *accenſi*, Livy obſerves, were placed at the rear of the army, becauſe no great matter was expected from them: they were taken out of the fifth claſs of citizens.

ACCENSI was alſo an appellation given to a kind of adjutants, appointed by the tribune to aſſiſt each centurion and decurion. In which ſenſe, *accenſus* is ſynonymous with *optio*.—In an ancient inſcription, given by à Torre, we meet with ACCENSUS EQUITUM ROMANORUM; an office no where elſe heard of; that author ſuſpects it for a corruption, and inſtead thereof reads A CENSIBUS.

ACCENSION, ACCENSIO, in *Phyſics*, the act of kindling, or ſetting a body on fire.

The word is formed of the Latin *accendere*, *to kindle*; a compound of *ad*, *to*; and *candere*, *to glow*. Though ſome grammarians ſuſpect the primitive ſignification of *accendere*, to have been, *to render famous*.

Accenſion, on other occaſions, is called INFLAMMATION, IGNITION, CONFLAGRATION, &c.

Accenſion, ſtands oppoſed to EXTINCTION.

Chemiſts furniſh us with various inſtances of the *accenſion* of cold liquors by bare mixtion: as of the acid ſpirits of minerals, and the eſſential oils of plants.

ACCENT, in its primitive ſenſe, an affection of the voice, which gives each ſyllable of a word its due pitch, in reſpect of height or lowneſs.

The word is originally Latin, *accentus*, a compound of *ad*, *to*; and *cano*, *to ſing*. In this ſenſe, *accent* is ſynonymous with the Greek τονος, the Latin *tenor*, or *tonor*, and the Hebrew טעם *guſtus*, *taſte*.

The *accent*, properly, only reſpects high and low, or or acute and grave.—Though the modern grammarians uſe it alſo in reſpect of loud and ſoft, long and ſhort; but this confounds *Accent* with *Quantity*.

The difference between the two may be conceived from that which we obſerve between the beat of a drum, and the ſound of a trumpet: the former expreſſes every thing belonging to loud and ſoft, and long and ſhort: but, ſo long as there is a μονοτονια in the ſound, there is nothing like *accent*.

ACCENT is alſo uſed in grammar, for a character placed over a ſyllable, to mark the *accent*, i. e. to ſhew it is to be pronounced in a higher, or in a lower tone; and to regulate the inflexions of the voice in reading. It is diſtinguiſhed from *emphaſis*, as the former regards the tune of the voice, the latter the ſtrength of it.

We reckon three grammatical *accents* in ordinary uſe, all borrowed from the Greeks, viz. the *acute accent*, which ſhews when the tone of the voice is to be raiſed; and is expreſſed thus (´).

In modern writings it is a little line, or *virgula*, placed over the vowel, a little ſloping or inclined, in its deſcent, from right to left, as ´.—It is not ordinarily uſed, either in Engliſh, or Latin: the French, indeed, retain it; but it is only to mark the cloſe or maſculine é.

The *grave accent*, when the note or tone of the voice is to be depreſſed; and is figured thus (`).

The *circumflex accent*, which is compoſed of both the acute and the grave; it points out a kind of undulation of the voice, and is expreſſed thus (˜ or ˆ).

But if it be true, that the whole ſyſtem of pronunciation turns on three *accents*, it is no leſs true, that each of theſe three admits of ſeveral degrees. The acute *accent*, for inſtance, may be either higher, or lower; may be ſimply acute, or very acute; and the like holds of the grave and circumflex. So that each of the three common *accents* is, as it were, a genus, including divers particular ſpecies; though the ancient grammarians have not thought fit to give particular names and figures to all theſe differences.

Words which have no accents are called *Atonics*.

The Hebrews have a grammatical, a rhetorical, and a muſical *accent*; though the firſt and laſt ſeem, in effect, to be the ſame; both being compriſed under the general name of *tonic accents*, becauſe they give the proper tone to ſyllables: as the rhetorical *accents* are ſaid to be *euphonic*; inaſmuch as they tend to make the pronunciation more ſweet and agreeable.

There are four euphonic *accents*, and twenty-five tonic; of which ſome are placed above, and others below the ſyllables; the Hebrew *accents* ſerving not only to regulate the riſings and fallings of the voice, but alſo to diſtinguiſh the ſections, periods, and members of periods, in a diſcourſe; and to anſwer the ſame purpoſes with the points in other languages. Their *accents* are divided into *emperors*, *kings*, *dukes*, &c. each bearing a title anſwerable to the importance of the diſtinction it makes.—Their emperor rules over a whole phraſe, and terminates the ſenſe completely; anſwering to our point.—Their king anſwers to our colon; and their duke to our comma.—The king, however, occaſionally becomes a duke, and the duke a king, as the phraſes are more or leſs ſhort.—It muſt be noted, by the way, that the management and combination of theſe *accents* differs in Hebrew poetry from what it is in proſe.

The uſe of the tonic, or grammatical *accents*, has been much controverted; ſome holding that they diſtinguiſh the ſenſe, while others maintain that they are only intended to regulate the muſic, or ſinging; alledging that the Jews ſing rather than read, the ſcriptures in their ſynagogues.

The truth ſeems here to lie between the two opinions: for though we are inclined to think, that the primary intention of theſe *accents* was to direct the ſinging; yet the ſinging ſeems alſo to have been regulated according to the ſenſe; ſo that the *accents* might ſerve not only to guide the ſinging, but alſo to point out the diſtinctions.—Though it muſt be confeſſed, that many of theſe diſtinctions are too ſubtle and inconſiderable; nor can the modern writers, or the editors of old ones, agree in opinion on this ſubject; ſome of them making twice as many of theſe diſtinctions as others.

The Hebrew *accents*, in effect, have ſomething common with thoſe of the Greeks and Latins; and ſomething peculiar to themſelves.—What they have in common, is, that they mark the tones; ſhewing how the voice is to be raiſed, and ſunk, on certain ſyllables. What they have peculiar is, that they do the office of the points in other languages.

It is certain the ancient Hebrews were not acquainted with theſe *accents*; ſo that, at beſt, they are not *jure divino*.—The opinion which prevails amongſt the learned, is, that they were invented about the ſixth century, by the Jewiſh doctors of the ſchool of Tiberias, called the Maſſoretes.

The learned Hennin affirms them to be of Arabic invention; and to have been adopted and transferred thence into the Hebrew by the Maſſoretes: eſpecially by the celebrated Rabbi Ben Aſcher, who flouriſhed in the middle of the ſixth century; on occaſion of the emperor Juſtinian's prohibiting the reading their traditions in their ſynagogues. He adds, that they were firſt brought to their degree of perfection, by Rabbi Juda Ben David Chiug, a native of Fez, in the eleventh century.—It is indeed poſſible, the Jews might borrow their points from the Arabs: but how they ſhould have their *accents* from them is hard to conceive, the Arabic language having no ſuch thing as *accents*, either in proſe or verſe.

As to the Greek *accents*, now ſeen both in manuſcript and printed books, there has been no leſs diſpute about their antiquity and uſe, than about thoſe of the Hebrews—Iſaac Voſſius, in an expreſs treatiſe De Accentibus Græcanis, endeavours to prove them of modern invention; aſſerting, that they anciently had nothing of this kind, but only a few notes in their poetry, which were invented by Ariſtophanes the grammarian, about the time of Ptolemy Philopater; and that theſe were of muſical, rather than of grammatical uſe, ſerving as aids in the ſinging of their poems; and very different from thoſe introduced afterwards.

This appears from inſcriptions as well as manuſcripts, none of which, till 170 years before Chriſt, has either accent, ſpirit, apoſtrophus, or ιωτα ſubſcribed.—He adds, that Ariſtarchus, a diſciple of Ariſtophanes, improved on his maſter's art; but that all they both did, was only deſigned to facilitate youth in the making of verſes.—The ſame Voſſius ſhews from ſeveral ancient grammarians, that the manner of writing the Greek *accents* in thoſe days, was quite different from thoſe now uſed in our books.

Hen. Chriſt. Hennin thinks, that *accents* were the invention of the Arabians, about nine hundred years ago; and that they were only uſed in poetry; that they were intended to aſcertain the pronunciation of the Greek, and to keep out that barbariſm which was then breaking in upon them; that the ancient *accents* of Ariſtophanes were perfectly agreeable to the genuine Greek pronunciation, but that the modern ones of the Arabs deſtroy it. Wetſtein, Greek profeſſor at Baſil, in a learned diſſertation, endeavours to prove the Greek *accents* of an older ſtanding.—He owns that they were not always formed in the ſame manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the ſeveral parts of Greece.

He brings ſeveral reaſons à priori for the uſe of *accents*, even in the earlieſt days; as that they then wrote all in capital letters equidiſtant from each other, without any diſtinction either of words, or phraſes; ſo that without *accents* they could ſcarce be intelligible: and that *accents* were neceſſary to diſtinguiſh ambiguous words, and to point out their proper meaning; and this ſentiment he confirms from a diſpute on a paſſage in Homer, mentioned by Ariſtotle in his Poetics, chap. v. Accordingly, he obſerves, that the Syrians, who have tonic, but no diſtinctive *accents*, have yet invented certain points, placed either below or above the words, to ſhew their mood, tenſe, perſon, or ſenſe. See farther in his Diſſertatio Epiſtolica de Accentuum Græcorum Antiquitate & Uſu. Baſil, 1686.

The uſe of *accents*, to prevent ambiguities, is moſt remarkably perceived in ſome eaſtern languages, particularly the Siameſe and Chineſe. The Chineſe only reckon four accents; for which the miſſionaries uſe the following marks, *á*, *â*, *à*, *ã*; to which they have added a fifth, thus *ă*. They make a kind of modulation, wherein, prolonging the duration of the ſound of the vowel, they vary the tone; raiſing and falling it by a certain pitch of voice: ſo that their talking is a ſort of muſic or ſinging. The ſame ſound *ya*, according to the *accent* affixed to it, ſignifies *God*, a *wall*, *excellent*, *ſtupidity*, and a *gooſe*.—If they deviate ever ſo little from the *accent*, they ſay quite a contrary thing than what was intended. Thus, meaning to compliment the perſon you are talking to with the title Sir, you call him a beaſt with the ſame word, only a little varied in the tone.

The Siameſe are alſo obſerved to ſing rather than talk. Their alphabet begins with ſix characters, all only equivalent to a K, but differently *accented*. For though in the pronunciation the *accents* are naturally on the vowels, yet they have ſome to diverſify ſuch of their conſonants as are in other reſpects the ſame.

As minutely as the *accents* of words have been ſtudied, the *accents* of ſentences ſeem to have been utterly overlooked: yet it may be obſerved, that all mankind lower the voice at the end of a period, elevate it in interrogations, and the like. See Bacon, de Augment. Scien. l. vi. cap. 1. Elem. Crit. vol. 2.

ACCENT is alſo applied, not very properly, to the characters which mark the quantities of ſyllables, or the time the voice is to dwell on them.

The ſpurious *accents* anſwer to the characters of time in muſic; as crotchets, quavers, &c.—The genuine *accents* rather anſwer to the muſical notes, ſol, fa, &c.

Such are the *long accent*, which ſhews that the voice is to ſtop on the vowel, and is expreſſed thus (¯).

The *ſhort accent*, which ſhews that the time of pronunciation ought to be ſhort, and is marked thus (˘).

Some even rank the hyphen, diaſtole, and apoſtrophe, among *accents*.

ACCENT alſo denotes a certain inflexion of voice; or a peculiar tone, and manner of pronunciation, contracted from the country, or province, where a perſon was bred. In this ſenſe, we ſay, the Welſh tone or *accent*, the northern *accent*, the Gaſcoign *accent*, Norman *accent*, &c.

ACCENT is alſo a tone or modulation of the voice, frequently uſed as a mark of the intention of the ſpeaker, and giving a good or an evil ſignification to his words.

One may give offence with the ſofteſt and moſt ſoothing words imaginable, by a proper management of the *accent*, and manner of pronouncing them.—The *accent* frequently gives a contrary ſenſe to what the words themſelves naturally imported.

ACCENT, in *Muſic*, is a modulation of the voice, to expreſs a paſſion.

Every bar or meaſure is divided into *accented* and *unaccented* parts.

The *accented* parts are the principal; being thoſe intended chiefly to move and affect: it is on theſe the ſpirit of the muſic depends.

The beginning and middle, or the beginning of the firſt half of the bar, and of the latter half of it, in common time; and the beginning of the three notes in triple time, are always the *accented* parts of the meaſures.

In common time, the firſt and third crotchet of the bar are on the *accented* part of the meaſure.—In triple time, where the notes always go by three and three, that which is in the middle of every three is always *unaccented*; the firſt and laſt *accented*. But the *accent* in the firſt is ſo much ſtronger, that in many caſes the laſt is accounted as if it had no *accent*.

The harmony is always to be full, and void of diſcords in the *accented* parts of the meaſure. In the *unaccented* parts this is not ſo abſolutely neceſſary; diſcords here paſſing without any great offence to the ear.

ACCENT, in *Poetry*. See REST.

ACCEPTANCE, the act of receiving, or admitting.

Acceptance, among civilians, is the concurrence of the will, or choice of the donee, which renders the act complete; and without which the donor may revoke his gift at pleaſure.

In beneficiary matters, the canoniſts hold, that the *acceptance* ſhould be ſignified at the ſame time with the reſignation; not *ex intervallo*.

ACCEPTANCE, in common law, denotes a tacit agreement to a preceding act, which might have been defeated and avoided, were it not for ſuch *acceptance* had.—If a man and his wife, ſeiſed of land in right of the wife, make a joint leaſe, or feoffment by deed, reſerving rent; the man dying, and the wife receiving the rent; ſuch receipt is deemed an *acceptance*, and ſhall make the leaſe good: ſo that ſhe ſhall be barred from bringing the writ, CUI IN VITA.

So if a leſſee for the term of twenty years, accept a leaſe of the ſame land for ten years: by the leſſee's *acceptance* of the new leaſe, the term of twenty years is determined in law. 2 Roll. Abr. 469.

ACCEPTANCE, in *Commerce*, is particularly uſed in reſpect of bills of exchange.—To *accept* a BILL *of exchange*, is to ſign, or ſubſcribe it; and thereby become principal debtor of the ſum contained therein; with an obligation to pay or diſcharge it at the time prefixed.

The *acceptance* is uſually performed by him on whom the BILL is drawn; upon its being preſented to him by the perſon on whoſe behalf it was drawn, or by ſome others by his order.—While the acceptor is maſter of his ſignature, i. e. before he has returned the *accepted* bill to the bearer, he may eraſe his *acceptance*; but not after he has once delivered it.

A ſmall matter amounts to an *acceptance*, ſo that there be a right underſtanding between both parties; as, "Leave "your bill with me, and I will accept it;" or "call "for it to-morrow, and it ſhall be accepted." This obliges as effectually by the cuſtom of merchants, and according to law, as if the party had actually ſubſcribed, or ſigned it, which is uſually done.

But ſhould a man ſay, "Leave your bill with me; I will "look over my accounts and books between the drawer "and me, and call to-morrow, and accordingly the bill "ſhall be accepted." This ſhall not amount to a complete *acceptance*; for this mention of his books and accounts, was really intended to give him an opportunity of examining if there were effects in his hands to anſwer; without which perhaps he would not accept the ſame; and ſo it was ruled by the lord chief juſtice Hale, at Guildhall, London.

A bill may be accepted for part; becauſe the party upon whom the ſame was drawn, had no more effects in his hands; which being uſually done, there muſt be a proteſt, if not for the whole ſum, yet at leaſt for the reſidue: however, after payment of ſuch part, there muſt be a proteſt for the remainder.

Bills payable at ſight are not to be *accepted*; as being to be acquitted at their preſenting; or, in defect of payment, to be proteſted.—In bills drawn for a certain number of days after ſight, the *acceptance* muſt be dated; becauſe the time is to be accounted therefrom.—The form of this *acceptance* is, *accepted ſuch a day*; and then the ſignature.

Bills drawn payable on a day named, or at USANCE, or double uſance, need not be dated; uſance being reckoned from the date of the bill itſelf.—On theſe it is ſufficient to write, *accepted*, and the ſignature.

If the bearer of a bill be contented with an *acceptance* to be paid in twenty days after ſight, where, in the bill itſelf, only eight days are expreſſed, he runs the riſque of the twelve additional days: ſo that if the acceptor fail, he has no remedy againſt the drawer. And if the bearer contents himſelf to receive a leſs ſum than is expreſſed, in part, he is to ſtand the chance of the reſt.

ACCEPTATION, in *Grammar*, the SIGNIFICATION of a word; or the ſenſe wherein it is taken and received. Thus we ſay:

Such a word has ſeveral *acceptations*. In its firſt and moſt natural *acceptation*, it denotes, &c.

ACCEPTILATION, in the *Civil Law*, an acquittance given without receiving any money; or a declaration of the creditor, in favour of the debtor, ſignifying, that he is ſatisfied for his debt, and forgives all farther claim, or demand; though in reality no payment has been made.

ACCEPTOR, of a bill of exchange, the perſon who accepts the bill.

The *acceptor*, who is uſually the perſon on whom the bill is drawn, becomes perſonal debtor by the acceptance; and is obliged to pay it, though the drawer fail before it becomes due.

ACCESS, in a general ſenſe, ſignifies the approach of a thing towards another.

In which ſenſe, *acceſs* ſtands oppoſed to *receſs*.

We ſometimes ſay, the *acceſs* of bodies, the *acceſs* of the moon, the ſun, planets, &c. but more frequently, the approach of bodies, the appulſe of the moon, the riſing of the ſun, &c. Geometricians ſpeak of a line called the curve of equable *acceſs*, or approach.

Access, in a more particular ſenſe, denotes entrance, or admiſſion.

We ſay, ſuch a perſon has *acceſs* to the prince: the *acceſs* on that ſide was very difficult, by reaſon of rocks, &c.

Access, in *Medicine*, denotes a fit, or return of ſome periodical diſeaſe.

We ſay an *acceſs* of the gout, but eſpecially of an ague, an intermitting fever, an epilepſy, &c. an *acceſs* of madneſs; ſometimes alſo a prophetical *acceſs*, a cold *acceſs*, &c. *Acceſs* is frequently confounded with *paroxyſm*; but they are different things; an *acceſs* being properly the beginning, or firſt onſet of a diſeaſe, a PAROXYSM the height of it.

ACCESSIBLE, ſomething that may be approached; or, that acceſs may be had to.

Such a place, a fortreſs, is *acceſſible* from the ſea-ward; i. e. the paſſage to it is practicable. See FORTIFICATION.

ACCESSION, in a general ſenſe, is the act of approaching, or going to a place, perſon, or thing. It is more particularly uſed for the act whereby a thing is joined or united to ſomething exiſting before.

Accession is alſo uſed for the act of engaging, and becoming a party, in a treaty before concluded between other powers; on the ſame footing and conditions as if originally comprehended in the treaty itſelf: ſuch as The *acceſſion* of the States General to the treaty of Hanover; of the Czarina to the treaty of Vienna, &c.

Accession, in the language of the *Conclave*, is a method of electing a pope, by procuring for ſome candidate two thirds of the voices, upon which the reſt are inrolled by way of *acceſſion*.

Accession, in the *Civil Law*, denotes a method of acquiring property in certain things, by virtue of their connection with other things, which already belong to us.

Acceſſion is effected divers ways, from whence ariſe ſeveral ſpecies of it: *ſimple* and *mixt*; *natural* and *artificial*; *diſcrete* and *concrete acceſſion*.

ACCESSORY, or **Accessary**, ſomething that accedes, or is added to another more conſiderable thing.

In which ſenſe, the word ſtands oppoſed to PRINCIPAL.

Accessory, or **Accessary**, in *Common Law*, is chiefly uſed for a perſon guilty of a felonious offence, not principally, but by participation: as, by advice, command, or concealment.

There are two kinds of *acceſſories*; *before* the fact, and *after* it.—The *firſt* is he who commands, or procures another to commit felony, and is not preſent himſelf; for if he be preſent, he is a principal.

The *ſecond* is he who receives, aſſiſts, or comforts any man that has done murder, or felony, whereof he has knowledge. A man may alſo be *acceſſory* to an *acceſſory*, by aiding, receiving, &c. an *acceſſory* in felony.

An *acceſſory* in felony ſhall have judgment of life and member, as well as the principal, who did the felony; but not till the principal be firſt attainted, and convict, or outlawed thereon.—Where the *principal* is pardoned without attainder, the *acceſſory* cannot be arraigned; it being a maxim in law, *Ubi non eſt principalis, non poteſt eſſe acceſſorius*. But if the principal be pardoned, or have his clergy after attainder, the *acceſſory* ſhall be arraigned. 4 and 5 W. & M. cap. 4. And by Stat. 1 Anne, cap. 9, it is enacted, that where the *principal* is convicted of felony, or ſtands mute, or challenges above twenty of the jury, it ſhall be lawful to proceed againſt the *acceſſory* in the ſame manner as if the *principal* had been attainted; and notwithſtanding ſuch *principal* ſhall be admitted to his clergy, pardoned, or delivered before attainder. In ſome caſes alſo, if the *principal* cannot be taken, then the *acceſſory* may be proſecuted for a miſdemeanor, and puniſhed by fine, impriſonment, &c. Stat. ibid. See Stat. 5 Anne, cap. 31. In the loweſt and higheſt offences there are no *acceſſories*, but all are *principals*: as in riots, routs, forcible entries, and other treſpaſſes, which are the loweſt offences.—So alſo in the higheſt offence, which is, according to our law, high treaſon, there are no *acceſſories*. Cok. Littlet. 71.

Acceſſories, in petty treaſon, murder, and in felonies of ſeveral kinds, are not to have their clergy.—There can be no *acceſſory* before the fact in manſlaughter; becauſe that is ſudden and unprepenſed.

Accessory by ſtatute, is ſuch a one as abets, adviſes, aids, or receives one that commits an offence, which is made felony by ſtatute.

Accessory *nerves*, **Accessorius** *Williſii*, or *Par* **Accessorium**, in *Anatomy*, a pair of nerves, which, ariſing from the medulla in the vertebræ of the neck, aſcend, and enter the ſkull, and paſs out of it again, with the par vagum, wrapped up in the ſame common integument, and after quitting them, are diſtributed into the muſcles of the neck and ſhoulders.—See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit.* rr.

In the aſcent towards the head, they receive branches from each of the firſt five pair of cervical nerves, near their riſe from the medulla; and ſend forth twigs to the muſcles of the larynx, gula, &c.—Uniting with a branch of the intercoſtal, they form the plexus ganglioformis.

Accessory, among *Painters*, an epithet given to ſuch parts of an HISTORY-*piece*, as ſerve chiefly for ornament, and might have been wholly left out: ſuch are *vaſes*, *armour*, &c.

ACCIDENCE, **Accidentia**, a name chiefly uſed for a little book, containing the firſt elements, or rudiments of the Latin tongue.

ACCIDENS, **Accident**, in *Philoſophy*.

Per **Accidens**, is frequently uſed among *Philoſophers* to denote what does not follow from the nature of a thing, but from ſome accidental quality thereof: in which ſenſe it ſtands oppoſed to PER *ſe*, which denotes the nature and eſſence of a thing.

Thus, fire is ſaid to burn *per ſe*, or conſidered as fire, and not *per accidens*; but a piece of iron, though red-hot, only burns *per accidens*, by a quality *accidental* to it, and not conſidered as iron.

ACCIDENT, **Accidens**, in *Philoſophy*, ſomething additional, or ſuperadded, to a SUBSTANCE; or not eſſentially belonging thereto, but capable, indifferently, either of being or not being in it, without the deſtruction thereof.

The ſchoolmen diſtinguiſh three kinds of *accidents*; *verbal*, *predicable*, and *predicamental*.

Accident, *Verbal*, *Accidens verbale*, ſtands oppoſed to eſſence; and in this ſenſe, the adjuncts to a thing, though ſubſtances themſelves, are denominated *accidents* thereof. Thus, the cloaths a man has on, though real ſubſtances, yet, as they are not eſſential, but adventitious or acceſſory to his perſon, are *accidents*.

Accident, *Predicable*, *Accidens prædicabile*, is uſed in oppoſition to *proper*.—Such is any common quality; as whiteneſs, heat, learning, or the like.

Thus a man may be ſick or well; and a wall white or black; yet the one be ſtill a man, and the other a wall.

Theſe are called in the ſchools, *predicable accidents*; becauſe uſually laid down and explained in the doctrine of predicables.

Accidents, *Predicable*, may either be taken in the ABSTRACT, as whiteneſs, learning; or in the CONCRETE, white, learned.

If taken in the *abſtract*, as is done by Porphyry, the *accident* is defined as above, that which may either be preſent, or abſent, without the deſtruction of its ſubject.

If it be taken in the *concrete*; *accident* is uſually defined by the ſchoolmen, to be ſomething capable of being predicated contingently, of many, in reſpect of quality.—As learning, which may probably be predicated of you, him, &c.

Accident, *Predicamental*, *Accidens prædicamentale*, is a mode, or modification of ſome created ſubſtance, inhering or depending thereon, ſo as not to be capable of ſubſiſting without the ſame.

In this ſenſe, *accident* is oppoſed to *ſubſtance*.—Whence, as ſubſtance is defined a thing that ſubſiſts of itſelf, and the *ſubſtratum* of *accidents*; ſo an *accident* is ſaid to be that *cujus eſſe eſt ineſſe*: and therefore Ariſtotle, who uſually calls ſubſtances ſimply οντα, entities, beings; commonly calls *accidents*, οντος οντα, entities of entity; requiring ſome ſubſtance wherein to reſide, as their ſubjects of adheſion.

Accident, then, has an immediate and eſſential dependence on its ſubſtance; both as to its production, its continuation, and its effects: it ariſes or is deduced from its ſubject, is preſerved or ſubſiſted by it; and can only be affected by what alters, or affects, the ſubject.

The old ſchoolmen, however, will not have *accidents* to be mere modes of matter, but entities really diſtinct from it: and, in ſome caſes, ſeparable from all matter.—But the notion of real *accidents*, and qualities, is now exploded. Ariſtotle and the Peripatetics make nine kinds or claſſes of *predicamental accidents*; others contract them into a leſs number.

ACCIDENT, *Abſolute*, is a term uſed in the Romiſh theology, for a predicamental *accident*, which ſubſiſts, or may poſſibly ſubſiſt, at leaſt miraculouſly, and by ſome ſupernatural power, without a ſubject.

Such, they contend, are the *accidents* of the bread and wine in the euchariſt, e. g. the colour, flavour, figure, &c. thereof, which remain after the ſubſtances they belonged to are changed into other ſubſtances of fleſh.

The Carteſians, univerſally, combat the notion of *abſolute accidents*; it being their doctrine, that the eſſence of matter conſiſts in extenſion; and that *accidents* are only modifications thereof, in no wiſe diſtinct from it: an *accident* therefore without a ſubject muſt be a contradiction.—And hence, Carteſianiſm is branded as contrary to the Roman catholic faith.

Various expedients have been invented by the Carteſians, to account for tranſubſtantiation, &c. without the hypotheſis of *abſolute accidents*.—Some hold, that the uſual impreſſions are made on the ſenſe by the immediate agency of God; and without any thing remaining of the former nature. Others aſcribe the whole to hetorogeneous matters contained in the pores of the bread, &c. which remaining unaltered by the tranſubſtantiation, produce the ſame ſenſations as the bread produced.

ACCIDENT, in the popular ſenſe of the word, ſignifies a contingent effect; or ſomething produced caſually, and without any foreknowledge or deſtination thereof in the agent that produced it.

ACCIDENT, in *Heraldry*, is an additional note, or mark, in a coat-armour, not neceſſarily belonging thereto; but capable either of being retained, or omitted, without altering the eſſence of the armour.—Such are ABATEMENTS, DIFFERENCES, and TINCTURE.

ACCIDENT, among *Phyſicians*, is ſometimes uſed for what is more generally called SYMPTOM.

ACCIDENTS, in *Aſtrology*, denote the moſt extraordinary occurrences in the courſe of a man's life: ſuch are a remarkable inſtance of good fortune, a ſignal deliverance, a great ſickneſs, &c.

ACCIDENTAL, ſomething that partakes of the nature of an *accident*; or, that is not eſſential to its ſubject, but indifferent.

Thus, whiteneſs is *accidental* to marble; and heat, to iron.

ACCIDENTAL *Colours*, ſo called by M. Buffon, are thoſe which depend upon the affections of the eye, in contradiſtinction to ſuch as belong to the light itſelf. The impreſſions made upon the eye by looking ſtedfaſtly on objects of a particular colour are various, according to the ſingle colour, or aſſemblage of colours, in the object, and they continue for ſome time after the eye is withdrawn, and give a falſe colouring to other objects which are viewed during their continuance. M. Buffon has endeavoured to trace the connection which theſe *accidental* colours have with thoſe that are natural, in a variety of inſtances. The ſubject has likewiſe been conſidered by M. de la Hire, and M. Æpinus; and M. d'Arcy has contrived a machine for meaſuring the duration of the abovementioned impreſſions on the eye, and he inferred, in the reſult of ſeveral trials, that the effect of the action of light on the eye continued about eight thirds of a minute. See Ac. Par. 1743. Ditto, 1765. Nov. Com. Petrop. v. 10. And for an abſtract, Dr. Prieſtley's Hiſt. &c. of Diſcoveries relating to Viſion, &c. p. 631.

ACCIDENTAL *Point*, in PERSPECTIVE, is a POINT in the horizontal line, where lines parallel to one another, though not perpendicular to the picture, or repreſentation, meet.

ACCIDENTAL *Dignities*, and *Debilities*, in *Aſtrology*, are certain caſual diſpoſitions, and affections, of the planets, whereby they are ſuppoſed to be either ſtrengthened, or weakened, by their being in ſuch a houſe of the figure.

ACCIPENSER, in the Linnæan ſyſtem of *Zoology*, the name of a genus of fiſh, of the order of the *chondropterygii*. This genus comprehends the ſturgeon, &c. Its diſtinguiſhing characters are, that the mouth is tubulated, and without teeth; and the gills have only one hole or aperture on each ſide.

The ſpecies of this genus are two, the STURGEON and the HUSO, or iſinglaſs-fiſh.

There have been many diſputes, whether the ſturio or ſturgeon be the ſame fiſh with the *accipenſer* or not, and what was the difference between the *accipenſer* and *ſilurus* of the ancients; but the whole ſeems to have been this, that the Romans called the ſturgeon *accipenſer*, when they had it freſh, and caught in their own neighbourhood, but *ſilurus*, when it was brought to them in pickle from the Grecian ports.

ACCIPESIUS, in *Ichthyology*, a name given by Athenæus and other of the Greek writers, to the ſturgeon, called by others *oniſcos*. See ACCIPENSER.

ACCIPITER, in *Ichthyology*, a name given by Gellius, and ſome others, to the fiſh called by others, the *milvus* and *lucerna*. It is a ſpecies of the *trigla*, and is diſtinguiſhed by Artedi, by the name of the *trigla*, with the head a little aculeated, and with a ſingular fin, placed near the pectoral fins.

ACCIPITER, the *hawk*, in the Linnæan ſyſtem of *Zoology*, the name of one whole order of birds: the diſtinguiſhing character of which, is, their having a hooked or crooked beak. Of this order there are three genera, the PARROT, the OWL, and the FALCON, diſtinguiſhed by their ſeveral marks.

ACCIPITRINA, in *Botany*, a name by which ſome authors have expreſſed the hawk-weed, and others the flixweed or *Sophia chirurgorum*.

ACCISMUS, denotes a feigned refuſal of ſomething which a perſon earneſtly deſires. The word is Latin, or rather Greek ακκισμος; ſuppoſed to be formed from *Acco*, the name of a fooliſh old woman, famous in antiquity, for an affectation of this kind.

Acciſmus is ſometimes conſidered as a virtue, ſometimes as a vice, which Auguſtus and Tiberius practiſed with great ſucceſs.

Cromwell's refuſal of the crown of England, may be brought as an inſtance of an *acciſmus*.

ACCLAMATION, a confuſed noiſe, or ſhout of joy, by which the public expreſs their applauſe, eſteem, or approbation of any thing.

Acclamation, in a more proper ſenſe, denotes a certain *formula* of words, uttered with extraordinary vehemence, and in a peculiar tone, ſomewhat reſembling a ſong frequent in the ancient aſſemblies.

Acclamations were uſually accompanied with applauſes, with which they are ſometimes confounded, though they ought to be diſtinguiſhed; as

Acclamation was given by the voice, applauſe by the hands; beſides, *acclamation* was alſo beſtowed on perſons abſent, applauſe only on thoſe preſent. *Acclamation* was alſo given by women, whereas applauſe ſeems to have been confined to men.

Acclamations are of divers kinds; *eccleſiaſtical*, *military*, *nuptial*, *ſenatorial*, *ſynodical*, *ſcholaſtic*, *theatrical*, &c.

Biſhops and other eccleſiaſtical officers, were elected by the *acclamations* of the people. We meet with loud *acclamations*, muſical and rhythmical *acclamations*, *acclamations* of joy and reſpect, and even of reproach and contumely. The former, wherein words of happy omen were uſed, were alſo called *laudationes & bona vota*, or good wiſhes: the latter, *execrationes & convicia*.—But their principal uſe has always been at the ſolemn entries of princes, and heroes; where they are uſually attended with good wiſhes, prayers, vows, &c.

Antiquity has handed down to us ſeveral forms of *acclamation*; the Hebrews uſed to cry, Hoſanna; the Greeks, Αγαθη τυχη, *good luck*.—The Romans to their princes, generals, &c. *Dii te nobis ſervent, veſtra ſalus, noſtra ſalus: the Gods preſerve you for us*; *your ſafety, our ſafety.*

The *acclamations* of the army were generally *Io triumphe*, or *ſalve imperator*.

ACCLAMATION is alſo applied among the *Antiquaries* to certain medals; whereon the people are repreſented expreſſing their joy for ſome conſiderable favour.

In this ſenſe, *acclamation* is alſo uſed to denote the vows repreſented on medals, for the proſperity of the emperor and commonwealth.

ACCLAMATION alſo denotes a method of election, practiſed in the ACADEMY of *Arcadi*, when the votes are not given in ſecret, as is practiſed on other occaſions, but *viva voce*. Cardinals, princes, viceroys, and embaſſadors, are elected by *acclamation*.

The members thus choſen, aſſume the title *Arcade acclamato*, a dignity ſomewhat ſuperior to the reſt.

ACCLAMATION, in *Rhetoric*, is a figure of ſpeech, thus called by the Latins, by the Greeks *epiphonema*.

ACCLIVIS, in *Anatomy*, a muſcle, otherwiſe called OBLIQUUS *aſcendens*.

ACCLIVITY, the ſteepneſs, or ſlope, of a line or PLANE inclined to the HORIZON; taken upwards.

The aſcent of a hill is an *acclivity*: the deſcent of the ſame a *declivity*.

Some writers of fortifications uſe *acclivity* for TALUS.

ACCOLA, in a general ſenſe, denotes an inhabitant near any certain place.

The word is compounded of *ad*, *to*; and *colere*, *to dwell*, *inhabit*; *accola eo quod adveniens terram colat*. Hence ſome place the diſtinguiſhing character of *accolæ* in this, that they come from elſewhere: *Accola cultor loci in quo non eſt natus*; by which they ſtand oppoſed to *incolæ*—According to the verſe:

> *Accola non propriam, propriam colit incola terram.*

ACCOLADE, a ceremony anciently uſed in the conferring of knighthood.

The word literally denotes an embrace, or hugging; being formed of *ad*, *to*; and *col*, or *collum*, *neck*.

Antiquaries are not agreed, wherein the *accolade* properly conſiſted.—The generality ſuppoſe it to be, the embrace or kiſs, which princes anciently gave the new knight, as a token of their affection.—Whence the word *accolade*, q. d. a claſping, or taking round the neck. A very ingenious author will rather have it to be a blow on the chine of the neck, given on the ſame occaſion. Fauchet ſeems to reconcile the two opinions: he ſuppoſes it to be the kiſs; but withal, imagines the kiſs to be intended as a ſtroke on the cheek, *En leur baillant ſur la joue.*—The ceremony being only an imitation of that practiſed among the Romans, in the *manumiſſion* of their ſlaves, where it is known a blow was given.

For the *accolée*, or blow, John of Saliſbury aſſures us, it was in uſe among the ancient Normans: by this it was that William the Conqueror conferred the honour of knighthood on his ſon Henry.

At firſt, it was given with the naked fiſt; thus Lambertus Ardenſis, deſcribing the manner in which Baldric, count de Guines, was created knight by Thomas à Becket, ſays, *eidem comiti in ſignum militiæ gladium lateri et calario ſui militis pedibus aptavit, & alapam collo ejus inflixit.* But this was afterwards changed into a blow with the flat of a ſword, on the ſhoulder of the knight.

Salmonet, and after him the continuators of Morery, mention an order in England, called knights of the *accolade*; ſo called from the manner of their creation. The order here meant is that of knights bachelors, or *equites aurati.* But the name, if ever, is now no longer known among us.

ACCOLE'E is ſometimes uſed as ſynonymous with Accolade.

Accolée is alſo uſed in *Heraldry* in divers ſenſes, when two things are joined together, as two ſhields divided at the flanks, they are ſaid to be *accolée.*

Accolée is alſo uſed in ſpeaking of lions, dogs, and other animals, which have collars, or crowns about their necks; as the lion in the arms of the name of Ogilvy.

Engliſh heralds ordinarily ſay, *collared*, or *gorged* with an open crown, inſtead of *accolée.*

Others uſe the term *accolée*, when two keys, batoons, maces, ſwords, &c. are ſaltier wiſe, behind the ſhield.

ACCOMMODATION, in *Philoſophy*, the application of one thing, by analogy, to another.

To know a thing by *accommodation*, is to know it by the idea of a ſimilar thing referred thereto.

Accommodation, is alſo uſed in *Theology:* thus, a prophecy of ſcripture is ſaid to be fulfilled properly, as when a thing foretold comes to paſs; and improperly, or by way of *accommodation*, when an event happens to any place or people, like to what fell out ſome time before to another.—This method of explaining ſcripture by *accommodation*, ſerves as a key for ſolving ſome of the greateſt difficulties relating to the prophecies.

The primitive church accommodated multitudes of Jewiſh, and even heathen ceremonies and practices to Chriſtian purpoſes; but the Jews had before done the ſame by the Gentiles: ſome will even have circumciſion, the tabernacle, brazen ſerpent, &c. to have been originally of Egyptian uſe, and only accommodated by Moſes to the purpoſes of Judaiſm. Saurin's Diſſert. Old Teſt. tom. I. p. 506. Middleton's Letters from Rome.

Accommodation, in *Law*, is alſo uſed for an amicable agreement, or compoſition, between two contending parties.—Thus we ſay, The proceſs is grown ſo intricate and perplexed, that there is no hope of getting out of it but by an *accommodation.*

Theſe *accommodations* are frequently effected by means of compromiſe, and arbitration.

ACCOMPANYMENT, ſomething attending, or added as a circumſtance to another; either by way of ornament, or for the ſake of ſymmetry, or the like.

Accompanyment, in *Muſic*, denotes the inſtruments which accompany a voice, to ſuſtain it, as well as to make the muſic more full.

The *accompanyment* is uſed in recitative, as well as in ſong; on the ſtage, as well as in the choir, &c. The ancients had likewiſe their *accompanyments* on the theatre; they had even different kinds of inſtruments to *accompany* the chorus, from thoſe which accompanied the actors in the recitation.

The *accompanyment*, among the moderns, is frequently a different part or melody, from the ſong it accompanies. It is diſputed whether it was ſo among the ancients.—The organiſts ſometimes apply the word to ſeveral pipes which they occaſionally touch to *accompany* the treble; as the drone, flute, &c.

Accompanyments, in *Heraldry*, are all ſuch things as are applied about the ſhield, by way of ornament; as the belt, mantlings, ſupporters, &c.

A thing is alſo ſaid to be *accompanied*, when there are ſeveral bearings, or figures, about ſome principal one; as a ſaltier, bend, feſs, chevron, or the like.

ACCOMPLICE, one that has a hand in a buſineſs; or is privy in the ſame deſign or crime with another. See Accessory.

The word is compounded of *ad, to*; *con, together*; and *plicare, to fold.*

By the law of Scotland, the *accomplice* can only be proſecuted after the conviction of the *principal* offender: unleſs the acceſſion of the *accomplice* is immediate, in *ipſo actu*, ſo as in effect to render them *co-principal.*

By the general rule, the *accomplice* ſuffers the ſame puniſhment with the *principal* offender. Yet if he be remarkably leſs guilty, juſtice will not permit equal puniſhment.

The council of Sens, and ſeveral other ſynodical ſtatutes, expreſly prohibit the revealing of *accomplices.*

ACCOMPLISHMENT, the entire execution, atchievement, or fulfilling of ſomething propoſed, or undertaken.

Accomplishment, in *Theology*, is principally uſed in ſpeaking of events foretold by the Jewiſh prophets, in the Old Teſtament, and fulfilled under the New.

Mr. Sykes has a particular inquiry into the meaning of thoſe words uſed by the evangeliſt: That it might be fulfilled, or accompliſhed, which was ſpoke by the prophets; where he ſhews. that the ἵνα πληρωθη, *fulfilled*, does not neceſſarily refer to a prediction of a future event *accompliſhed*; but is frequently a mere accommodation of words, borrowed from ſome other author, and accommodated to the preſent occaſion. Grotius ſuggeſted the opinion firſt.

Accomplishment is more particularly uſed for the acquirement of ſome branch of learning, uſeful art, polite exerciſe, &c.

ACCOMPT. See Account.

ACCORD, in *Muſic*, is more uſually called Concord.

The word is formed, according to ſome, from the Latin *ad, to*; and *cor*, the *heart*; but others, with greater probability, derive it from the French *corde*, a *ſtring*, or *cord*; on account of the agreeable union between the ſounds of two ſtrings ſtruck at the ſame time. Whence alſo ſome of the conſonants in muſic come to be called *tetrachord, hexachord*, &c. which are a fourth, and a ſixth.

Accord, in *Law*, is a verbal agreement between two, at the leaſt, to ſatisfy an offence that the one hath committed againſt the other; whether it be a treſpaſs, or the like; for which the one agrees to make, and the other to accept, a certain ſatisfaction.—This, if executed, becomes a good bar in law to any ſuit to be brought for the ſame matter.

Accord with ſatisfaction is a good plea in perſonal actions, where damages only are to be recovered; and in all actions which ſuppoſe a wrong *vi & armis*, where a *copias* and *exigent* lay at the common *Law*, in treſpaſs and ejectment, detinue, &c. So in an appeal of *Maihem.* But in real actions it is not a good plea. 4 Rep. 1. 9. 70. 9 Rep. 77.

ACCOUNT, or Accompt, in *Arithmetic*, a *calculus*, or computation of the number of certain things, or computation of time, &c.

The word is compounded of *ad, to*; and *computus*, a *computation.*

There are various ways of *accounting*; as, by enumeration, or telling one by one; and by the rules of arithmetic, addition, ſubtraction, &c.

We *account* time by years, months, &c. The Greeks *accounted* it by olympiads; the Romans, by indictions, luſtres, &c. We *account* diſtances by miles, leagues, &c.

Account is alſo uſed in reſpect of a company or ſociety, when two or more perſons have received or diſburſed money for each other; or when this has been done by their order or commission.

Account, or Accounts, is alſo uſed, collectively, for the ſeveral books or regiſters which merchants keep of their affairs and negociations.

There are divers kinds of *accounts* among merchants, as *perſonal, real, imaginary, general, particular accounts*, &c.

Accounts, *Perſonal*, are thoſe which diſcover what each perſon, or ſubject, with whom a man has dealings on credit, owes to, or has owing to him.

Accounts, *Real*, are thoſe whereby a dealer diſcovers what effects are on hand at any time, and what is gained or loſt on each.

Every *account* is diſtinguiſhed into two parts, for which two oppoſite pages are aſſigned of one folio or opening; the name of the perſon with whom a man has *account* being written on the top of each, with the word debtor on the left-ſide, and creditor on the right.

Account, *Perſonal*, is to contain on the debtor ſide what the perſon owes me, and the payments I make to him; and on the creditor ſide, all that I owe to him, and the payments he makes of his debts to me.

Account, *Real*, muſt contain on the debtor ſide the quantity and value of what was upon hand at the beginning of the *account*, and all afterwards received, with the coſts and charges thereof; and on the creditor ſide, the quantity and value of what is diſpoſed of or any way taken out of it, with the returns made by it.

Accounts, *Imaginary*, are then brought in to make a balance between credit and debt, and in caſes where the real and perſonal *accounts* will not in the articles belonging to them make, as they uſually do, ſuch balance.

The chief of theſe is the *account* of *profit* and *loſs*; on the debtor ſide of which are entered all loſſes, and on the creditor ſide all gains. Such alſo is the *ſtock account*, &c.

Accounts, *Sundry*, when one *account* is balanced by ſundry; i. e. when one debtor or creditor for a ſum, and ſundry *accounts* creditors or debtors for the parts of the ſum; it is entered under the head of to, or by, *ſundry accounts*.

Accounts, *General*, are thoſe where all the goods of the ſame name are put into one *account*.

Accounts, *Particular*, are thoſe where each ſpecies, or ſubdiviſion of things under the ſame name, have their ſeparate *account*.

Account, *Open*, is uſed for an *account* not liquidated or ſettled.

Account *in bank* is a fund of money, which merchants, or others, place in the common caſh of a bank, to be in readineſs for the payment of bills of exchange, or promiſſory notes, purchaſes, and other debts contracted in the courſe of buſineſs.

Account *Current* amounts to the ſame with an open *account*.

Account, *opening an*, with any one, ſignifies the placing him, for the firſt time, in the great book. This is done by writing his name, ſurname, and place of reſidence, in large characters, and afterwards charging him with articles, either of debtor or creditor, as affairs turn up. When an *account* is opened with any perſon in the great book, his name is to be entered at the ſame time in the index, or alphabet book, with the page wherein his *account* is to be found.

Account, *placing a Sum to an*, is to enter down in the great book the ſeveral particulars for which a perſon becomes either debtor or creditor.

Account, *examining an*, is the reading it exactly over, pointing the ſeveral articles, and verifying the computation, in order to find whether there be any error, and whether the ſum total, or the balance, be juſt.

Account, *caſting up, or cloſing an*, is the ſtating and ſettling of it, to find the balance: this is called alſo *balancing* or *ſettling an account*.

Accounts are *cloſed* in the great book, on two occaſions: the firſt, when it is required to terminate an affair entirely, either with debtors or creditors, in order to learn what is due. The ſecond, when it is neceſſary to carry on the *account* to another page of the ſame book, or to a new book, for want of room.

Account, *Balance of an*, is the ſum by which the debt exceeds the credit, or *vice verſa*, upon ſtating or ſettling of it.

Account *of Sales*, is an *account* given by one merchant to another, or by a factor to his principal, of the diſpoſal, charges, commiſſion, and nett proceeds of certain merchandize, ſent for the proper, or company, account of him, who conſigned the ſame to ſuch factor or vender.

When the like *account* is inland or domeſtic, the ſame is tranſmitted in the current money of that country wherein the buſineſs is tranſacted. As from a Blackwell-hall factor to the clothiers in the country, or from the warehouſemen in town, who deal by commiſſion for the country manufacturers, as bay-factors, drugget and duroy factors, and the like.

Account, *Money of*, is an arbitrary ſpecies, contrived for the facilitating, and expediting the taking, and keeping of *accounts*.—Such are pounds ſterling in England; livres and ſols in France; roupees in India; milrees in Portugal.

Accounts, *Books of*, of merchants and tradeſmen, are conſidered as a ſort of private inſtruments, and in the civil law, and law of merchants, are allowed to make a half proof. The reaſon is, that merchants are often under a neceſſity of dealing on truſt, without note or writing. Hence the ſuppletory oath of the merchant, with his book of *accounts*, is admitted abroad as a full proof againſt his chapman. But in England this is under ſome limitation. See Stat. 7. Jac. I. cap. 12. which confines this ſpecies of proof to ſuch tranſactions as have happened within one year before the action brought; unleſs between merchant and merchant, in the uſual intercourſe of trade.

Account, or **Accompt**, in a legal ſenſe, is a particular detail, or enumeration, delivered to a court, a judge, or other proper officer or perſon, of what a man has received or expended on the behalf of another, whoſe affairs he had the management of.

In the REMEMBRANCER's office in the exchequer, are entered the ſtates of all the *accounts* concerning the king's revenue; for cuſtoms, exciſe, ſubſidies, &c.

The great *accounts*, as thoſe of the mint, wardrobe, army, navy, tenths, &c. are called *impreſt accounts*.

All *accounts* which paſs the remembrancer's office, are brought to the office of the clerk of the PIPE. See TALLY and AUDITOR.

Account, in *Common Law*, denotes a writ or action which lies againſt a perſon, who by his office ought to give an *account*, but refuſes.

A writ or action of *account* properly lies only againſt bailiffs, receivers, and guardians in SOCAGE; though others are alſo brought in as a ſecondary intendment.

By 4 and 5 Anne, actions of *account* may be brought againſt the executors and adminiſtrators of guardians, bailiffs, receivers, &c. and by one jointenant, &c. againſt the other, his executors and adminiſtrators, as bailiff for receiving more than his ſhare: however, actions of *account* are now very ſeldom uſed; the moſt ready and effectual way of ſettling matters of *account* being by bill in a court of equity.

Accounts, *Chamber of*, in the French polity, is a ſovereign court, of great antiquity, where the *accounts* relating to the king's revenue are delivered in, and regiſtered. This anſwers pretty nearly to the court of exchequer in England.

There are preſidents of *accounts*, maſters of *accounts*, correctors of *accounts*, &c.

ACCOUNTANT, or **Accomptant**, a perſon, or officer, appointed to keep, or make up the *accounts*, of a company, office, court, or the like.

Thus there are *accountants* in the cuſtom-houſe, the exciſe, &c. See CHANCERY, COUNTING-*Houſe*, BOOK-*Keeping*.

ACCOUTREMENT, an ancient term, uſed for an habiliment; or a part of the apparatus and furniture of a ſoldier, knight, or even of a gentleman.

The word is formed from the ancient German, *kuſter*; whence *coutre*, a name uſed in ſome cathedrals in France, e. g. at Bayeux, for the ſacriſtan or officer, who has the care of furniſhing, and ſetting out, the altar, in the church; called in German *kuſter*, νεωκορος.

ACCRETION, in *Phyſics*, the growth or increaſe of an organical body, by the acceſſion of new parts. Alſo a growing together, as of the fingers to one another.

The word is compounded of *ad*, *to*; and *creſcere*, *to grow*. *Accretion* is of two kinds; the one, conſiſting in an external appoſition of new matter.

This is what we otherwiſe call, *juxtapoſition*; and it is thus, ſtones, ſhells, &c. are ſuppoſed to grow.

The other is by ſome fluid matter received into proper veſſels, and gradually brought to adhere, or grow to the ſides thereof.—This is what we call *introſuſception*; and it is thus that plants and animals are nouriſhed.

Accretion, in the *Civil Law*, denotes the union or ACCESSION of a thing vague or vacant, to another already occupied, or diſpoſed of.

A legacy given to two perſons jointly, *tam re quam verbis*, falls wholly to him that ſurvives the teſtator, by right of *accretion*.—ALLUVION is another ſpecies of *accretion*.

ACCROCHE', in *Heraldry*, denotes a thing's being hooked into another.

ACCROACHING, in old *Law* books, the act of incroaching or uſurping on another's right; and particularly the attempt to exerciſe royal power, which was a very vague charge, and led to a multitude of conſtructive treaſons. Theſe are limited and defined by Stat. 25 Edw. III. cap. 2. The word is originally French, *accrocher*, which ſignifies to faſten a thing by a hook.

ACCRUE, or **Accrew**, in *Law*, is underſtood, of a part that accedes to, or follows the property of, another part or perſon.

ACCUBATION, a poſture of the body, between ſitting and lying.

The word is compounded of *ad*, *to*; and *cubo*, *I lie down*. *Accubation*, or *accubitus*, was the table poſture of the Greeks and Romans; whence we find the words particularly uſed for the lying, or rather as we call it, ſitting down to meat.

The Greeks introduced this poſture. The Romans, during the frugal ages of the republic, were ſtrangers to it. But as luxury got footing, this poſture became adopted, at leaſt by the men; for as to women, it was reputed an indecency in them to lye down among the men; though afterwards this too was got over. But children did not lye down, nor ſervants, nor ſoldiers, nor perſons of meaner condition; but took their meals ſitting, as a poſture leſs indulgent.

The Roman manner of diſpoſing themſelves at table was this: a low round table was placed in the cœnaculum, or dining-room, and about this uſually three, ſometimes only two beds, or couches; according to the number of which, it was called *bielinium*, or *triclinium*. Theſe were covered with a ſort of bed-cloaths, richer or plainer, according to the quality of the perſon, and furniſhed with quilts and pillows, that the gueſts might lie the more commodiouſly. There were ordinarily three perſons on each bed; to crowd more was eſteemed ſordid. In eating they lay down on their left ſides, with their heads reſting on their pillows, or rather on their elbows. The firſt lay at the head of the bed, with his feet extended behind the back of the ſecond; the ſecond lay with the back of his head towards the navel of the firſt, only ſeparated by a pillow, his feet behind the back of the third; and ſo of the third, or fourth. The middle place was eſteemed the moſt honourable. Before they came to table, they changed their cloaths, putting on what they called *cœnatoria veſtis*, the dining garment, and pulled off their ſhoes, to prevent ſoiling the bed.

ACCUBITOR, an ancient officer of the emperor of Conſtantinople; whoſe buſineſs was to lie near the emperor. The *accubitor* was the head of the youths of the bedchamber; and had the cubicularius and procubitor under him.

ACCUMULATION, the act of heaping, or amaſſing ſeveral things together.

The word is originally compounded of *ad*, *to*; and *cumulus*, *heap*.

ACCUMULATION, in a *legal* ſenſe, denotes a concurrence of ſeveral titles to the ſame thing; as, when a perſon claims lands, a benefice, or the like, in virtue of ſeveral titles, or pretenſions of different kinds; e. g. by death, by reſignation, &c. Or it denotes a concurrence of ſeveral circumſtances to the proof of one fact: thus, we read of *accumulative* treaſon; which is, where a fact is not treaſon in itſelf, but becomes ſo by an *accumulation* of circumſtanecs.

The earl of Strafford was condemned of *accumulative* treaſon; none of the facts alledged againſt him amounting ſingly to treaſon. But his attainder was reverſed by 13 & 14 Car. II. cap. 29.

ACCUMULATION, in the ancient *Agriculture*, denotes the operation of covering up the roots of trees, by throwing on them the earth that had been before dug from them. In which ſenſe, *accumulation* ſtands oppoſed to ABLAQUEATION.

ACCUMULATION *of arms*, *cumulatio armorum*, in *Heraldry*, is what the moderns call QUARTERING of arms.

ACCUMULATION *of degrees*, in an *Univerſity*, is uſed for the taking of ſeveral DEGREES together, and with fewer exerciſes, or nearer to each other, than the ordinary rules allow of.

ACCURSED, ſomething that lies under a curſe, or ſentence of EXCOMMUNICATION.

In the Jewiſh idiom, *accurſed* and crucified were ſynonymous. Among them, every one was accounted *accurſed*, who died on a tree.

This ſerves to explain the difficult paſſage in Rom. ix. 3. where the apoſtle Paul wiſhes himſelf *accurſed after the manner of Chriſt*, i. e. crucified, if happily he might by ſuch a death ſave his countrymen. The prepoſition ἀπὸ here made uſe of, is uſed in the ſame ſenſe, 2 Tim. i. 3. where it obviouſly ſignifies *after the manner of*.

ACCUSATIO, among *Phyſicians*, is a word of the ſame import as INDICATIO.

ACCUSATION, ACCUSATIO, in the *Civil Law*, the intenting a criminal action againſt any perſon, either in one's own name, or that of the public.

The word is compounded of *ad*, *to*; and *cauſari*, *to plead*.

By the Roman law, there was no public *accuſer*, for public crimes; every private perſon, whether intereſted in the crime, or not, might *accuſe*, and proſecute the *accuſed* to puniſhment, or abſolution.

But the *accuſation* of private crimes was never received but from the mouths of thoſe who were immediately intereſted in them.—Thus none but the huſband could accuſe his wife of adultery.

Indeed, it was not properly an *accuſation*, except in public crimes; in private ones, it was called ſimply ACTION, or intenting an action, *intendere actionem*, or *litem*.

Cato, who was eſteemed the moſt innocent perſon of his age, had been *accuſed* forty-two times, and abſolved as often.

When the accuſed *accuſes* the accuſer, it is called *recrimination*; which is not admitted till the *accuſed* has been firſt purged.

The ancient Roman lawyers diſtinguiſhed between *poſtulatio*, *delatio*, and *accuſatio*: for firſt, leave was deſired to bring a charge againſt one, which was called *poſtulare*; then he againſt whom the charge was laid, was brought before the judge, which was called *deferre*, or *nominis delatio*: laſtly, the charge was drawn up, and preſented, which was properly the *accuſatio*.

The *accuſation* properly commenced, according to Pædianus, when the *reus*, or party charged, being interrogated, denied he was guilty of the crime, and ſubſcribed his name to the *delatio* made by his opponent.

By the cruel laws of the INQUISITION, the *accuſed* is forced to accuſe himſelf of the crime objected to him. There are three ways of entering an information in the tribunal of the inquiſition. The firſt, by way of inquiſition, when a private perſon, applying to the inquiſitor, declares he will neither be *denunciator*, nor *accuſer*, but that common fame gives out, that ſuch and ſuch a perſon is an *heretic*: the ſecond, by way of *accuſation*, when the informer takes on him the office of *accuſer*, which rarely happens; becauſe, in this caſe, the *accuſer* is obliged to prove, and expoſes himſelf to the *lex talionis*, in caſe his information prove falſe. The laſt, and moſt uſual way, is by *denunciation*, that is, by naming thoſe who know the fact.

It has formerly been the cuſtom in ſome parts of Europe, where the *accuſation* was very heavy, either to decide it by combat, or at leaſt make the *accuſed* purge himſelf by oath; which, however, was not admitted, excepting a certain number of his neighbours and acquaintance ſwore together with him.

In the French *Law*, none but the *procureur general*, or his deputies, can form an *accuſation*, except for high treaſon, and coining, where *accuſation* is open to every body. In other crimes, private perſons can only act the part of denouncers, and demand reparation for the offence, with damages.

Writers on politics treat of the benefit and the inconveniencies of public *accuſations*. Various arguments are alledged, both for the encouragement and the diſcouragement of *accuſations* againſt great men. Nothing, according to Machiavel, tends more to the preſervation of a ſtate, than frequent *accuſations* of perſons truſted with the adminiſtration of public affairs. This, accordingly, was ſtrictly obſerved by the Romans, in the inſtances of Camillus, accuſed of corruption by Manlius Capitolinus, &c. *Accuſations*, however, in the judgment of the ſame author, are not more beneficial than calumnies are pernicious; which is alſo confirmed by the practice of the Romans. Manlius not being able to make good his charge againſt Camillus, was caſt into priſon.

ACCUSATIVE, in *Grammar*, the fourth caſe of nouns that are declined.

Its uſe may be conceived from this, that all verbs which expreſs actions that paſs from the agent, as *to beat*, &c. muſt have ſubjects to receive thoſe actions: for, if I beat, I muſt beat ſomething; ſo that ſuch verb evidently requires after it a noun, or name, to be the object of the action expreſſed. Hence, in all languages, which have caſes, the nouns have a termination which they call *accuſative*; as, *amo Deum*, *I love God*.

In Engliſh, we have nothing to diſtinguiſh this caſe from the *nominative*; but as we ordinarily place words in their natural order, it is eaſily diſcovered; the *nominative* conſtantly preceding, and the *accuſative* following the verb.—Thus, when we ſay, the prince loves the princeſs, and the princeſs loves the prince: the prince is the *nominative* in the firſt, and the *accuſative* in the laſt; and the princeſs the *accuſative* in the firſt, and the *nominative* in the ſecond.

ACENTETUM, or ACENTETA, in *Natural Hiſtory*, a name given by the ancients to the pureſt and fineſt kind of rock cryſtal. They uſed the cryſtal in many ways, ſometimes engraving on it, and ſometimes forming it into vaſes and cups, which were held next in value to the *murrhina vaſa* of thoſe times. The cryſtal they obtained from the mines of Cyprus was much eſteemed, but often faulty in particular parts, having hairs, cracks, and foulneſſes, which they called ſalts, in the midſt of the large pieces. Pliny tells us, that when it was uſed for engraving on, the artiſt could conceal all theſe blemiſhes among the ſtrokes of his work; but when it was to be formed into cups and precious vaſes, they always choſe the *acentatum*, that is, the pure cryſtal, which had no flaws or blemiſhes.

ACEPHALI, or ACEPHALITÆ, frequently occurs in *Eccleſiaſtical Hiſtory*, as the denomination of divers ſects: particularly,

1. Of thoſe who in the affair of the council of Epheſus, refuſed to follow either St. Cyril, or John of Antioch.
2. Of certain Chriſtians of the fifth century, who at firſt followed Peter Mongus; but afterwards abandoned him, upon his ſubſcribing the council of Chalcedon; being generally of the opinion of Eutyche, that there was only one nature in Chriſt.
3. Of the adherents of Severus of Antioch; and of all in general who refuſed to admit the council of Chalcedon.

ACEPHALUS, or ACEPHALOUS, ſomething that wants a head.

The word is compoſed of the privative α, and κεφαλη, *caput*, *head*.

Pliny repreſents the Blemmyes as a headleſs, or *acephalous* nation.

But though the exiſtence of a nation of *acephali* be ill warranted, naturaliſts furniſh ſeveral inſtances of individuals born without heads, by ſome *luſus* or aberration of nature. Wepſer gives a catalogue of ſuch *acephalous* births from Shenckius, Licetus, Paræus, Wolfius, Mauriceau, &c.

Acephalous worms, or what are ſuppoſed ſuch, are frequent.—The *lumbricus latus*, or joint-worm, was long taken to be *acephalous*: the firſt who gave it a head was Tulpius, and after him Fehr; the former even makes it *biceps*, or two-headed.

The levellers in the reign of Henry I. were called *acephali*.

This word, in our ancient *Law*-books, is alſo uſed for thoſe poor people who had no proper lord; as holding nothing in fee, either of king, biſhop, baron, or other feudal lord.

ACEPHALUS is alſo uſed in *Poetry*, for a verſe which is lame or defective, by wanting a beginning.

Some alſo give the name ακεφαλος to all verſes which begin with a ſhort, inſtead of a long ſyllable.

ACER, in *Botany*. See MAPLE.

ACERATOS, *ακηρατος*, from *α* negative and *κεραω*, or *κεραννυμι*, *to mix*; unmixed, uncorrupted. It is applied ſometimes to the humours of the body by Hippocrates. Paulus Ægineta mentions a plaſter under this name, but probably means *aceron*. See ACERIDES.

ACERB, ACERBUS, a compound taſte, conſiſting of four, with the addition of a degree of roughneſs, and aſtringency.

Such is the taſte of pears, grapes, and moſt other fruits before they are ripe.

Phyſicians uſually make *acerb* an intermediate ſavour between acid, auſtere, and bitter. All matters which come under this denomination are aſtringent.

ACERIDES, *ακηριδες*, from *α* negative; and *κηρος*, *wax*. Plaſters made without wax are thus called.

ACERINA, in *Ichthyology*, a name given by Pliny and other of the old *Naturaliſts*, to the fiſh we at this time call the CERUNA, and AURATA *fluviatilis*, and in England the *ruffe*. It is a genuine ſpecies of PEARCH, and is diſtinguiſhed by Artedi from all the other fiſh of that genus, by having the back fin ſingle, and the head cavernous.

ACEROSUS; it is an epithet, denoting the browneſt and coarſeſt ſort of bread, made of flour not ſeparated from the bran.

ACERRA, in *Antiquity*, a kind of altar, erected near the bed of a perſon defunct. It was much uſed among the Romans; and the friends and familiars daily burnt incenſe on it, till the time of the burial.

By the laws of the *Twelve Tables*, the erecting of *acerræ* was prohibited.

The *acerra* alſo ſignified a little pot, wherein the incenſe and perfumes were put, to be burnt on the altars of the gods, and before the dead.

The *acerra* appears to have been the ſame with what was otherwiſe called *thuribulum*, and *pyxis*; ſome have alſo confounded it with the *pateræ*, in which libations were offered.

We find mention of *acerræ* in the ancient church. The Jews had alſo their *acerræ*, in our verſion rendered *cenſers*; and the Romaniſts ſtill retain them under the name of *incenſe pots*.

In Roman writers, we frequently meet with *acerra plena*, a full *acerra*; to underſtand which it is to be obſerved, that people were obliged to offer incenſe in proportion to their eſtate and condition; the rich in larger quantities, the poor only a few grains: the former poured out *acerras* full on the altar; the latter took out two or three bits with their fingers.

ACESCENT, a word uſed to denote any thing which is turning ſour, i. e. *acid*, or which is ſlightly *acid*. It is only applied properly to denote the firſt of theſe two meanings. The ſecond may be better expreſſed, by either of the words *acidulous*, or *ſub-acid*.

ACESTA, ſignifies curable diſtempers.

ACESTIDES; thus the chimneys of furnaces where braſs was made, were called; contrived narrow at top, on purpoſe to receive the fumes of the melting metal, and collect them, that CADMIA might be produced in greater quantities.

ACESTIS, *ακεϛις*; a fictitious ſort of CHRYSOCOLLA, made of Cyprian verdigreaſe, the urine of children, and nitre.

ACESTRIDES, female phyſicians; midwives were ſo called among the Greeks.

ACETABULUM, in *Antiquity*, a little vaſe, or cup, uſed at table to ſerve up things proper for ſauce, or ſeaſoning: much after the manner of our ſalts, and vinegar-cruets.

Hence Agricola, in his treatiſe of Roman meaſures, takes the name to have been formed from *acetum*, *vinegar*; as ſuppoſing it principally deſtined to ſerve vinegar in.

ACETABULUM alſo denotes a Roman MEASURE, uſed both for liquid and dry things, chiefly in medicine.

The *acetabulum* contained a *cyathus*, and a half, as is proved by Agricola, from two verſes of Fannius; who, ſpeaking of the *cyathus*, ſays, it weighs ten drachms; and the *oxybaphus*, or *acetabulum*, fifteen, or about one eighth of a pint.

Bis quinque hunc faciunt drachmæ, ſi appendere tentes:
Oxybaphus fiet, ſi quinque addantur ad illas.

Binet, in his treatiſe of weights and meaſures prefixed to his tranſlation of Pliny, makes the *acetabulum* of oil weigh two ounces and two ſcruples; the *acetabulum* of wine, two ounces, two drachms, a grain, and a third of a grain; and the *acetabulum* of honey, three ounces, three drachms, a ſcruple, and two *ſiliquæ*.]

ACETABULUM, in *Anatomy*, is uſed for a deep cavity, in certain bones, appointed for the reception of the large heads of other bones, in order to their articulation.—See *Tab. Anat.* (*Oſteol.*) *fig.* 12. *lit.* b. Thus the cavity of the iſchium, or huckle-bone, which receives the head of the thigh-bone, is called *acetabulum*, and ſometimes *cotyle*, or *cotyloides*.

The *acetabulum* is lined, and capped round with a cartilage, whoſe circular margin is called *ſupercilium*.—In its bottom lies a large mucilaginous gland.

ACETABULUM is alſo uſed, by *Anatomiſts*, in the ſame ſenſe with COTYLEDON.

ACETABULUM, in *Botany*, the name of a genus of ſea-plants, compoſed of leaves formed in the ſhape of a baſon, and making a ſort of inverted cone.

It ſignifies alſo a glandular ſubſtance, found in the placenta of ſome animals.

ACETARIA. See SALLET.

ACETARY is uſed for an inner part in the ſtructure of certain fruits; thus called from the ſourneſs of its taſte.

The *acetary* of a pear is a globular part, lying within the calculary, or choak, and ſurrounding the core. It is of the ſame ſubſtance with the parenchyma or pulp, only that the bladders of which it conſiſts are ſmaller, and rounder than thoſe of the PARENCHYMA: from whence however it ſeems to be derived. Whence it is ſometimes alſo called, the *inner parenchyma*.

The quince alſo has an *acetary*, reſembling, though leſs than that of a pear.

ACETIFICATION is uſed by ſome *Chemiſts* to denote the action or operation whereby vinegar is made.

Acetification is a branch or ſpecies of fermentation, ariſing by expoſing vinous liquors in open veſſels, and a warm place, which turns them acid.

Acetification chiefly differs from the fermentation whereby wine is made, in this, that the latter is effected by a gentler heat, ſufficient only to raiſe, and rarify the ſulphureous parts; whereas, in *acetification*, there is what is ſufficient to raiſe and rarify the ſaline parts; which is the preciſe point, wherein *acetification* conſiſts.

ACETOSA, in *Botany*. See SORREL.

ACETOSELLA, in *Botany*, *Wood* SORREL.

ACETOUS *Acid*, is the ſame as VINEGAR.

ACETOUS *Fermentation*, is that fermentation by which vinegar is produced,

ACETOUS *Æther*, is an ÆTHER made by means of vinegar.

ACETUM, in *Medicine*, &c. the ſame with vinegar; the properties, uſes, and preparations whereof, ſee under the article VINEGAR.

The word is pure Latin; formed of *acere*, *to be ſharp*.

There are ſeveral medicines in the ſhops, whereof this liquor is the baſis; as,

ACETUM *diſtillatum*, diſtilled vinegar; chiefly uſed in preparations for diſſolution and precipitation.

ACETI, *Spiritus*, ſpirit of vinegar; made by drenching copper-filings with diſtilled vinegar, then evaporating it till the fumes of the vinegar cannot be ſmelt; the ſaturation and evaporation to be again repeated, till the menſtruum be ſatiated; which being then diſtilled, the ſpirit comes over.—Its qualities and uſes are much the ſame with thoſe of the diſtilled vinegar, only it is more powerful.

ACETUM *Roſatum*, vinegar of roſes; this is made of roſe-buds infuſed in vinegar forty or fifty days; the roſes are then preſſed out, and the vinegar preſerved.—It is chiefly uſed by way of embrocation on the head and temples, in the head-ach.

After the like manner are made *acetum ſambucinum*, vinegar of elder; *acetum anthoſatum*, vinegar of roſemary-flowers; *acetum ſcilliticum*, vinegar of ſquills, &c.

The German diſpenſatories abound with medicated vinegars; chiefly aimed againſt peſtilential diſeaſes; but they are not uſed among us.—Our diſpenſatories indeed retain ſome of them, as the *Acetum Theriacale Norimbergenſe*; but it is never preſcribed.

ACETUM *Alcalizatum*, is made of diſtilled vinegar; with the addition of ſome alkaline, or volatile ſalt.

ACETUM *Philoſophorum*, a ſour kind of liquor; made by diſſolving a little butter of antimony in a great deal of water.

ACETUM *Eſuriens*, in *Chemiſtry*, a diſtilled vinegar, rectified with the help of verdigreaſe. It is made by diſſolving the common verdigreaſe in fine diſtilled vinegar, then evaporating the ſolution, and recovering the verdigreaſe again in form of cryſtals; and from this, by a proper degree of fire, diſtilling with a retort an acid ſpirit, which is the richeſt acid that can by any art be prepared from vinegar.

ACETUM *Portabile*. See VINEGAR.

ACHAC, in *Zoology*, the name given by the people of the Philippine iſlands, to a bird common there. It is of the ſize of a common hen; its belly, breaſt, and neck, are of a pale brown, and its back of a duſty reddiſh colour; its wings are extremely beautiful, being principally of a greeniſh blue colour; the tail is white, ſhort, and continually in motion; the eyes are black, and the beak is thick and ſtrong, and is of a black colour, and obtuſe figure; the legs are reddiſh, and the claws black: when it makes any noiſe, it ſeems to utter the word, *phi*, *phi*, very often repeated. It lives principally about the cultivated parts of the iſlands, and feeds on rice, and other vegetables, being properly of the partridge kind.

ACHALALACTLI, in *Zoology*, the name of an American bird, deſcribed by Nieremberg, and remarkable for a chain or ring of ſilvery whiteneſs round its neck. It is of the ſize of a pigeon, its beak is ſharp, and three fingers breadth long, and its head is ornamented with a very long creſt of a bluiſh black colour. The belly and under ſide of the wings are white, and the back and outſide of the wings are of the colour of the creſt, of a bluiſh black, and variegated with white ſpots; the tail is partly black, and partly blue. It is common about the lakes and rivers of Mexico, and feeds on ſmall fiſh.

ACHAMELLA, in *Botany*. See ACMELLA.

ACHANDES, in *Ichthyology*, a name given by ſome to the REMORA.

ACHANE, Αχανη, an ancient Perſian corn meaſure, containing 45 Attic *medimni*.

ACHAOVA, in the *Materia Medica* of the ancients, the name of an herb much celebrated in many diſtempers; but we are not aſſured at preſent, what is the plant that it truly belongs to. Some have eſteemed it, what is called in Egypt uchove, an herb nearly reſembling chamomile, but lower, and with broader leaves, approaching to thoſe of feverfew, and of a faint, but not diſagreeable ſmell.

Avicenna ſeems however to have meant a different plant by this name, and probably the herb we call MARUM.

ACHARISTON; under this name Galen deſcribes ſome compoſitions of ſingular efficacy, which cured ſo quickly, that they were undervalued; as the Greek name implies.

ACHAT, in our *Law* French, ſignifies a contract, or bargain; eſpecially in the way of purchaſe.

Purveyors were by act of parliament 36 Ed. III. ordained to be thenceforth called ACHATORS.

ACHATES, in *Natural Hiſtory*, the ſtone popularly called AGAT, LAPIS *jaſpis*, &c.

ACHE, or ACH, a painful ailment in any part of the body. *Aches* may be either ſcorbutic, or rheumatic, owing to violent pains, or the like. See HEAD-*Ach*, &c.

ACHE, in ſome old authors, a name given to the plant called *apium paluſtre*, or *paludapium*, in Engliſh, SMALLAGE.

ACHEMENIS, a herb mentioned by Pliny; ſuppoſed by the ancients to have the property of exciting terror.

ACHERNER, or ACHARNER, in *Aſtronomy*, a ſtar of the firſt magnitude in the ſouthern extremity of the conſtellation ERIDANUS, but inviſible in our latitude.

ACHERSET, a meaſure of corn, conjectured to be the ſame with our quarter or eight buſhels. The monks of Peterborough had an allowance weekly of twelve *acherſotes de frumento*, and eight *acherſotes de braſio*, and ſix *de gradi*, and eleven *acherſotes de fabis*, &c. Spelman.

ACHETA, in *Natural Hiſtory*, a name by which the ancients called the large ſpecies of CICADA, the nymphs of which they uſed to eat, and eſteemed an excellent food: the ſmaller kind, which ſeems to have been our middling ſort (for we have three kinds) they called TETTIGONIA.

ACHIA, a kind of cane which grows in the Eaſt Indies, and is pickled there while green, with ſtrong vinegar and pepper, together with ſome other ſpice and ingredients.

ACHIAR, is a Malayan word, ſignifying all ſorts of fruits and roots, pickled with vinegar and ſpice. The Dutch import from Batavia all ſorts of *achiar*. The name is applied to whatever the *achiar* is made of; as *bamboe achiar*, &c.

ACHLÆNUS, or ACHÆINUS, in *Natural Hiſtory*, a word uſed by the ancients to expreſs a ſtag or deer, in the ſecond year's age. In the firſt, it was called *nebrus*, in the third *dicrotus*, and always after that *ceraſtes*.

ACHICOLUM, is uſed to expreſs the *fornix*, *tholus*, or *ſudatorium* of the ancient baths; which was a hot room where they uſed to ſweat. It is alſo called *architholus*.

ACHILLEA, in the *Materia Medica* of the ancients, a name given to the gum, which we at this time know by that of *ſanguis draconis*, or DRAGON'S-BLOOD.

The ancient Greeks called this *cinnabari*; and the uſe of that word for the mineral which we now call cinnabar, was only becauſe of its being of the ſame fine red colour with this gum. Avicenna treating of the *achillea*, ſays it is otherwiſe called *ſanguis draconis*, and deſcribes it as a red gum, univerſally known in his time.

ACHILLEA, in the Linnæan ſyſtem of *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs of plants, the common calyx of which is ovated, and imbricated with oval, acute, connivent ſquamæ: the compound flower is radicated; the hermaphrodite florets are numerous and tubulous; the female florets are ligulated, and the proper hermaphrodite ones funnel-ſhaped; there is no pericarpium, and the ſeed is ſingle, oval, and naked.

ACHILLEA *Lutea*. See AGERATUM.

ACHILLEA *Montana*. See JACOBEA.

The ancient *Botaniſts* gave the name *achillea* to a plant, which is ſaid to be the ſame with our millefolium, from Achilles, who, having been the diſciple of Chiron, firſt brought it into uſe for the cure of wounds and ulcers.

ACHILLEA *Gallica*, a name given to mountain rag-wort, or corn MARYGOLD.

ACHILLEIS, or ACHILLEID, a celebrated poem of Statius, of the epic kind, wherein he propoſed to deliver the whole life and actions of Achilles.

It only takes in his infancy, the poet being prevented from proceeding by death.

It is a point controverted among the critics, whether the whole life of a hero, e. g. of Achilles, be a proper ſubject of an EPIC poem?

ACHILLES, a name which the ſchools give to the principal argument alleged by each ſect of philoſophers in behalf of their ſyſtem.

In this ſenſe, we ſay, this is his *Achilles*; that is, his maſter-proof: alluding to the ſtrength and importance of Achilles among the Greeks.

Zeno's argument againſt MOTION, is peculiarly termed *Achilles*.—That philoſopher made a compariſon between the ſwiftneſs of *Achilles*, and the ſlowneſs of a tortoiſe: arguing, that, if the tortoiſe were one mile before *Achilles*, and the motion of *Achilles* 100 times ſwifter than that of the tortoiſe, yet he would never overtake it. But this ſophiſm is eaſily ſolved, by expreſſing the whole relative diſtance ran by the tortoiſe before *Achilles* overtook him, by the following ſeries, $\frac{1}{100}+\frac{1}{10000}+\frac{1}{1000000}$, &c. the ſum of which is $\frac{1}{99}$ of a mile; and the diſtance run by *Achilles* is one mile; ſo that when *Achilles* had run $1\frac{1}{99}$ of a mile, he would have overtaken the tortoiſe.

ACHILLES, *Tendon of*, CHORDA *Achillis*, is a large TENDON, formed by the union of the tendons of the four extenſor muſcles of the FOOT.

It is ſo called, becauſe the fatal wound whereby Achilles is ſaid to have been ſlain, was given there.

ACHIOTL, in *Botany*, a name given by ſome authors to the *uraca*, or *arnotto*, called *orleana*, and *orellana*, by other writers.

ACHIOTTE, a red drug from America, uſed in dying, and in the preparation of chocolate.

The word is Braſilian, where it properly ſignifies the tree from whence this matter is procured. Ray writes it *acchiote*. *Achiotte* is the ſame with what the French frequently call ROUCOU, and the Dutch *orleane*. It has been commonly eſteemed a kind of *argilla*, or earth; but later obſervers find it a flower, or ſeed of a tree, which grows chiefly in very hot countries, as Yucutan, or Campeche, and Guatimala. It is about the ſize of a plum-tree, only more tufted; its branches being longer than the trunk. The fruit is encloſed in a rind like a cheſnut, except that it is of an oval figure. It begins to open croſs-ways from the middle to the top, and ſubdivides into four parts; having, in the middle, a beautiful carnation-coloured flower. The tree has no leaves; but inſtead thereof ſhoots out filaments like thoſe of ſaffron, only bigger and longer. Between theſe grow little ſoft vermilion coloured grains, about the ſize of pepper-corns; which the Indians, ſepararing from the filaments, bake in cakes of about half a pound each; in which form the drug is brought into Europe.

The poor people uſe *achiotte* inſtead of ſaffron; it is uſed as marigolds are, to give a yellow colour to cheeſe, in Glouceſterſhire, and others mix it as an ingredient in chocolate, during the grinding of the cocoa, the quantity of two drams to a pound, to give it a reddiſh colour, &c. though this practice was formerly more frequent than at preſent; the opinion of its being an earth, which even Mr. Ray fell into, having diſcredited its uſe. Some alſo uſe it to dye wax of a vermillion colour. Phyſicians hold it a good cordial, and preſervative againſt retention of urine. It is made, as we make STARCH.

According to Savary, to procure the *achiotte*, they ſhake out the grains in an earthen veſſel, ſoak and then waſh them in ſeveral repeated warm waters, till they have diſcharged all their vermillion colour; after which letting the water ſtand to ſettle, the *fecula* at the bottom is taken and formed into little cakes and balls; which when pure, and not adulterated either with red earth, or fine brick-duſt, are highly valued. Some alſo uſe fire to boil the *achiotte*, and give it a farther conſiſtence.

ACHIROPŒTOS, a name given by ancient writers to certain miraculous pictures of Chriſt and the Virgin, ſuppoſed to have been made without hands.

The moſt celebrated of theſe is the picture of Chriſt, preſerved in the church of St. John Lateran at Rome; ſaid to have been began by St. Luke, but finiſhed by the miniſtry of angels.

ACHLIS. See MACHLIS.

ACHLYS, in *Medicine*, a darkneſs, or dimneſs of ſight, ariſing from a ſmall *cicatricula* on the pupil, occaſioned by a ſuperficial ulcer on the *cornea*.

The word is Greek, and literally ſignifies a kind of cloud. In a metaphorical ſenſe, *achlys* alſo denotes a diſorder of the womb; anſwering to what Latin writers call *ſuffuſio uteri*.

ACHNE has various ſignifications; ſometimes it denotes lint; at other times chaff, or froth of the ſea. Hippocrates uſes it to denote a white mucilage, obſervable in the eyes of patients who have fevers; and alſo a white mucus in the fauces, thrown up from the lungs.

ACHOR, in *Medicine*, the third ſpecies or degree of a TINEA, or ſcald-head.

Achor is a ſort of ſmall running ulcer on the face and head, chiefly of children while at ſuck; by which the ſkin is broken into a number of little holes, out of which iſſues a viſcid humour, like *ichor*, whence its name.

ACHOR differs from the FAVUS and TINEA only in the degree of virulence. It is called *favus* when the perforations are large, and *tinea*, when they are like thoſe which are made by moths in cloth.

Writers of medical obſervations afford divers anomalous inſtances of *achores*, viz. ſome are found even in aged people, others on the feet; others reſembling the venereal diſeaſe; others which diſappeared upon cutting the hair, and returned on its growing anew; others followed by a thickneſs of hearing; others by panics; and others by a *gutta ſerena*. Their drying up has ſometimes been followed by a fever, their repulſion inwards by an epilepſy.

ACHROMATIC, in *Optics*; a term, ſays M. Des Landes, firſt introduced into his *aſtronomy*, to denote TELESCOPES of a new invention, contrived to remedy *aberrations* and colours. The word is compoſed of the privative *α*, and *χρωμα*, *colour*. See ABERRATION and TELESCOPE.

ACHRONICAL, in *Aſtronomy*. See ACRONYCHAL.

ACHTELING, a meaſure for liquids uſed in Germany. Thirty-two *achtelings* make a *heemer*; four *ſciltems*, or *ſciltins*, make an *achteling*.

ACHTENDEELING, or ACHTELING, a meaſure for grain, uſed in ſome parts of Holland.

ACHY, a ſpecies of CASSIA that grows in Arabia.

ACHYRONIA, in *Botany*, the name given by Van Royen, and continued by Linnæus, to a genus of plants of the papilionaceous kind, the characters of which are theſe. The flower has a perianthium, divided into five ſegments at the edge, the upper one being longer than the reſt; the vixillum of the flower is compreſſed, hairy or rough on the outſide, and obtuſe; the alæ are lunated, obtuſe, and open, and are ſhorter than the vixillum; the carina is bifid, and its length the ſame as that of the alæ; the ſtamina are nine or ten filaments growing into a ſort of vagina; the antheræ are roundiſh, but ſomewhat oblong; the germen of the piſtil is oval; the ſtyle is ſimple, and aſcendent; the ſtigma is acute; the fruit is an oval oblong pod, containing a few kidney-ſhaped ſeeds.

ACHYROPHORUS, in *Botany*, the name of a genus of plants of the ſame characters with the HYPOCHÆRIS.

ACIA, a term in the Roman *Surgery*, about the meaning whereof, phyſicians and commentators are much divided. Celſus ſpeaking of the healing of wounds, either by ſuture, or the fibula, ſays, each is beſt effected by means of a ſoft *acia*, not too much twiſted, that it may ſit the eaſier on the body.

Boxhornius will have the *acia* to be the *acus* of the fibula, or that part which pinched—In which view *acia mollis* only imported, that it was not ſet ſo as to pinch too much.

ACICOCA, a herb that grows in Peru, and is ſometimes uſed inſtead of the herb *paraguay*, of which it is ſaid to have all the properties.

ACICULÆ, in *Natural Hiſtory*, ſmall ſpikes, or prickles, in form of needles, with which nature has armed ſeveral creatures. See *Tab. of Fiſhes*, N°. 20. and *Tab. of teſtaceous and cruſtaceous Animals*, N°. 13. See alſo *Tab. of Quadrupeds*, N°. 15, 25, and 26.

ACIDS derive their name from the word *acere*, *to be ſharp*; which expreſſes one quality by which they are diſtinguiſhed, viz. their ſour taſte. They form one of the general claſſes, into which ſimple ſalts are divided, and are the moſt ſimple of all ſaline ſubſtances. If they were ſeparated from water, to which they have a ſtrong affinity, and from all other ſubſtances not neceſſary to their ſaline eſſence, they would appear under a concrete or ſolid form: but the contact of the air, which is loaded with watery vapours, is ſufficient to diſſolve them, and therefore they are always in a fluid ſtate. On this account, it is not eaſy to aſcertain the quantity of *acid* in *acid* liquors. Homberg made ſeveral experiments to this purpoſe, by combining *acid* liquors with ſalt of tartar, ſo as to form neutral ſalts; imagining that the weight gained by this alkali from its union with *acids*, or the difference between the weight of the ſalt of tartar and the neutral ſalt produced, was equal to the weight of real *acid* contained in the quantity of *acid* liquor employed. But as he did not conſider, that the air expelled from ſalt of tartar, during its combination with *acids*, makes a very conſiderable part of the weight of that alkali, the inferences from his experiments are not juſt; and the real quantity of *acid* contained in an *acid* liquor, is ſo much more than the quantity inferred by him, as the whole weight of the fixable air diſengaged from the ſalt of tartar.

Acid ſalts are all found to be volatile; by which they are diſtinguiſhed from the reſt, which are either fixed, or have an urinous, inſtead of an *acid* taſte.

Some chemical philoſophers have even made it very probable, that it is the *acid*, which is the ſaline part, or principle, in all ſalts. They conſider it as a ſubtle, penetrating ſubſtance, diffuſed through the ſeveral parts of the globe; which, according to the different matters it happens to be united with, produces different kinds of bodies.

Of this ſentiment is Sir Iſaac Newton.—'In decompounding ſulphur, ſays that author, we get an *acid* ſalt of the ſame nature with oil of ſulphur *per campanum*; which ſame *acid*, abounding in the bowels of the earth, unites ſometimes with earth, and thus makes *alum*; ſometimes with earth and *bitumen*, and thus compounds ſulphur.' In reality, all our native ſalts, though without any mixture from art, are yet found to be real mixtures; and their compoſition and decompoſition are eaſily made.

Acids poſſeſs ſeveral common properties, beſide the ſharpneſs or ſourneſs of their taſte. They are readily united with water; and from this union, a new compound fluid is formed, whoſe ſpecific gravity differs from the mean gravity of its component parts. They may be likewiſe combined with ſpirit of wine, and form a very volatile ſubſtance, which chemiſts have denominated *æther*. They may be alſo combined with abſorbent earths, with alkaline ſalts, with metallic ſubſtances, with phlogiſton, and with oils; and in the proceſs of uniting with them, diſcharge all or part of the fixable air which they contain. The combination with alkaline ſubſtances occaſions a violent effervеſcence, and produces neutral ſalts. They diſſolve the aſhes of vegetables, and the ſolid parts of animals. All ſolutions, the metallic ones excepted, deſtroy the acrimony of the diſſolving *acid*, and the menſtruum loſes its diſſolving power.

Acids likewiſe for the moſt part agree in changing into red the blue colours of vegetable juices, and in heightening the colour of thoſe that are red. But this property is not common to all *acids*; for the volatile ſulphureous *acid* deſtroys theſe colours. Nor is it peculiar to *acids*; for *alum*, a neutral ſalt, produces the ſame effect.

Acids reſiſt fermentations; they are not ſo eaſily frozen as water, and they generate cold, when poured upon ice. M. Homberg explains the action of *acids* on alkalies, and accounts for the great number of little bubbles, and the heat produced thereby, in the following manner.—The matter of light, which he ſuppoſes to be the chemical principle, ſulphur, and to poſſeſs the whole extent of the univerſe, is kept in a perpetual motion by the continual impulſes which the ſun, and fixed ſtars give it; but this motion, happening on ſome occaſions to be ſlackened, may be retrieved again, and augmented by the near approach of flame, which this author ſuppoſes to be the only matter capable of giving motion to light. Light cannot proceed in its motion, without continually ſtriking againſt the ſolid bodies, and paſſing through all the porous ones which it meets with.

Suppoſe, now, *acids* to be little, ſolid, pointed bodies, ſwimming at liberty in an aqueous fluid, and kept in continual motion by the repeated impulſes of the matter of light; and alkalies to be ſpongious bodies, whoſe pores have formerly been filled with the points of *acids*, and which ſtill retain the dents or impreſſions thereof, and are ready to receive the like points again: it is eaſy to conceive, that if ſome of theſe porous alkalies float in the ſame liquor wherein the ſolid *acids* float, theſe latter, being impelled by the matter of light, will enter the cavities of the former; and that they will do it the more readily, if the motion of the impelling light has been accelerated by external heat.

The introduction of *acids* into the pores of alkalies is, to all appearance, effected with great velocity and friction; inaſmuch as it produces ſo conſiderable a degree of heat; and as the pores of the alkalies were before filled with an aerial matter, which is now expelled by the points of the *acids*, that air is put in motion, and produces the bubbles which are ſo much the more ſenſible, as the heat accompanying the action is the greater. Homberg's Eſſai du Sel principe.

Sir Iſaac Newton accounts for the effects of *acids*, by the great principle of attraction. See Affinity.

Acids differ conſiderably from each other with regard to their ſtrength, their ſolvent power, and the changes produced in them by the bodies on which they act.

Acids ſeem, from their univerſality, to be of the greateſt uſe in the œconomy of the world. The air, earth, and ſea, abound with them. It is obſerved, that the air is moſt replete with *acid*, when the wind blows from the north and eaſt, and when the weather is ſerene; a fact, which, according to Hoffman, is confirmed by the obſervations of thoſe who are concerned in nitre works: from whence we may conclude, that the *aerial acid* is inſtrumental to the production of cold in the air. The analogy between *acids* and *cold*, and between alkalies and heat, is very remarkable. *Heat* and alkalies promote the putrefaction of dead bodies; or, in other words, deſtroy the coheſion of their parts: on the contrary, *acids* and *cold* preſerve them from putrefaction, by preſerving the coheſion of their component parts.

Acids are diſtributed into three general claſſes, according to the ſubſtances from which they are extracted; viz. *animal*, *mineral*, and *vegetable acids*. Nevertheleſs, it is the opinion of Stahl, and of other eminent chymiſts, that there is but one primitive acid; and that all the other *acids* are only different modifications or combinations of it.

Acid, *Aerial*, a name given by Mr. Bergman of Upſal to fixed air, becauſe he found that this ſpecies of air had an *acid* quality, by its changing the blue juice of tourneſole into red; and the fact was farther verified by Mr. Hey, and Mr. Bewley; the latter of whom has proved, by a ſeries of experiments, that fixed air does not owe its *acidity* entirely to the nature of the ſubſtances from which it is extracted, as Sig. Landriani, and ſome foreign philoſophers, imagine; but that it is an original *acid ſui generis*, expelled from the ſubſtances with which it is combined, by the force of fire, or by the power of a ſuperior *acid*; but Dr. Prieſtley rather apprehends, that it is a modification of the nitrous *acid*.

Acid *of Amber* is ſuppoſed by Dr. Monro to be an *acid ſui generis*, and extracted from ſalt of *amber*. Phil. Tranſ. vol. lxvii. p. 1. Nº. 49.

Acids, *Animal*, are thoſe which have been lately diſcovered in certain *animal* ſubſtances; as butter, fat, blood, ants, and flies.

M. Homberg firſt aſcertained the exiſtence of a latent *animal acid*, and he has propoſed two ways of procuring it. One way is, by concentrating the phlegm which ariſes firſt in the common diſtillation of *animal* ſubſtances for their volatile ſalt and oil. The reſiduum of this phlegmatic liquor, when it has been rediſtilled with a gentle heat, till only a ſmall portion is left, will yield an *acid*; which he has ſometimes concentrated ſo far, that it ſeemed to be as ſtrong as common vinegar.

The other method of collecting this *acid* is, by mixing earthy matters with the animal ſubject at firſt, and urging the diſtillation after all the alcaline ſalt and oil have ariſen. The *acid* is at length forced out by the great vehemence of fire. Whether this *acid* be any other than part of the *vegetable acid* derived from plants in the ordinary way of food and nutrition, or of the *acid* of the *marine* ſalt which *animal* ſubſtances poſſeſs, muſt be determined by future experiments and obſervations. But it is certain that they differ in the ſame circumſtances as the *vegetable acids* do from *mineral acids*.

Mr. Hook has long ſince obſerved, that inſects which are furniſhed with ſtings, as bees, waſps, and hornets, diſcharge, when irritated, an *acid* juice; but none yield ſo large a quantity as ants. Ants in their *chryſalis*, or maggot ſtate, have no *acid*; but if a ſtick be thruſt into an ant-hill, they will diſcharge a fluid, which has an *acid* taſte and ſmell; and which will make the blue flowers of ſuccory, borrage, &c. red. And this *acid* obtained, either by diſtillation, or by throwing the living animals into water, till it be ſufficiently impregnated with it, will, with lead, make a peculiar ſort of *ſaccharum ſaturni*, which on diſtillation will give back the *acid* in its own form again.

M. Margraaf has demonſtrated, by ſome late experiments, that it bears no analogy either to the *marine*, or *vitriolic acid*; becauſe it does not precipitate ſilver, lead, or mercury, from the *nitrous acid*, nor quicklime from the *marine*. He concludes upon the whole, that this *acid* much reſembles that of vinegar, though in ſome reſpects it is different.

Acids, *Concrete*, are ſaline ſolid ſubſtances, which have the properties of *acids*; ſuch as cryſtals of tartar, eſſential ſalts of vegetables, the volatile *acid* ſalt of amber, and of ſome other bitumens, and the flowers of benjamin.

Acid, *Fluor*, is a new *mineral acid*, ſo called from the name which the chemiſts have given to the ſubſtance from which it is extracted. This ſubſtance is of the ſame kind with the Derbyſhire *ſpar*. The *acid* is expelled from it by oil of vitriol; and as it was firſt diſcovered by Mr. Scheele, a Swede, it is often diſtinguiſhed by the name of the Swediſh *acid*. Mr. Scheele ſuppoſed, that *acid* and water were the conſtituent parts of the foſſil from which it was procured. Mr. Boulanger apprehends, that this new *acid* is only the *acid* of ſalt combined with an earthy ſubſtance. But Dr. Prieſtley, in the reſult of his experiments, has proved, that the *fluor acid* is the *acid* of vitriol, charged with ſo much phlogiſton as is neceſſary to its taking the form of air, and alſo with much of the earthy matter of the ſpar. Experiments and Obſervations on different kinds of Air, vol. ii. p. 188.

Acids *Fluor* ſometimes denote thoſe *acids*, which are always in a fluid ſtate; ſuch are the volatile, vitriolic, nitrous, marine *acids*, and thoſe which are obtained by diſtillation from vegetable and animal ſubſtances.

Acid, *Marine*, is one of the three *mineral acids*; ſo called, becauſe it is generally obtained from ſea ſalt; though it may be likewiſe extracted from ſal gem, or foſſile ſalts, and from the ſalt of ſaline fountains and pits. This *acid* is ſtronger than any of thoſe of the *vegetable* or *animal* kingdom; but weaker than the *vitriolic* or the *nitrous*. It is never found pure, but always combined with an alkali, ſo as to form a neutral ſalt. As it is more volatile than the other *mineral acids*, it cannot be ſo eaſily combined with phlogiſton, though many facts ſufficiently aſcertain the practicability of ſuch a combination. This ſpecies of *acid* is ſuppoſed by the chemiſts to be an offſpring of the *vitriolic acid*, and to conſiſt of this *acid* combined with an inflammable and a mercurial principle. Becker aſcribes its peculiar properties to a principle, which he calls mercurial earth; but Stahl rejects this part of his theory; and expreſſes a wiſh, that the exiſtence of the mercurial earth could be as well aſcertained as the exiſtence of phlogiſton.

The *marine acid* eaſily diſſolves zinc, iron, and copper; it acts with greater difficulty on tin, and ſcarcely acts at all in its liquid ſtate on ſilver, mercury, lead, or regulus of antimony. It diſſolves gold by the help of the *nitrous acid*; and by a modern diſcovery, gold and platina are rendered ſoluble in this menſtruum, either by previous ſolution in aqua regia and precipitation from that menſtruum, by means of an alkali, or by a previous calcination with tin and other imperfect metals.

Some of the moſt remarkable phænomena attending the combination of *marine acid* with metallic ſubſtances, are the following: it diſſolves theſe ſubſtances with leſs heat and efferveſcence, and with fewer vapours than *nitrous acid* does. All combinations of metals with this *acid* are eaſy of fuſion in the fire; there are few which concrete into a cryſtalline form. The metals with which it contracts the ſtrongeſt union, are thoſe to which it unites with the greateſt difficulty. *Marine acid* volatilizes either wholly, or in part, the metals with which it is united; and forms with thoſe metallic ſubſtances to which it moſt firmly adheres, ſuch as mercury, regulus of antimony, ſilver and lead, metallic ſalts, much more corroſive than thoſe formed by the *vitriolic* or *nitrous acid*. Homberg indeed found, that *marine acid* of itſelf corrodes glaſs more than any other *acid*.

This *acid* can only be obtained by means of an intermediate ſubſtance ſufficiently powerful to diſengage it from the native fixed alkali, which is the baſis of common ſalt. *Vitriolic acid* is the moſt proper for this purpoſe.

Acids, *Mineral*, are one of the general claſſes into which *acids* are diſtributed. They derive their name from the *mineral* ſubſtances from which they are procured; and they are ſubdivided into the marine, nitrous, and vitriolic *acids*. With reſpect to their general character, they are more ſimple, leſs volatile, more ſuſceptible of concentration, and ſtronger than the *acids* obtained from *animals* or *vegetables*.

Acid, *Nitrous*, is the moſt limited, and the leaſt frequent in the earth, of all the *mineral acids*. It is ſeldom met with in any combination, but in the neutral ſalt, from which it derives its name. The concentrated *nitrous acid* is weaker and much more volatile than the *vitriolic*. In this ſtate it ſtrongly attracts the moiſture of the air, and when mixed with water, occaſions a great heat and ebullition. M. Baumè obſerves, that while they are mixing, the liquor aſſumes a blue or deep green colour, though the vapours at the ſame time retain their original yellowiſh red. It fulminates, when ignited, on the contact of any inflammable matter; and burſts into flame, when mixed with diſtilled and expreſſed oils. It is of a yellowiſh red flame colour, emits vapours of the ſame colour, and poſſeſſes a peculiar taſte and ſmell. The *nitrous acid* contains phlogiſton, and yet takes it with avidity from moſt other ſubſtances. By means of this property, the ſubſtances into which it enters, burn without the aſſiſtance of common air.

This *acid* is one of the moſt powerful menſtruums in chemiſtry; not that it is ſtronger than either the *vitriolic* or *marine*; but on account of the facility, quickneſs, and activity, with which it diſſolves moſt ſubſtances. It corrodes and diſſolves all metallic bodies, except gold and platina; and Dr. Brandt has found, that by particular management it can diſſolve gold. But its action is moſt vehement on thoſe metals, which contain moſt inflammable matter, as zinc and iron. This *acid* combined with fixed vegetable alkali forms nitre; with marine or foſſil alkali, it forms a neutral ſalt, which ſhoots into cubical cryſtals, hence called *nitrum cubicum*; with volatile alkali, it produces the nitrous *ſal ammoniacum*. *Nitrous acid* eaſily diſſolves all calcareous and abſorbent earths. It is eaſily combined with oils, and with ſpirits of wine. This *acid*, which is ſometimes called ſpirit of nitre, may be procured by mixing two parts of dry or powdered clay with one part of nitre, and diſtilling the compoſition in a reverberatory furnace, with a gradual heat. Clay is very proper for decompoſing nitre, becauſe it contains a *vitriolic acid*. Martial vitriol is uſed for producing ſmoaking ſpirit of nitre; and pure *vitriolic acid* is made uſe of in diſtilling Glauber's ſmoaking ſpirit of nitre.

Acid, *Phoſphoric*. See Phosphorus.

Acid, *Vague*, a general term uſed by ſome chemiſts for the *vitriolic acid*. See Acid *Vitriolic*.

This mixing with foſſil oil, *petroleum*, *oleum tenæ*, or the like, conſtitutes the various ſorts of native foſſil tranſparent ſulphurs; uniting with ſemi-metals, it forms cinnabar, antimony, and other foſſils, both ſolid and fluid; uniting with metals, it forms divers kinds of vitriols; with calcareous earths, different alums; and laſtly, with *pyrites*, which is the *matrix* of vitriol, calcined in a wood fire, it produces common ſulphur. See Acids.

Acids, *Vegetable*, are thoſe which are procured from *vegetable* ſubſtances. Such are the juices of ſour fruit, ſour wine, or vinegar; cryſtals of tartar; all the eſſential, *acid*, concrete ſalts, procured by cryſtallization from the expreſſed juices of plants; and laſtly, all the *acids* obtained from *vegetable* ſubſtances in analyſing them by diſtillation. They differ from *mineral acids* in being leſs ſimple, leſs fixed, leſs ſuſceptible of concentration, and weaker.

Acid, *Vitriolic*, is the third ſpecies of the *mineral acids*; and was formerly obtained from martial vitriol. This *acid* is copiouſly diffuſed through the earth, the waters of the ocean, and the atmoſphere, and is ſuppoſed by ſome to be the baſis of all the other *acids*. It abounds moſt in the mineral kingdom, combined with various other bodies. Its ſpecific gravity, when it is highly concentrated, is more than double that of water. M. Heilot obtained ſome, concentrated to ſuch a degree, as to become ſolid and cryſtalline. This *acid* being likewiſe more fixed than water, admits a much greater degree of heat. It very freely imbibes moiſture, and acquires hereby a very conſiderable increaſe of weight. It diſſolves the aſhes of vegetables and calcareous earths; and when combined with the latter forms a matter called *ſelenites*, reſembling ſalt in its appearance, but differing from it in taſte and ſolubility. It may be likewiſe combined with alkalies, both vegetable, fixed, and foſſil. This *acid* alſo acts upon all metallic ſubſtances by means of their phlogiſton, and diſſolves them with a moderate efferveſcence and heat; and by diſcharging part of the inflammable principle, calcines them more or leſs, according to their nature, and the manner of making the ſolution. This *acid*, when ſtrongly concentrated, will act powerfully on oils; and being diſtilled together with ſpirits of wine, yields *æther*. The *vitriolic acid* is more ſimple and powerful than the *nitrous* and *marine acids*, ſeparates them from the alkalies to which they are united, and ſubſtitutes itſelf in their place. This *acid* may be procured by collecting the vapour of burning ſulphur, confined by means of a glaſs bell, and received into the vapour of water.

Acids, *Volatile*, are thoſe which are more *volatile* than other *acids*: ſuch is the *volatile vitriolic*, or ſulphureous *acid*, which is only the common *vitriolic* acid combined with phlogiſton. Thoſe who are deſirous of farther information concerning the ſubject of *acids* in general, and the ſeveral claſſes and ſpecies of them above enumerated, may conſult Neumann's Works, tranſlated by Dr. Lewis, and Macquer's Dictionary of Chemiſtry.

Acids, in the *Materia Medica*, denote ſuch medicines as are poſſeſſed of an *acid* quality: as vinegar, ſpirit of vitriol, &c.

Acids and *alkalies* have been conſidered by ſome chemiſts as the two *athletæ* of nature, the great inſtruments whereby all things were effected; and the cauſe not only of a natural, but preternatural diſeaſes and cures. This hypotheſis we chiefly owe to Tachenius, a German chemiſt, and a follower of Helmont's ſyſtem, who publiſhed two books to ſhew, that all natural things are compoſed of *alkali* and *acid*. The *acid*, which was generated in the air from the ſun, and contained in it the hidden ſeeds of all things, aſſociated the *alkali* to itſelf; and from hence, as a paſſive ſubject, aroſe the *eſſe*, or forms of things. He was followed by Swalve, and his doctrine has been ſince defended by others, but combated and refuted by Bohnius, Boyle, Bertrand, Pitcairn, Hoffman, &c.

Some have pretended to correct and improve this hypotheſis of *acia* and *alkali*, by making *acid* and *viſcid* the cauſes of all diſeaſes, and fluid *alkali* the inſtrument of all cures. Act. Erud. Lipſ. An. 1689.

In reality, though the terms *acid* and *alkali* be new, notions much reſembling thoſe already recited may be met with in ancient writers, who frequently aſcribe the origin of many diſeaſes to unnatural, ſour, and corroſive juices, in the belly.

Acids, Mr. Boyle obſerves, not only diſturb the body while they continue *acid*, but in many caſes create diſtempers, whereof they ſhould ſeem the remedies.

Helmont aſſerts, that no *acid* can be lodged naturally in any part of the body, except the ſtomach; that if it extend farther, it becomes unnatural, infects the ſweet and balſamic juices, and proves the cauſe of moſt diſeaſes.

To correct the redundancy of *acids* in the ſtomach, all *alkalious*, or urinary ſalts, both fixed, as of wormwood, centaury, carduus; and volatile, as ſpirit of ſal ammoniac, ſpirit and ſalt of hartſhorn, ſcurvy-graſs, &c. are recommended. Under corrections alſo come all fixed earthy or metalline concretes, which abſorb the *acid*, as iron, ſaccharum ſaturni, antimony, and all oils and fat things, which obtund and inoſculate the parts of *acids*, as ſpirits of wine, oil of cloves, &c.

The medicinal qualities of *acids* are much diſputed by many phyſicians. Some alledge, that they are hurtful in coughs, and moſt of them, the juice of lemons excepted, in diſeaſes of the breaſt. A large doſe of ſuch as are very concentrated, taken internally, would prove a very corroſive poiſon. However, *acids*, properly adminiſtered, are excellent cooling and aperitive medicines, fit to quench thirſt, and to leſſen the acrimony of the bile. Theſe, being powerful *antiſeptics*, are eſteemed good in all putrid and malignant diſeaſes; nor are they leſs efficacious in inflammatory and feveriſh caſes. However, great care ought to be taken not to adminiſter them in ſuch large quantities as to corrode the bowels, or to coagulate the blood. *Acids* are alſo commended in the plague, and as *ſtyptics*. Thus vinegar not only ſerves to ſtop hæmorrhages, but being ſprinkled upon a red-hot tile, or iron, corrects the putrefaction of the air.

ACIDITY, Aciditas, the quality which conſtitutes or denominates a body *acid*; or that ſenſation of ſharpneſs and ſourneſs which *acids* excite upon the taſte.

ACIDULÆ, in *Natural Hiſtory*, a ſpecies of mineral waters, diſtinguiſhed by a latent acidity in their nature. When they are unaccompanied with heat, they are called *acidulæ*; but if heat be added to their briſk ſpirit, they are denominated *thermæ*.

Acidulæ are native waters, impregnated with particles of ſome acid mineral, as vitriol, alum, nitre, or ſalt; and, as Dr. Seip of Prymont firſt diſcovered, in 1736, and Dr. Brownrigg of Whitehaven farther evinced, with a conſiderable quantity of fixed air, formerly known by the name of their *ſpirit*, or *mephitis*, to which they owe their briſk ſparkling quality. Phil. Tranſ. Abr. vol. viii. p. 659; and Phil. Tranſ. vol. lv. p. 236, &c. For Dr. Prieſtley's method of making artificial waters of this kind, ſee the article Pyrmont.

The phyſicians alſo frequently include chalybeat and aluminous, or ferregineous, waters, under the claſs of *acidulæ*.

Their virtues depend, in general, on the principles and ingredients in their compoſition. A general analyſis of mineral waters may be made, either by evaporation, which will diſcover both the quantity of ſolid matter contained in the water, and, by ſubſequent trials, the peculiar nature of it; or by diſtillation, whence it may be known, whether the water contains any volatile matter, ſaline or bituminous; or again, by the mixture of certain liquors. The moſt common for this purpoſe are the infuſion of galls, ſyrup of violets, *ol. tart. per deliq. tinct. argenti, ſal. alk. vol. tinct. ſulp. vol. ſoap* and *aqua fortis*. But for a minute and more accurate inveſtigation, the materials are more numerous, and the *apparatus* more conſiderable. The *operator* ſhould be provided with ſcales and weights, an hydroſtatic balance, different ſorts of glaſſes and cements, a thermometer, a hand-pump, microſcopes, crucibles, &c.

A ſmall quantity of the infuſion of *galls* will diſcover whether the water be impregnated with iron. If it contains a coarſe oker, the colour ſtruck by the *galls* is very dark; the finer iron produces an inky purple; but the fineſt, ſuch as the Pyrmont water contains, gives an azure blue. A dram of *ſyrup* of *violets*, mixed with a ſmall wine-glaſs of the mineral water, will produce a green colour, if there be any alkaline ſalt, or alum, in it; though Dr. Rutty ſays, that if the ſpirit be new, alum will turn it red. This green colour is alſo obſerved, when a ſolution of iron is met with; with an acid, the ſyrup produces a red.

Ol. tart. per deliq. dropped into a ſmall quantity of the water to be examined, diſcovers earthy matter, by precipitating it in the form of a white cloud; if a whitiſh cloud riſes to the top, and the water be clear underneath, the quantity of earthy matter is very little. This oil precipitates the contents of all hard waters. If it meets with a ſolution of mercurial particles, it diſcovers them by producing a yellow colour; and it ferments with acids.

Tinct. argenti, if made with pure *aqua fortis*, is the moſt delicate addition for diſcovering ſea-ſalt in water, which it joins with, and falls in a milky cloud.

Sal. alk. vol. precipitates the contents of hard water, and diſcovers mercury, or any of its preparations, by turning the liquor whitiſh, and coagulating part of it. It diſcovers copper, by producing a blue colour.

Tinct. ſulph. vol. diſcovers lead in water, by turning it into a duſky brown colour. *Soap* readily determines whether the water be hard or ſoft, by diſſolving in it; if hard, the *ſoap* curdles; but if ſoft, forms with it an homogeneous mixture, and with a little agitation a froth is raiſed. *Aqua fortis* turns the water into a green colour, if it contains a ſolution of copper. After all, Dr. Lewis obſerves, that he can recollect but two inſtances, in which ſimple mixture affords any degree of certainty; the blue colour from copper and volatile alkali, and the bluiſh or purple from iron, and ſome aſtringents. See Hoffman de Acidulis, &c. Shaw's Improvements on Mineral Waters, in his Chemical Works, and Neumann's Works, with Dr. Lewis's Additions, p. 252.

ACIDULATED, any thing wherein acid juices have been put, in order to give it a coolneſs, and briſkneſs.

ACIDULOUS denotes a thing that is ſlightly *acid*; it is ſynonymous with the word *ſub-acid*.

ACIDUM *Ætherium*, *aluminoſum*, *catholicum*, *primigenium*, *ſulphureum*, are all different names for SPIRIT *of vitriol*.

ACIDUM *Pingue*, a name firſt given by M. Meyer, and afterwards adopted by M. Crans, and ſome other German chemiſts, to a certain cauſtic *acid*, which magneſia, limeſtone, or any calcareous earth, meets with in the fire, and attracts, loſing at the ſame time a conſiderable portion of water; and by means of which it is *neutraliſed*, rendered *cauſtic* and uncryſtalizable, and deprived of the property of efferveſcing with *acids*. M. Meyer ſuppoſes, that this ſubſtance nearly approaches to that of fire and of light; that by the aid of this *acid* lime unites with oil, diſſolves ſulphur, &c. that it enters very abundantly into the compoſition of vegetables and animals; that it is this which eſcapes from charcoal when burning, which increaſes the weight of metallic *calces*, and in general anſwers the various purpoſes in nature, which the Engliſh philoſophers, Hales, Black, Macbride, Prieſtley, and others, have aſcribed to fixed air. See AIR FIXED.

This new doctrine was attacked, and the Engliſh ſyſtem defended, in the year 1769, by M. Jacquin, a profeſſor at Vienna; but before this period it had made a very rapid progreſs in Germany; it was adopted by many chemiſts of reputation, and taught publicly in their ſchools. In 1770, M. Crans, phyſician to the king of Pruſſia, publiſhed a reply to M. Jacquin; in which he diſcovers a very zealous attachment to the *acidum pingue* of M. Meyer. See Lavoiſier's Eſſays Phyſical and Chemical, vol. i.

ACIDUM *Vitrioli vinoſum*. See ÆTHER and SPIRIT *Ætherial* of Frobenius.

ACINACES, in *Antiquity*, a kind of cutlas or ſcimetar, in uſe among the Perſians.

ACINARIA, in *Botany*, a name given by ſome to the marſh whortle-berries, or *vaccinia paluſtria*.

ACINI, in *Botany*, ſmall grains, or berries, growing in bunches, after the manner of grapes; alſo the ſtones or

ſeeds of grapes. The berries of the *elder*, *privet*, *ivy*, &c. are of this kind, and ſo called.

Anatomiſts have called ſome glands, of a ſimilar formation, *acini glanduloſi*.—See *Tab. Anat.* (*Splanch.*) *fig.* 41. *lit.* bb & dd, &c.

ACINIFORMIS *Tunica*, the ſame with the TUNICA UVEA of the eye. It is alſo called ACINOSA *tunica*.

ACINODENDRON, in *Botany*, the name given by Burman, in his Theſaurus, to a genus of plants, afterwards called MELASTOMA, belonging, in the Linnæan ſyſtem, to the genus *thymus*, and to the claſs and order *didynamia gymnoſpermia*.

ACINOS, ſtone, or wild BASIL.

ACINUS properly ſignifies the grape. See ACINI. It is alſo the name of the STAPHYLOMA.

ACITLI, in *Zoology*, the common Mexican name for the great creſted diver, common to Europe and America, and more uſually called by authors, the LEPUS *aqueus*, or water-hare.

ACKNOWLEDGMENT-*Money*, a ſum paid, in ſome parts of England, by tenants, on the death of their landlords, as an *acknowledgment* of their new lords.

ACLIDES, in the Roman *Military Art*, a kind of miſſive weapon, having a thong fixed to it, by which, after caſting it out of the hand, it might be drawn back again.

Servius deſcribes the *aclides* as full of ſpiculæ, or eminences. It was full of ſpikes, and ſo would do miſchief both where it ſtruck, and in the withdrawing. Each warrior ſeems to have been furniſhed with two.

ACLOWA, in *Botany*, the name of a plant common in Guinea, and uſed by the natives to cure the Itch. They rub it on the body, as we do our unguents. Petivier accounts it a kind of *colutea*, and has named it the *Guinea ſcorpioide colutea*, with leaves like the gum tragacanth ſhrub.

ACME, the height or top of any thing.

The word is Greek, ſignifies point, and is more eſpecially uſed to denote the height, or utmoſt vehemence, of a diſtemper.

Accordingly, ſome *inſtitution*-writers divide diſeaſes into four ſtates, or periods:

1. *Arche*, the beginning, or firſt attack.—2. *Anabaſis*, the growth.—3. *Acme*, the height—And, 4. *Paracme*, which is the declenſion of the diſtemper.

ACMELLA, in *Botany*, a plant which grows in the iſland of Ceylon, of which there are three ſpecies noted by botaniſts. It is commended in nephritic diſorders, but very rarely uſed. It is alſo called ACHAMELLA.

ACNE is a name given to a ſmall purple, or hard tubercle, on the face.

ACNIDA, in *Botany*, a genus of the *dioecia pentandria* in the Linnæan ſyſtem.

ACO, a name given to a fiſh found in the Mediterranean, called alſo AQUO, SARACHUS, and SARACHINUS.

ACOEMETÆ, or ACOEMETI, a name given to certain monks in the ancient church, who flouriſhed, particularly, in the Eaſt; and who were thus called, becauſe they had divine ſervice performed, without interruption, in their churches.

The word is formed of the privative *α*, and χοιμαω, *to lie down*, or *ſleep in bed*.

The *acoemetæ* divided themſelves into three bodies, each of which officiated in their turn, and relieved the others: ſo that their churches were never ſilent, night nor day.

The STYLITES were alſo ſometimes called *acoemetæ*.

There are a kind of *acoemetæ* ſtill ſubſiſting in the Romiſh church; the religious of the Holy Sacrament coming properly enough under that denomination; in regard they keep up a perpetual adoration; ſome or other of them praying, before the ſacrament, day and night.

ACOLCHICHI, in *Zoology*, the Mexican name for a bird, deſcribed by Nieremberg under the name of the PTEROPHOENICO *Indiarum*.

ACOLIN, in *Zoology*, the name of a bird of the partridge kind, common in the Spaniſh Weſt Indies. It is no larger than a ſtarling; its legs and feet are of a pale greeniſh colour, and its toes very long; its beak is yellow, and ſomewhat long; its head ſmall; its breaſt and belly are white; its ſides are ſpotted with brown, and its back and tail of a duſky yellowiſh brown; its tail is very ſhort, and both that and the back have ſome black ſpots, and ſome narrow ſtreaks of white. It frequents the ſides of lakes, and is ſuppoſed to feed on flies, worms, and other inſects, which are found about watery places. It is a tolerably well taſted bird.

ACOLUTHI, or ACOLYTHI, in *Antiquity*, a term applied to ſuch perſons as were ſteady and immoveable, in their reſolutions.

The word Ακολυθος is compounded of the privative *α*; and κελευθος, *via*, *way*; as ſtill perſiſting in their way, or courſe.

For this reaſon, the Stoics were called *acolythi*; becauſe nothing could ſhake or alter their reſolves.

Among the *Eccleſiaſtical Writers*, the term *acolythus*, or *acolythiſt*, is peculiarly applied to thoſe young people, who, in the primitive times, aſpired to the miniſtry; and, for that purpoſe, continually attended the biſhops: which aſſiduity occaſioned their being diſtinguiſhed by this appellation.

In the Romiſh church, *acolythi* were of longer continuance; but their functions were different from thoſe of their firſt inſtitution. They were ſuch as had only received the firſt of the four leſſer orders, whoſe buſineſs was to light the tapers, carry the candleſticks, the incenſe-pot, and prepare the wine and water.

At Rome there were three kinds of *acolythi*; viz. *palatini*, who waited on the pope; *ſtationarii*, who ſerved in churches; and *regionarii*, who, together with the deacons, officiated in other parts of the city.

ACOLUTHI, or *Acolythus*, was alſo a title in the Grecian empire, given to the captain or commander of the VARANGI, a body of guards appointed for the ſecurity of the emperor's palace.

ACOLYTHIA, in the Greek church, denotes the office, or order of divine ſervice.

The ſame name is alſo given to the prayers, ceremonies, hymns, and the like, whereof the Greek ſervice is compoſed.

ACON, an inſtrument uſed in the ancient exerciſes, like the *diſcus*.

ACON gave name to an ancient order of knighthood, who were afterwards united to the knights *hoſpitallers*.

ACONCROBA, in *Botany*, a name given by the natives of Guinea to a plant, growing wild with them, and in great eſteem for its virtues in the ſmall-pox. They give an infuſion of it in wine. The leaves of this plant are opake, and as ſtiff as thoſe of the phillerey; they grow in pairs, and ſtand on ſhort foot-ſtalks; they are ſmall at each end, and broad in the middle; and the largeſt of them are about three inches in length, and an inch and quarter in breadth in the middle. They ſomewhat reſemble thoſe of our bay. They are of a duſky colour on the upper ſide, and of a pale green underneath.

ACONE, in the *Natural Hiſtory* of the ancients, the name of a ſtone uſed as a whetſtone, and for ſeveral other purpoſes; but more uſually known among the Romans by the name COTICULA. It ſignifies alſo a mortar for the purpoſe of levigation.

ACONITE, MYOCTONON, in *Botany*, a plant, famous among the ancients, both in quality of a POISON, and a remedy.

Aconitum is ſaid, by ſome, to take its name from Aconæ, a city in Bithynia, where it grew in great abundance: though it is alſo found in other places, particularly the mountains about Trent, &c.

The flower is of the polypetalous anomalous kind, conſiſting of five irregular leaves, and ſomewhat reſembling a man's head, with a hood or helmet on it. The upper petal ſeems to perform the office of a hood or helmet; the two lower leaves repreſent that part of the helmet which receives the lower jaw, and the two wings ſeem adapted to the upper part of the face, or the temples. From the center of the flower there ariſe two piſtils, ſhaped like feet, and received into the hollow of the upper petal or hood, as is alſo the piſtil, which finally becomes a fruit, compoſed of ſeveral membranaceous vaginæ collected into a head, and uſually containing angular and wrinkled ſeeds. See *Tab.* I. *of Botany*, *Claſs* II.

The ancient botaniſts give the name *aconite* to ſeveral plants, of different kinds.—One ſpecies they called *lycoctonum*, λυκοκτονον, *wolfs-bane*; or *cynoctonon*, κυνοκτονον, *dogs-bane*, from its effects: of theſe they had likewiſe their diviſions; as the *napellus*, thus called *a napo*, becauſe its root reſembled the turnep-kind: another called *anthora*, q. d. *anti-thoræ*, good againſt diſorders cauſed by the *thora*, another kind of *aconite*.

Dioſcorides only makes two kinds of *aconite*; the firſt the ſame with the *thelyphonium*, the ſecond the proper *aconite*. In ſtrictneſs there appears to have been but one ſpecies of *aconite*, which reſembled the *thelyphonium* in its virtue and effects, but differed from it in leaf, colour, ſoil, root, &c. Mr. Tournefort, however, enumerates twenty-one ſpecies of *aconite*.

The claſs of *aconites* is held extremely cauſtic and acrimonious, in virtue whereof they produce mortal convulſions, or inflammations, which end in mortifications. The ancients were ſo ſurpriſed at theſe effects, that they were afraid to touch the plants; and hence a thouſand ſuperſtitious precautions about the manner of gathering them.—Their roots are, however, held of ſervice in malignant fevers, by ſome; and, accordingly, make an ingredient in ſome orvietans, and other alexipharmic compoſitions.

The ancients uſed this plant againſt the ſting of the ſcorpion, which is ſaid to be deadened by the touch of the *aconite*, and reſtored to its vigour by that of hellebore.—Theophraſtus relates, that there was a way of preparing it, in thoſe days, ſo as it ſhould only deſtroy at the end of one, or two years.—Arrows dipt in its juice are ſaid to prove mortal, wherever they wound.—The Indians uſed *aconite*, corrected in cows urine, with good ſucceſs againſt fevers.

Some compare the poiſon of the *aconite* to that of the NAPELLUS. Others ſeem to make it of the ſame kind with that of the SALAMANDER. Dr. Mead will have it to agree with the CICUTA. It is the root alone that is hurtful; for its leaves and fruit are ſaid to be innocent.

The Engliſh call this plant wolf's-bane, from the Anglo-Saxon *wulfes-bane*.

ACONITI, *ακονιτι*, is an appellation given to ſome of the ancient ATHLETÆ, but differently interpreted. Mercurialis underſtands it of thoſe who only anointed their bodies with oil, but did not ſmear themſelves over with duſt, as was the uſual practice. M. Burette will have it to ſignify thoſe who conquered eaſily without duſt, q. d. *απονητι*, *αμαχει*, *with little trouble*.

ACONITON ſignifies not plaſtered, and is a name given to veſſels not lined within.

ACONTIAS, a name uſed by ſome authors, for a ſort of COMET, or METEOR, whoſe head appears round, or oblong, and its tail very long, and ſlender, reſembling a javelin.

It takes its denomination from a ſerpent thus called, frequent in Calabria and Sicily; where it is alſo named *ſaettone* (from *ſagitta*, *an arrow*), by reaſon of its flying at paſſengers like an arrow; in order to which, it winds itſelf up a tree, to ſpring thence with the greater violence. For the like reaſon the Greeks call it *acontias*, of *ακοντιον*, a *dart*, or *arrow*.

It differs from the XIPHIAS, in that it is longer, and more like a dart; and the other is ſhorter and broader in the middle.

ACONTIAS, in *Zoology*, the name of a ſpecies of ſerpent, called alſo JACULUM, or the dart-ſnake, from its manner of vibrating its body in the manner of a dart. Bellonius found one of theſe in the iſland of Rhodes, which he deſcribes in this manner. It is about three hands-breadth long, and of the thickneſs of one's little finger. Its colour is a milky grey on the back, variegated with ſmall black ſpots, like ſo many eyes; and on the belly it is perfectly white. The neck is wholly black, and from that two milk-white ſtreaks run all the way along the back to the tail; the black ſpots alſo are each ſurrounded with a ſmall circle of white. It is found in Egypt and Lybia, and in the iſlands of the Mediterranean. It is alſo called CENCHREAS and CENCHRITES.

ACONTIUM, in *Ancient Writers*, a kind of Grecian dart, or javelin, ſomewhat reſembling the Roman PILUM.

ACOPA, in *Botany*, a name given by Dioſcorides, and ſome other authors, to the TRIFOLIUM *paludoſum*, or buck-bean.

ACOPA, in *Medicine*, is alſo uſed to denote remedies againſt the ill conſequences proceeding from laſſitude, occaſioned by too violent labour, exerciſe, or the like; ſuch as tenſions, pains in the bones, &c. They are alſo proper on many other occaſions, ſome being of a warm, others of a mollifying nature. The name is alſo applied to the ſoft cerates made uſe of for tumours, &c.

The word is derived from *α* privative, and *κοπος*, *wearineſs*.

ACOPIS, the name of a ſort of foſſile ſalt, deſcribed by Pliny, and ſaid to have been uſed by the ancients, mixed with oil, and heated, to rub over the limbs to cure wearineſs. Others ſay it is a precious ſtone like glaſs, marked with ſpots of a golden colour.

ACOPON, or ACOPUM, ſee ACOPA.

ACOPOS, a plant mentioned by Pliny, ſaid to be the ſame with the ANAGYRIS of Dioſcorides, which Gerard ſays is the bean-trefoil; it ſignifies alſo LABURNUM.

ACOR ſignifies ſourneſs or acrimony.

ACORDINA denotes Indian tutty.

ACORI, or BLUE CORAL, in *Natural Hiſtory*. The true *acori* is very ſcarce; ſome, however, is fiſhed on the coaſts of Africa, particularly from Rio-del-re, to the river of the Camarones. This CORAL is part of the merchandize which the Dutch trade for with the Camarones; that of the kingdom of Benin is alſo very much eſteemed. It grows in form of a tree on a rocky bottom. It is alſo a name for the greater GALANGAL root.

ACORN, in *Natural Hiſtory* and *Agriculture*, denotes the fruit of trees of the oak kind.

The *acorn*, according to Dr. Grew, is the nut of an oak, with this only difference, that beſides the cup it ſtands in, it has only a leathern or parchment cover, inſtead of a ſhell. And hence it is, that whereas the kernel of a nut is ſweet, that of an *acorn* is of a very rough taſte; the auſtere parts of the ſap, which in a nut are drained off into the ſhell, being here imbibed by the kernel itſelf.

Writers on huſbandry give rules concerning ſeminaries or nurſeries of *acorns*, the propagating, ſowing, or planting of *acorns*.

For timber, thoſe *acorns* are to be choſen as ſeed which are moſt ſolid and heavy, not thoſe which are biggeſt. See SEEDS.

In the Phil. Tranſ. vol. lviii. Nº 11, an. 1768, p. 75, there is a curious and important memoir by John Ellis, Eſq. containing a method of preſerving *acorns* in bee's-wax, for a whole year, in a ſtate fit for vegetation, whereby other ſeeds may be preſerved in like manner; and ſuch as are valuable may be brought over from the Eaſt Indies, to plant for the benefit of the American colonies.

Acorns were the food of the firſt ages; but when corn was found out, *acorns* were neglected. They are of little uſe in our days, but to fatten hogs, and other cattle, and poultry. Yet among the Spaniards the *acorn*, GLANS *Iberica*, is ſaid to have long remained a delicacy, and to have been ſerved up in the nature of a deſert.

In dearths, *acorns* have been ſometimes dried, ground into meal, and baked into bread.

The inhabitants of Chio held out a long ſiege, without other food. But they are ſaid to breed head-achs and ventoſities, and to be hard of digeſtion. A decoction of *acorns* is reputed good againſt dyſenteries and colics. A peſſary of them is ſaid to be good in immoderate fluxes of the menſes.

ACORN, in *Sea-Language*, denotes a little ornamental piece of wood in the ſhape of a cone, fixed on the top of the ſpindle on the maſt-head, above the vane, to keep it from coming off the ſpindle in a whirlwind, or when the ſhip leans much upon one ſide under ſail.

ACORUS, a medicinal plant, of the flag kind; frequently confounded by the ancients, and alſo by the modern apothecaries, with the CALAMUS *aromaticus*. It pertains to the claſs of *hexandria monogynia*, in the Linnæan ſyſtem. They are diſtinguiſhed by this, that from the middle of ſome of the leaves of the latter, there ariſes a longiſh cluſter of an infinity of little flowers, the thickneſs of the little finger, and reſembling *macropiper*, or long pepper.—The other is the common flag-flower.

It is only the root of the ACORUS that is uſed in phyſic; and it is this we uſually call *acorus*.—The *calamus aromaticus* is brought from Lithuania and Tartary: it is knotty, reddiſh without, and white within; as thick as the little finger, and half a foot long.

It is ſpicy and bitteriſh; and uſed in cephalic and ſtomachic compoſitions.—It is alſo an ingredient in the THERIACA *Andromachi*. Its principal uſe is in obſtructions of the menſes, ſpleen, and liver; in the cholic, &c.

Some rank *galangals* as a ſpecies of *acorus*.

ACORUS *adulterinus*, or *vulgani*, in the *Materia Medica*, the name of the root of the *iris lutea paluſtris*, or common yellow water-FLAG-*flower*.

ACOS, in *Medicine*, ſignifies a remedy.

ACOUSMATICI, an appellation given to ſuch among the diſciples of Pythagoras, as were ſtill under five years probation.

The *acouſmatici* are ſometimes alſo called by Latin writers, *acuſtici*. The *acouſmatici* ſtood oppoſed to the *mathematici*, who were thoſe initiated into the ſecrets of ſcience; and the *acouſmatic* philoſophy, to the *mathematic*.

Some have denied the appellation of Pythagoreans to be due to the *acouſmatici*, becauſe many of theſe had their learning not immediately from Pythagoras, but from Hippaſus, who, according to ſome, was of Crotona, but according to others, of Metapontium.

ACOUSTICS, ACOUSTICA, the doctrine, or theory of hearing, or of ſounds.

The word is formed of the Greek ακȣω, *audio, to hear*.

Acouſtics is the ſame with what we otherwiſe call PHONICS.

ACOUSTICS, ACOUSTICA, or ACOUSTIC *Medicines*, are remedies againſt the imperfections and diſorders of the EAR; or of the ſenſe of HEARING.

ACOUSTIC is particularly applied to *inſtruments* uſed by thoſe who are dull of hearing, to ſupply that defect.

Dr. Hook ſays, it is by no means impoſſible to hear the loweſt whiſper that can be made, to the diſtance of a furlong; and that he knows a way of hearing any perſon ſpeak through a ſtone-wall three feet thick.

ACOUSTIC *Nerve*. See AUDITORY *Nerve*.

ACOUSTIC *Veſſels*. In the ancient theatres there were a kind of *acouſtic* veſſels, made of braſs, ſhaped, as ſome have ſaid, in the bell-faſhion, which being of all tones within the pitch of the voice, or even of inſtruments, rendered the ſounds more audible, ſo that the actors could be heard through all parts of the theatres, which were even 400 feet in diameter.

ACOUSTIC *Duct*, is applied to the external paſſage of the ear; called alſo *meatus auditorius*.

ACQUEST, or ACQUIST, is underſtood in a legal ſenſe, of GOODS, or effects, not deſcended or held by inheritance; but acquired either by purchaſe, or donation.

The word is formed of the verb *acquerir*, from *acquirere, to acquire*, or *get*.

The French laws make a deal of difference between *acqueſts*, and hereditary effects. The civil law allows none. See HEIR.

ACQUEST is alſo popularly uſed for conqueſt, or a place acquired by the ſword.

ACQUIETANDIS *Plegiis*, a writ of juſticies lying for a ſurety againſt the creditor that refuſes to acquit him after the debt is paid.

ACQUIETARE, in ancient *Law-Books*, ſignifies to diſcharge, or pay the debts of a perſon deceaſed; as the heir thoſe of his father, &c.

ACQUISITION, the act of procuring a right or title to the enjoyment, or property of a thing.

ACQUISITION is alſo ſometimes uſed for an ACQUEST.

ACQUITTAL, a diſcharge, deliverance, or ſetting free of a perſon from the guilt or ſuſpicion of an offence.

Acquittal is of two kinds; in *law*, and in *fact*.—When two are appealed or indicted of felony, one as principal, the other as acceſſory; the principal being diſcharged, the acceſſory is, by conſequence, alſo freed: in which caſe, as the acceſſory is *acquitted by law*, ſo is the principal *in fact*.

ACQUITTAL is alſo uſed, where there is a lord MESN, and tenant, and the tenant holds land of the meſn, and the meſn holds over the lord paramount: here, the meſn ought to acquit the tenant of all ſervices claimed by any other for the ſame lands; the tenant being to do ſervice to the meſn only, and not to divers lords for one parcel of land.

ACQUITTANCE, or QUITTANCE, a releaſe, or diſcharge in writing, of a ſum of money, or other duty, which ought to be paid, or done.

The verb *acquit*, the participle *acquitted*, and the noun *acquittal*, do all ſignify a diſcharge from an offence objected.—In which ſenſe, we meet with *acquitted* by proclamation.

ACRASIA, ΑΚΡΑΣΙΑ, is uſed by ſome writers in phyſic, for the exceſs or predominancy of one quality above another; either in a mixture, or in the conſtitution of a human body. The word is uſed by Hippocrates, and other Greek *medicinal* writers, to expreſs exceſs of any kind, intemperance and imbecillity.

ACCAI, an Arabic word, ſignifying either SATYRIASIS, or FUROR *uterinus*.

ACRAS, or rather *Achras*, the wild PEAR.

ACRATISMA, in *Antiquity*, a breakfaſt among the old Greeks, conſiſting of a morſel of bread ſoaked in pure unmixed wine.

ACRATONELLI. See MULSUM.

ACRATOS, from α negative, and κεραννυμι, *I mix*; ſimple, unmixed. This is very often uſed by Hippocrates, and applied to excretions of different ſorts, and is always of very bad preſage. Thus in his Prænotiones, he obſerves, that in all painful diſorders of the pleura and lungs, the ſpittle ſhould appear mixed and yellow; and that it is a dangerous ſymptom if it be all yellow, without any mixture. And immediately after he tells us, that if the ſpittle be ſo unmixed, as to appear black, it is a very bad preſage.

ACRE is uſed in the dominions of the Mogul, in regard to his revenues, for the ſum of 100,000 roupees; eight roupees being equal to about one pound ſterling.

ACRE, a quantity of land, containing four ſquare ROODS, or 160 ſquare POLES, or PERCHES.

The word perhaps is formed from the Saxon *acere*, or German *acker*, *field*, of the Latin *ager*. Salmaſius derives it from *acra*, uſed for *acæna*, a land meaſure among the ancients, containing 10 feet.

By the cuſtom of countries the perch differs in quantity, and of conſequence, the acres of land: it is commonly but 16½ feet; but in Staffordſhire it is 24 feet. According to the Stat. 34 Hen. VIII. concerning the ſowing of flax, it is declared, that 160 perches make an *acre*; and the ordinance of meaſuring land, 35 Edw. I. agrees with this account. The word *acre* formerly meant any open ground or field; as Caſtle-*acre*, Weſt-*acre*, &c. and not a determined quantity of land.

Alſo *acre*, or *acre*-fight, is an old ſort of duel, fought by ſingle combatants, Engliſh and Scotch, between the frontiers of their kingdoms, with ſword and lance; and this duelling was alſo called camp-fight, and the combatants, champions, from the open field, that was the ſtage of trial.

Acre alſo by computation is 10 ſquare chains, of 22 yards each, that is, 4840 ſquare yards. And a mile being 1760 yards ſquare, a mile ſquare will be found to contain 640 *acres*.

The Scotch *acre* contains four Scotch roods, and bears proportion to that of the Engliſh by ſtatute, as 100,000 to 78,694, regard being had to the difference betwixt the Scotch and Engliſh FOOT.

The French *acre*, *arpent*, contains 1¼ Engliſh *acre*, or 55206 ſquare Engliſh feet, whereof the Engliſh *acre* contains only 43560.—The Straſburg *acre* is about half an Engliſh *acre*.—The Welch *acre* contains commonly two Engliſh ones.—The Iriſh *acre* is equal to one *acre*, two roods, nineteen perches $\frac{27}{121}$, Engliſh.

Houghton gives a table of the number of *acres* to a houſe in each county of South-Britain, which is found to vary in the Engliſh counties, from 3½ *acres*, the proportion in Middleſex, and 17½ in Surry, to 49 *acres* in Southampton. In the Welſh counties, from 51 *acres*, as it is found in Flintſhire, to 193, as in Merionethſhire.

Dr. Grew attempts to aſcertain the number of *acres* in England, which, according to him, amounts to 46 millions and 80000. Phil. Tranſ. N°. 330, p. 266, ſeq. or Abr. vol. iv. p. 450.

Sir William Petty reckons but 28 millions; others 29 millions. And by an account of the number of *acres* in each county, ſuppoſed to be taken from ſome old regiſter, the number of *acres* in England amounted only to 39¼ millions. But Dr. Grew ſhews, that this is too little.

The United Provinces are ſaid to contain 4382000 *acres*. The province of Holland but one million of *acres*; and was thought formerly to contain 2,400,000 ſouls. But by the more accurate computations of Mr. Kerſſeboom, that province does not contain one million of ſouls. If England were as well peopled in proportion, it would contain 46 millions of inhabitants; that is, perhaps, about five times as many as it now contains.

By a ſtatute of 31 Eliz. it is ordained, that if any man erect a new cottage, he ſhall add four *acres* of land to it. See SURVEYING.

ACRE-*Tax*, a tax laid on land at ſo much per *acre*.—In ſome places this is alſo called *acre-ſhot*.

Impoſitions on lands in the great level are to be raiſed by a proportionable *acre-tax*, 20 Car. II. cap. 8.—An *acre-tax* of 2*s*. 6*d*. *per acre*, for draining Hadenham-level, 13 Geo. I. cap. 18.

ACREME, a term ſometimes uſed in ancient law-books, for ten acres.

ACRIBEIA, a term purely Greek, Ακριϐεια, literally denoting an exquiſite or delicate accuracy; it is ſometimes uſed in our language for want of a word of equal ſignificancy.

ACRID, in *Natural Hiſtory*, denotes any thing ſharp or pungent to the taſte.

Ancient *Naturaliſts* diſtinguiſh two kinds of *acrid* taſtes; the firſt proceeding from hot and dry, as that of pepper; the ſecond from hot and moiſt, as that of garlic.

Acrid, according to Grew, properly belongs to the claſs of compound taſtes. It is not ſimply ſour or pungent; there being bodies not *acrid*, which yet are pungent, e. g. *arum*; nor is it ſimply hot; for there are many hot bodies which are not *acrid*, as the roots of zedoary, yarrow, and contrayerva.—The characteriſtic therefore of *acritude* conſiſts in pungency joined with heat.

Acrid bodies, by the pungency and tenuity of their parts, incide, digeſt, heat, open, irritate, purge, cauſe appetite, &c. They inflame the ſkin, when chewed produce ſaliva, and when ſnuffed, ſneezing.

The eating of *acrid* food with thoſe intentions, is particularly called by the Greeks *drimyphagia*.

Acrid things are hurtful to the head and eyes, and contrary to bilious temperaments; but advantageous to pituitous ones.

Acrids may be divided into claſſes, according as they yield their acrimony. 1. By diſtillation. 2. By infuſion. 3. Neither by infuſion nor diſtillation.

In leucophlegmatic habits they are powerful expectorants, deobſtruents, diuretics, and emmenagogues. Their virtue frequently depends on the trouble which they give to the ſtomach.

ACRIDOPHAGI, in the ancient *Geography*, a nation, or people, ſaid to have fed on locuſts.

The word is compounded of ακρις, *locuſt*, and φαγω, *to eat*.

The *Acridophagi* are repreſented as a people of Ethiopia, inhabiting near the deſerts. In the ſpring they made proviſion of a large kind of locuſts, which they ſalted, and kept for their ſtanding food all the year: they lived to forty years of age, then died, as is ſaid, of a ſort of winged worms generated in their bodies. See S. Jerom againſt Jovinian, lib. ii. and on S. John, cap. 4. Diodor. Sicul. lib. iii. cap. 3. and 29. and Strabo, lib. xvi.—Pliny alſo ſpeaks of *Acridophagi* in Parthia; and S. Jerom, in Libya.

Though the circumſtances of theſe people be fabulous; yet may the *Acridophagia* be true; and to this day they are ſaid to eat locuſts in ſome parts of the Eaſt. This is confirmed by the accounts of the Daniſh miſſion, in Niebuhr's Deſcription de L'Arabie, p. 150, & ſeq. And hence S. John the Baptiſt is ſaid to have lived on locuſts, ακριδες, and wild honey, Matth. cap. iii. ver. 4.

Yet is the rendering ακριδες, by locuſts, as the Engliſh tranſlators have done, much controverted.—Iſidore of Peluſium, in his 123d epiſtle, ſpeaking of this food of S. John, ſays, it was not animals, but the tops of herbs; and even charges thoſe who underſtood the word otherwiſe with ignorance; but St. Auguſtine, Beda, Ludolphus, and others, are of a different opinion. Accordingly, the Jeſuits of Antwerp reject, with contempt, the opinion of the Ebionites, who for ακριδες put εγχριδες, a delicious diet, prepared of honey and oil; that of ſome other innovators, who read αχαριδες, or χαριδες, *ſea-crabs*; and that of Beza, who reads αχραδες, *wild pears*.

ACRIFOLIUM ſignifies any prickly-leaved plant.

ACRIMONY, that quality in things which renders them ACRID to the taſte.

Acrimony imports much the ſame with *aſperity*, or ſharpneſs; and expreſſes a quality in bodies, by which they corrode, deſtroy, or diſſolve others.

Salts are only cauſtic in virtue of their *acrimony*. The *acrimony* of the bile is ſuppoſed the cauſe of divers diſorders; and a catarrh is believed to be a defluxion of *acrimonious* humour.

The Briſtol water is recommended by Dr. Randolph for tempering the bad effects of *acrimonious* blood. This he mentions as its firſt and principal virtue. See his Enquiry into the Medicinal Virtues of Briſtol Water, 8vo. 1750.

ACRIS ſignifies a locuſt, the top of a mountain, and the extremities of fractured bones.

ACRIVIOLA, ſee NASTURTIUM *Indicum*, for which it is a name.

ACROAMATIC, in a more general ſenſe, denotes a thing ſublime, profound, or abſtruſe. In which ſenſe, it ſtands oppoſed to *exoteric*.

We ſay *acroamatic* philoſophy, *acroamatic* theology, an *acroamatic* method, *acroamatic* interpretation, &c.

Few ſects, or profeſſions, but have two ways of teaching, if not two ſorts of doctrine, an *acroamatic* for adepts and proficients; and an *exoteric* for novices. We find traces of this among the heathen as well as Chriſtian divines, philoſophers, and chemiſts. Hence the ceremonies of initiations, and ablutions, the diſcipline of ſecrecy; and hence alſo the origin of fables, ænigmas, parables, ſymbols, &c.

ACROAMATIC is ſometimes alſo uſed in a more general ſenſe for any thing kept ſecret, or remote from popular uſe.

In which ſenſe Reimman gives the title *bibliotheca acroamatica*, to a deſcription of the MSS. of the library of Vienna, abridged from the vaſt commentaries of Lambecius and Neſſelius.

ACROAMATICI, a denomination given the diſciples, or followers of Ariſtotle, &c. who were admitted into the ſecrets of the inner or *acroamatic* philoſophy.

ACROATICS, a name given to Ariſtotle's lectures in the more difficult and nice parts of philoſophy; to which none but his diſciples and intimate friends were admitted, whereas the *exoteric* were public or open to all; but there are other differences. The *acroatic* were ſet apart for the higher and more abſtruſe ſubjects; the *exoteric* were employed in rhetorical and civil ſpeculations. Again, the *acroatics* were more ſubtle and exact, evidence and demonſtration being here aimed at; the *exoterics* chiefly aimed at the probable and plauſible. The former were the ſubject of the mornings exerciſes in the Lyceum, the latter of the evenings: add that the *exoterics* were publiſhed, whereas the *acroatics* were kept ſecret, being either entirely concealed, or if they were publiſhed, it was in ſuch obſcure terms, that few but his own diſciples would be the wiſer for them. Hence, when Alexander complained of his præceptor for publiſhing his *acroatics*, and thus revealing what ſhould have been reſerved to his diſciple; Ariſtotle anſwered, that they were made public and not public, for that none who had not heard them explained by the author, *viva voce*, would underſtand them.

The word is formed from ακροαομαι, *to hear*.

ACROBATICA, or ACROBATICUM, an ancient engine, whereby people were raiſed aloft, that they might ſee more conveniently about them.

The *acrobatica* among the Greeks amounted to the ſame with what they call *ſcanſorium* among the Latins.

Authors are divided as to the office of this engine. Turnebus and Barbarus take it to have been of the military kind, raiſed by beſiegers, high enough to over-look the walls, and diſcover the ſtate of things on the other ſide. Baldus rather ſuppoſes it a kind of moveable ſcaffold, or cradle, contrived for raiſing painters, plaiſterers, and other workmen, to the tops of houſes, trees, &c. Some ſuſpect that it might have been uſed for both purpoſes.

ACROCHIRISMUS, ακροχειρισμος, among the ancients, a kind of gymnaſtic exerciſe, wherein the two parties contended only with their hands and fingers, without cloſing, or engaging the other parts of the body.

The word is alſo written *acrochireſis*, and *acrochiria*: it is originally Greek, formed from ακροχειρ, the part employed in this combat, which ſome would needleſsly reſtrain to the tips of the fingers; though the *etymon* does not make this neceſſary.

Some make this a diſtinct exerciſe from wreſtling, and ſuppoſe it to have given the denomination *acrochiriſtæ* to a peculiar ſet of *athletæ* who profeſſed it. Others with more probability conſider it as only a ſpecies, or branch of wreſtling; ſome will have it to have been properly only a prelude to a wreſtling bout, wherewith the *athletæ* began to try each others ſtrength, and bring their arms into play. This exerciſe made part of the *pancratium*. Pauſanias ſpeaks of a famous *pancratiaſt*, named Soſtrates, who got the ſurname *Acrochirſites*, or *Acrochiriſtes*, from his having overcome all his antagoniſts at the *acrochiriſm*.—It appears to have been in uſe in the age of Hippocrates, who aſcribes to it a virtue of extenuating the reſt of the body, and making the arms fleſhy.

ACROCHORDON, a painful ſpecies of WART, very prominent and pendulous, having a large head with a ſmall pedicle, or baſe.

Theſe are alſo called *penſiles verrucæ*, or *hanging warts*, and ſtand diſtinguiſhed from *ſeſſiles verrucæ*, or *myrmecia*. Others deſcribe the *acrochordon*, as a harder, rougher ſort of wart, growing under the cutis, very callous, and uſually of the ſame colour with the ſkin; ſmall at bottom, and bigger upwards, but rarely exceeding the ſize of a bean.

ACROCOLIA, ακροκωλια, from ακρος, *extreme*, and κωλον, *a limb*. Theſe are the extremities of animals, which are uſed in food, as the feet of calves, ſwine, ſheep, oxen, or lambs; and of the broths of which, jellies are made. They are recommended by Hippocrates as proper food, where there is a tendency to a dropſy. They are in general recommended as ſtrengtheners for weak people.

ACROCORION, in *Botany*, a name uſed by ſome authors for the ſeveral ſpecies of the ſpring crocuſes.

ACROE, in *Botany*, the name given by the natives of Guinea, to a kind of ſhrub, which they uſe in wine, as a reſtorative and analeptic. It is of the trifoliate kind, and has ſomewhat of the appearance of the corallodendrons, but is not prickly; the middle or end leaf ſtands on a pedicle of an inch long, the other two leaves have no pedicles at all. Phil. Tranſ. N°. 232.

ACROMION, ACROMIUM, in *Anatomy*, the upper proceſs of the SCAPULA, or ſhoulder-blade.

The word is derived from ακρος, *higheſt*, and ωμος, *ſhoulder*, q. d. the extremity of the ſhoulder.

Some have thought the *acromion* of a nature different from other bones; becauſe, during infancy, it appears no more than a cartilage, which oſſifies by little and little, and about the age of twenty years becomes hard and firm, like a common bone.

ACROMONOGRAMMATICUM, among poets, denotes a kind of poem, or compoſition, wherein each ſubſequent verſe commences with the letter, with which the verſe preceding terminates.

ACROMPHALION, from ακρος, *extreme*, and ομφαλος, the *navel*; the tip of the navel.

ACRON, ακρον, in *Medicine*, ſignifies that which is moſt excellent in its kind.

ACRON, in *Botany*, among the ancients, was uſed to ſignify the *capitulum*, top, or flower of plants of the thiſtle kind.

ACRONYCHAL, ACRONICHUS, in *Aſtronomy*, is applied to the RISING of a ſtar or other point, above the horizon, when the ſun ſets; or its SETTING when the ſun riſes.

The *acronychal* is one of the three poetical riſings and ſettings of the ſtars; and ſtands diſtinguiſhed from COSMICAL and HELIACAL.

Among ancient writers, a ſtar was properly ſaid to be *acronychal*, or to riſe *acronychally*, which roſe in the evening, when the ſun was ſet. Greek writers, it is true, uſe the term ακρονυχιας indifferently, in ſpeaking either of evening or morning, by reaſon both are conſidered as ακρα της νυκτος, *the extremities of the night*. And hence, among them we find *acronychal* applied to the riſing and ſetting of the ſtars, either in the morning or evening. But the ancients were more diſtinct, and by the ακρονυκτιος rather meant the firſt beginning or approach of night, than the end or period of it; and accordingly among them, the ſtars which roſe in the evening, not thoſe in the morning, were ſaid to riſe *acronychally*.

This word is ſometimes ignorantly ſpelt *achronical*, or *achronichial*, from a miſtaken notion of its being derived from α, and χρονος, *time*.

ACRONYCHAL is likewiſe an appellation more peculiarly given to the ſuperior planets, Saturn, Jupiter, and Mars, when they were come to the meridian of midnight.

ACRONYCTÆ, ſtars riſing in the twilight, about ſunſetting.

ACROPATHOS ſignifies literally a diſeaſe at the top, or ſuperior part.

ACROPOSTHIA, ακροποσθιη, or ακροποσθια, from ακρος, *extreme*, and ποσθη, the prepuce, or ſkin, which covers the glans of the penis. The extremity of the prepuce, that which is cut off in circumciſion.

ACROSPELOS, a name given to the wild-oat graſs, or BROMUS.

ACROSPIRE, in *Natural Hiſtory*, &c. the ſame with PLUMULE.

ACROSPIRED, or ACRESPIRED, is uſed in reſpect of barley; which, in the operation of making MALT, is apt, after coming, or ſprouting, at the lower, or root-end, to become *acroſpired*, i. e. to ſprout alſo at the upper, or blade-end.

By 6 Geo. I. cap. 21. *Malt-makers* are forbid to wet or water their malt when on the floor, or couch; or to permit it to *acreſpire*.

ACROSTIC, a kind of poetical compoſition, the verſes whereof are diſpoſed in ſuch manner, as that the initial letters make up ſome perſon's name, title, motto, or the like.

The word is derived from the Greek ακρος, *ſummus*, that which is at one of the extremes; and ϛιχος, *verſus*.

There are alſo *acroſtics*, where the name or title is made up by the initial letters of the middle words, or the laſt of the final ones.—And others which go backwards; beginning with the firſt letter of the laſt verſe, and proceeding upwards. Some refiners in this trifling way, have even gone to PENTACROSTICS; where the name is to be repeated five times.

ACROSTIC is alſo an appellation given by ſome authors to two ancient epigrams in the firſt book of the Anthology; the one in honour of Bacchus, the other of Apollo. Each conſiſts of 25 verſes; the firſt whereof is the propoſition, or argument of the whole, and the other 24 compoſed of four epithets, beginning each with the ſame letter; and thus following in the order of the 24 letters of the Greek alphabet: ſo that the firſt of the 24 comprehends four epithets beginning with α; the ſecond as many, with β; and ſo of the reſt to ω; which makes 96 epithets for each god.

Among *Eccleſiaſtical Writers*, *acroſtics* denote the ends of verſes of pſalms, which the people ſang by way of chorus, or reſponſe, to the *præcentor*, or leader of the pſalm. This was called ſinging *acroſtics*, *acroſtichia*, which was a ſpecies of pſalmody uſual in the ancient church. *Acroſtic*, in this ſenſe, amounts to the ſame with *hypopſalma*, *diapſalma*, *acrotelution*, and *ephymnion*, which are all terms of the ſame ſignification.

Though an *acroſtic* properly ſignifies the beginning of a verſe, yet it is ſometimes alſo uſed for the end or cloſe of it; as by the author of the Conſtitutions, when he orders one to ſing the hymns of David, and the people to ſing after him the *acroſtics* or ends of the verſes.

It does not however denote preciſely the end of the verſe, but ſomething added at the end of a pſalm, or ſomething frequently repeated in the courſe of a pſalm, anſwering to our *gloria patri*.

Some pretend to find *acroſtics* in the Pſalms, particularly in thoſe called ABCDARIAN Pſalms.

ACROSTICUM, forked fern, in the Linnæan ſyſtem of *Botany*, belonging to the *cryptogamia filices*, the name of a genus of capillary plants, the character of which is, that the fructifications are not diſpoſed in any regular manner on the leaves, as in moſt of the other capillary plants; but they are ſo placed as to form a heap, covering the whole underſide of the leaf: the RUTA *muraria* is of this kind.

ACROSTOLIUM, in *Antiquity*, an ornament of the prow, or forecaſtle of a ſhip, chiefly of war; ſometimes ſhaped like a buckler, a helmet, or an animal, but more frequently turned circular or ſpiral. The ancients had divers decorations or additional parts to their ſhips, called by a general name κορυμϐα, thoſe on the prow were more particularly called ϛολος, of which the extreme part alone was denominated *acroſtolium*.

To the *acroſtolia* may be referred the *anſerculus*, mentioned by Bayſius; and alſo thoſe poliſhed ſteel pieces reſembling a duck's neck, uſed by the Venetians at the heads of their gondolas.

The *acroſtolia* were torn from vanquiſhed ſhips, and faſtened to the conqueror's, as a ſignal of victory. We frequently find them repreſented on the reverſes of ancient medals. An *acroſtolium* is alſo ſeen in the famous ſculpture of the *apotheoſis* of Homer.

ACROTELEUTIC, among *Eccleſiaſtical Writers*, denotes the end of a verſe or pſalm; or ſomething added thereto to be ſung by the people.

In which ſenſe *acroteleutic* amounts to the ſame with *acroſtic*, *hypopſalma*, *diapſalma*, *epode*, &c.

The *gloria patri* is by ſome writers called the *acroteleutic* to the pſalms; becauſe always uſed to be repeated by the people at the end of each.

Hence the word *acroteleutic* is ſometimes alſo uſed as ſynonymous with DOXOLOGY.

ACROTERIA, or **Acroters**, in *Architecture*, little pedeſtals, uſually without baſes, anciently placed at the middle, and the two extremes, of PEDIMENTS; and ſerving alſo to ſupport ſtatues.

The word in its original ſignifies the (ακρον) extremity of any body; as the tip of a rock, &c.

Thoſe at the extremes ought to be half the height of the TYMPANUM; and that in the middle, according to Vitruvius, ſhould be one eighth part more.

Acroteria ſometimes alſo ſignifies figures, whether of ſtone, or metal, placed as ornaments, or crownings, on the tops of temples, or other buildings.

Sometimes it alſo denotes thoſe ſharp PINACLES, or ſpiry battlements, which ſtand in ranges about flat buildings, with rails and balluſters.

Acroteria, among ancient *Phyſicians*, was uſed to denote the greater extremities of the body, as the head, hands, and feet.

The *acroteria* growing cold in acute diſtempers, is held a prognoſtic of death; as indicating a decay of the vital flame, either by reaſon of a coagulation of the blood, or too great a conſumption of it before.

Ariſtotle alſo uſes *acroteria*, for the tips or extreme parts of the fingers, covered by the nails; ſometimes alſo for the eminences of the bones.

ACROTERIASM, among ancient *Phyſicians*, the act of cutting off the extreme parts of the body, when putrefied, by a ſaw. The amputation of any extremity.

ACROTHYMIA, in *Surgery*, the name of a large tumour in the fleſh, riſing in the ſhape of a wart, though ſometimes depreſſed and flat, called THYMUS. See NÆVUS.

ACT, **Actus**, in *Phyſics*, an effective exerciſe, or application of ſome power, or faculty.

In this ſenſe, *act* ſtands oppoſed to power, *potentia*, which is only the capacity of *acting*, not the exertion of that capacity.

Though the word *act*, properly and primarily, be only applicable where the power might exiſt without being drawn forth into *act*; yet the ſchoolmen extend it farther; defining it by the preſence of any power or perfection, even though it could not be abſent.

In which ſenſe, God himſelf is ſaid to be a moſt pure *act*; by reaſon his perfections are always and neceſſarily preſent. And thus, form is called an *act*; inaſmuch as the preſence hereof completes the power and perfection of matter.—FORM, ſay ſome, is MATTER reduced into act. Even exiſtence is termed an *act*; becauſe, when this is given a being, nothing farther is wanted. The Greeks ſometimes call *act* εντελεχεια, a term denoting an actual poſſeſſion of perfection, by the Latins uſually rendered *perfectibabia*.

Metaphyſicians give various diviſions of *act*, viz. into *infinite*, as the *act* of creating; and *finite*, as the *act* of moving.—*Tranſient*, or thoſe exerciſed in other beings, as heating; and *immanent*, which remain in their own ſubject, as thinking.

Act, in *Logic*, is particularly underſtood of an operation of the human mind.

Thus, to diſcern and examine, are *acts* of the underſtanding: to judge and affirm, are *acts* of the will.

There are voluntary *acts*, and ſpontaneous ones, which ſeem produced without the privity, or participation, of the ſoul.

Act, in a *legal* ſenſe, is an inſtrument, or other matter in writing; of uſe to declare, or juſtify the truth of a thing. In which ſenſe, records, decrees, ſentences, reports, certificates, &c. are called *acts*, authentic *acts*, ſolemn *acts*, &c. See DEED.

Acts alſo denote the deliberations and reſolutions of an aſſembly, ſenate, council, or convocation; taken down by clerks, notaries, actuaries, or the like, and entered in a regiſter.

Acts *of the Senate*, *acta ſenatus*, among the Romans, were minutes of what paſſed and was debated in the ſenate-houſe.

Theſe were alſo called *commentarii*, and by a Greek name υπομνηματα. They had their origin in the conſulſhip of Julius Cæſar, who ordered them both to be kept and publiſhed. The keeping them was continued under Auguſtus, but the publication was abrogated. Afterwards all writings, relating to the decrees or ſentences of the judges, or what paſſed and was done before them, or by their authority, in any cauſe, were all called by the name ACTA. In which ſenſe we read of civil *acts*, criminal *acts*, intervenient *acts*, ACTA *civilia*, *criminalia*, *intervenientia*, &c.

Acts *of the People*, *acta populi*, among the Romans, were journals or regiſters of the daily occurrences, as aſſemblies, trials, executions, buildings, births, marriages, deaths, &c. of illuſtrious perſons, and the like.

Theſe were otherwiſe called *acta publica*, and *acta diurna*, or ſimply *acta*.

The *acta* only differed from annals, in that only the greater and more important matters were in the latter, and thoſe of leſs note in the former.

Their origin is attributed to Julius Cæſar, who firſt ordered the keeping and making public the acts of the people; ſome trace them higher, to Servius Tullius, who, to diſcover the number of perſons, born dead, and alive, ordered that the next of kin, upon a birth, ſhould put a certain piece of money into the treaſury of *Juno Lucina*; upon a death, into that of *Venus Libitina*; the like was alſo to be done upon aſſuming the *toga virilis*, &c. Under Mareus Antoninus, this was carried farther; perſons were obliged to notify the births of their children, with their names, and ſurnames, the day, conſul, and whether legitimate, or ſpurious, to the præfects of the *ærarium Saturni*, to be entered in the public *acts*. Though before this time the births of perſons of quality appear to have thus been regiſtered.

Acts, *Public*. The knowledge of public *acts* has been erected into a peculiar ſcience, called the *diplomatic*, of great importance to an hiſtorian, ſtateſman, chronologer, and even critic. The preſervation of them was the firſt occaſion of erecting libraries.

The ſtyle of *acts* is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineneſs, and even whether there be any certain rules at all? F. Germon will have the greater part of the *acts* of former ages to be ſpurious. Fontanini aſſerts, that the number of forged *acts* now extant is very ſmall. It is certain there were ſevere puniſhments inflicted on the forgers and falſifiers of *acts*.

The chief of the Engliſh *acts*, or public records, are publiſhed by Rymer, under the title of *Fædera*, and continued by Saunderſon: an extract whereof has been given in French by Rapin, and tranſlated into Engliſh, under the title of *acta Regia*. Great commendations have been given this work, and ſome exceptions made to it: as that there are many ſpurious *acts*, as well as errors in it; ſome have even charged it with falſifications.

The public *acts* of France fell into the hands of the Engliſh after the battle of Poitiers, and are commonly ſaid to have been carried by them out of the country. But the tradition is not ſupported by any ſufficient teſtimony, and has even been ſhewn by M. Bruſſel to be falſe.

Acts *of Council*. Theſe differed from canons, in that the latter contained only the reſults, or the laws and regulations agreed on, and drawn up in form; whereas the *acts* included the preceding debates, motions, &c.

In the firſt collections of councils, only the bare canons were delivered. Afterwards they began to give the *acts* as well as the canons.

Hence we have two kinds of ſynodical collections: one containing all the *acts*, or tranſactions, relating to matters of faith and doctrine; the other, containing only the canons relating to diſcipline, is called the book of CANONS.

Acts *of Parliament* are particularly denominated *Statutes*.

The *acts* of the Royal Society are called *Tranſactions*; thoſe of the Royal Academy of Sciences at Paris, *Memoirs*; thoſe of the ſocieties of Leipſic, &c. ſimply *acts*, ACTA *eruditorum*, &c.

The edicts and declarations of the council of the Roman emperors, were called conſiſtory *acts*, ACTA *conſiſtorii*.

Acts, *Clerk of the*, is an officer of the navy. See CLERK.

Acts are alſo matters of fact tranſmitted to poſterity in certain authentic books, and memoirs.

In which ſenſe we ſay, the ACTS of the Apoſtles, ACTS of the Martyrs, &c.

Acts *of the Apoſtles*, a canonical book of the New Teſtament, which contains great part of the lives of St. Peter and St. Paul; commencing at the aſcenſion of our Saviour, and continued down to St. Paul's arrival at Rome, after his appeal to Cæſar, comprehending in all about thirty years. St. Luke has been generally taken for the author of this book, and his principal deſign in writing it was to obviate the falſe ACTS, and falſe hiſtories, which began to be diſperſed up and down the world. The exact time of his writing it is not known; but it muſt have been at leaſt two years after St. Paul's arrival at Rome, becauſe it informs us that St. Paul dwelt two whole years in his own hired houſe; perhaps he wrote it while he remained with St. Paul, during the time of his impriſonment.

There are alſo ſpurious ACTS of the Apoſtles compoſed in Hebrew by one Abdias; tranſlated into Greek by his diſciple Eutropius; and thence into Latin, by Julius Africanus.

The book called *Acts* of Pilate, relating to Jeſus, is a falſe and ſuppoſititious relation of our Saviour's trial before Pilate; impiouſly framed by the enemies of Chriſtianity; and filled with the blackeſt blaſphemy.—The emperor Maximin, by a ſolemn edict, ordered it to be ſent into all the provinces of the empire; and injoined the ſchoolmaſters to teach and explain it to their ſcholars, and make them learn it by heart.

The piece was written with ſo much careleſſneſs or ignorance, that our Saviour's death was therein referred to the 4th conſulate of Tiberius, that is, to the 7th of his empire; which is eleven years before our Saviour's paſſion, and five before Pilate was made governor of Judea. See Euſebius, lib. ix. cap. 4. and 6. Ruffin, lib. i. cap. 5, &c.

The true and genuine *acts* of Pilate were ſent by him to Tiberius, who reported them to the ſenate; but they were rejected by that aſſembly, becauſe not immediately addreſſed to them: as is teſtified by Tertullian, in his Apol. cap. 5. and 20, 21. Euſeb. Hiſt. lib. ii. cap. 2.

Act, in the univerſities, a theſis maintained in public, by a candidate for a degree; or, to ſhew the capacity and proficiency of a ſtudent, in the UNIVERSITY.

The candidates for a degree of bachelor and maſter of arts are to hold philoſophy *acts*; thoſe for bachelor of divinity are to keep divinity *acts*, &c.

At Oxford, the time when the maſters or doctors complete their degrees, is alſo called the ACT; which is held with great ſolemnity: at Cambridge they call it the *commencement*.

Act *of Faith*, AUTO *da fe*, in the Romiſh church, is a ſolemn day held by the INQUISITION, for the puniſhment of heretics, and the abſolution of the innocent accuſed.

They uſually contrive the *auto* to fall on ſome great feſtival; that the execution may paſs with the more awe and regard: at leaſt it is always on a Sunday.

The *auto da fe* may be called the laſt act of the inquiſitorial tragedy; it is a kind of goal-delivery, appointed as oft as a competent number of priſoners in the inquiſition are convicted of hereſy, either by their own voluntary, or extorted confeſſion; or on the evidence of certain witneſſes. The proceſs is thus: in the morning, they are brought into a great hall, where they have certain habits put on, which they are to wear in the proceſſion. The proceſſion is led up by Dominican friars, after which come the penitents, ſome with ſan benitoes, and ſome without, according to the nature of their crimes; being all in black coats without ſleeves, and bare-footed, with a wax-candle in their hands. Theſe are followed by the penitents, who have narrowly eſcaped being burnt, who over their black coats have flames painted, with their points turned downwards, *feugo revolto*. Next come the negative, and relapſed, who are to be burnt, having flames on their habit pointing upwards; after theſe come ſuch as profeſs doctrines contrary to the faith of Rome, who, beſides flames pointing upwards, have their picture painted on their breaſts, with dogs, ſerpents, and devils, all open mouthed, about it. Each priſoner is attended with a familiar of the inquiſition, and thoſe to be burnt have alſo a Jeſuit on each hand, who are continually preaching to them to abjure. After the priſoners, comes a troop of familiars on horſe-back, and after them the inquiſitors, and other officers of the court, on mules; laſt of all, the inquiſitor-general on a white horſe, led by two men with black hats and green hat-bands.

A ſcaffold is erected in the Terreiro de Paio, big enough for two or three thouſand people; at one end of which are the priſoners, at the other the inquiſitors. After a ſermon made up of encomiums of the inquiſition, and invectives againſt heretics, a prieſt aſcends a deſk near the middle of the ſcaffold, and having taken the abjuration of the penitents, recites the final ſentence of thoſe who are to be put to death; and delivers them to the ſecular arm, earneſtly beſeeching at the ſame time the ſecular power, not to touch their blood, or put their lives in danger.

The priſoners being thus in the hands of the civil magiſtrate, are preſently loaded with chains, and carried firſt to the ſecular goal, and from thence in an hour or two brought before the civil judge, who, after aſking in what religion they intend to die, pronounces ſentence, on ſuch as declare they die in the communion of the church of Rome, that they ſhall be firſt ſtrangled, and then burnt to aſhes; on ſuch as die in any other faith, that they be burnt alive.

Both are immediately carried to the Ribera, the place of execution, where there are as many ſtakes ſet up, as there are priſoners to be burnt, with a quantity of dry furze about them. The ſtakes of the profeſſed, that is, ſuch as perſiſt in their hereſy, are about four yards high, having a ſmall board towards the top for the priſoner to be ſeated on. The negative and relapſed, being firſt ſtrangled and burnt, the profeſſed mount their ſtakes by a ladder; and the Jeſuits after ſeveral repeated exhortations, to be reconciled to the church, part with them, telling them they leave them to the devil, who is ſtanding at their elbow to receive their ſouls, and carry them with him into the flames of hell. On this a great ſhout is raiſed, and the cry is, let the dogs *beards be made*, which is done by thruſting flaming furzes, faſtened to long poles, againſt their faces, till their faces are burnt to a coal, which is accompanied with the loudeſt acclamations of joy. At laſt, fire is ſet to the furze at the bottom of the ſtake, over which the profeſſed are chained ſo high, that the top of the flame ſeldom reaches higher than the ſeat they ſit on, ſo that they rather ſeem roaſted than burnt. There cannot be a more lamentable ſpectacle; the ſufferers continually crying out, while they are able, *miſericordia per amor di Dios*: yet it is beheld by all ſexes, and ages, with tranſports of joy and ſatisfaction.

Acts, in *Poetry*, are certain diviſions, or principal parts, in a dramatic poem, contrived to give a reſpite, or breathing-time, both to the actors and ſpectators.

In the interval, between the *acts*, the ſtage remains empty, and without any action viſible to the ſpectators; though it is ſuppoſed all the while there is one paſſing out of ſight.

It is not, however, purely for the ſake of the reſpite, that theſe *acts* are obſerved; but to give affairs a greater degree of probability, and render the intrigue more affecting. For the ſpectator who ſees the action prepared that is to paſs in the interval, cannot forbear acting, in his imagination, the part of the abſent actors; by which means, he is the more agreeably ſurpriſed when a new *act* coming upon the ſtage, he ſees the effects of that action, which before he could but gueſs at.

To this it may be added, that authors contrive to have the moſt dry and difficult parts of the drama tranſacted between the *acts*, that the ſpectators may have no notion of theſe, excepting what their fancy preſents them with at a diſtance; and that nothing may appear upon the ſtage, but what is natural, probable, and entertaining.

The ancient Greek poets were unacquainted with this diviſion of a play into *acts*; though their epiſodes, or choruſes, ſerved almoſt the ſame purpoſe.

It is true, they conſidered their pieces as conſiſting of certain parts or diviſions, which they called *protaſis*, *epitaſis*, *cataſtaſis*, and *cataſtrophe*: but there were no real diviſions or interruptions anſwering to them in the repreſentation.

It was the Romans who firſt introduced *acts* into the drama; and in Horace's time, the five *acts* were grown into a law, as appears by the verſe,

> *Neu brevior quinto, neu ſit productior,* actu.

This law ſtands unrepealed to this day; though it ſeems to draw its force from the authority of Horace, rather than that of reaſon, or nature.—All plays are held irregular that have either more, or fewer, than five acts.

Some indeed have aſſerted, that every juſt action conſiſts of five diſtinct parts: and have undertaken to mark out the preciſe ſhare of the action, which each of the five *acts* ought to bear.

The firſt, they ſay, is to propoſe the matter or argument of the fable, and to ſhew the principal characters.—The ſecond, to bring the affair or buſineſs upon the carpet.—The third to furniſh obſtacles and difficulties.—The fourth either points a remedy for thoſe difficulties, or finds new ones in the attempt.—The fifth puts an end to all by a diſcovery.

Be this as it will, it is certain, on the principles of that great maſter of the drama, Ariſtotle, we may have a juſt and regular play, though only divided into three *acts*.

Theſe *acts* are ſubdivided into SCENES.

ACTE, the *elder*. See SAMBUCUS.

ACTEA, in *Botany*, the name whereby Linnæus diſtinguiſhes the *chriſtophoriana* of Tournefort. He ranges it under the *polyandria monogynia*.

ACTIAN *Games*, *Ludi* ACTIACI, ſolemn games, inſtituted, or, according to ſome, only reſtored, by Auguſtus, in memory of the victory at Actium.

Stephanus, and ſome others, will have them held every third year; but the more common opinion is that of Strabo, who ſays, they only returned every fifth, and were celebrated in honour of Apollo, ſince ſurnamed *Actius*.

By the way, it is a groſs overſight in ſome others, to imagine that Virgil inſinuates them to have been inſtituted by Æneas; from that paſſage Æn. III. v. 280.

> *Actiaque Iliacis celebramus littora ludis.*

It is true, the poet there alludes to the *Actian* games; but he only does it by way of compliment to Auguſtus, to attribute that to the hero from whom he deſcended, which was done by the emperor himſelf: as is obſerved by Servius.

ACTIAN *Years*, *Anni* ACTIACI, were a ſeries of YEARS, commencing from the æra of the battle of Actium; called the æra of Auguſtus. See EPOCHA.

ACTINE, ακτινη, in *Botany*, a name of the herb BUNIAS, or NUPUS.

ACTINIA, in the *Hiſtory* of *Inſects*, a genus of ſea-animals, of the order of the *gymnarthria*, naturally of a cylindric ſhape, but of variable figure; the *tentacula* are very numerous, and are ranged in ſeveral ſeries about the mouth, which is placed at one of the extremities of the body; theſe are in a continual vibratory motion, and by that means draw ſmall animals into its mouth for food. The whole animal is equally thick in all parts, and is about half an inch long; its tail is divided into three parts, or terminated, as it were, by three points: it is of a pale fleſh colour, except the *tentacula*, which have a beautiful variety of colours. It lodges itſelf in little cavities of rocks, and of the larger ſea-plants of the ſtony kind; and is found on the coaſts of the American iſlands, of various ſpecies; differing from each other in figure, colour, &c. See ANEMONIES.

ACTION, in a general ſenſe, denotes the operation of a power.

The idea of *action* is ſo familiar to us, that a definition may as eaſily obſcure as explain it.—Some ſchoolmen, however, attempt to expreſs its nature by 'a manifeſtation of the power or energy of a ſubſtance; made either within, or without it.'—Thus, ſay they, when the mind *acts*, what does it more, than perceive a vital power exerting itſelf; as, in reality, the ſeveral *actions* of the mind are no other than ſo many indications of its vitality?

It is a point controverted among the ſchoolmen, whether or no *action*, thus taken, be a thing diſtinct both from the agent, and the term, or effect. The *modiſts* ſtand for the affirmative, and the *nominaliſts* aſſert the negative. Theſe latter obſerve, that the *action* may be conſidered two ways, *entitatively* and *connotatively*.

ACTION, *entitatively* taken, is what we call a CAUSE, or what may act.

ACTION, *connotatively* conſidered, is the ſame cauſe, only conſidered as acting, or connoting the effect it produces. Now, ſay they, a cauſe may be without any *action*, connotatively taken, i. e. it may be conſidered as not producing an effect; but it cannot be without it entitatively, for that would be to be without itſelf. Hence they conclude, that the cauſe differs from the *action* connotatively, not entitatively taken; and the agent is the cauſe of the *action*, conſidered connotatively, not entitatively.

Actions are divided, with reſpect to their principle, into UNIVOCAL, where the effect is of the ſame kind with the cauſe; as the production of man by man; and EQUIVOCAL, where it is different; as the ſuppoſed production of frogs by the ſun.—And again, into VITAL; as nutrition, reſpiration, the *action* of the heart, &c. and NOT-VITAL; as heating.

With reſpect to their ſubject, *actions* are divided into IMMANENT; which are received within the agent that produced them; as are vital *actions*, cogitation, &c.—And TRANSIENT, which paſs into another.

In reſpect of duration, *actions* are again divided into INSTANTANEOUS, where the whole effect is produced in the ſame moment; as the creation of light: and SUCCESSIVE, where the effect is produced by degrees; as corruption, fermentation, putrefaction, diſſolution, &c.

The Carteſians reſolve all phyſical *action* into metaphyſical. Bodies, according to them, do not act on one another; the *action* all comes immediately from the Deity; the motions of bodies, which ſeem to be the cauſe, being only the occaſions thereof. See OCCASIONAL *Cauſe*.

It is one of the laws of nature, that *action* and reaction are always equal, and contrary to each other.

For the *actions of powers*, &c. ſee POWER, WEIGHT, MOTION, RESISTANCE, and FRICTION.

For the laws of the *action of fluids*, &c. ſee FLUID and SPECIFIC *Gravity*.

ACTION, in *Phyſics*; the *actions* or functions of the body, each part of which has an action peculiar to itſelf. They are divided by the writers of inſtitutes, into the *vital*, *animal*, and *natural*. The *vital* are ſuch as are eſſential to the ſubſiſtence of the individual: ſuch are the motions of the heart and lungs, the ſecretion of ſpirits in the cerebellum, on which the motions of the heart and lungs depend; and the circulation of the blood and fluids in their proper veſſels. *Pulſation* and *reſpiration* are the external ſigns of life.

The *natural actions* are ſuch as are neceſſary to the continuance of the animal, but not ſo immediately, but that it may ſubſiſt ſome time under a ſuſpenſion of them; as the digeſtion of the aliment, and its converſion into blood.

Under *animal actions* are comprehended thoſe which conſtitute the ſenſes of touch, taſte, ſmell, viſion, hearing, perception, imagination, memory, judgment, ratiocination, affections of the mind, and voluntary motion; without any, or all of which, it is poſſible for an animal to live.

In the year 1752, Dr. White publiſhed an ingenious performance, under the title of an Eſſay on the vital and other voluntary Motions of Animals, 8vo. and in the ſame year Dr. Simſon alſo a book on Vital and Animal Actions, 8vo.

ACTION alſo, in *Phyſics* and *Mechanics*, denotes the action of bodies on each other by preſſure.

If a body be urged by equal and contrary actions or preſſures, it will remain at reſt. But if one of theſe preſſures be greater than its oppoſite, motion will enſue towards the parts leaſt preſſed.

It is to be obſerved, that the *actions* of bodies on each other, in a ſpace that is carried uniformly forward, are the ſame as if the ſpace were at reſt; and any powers or motions that act upon all bodies, ſo as to produce equal velocities in them in the ſame, or in parallel right lines, have no effect on their mutual *actions*, or relative motions. Thus the motion of bodies aboard a ſhip, that is carried ſteadily and uniformly forward, are performed in the ſame manner as if the ſhip was at reſt. The motion of the earth round its axis has no effect on the *actions* of bodies and agents at its ſurface, but ſo far as it is not uniform and rectilineal. In general, the *actions* of bodies upon each other depend not on their *abſolute*, but *relative* motion.

ACTION, *Quantity of*, in *Mechanics*, is uſed for the product of the maſs of a body, by its velocity.

When a body is tranſported from one place to another, the *action* is the greater, in proportion to the maſs, to the velocity, or rapidity of the motion. See MOMENTUM.

Monſ. de Maupertuis lays it down as a general principle, that 'whenever any changes happen in nature, the quantity of *action* neceſſary to produce this change is always the leaſt poſſible.' And this, he ſays, is a law indicating the higheſt wiſdom.

From this general principle, and the common rule for finding a *minimum* by fluxions, he deduces the known laws of percuſſion, for hard and elaſtic bodies, and even the laws of reſt, as he calls them; that is of the equilibrium, or equipollency of preſſures.

This ingenious author ſeems to think, that the laws of motion, thus deduced, afford a ſtronger proof for the exiſtence of God, or of a firſt intelligent cauſe, than the other arguments commonly alledged, and deduced from the order of nature. But we apprehend, that few metaphyſicians will be of his opinion. The proof of a God from the order of nature ſeems to depend on two principles: 1. That there is an order in nature. 2. That this order is contingent. For if this order was not contingent, but abſolutely neceſſary, as Spinoſa, and other atheiſts pretend, it ſeems that no ſufficient reaſon, from the order of nature, could be aſſigned for the exiſtence of a firſt intelligent cauſe. Now, Monſ. de Maupertuis not having eſtabliſhed the contingency of his principle of the *minimum* of *action*, his argument ſeems defective in this reſpect; not to mention others.

Mr. Euler has demonſtrated, that in the trajectories deſcribed by bodies urged by central forces, the velocity, multiplied by the element of the curve, is always a minimum. Monſ. Maupertuis looks on this as an application of his principle, to the motion of the planets. Mem. de l'Acad. de Berlin, 1746, tom. ii. p. 290.

ACTION, in *Ethics*, or *moral* ACTION, is a voluntary motion, of a creature capable of diſtinguiſhing good and evil; whoſe effect, therefore, may be juſtly imputed to the agent. See MORAL.

A *moral action* may be more fully defined to be whatever a man, conſidered as endued with the powers of underſtanding and willing, with reſpect to the end he ought to aim at, and the rule he is to regard in acting, reſolves, thinks, does, or even omits to do; in ſuch manner as to become accountable for what is thus done or omitted, and the conſequences thereof.

The foundation, then, of the morality of *actions*, is, that they are done knowingly, and voluntarily.

All moral *actions* may be divided, with reſpect to the rule, into GOOD and EVIL.

ACTION, in *Oratory*, is an accommodation of the perſon of the orator to his ſubject; or, a management of the voice and geſture, ſuited to the matter ſpoken, or delivered.

Action makes one of the greateſt branches or diviſions of rhetoric, as uſually taught. The ancients uſually call it *pronunciation*.

Action is a collateral or ſecondary method of expreſſing our ideas; and is ſuſceptible of a kind of eloquence as well as the primary.—It is an addreſs to the external ſenſes; which it endeavours to move, and bring into its party, by a well-concerted motion and modulation; at the ſame time that the reaſon and underſtanding are attacked by force of argument. Accordingly, Tully very pertinently calls it *Sermo Corporis*, *the diſcourſe of the body*; and *Corporis Eloquentia*, *the eloquence of the body*.—The Roman mimes and pantomimes, we read, had ſuch a copia in this kind, ſuch a compaſs even of mute *action*, that voice and language ſeemed uſeleſs to them: they could make themſelves underſtood to people of all nations; and Roſcius, the comedian, is particularly famed, as being able to expreſs any ſentence by his geſtures, as ſignificantly and variouſly as Cicero with all his oratory. Quintilian gives us a ſyſtem of the rules of *action*; taken not only from the writings of the ancient orators, but from the beſt examples of the forum.

What we uſually attribute to eloquence, was really the effect of the *action* only, as ſome of the greateſt maſters in that way have frankly acknowledged.—Demoſthenes expreſly calls it, 'the beginning, the middle, and the end, of the orator's office;' and Cicero profeſſes, that 'it is not of ſo much importance what the orator ſays, as how he ſays it.'

After all, it is a point that will bear being controverted, whether *action* ought to be practiſed, and encouraged at all? A thing that has ſo much command over mankind, it is certain, muſt be very dangerous; ſince it is as capable of being turned to our diſadvantage, as to our advantage. It is putting a weapon in the hands of another, which, if he pleaſes, he may make uſe of to ſubdue and enſlave us: and, accordingly, hiſtory is full of the pernicious uſes made thereof.—For this reaſon, eloquence and *action* are generally diſcouraged in the modern policy; and both the bar, and the pulpit, are brought to a more frigid way of delivery.

Perhaps the foundation of all *action* may be vicious and immoral.—Voice and geſture, we know, will affect brutes; not as they have reaſon, but as they have paſſions: ſo far as theſe are uſed in a diſcourſe, therefore, it does not regard an aſſembly of men, more than it would a herd of quadrupeds: that is, their whole effort is ſpent, not on the rational faculties, which are out of the queſtion, but on the animal ones, which alone they endeavour to poſſeſs and actuate, independently of reaſon.—Nay, more, our reaſon, and the judgment itſelf, are intended to be biaſſed and inclined by them; *action* being only uſed as an indirect way of coming at the reaſon, where a direct and immediate one was wanting; i. e. where the judgment cannot be taken by the proper means, argument, it is to be taken indirectly, by circuition, and ſtratagem.

The natural order of things, then, is here inverted: our reaſon, which ſhould go before, and direct our paſſions, is dragged after them: inſtead of cooly conſidering, and taking cognizance of things; and according to what we perceive therein, raiſing ourſelves to the paſſions of grief, indignation, or the like, we are attacked the other way; the impreſſion is to be carried backwards, by virtue of the natural connection there is between the reaſon and the paſſions: and thus the helm, the principle of our actions, is taken out of our own hand, and given to another. See Passion.

The caſe is much the ſame here, as in ſenſation and imagination: the natural and regular way of arriving at the knowlege of objects, is by ſenſe; an impreſſion begun there, is tranſmitted to the imagination, where the image is produced, ſimilar to that which firſt ſtruck on the organ.—But the proceſs is ſometimes inverted: in hypochondriac, lunatic, and other delirious caſes, the image is firſt excited in the imagination; and the impreſſion thereof communicated back to the organs of ſenſe: by which means objects are ſeen, which have no exiſtence.

Upon the whole, *action* does not tend to give the mind any information about the ſubject that is diſcuſſed; nor is it deſigned to convey any arguments or ideas which the ſimple uſe of language would not convey. But is it not that which we ſhould form our judgments upon? And can any thing help us to form a juſt judgment, beſide that which in ſome way or other enlightens and convinces our underſtanding? When Cicero made Cæſar tremble, turn pale, and let fall his papers, he did not appriſe him of any new guilt which Cæſar did not know of: the effect had no dependence on Cæſar's underſtanding; nor was it any thing more than might have been produced by the unmeaning ſounds of a muſical inſtrument duly applied. However, *action* may be uſeful in awakening and fixing the attention, provided that it be accompanied with ſuitable argument and addreſs.

Action, in a *theatrical ſenſe*, is nearly the ſame with that among orators; with this difference, that the actor adapts his *action* to an aſſumed character, whereas the orator is ſuppoſed, in reality, to feel the paſſion which his *action* expreſſes, whether joy or grief, &c.

Action, in *Poetry*, is an event, either real or imaginary, which makes the ſubject of an epic, or dramatic poem. The *action* of a poem coincides nearly with the fable thereof; it being the uſual practice, not to take any real tranſaction of hiſtory, but to feign or invent one; or at leaſt to alter the hiſtorical fact, ſo as to render it in good meaſure fictitious.

F. Boſſu has two chapters, *Of real actions*, the recitals whereof are fables: and of *feigned actions*, the recitals whereof are hiſtorical.

The critics lay down four qualifications, as neceſſary to the epic and tragic *action*: the firſt, UNITY; the ſecond, INTEGRITY; the third, IMPORTANCE; and the fourth DURATION; to which ſome add a fifth, viz. CONTINUITY.

This unity is not only to exiſt in the firſt draught, or model of the fable; but in the whole epiſodized *action*.

In order to the integrity of the *action*, it is neceſſary, according to Ariſtotle, that it have a beginning, middle, and end.—If the three parts of a whole ſeem to be generally denoted by the words, *beginning*, *middle*, and *end*, Boſſu interprets them more expreſly, thus: the cauſes and deſigns of a man's doing an *action*, are the beginning; the effects of thoſe cauſes, and the difficulties met withal in the execution of thoſe deſigns, are the middle of it; and the unravelling and extricating of thoſe difficulties, is the end of the *action*.

The poet, ſays Boſſu, ſhould ſo begin his *action*, that, on one hand, nothing ſhould be farther wanting for the underſtanding of what he afterwards delivers; and, on the other, that what thus begins require after it a neceſſary conſequence. The end is to be conducted after the like manner, only with the two conditions tranſpoſed; ſo that nothing be expected after it, and that what ends the poem be a neceſſary conſequence of ſomething that went before it. Laſtly, the beginning is to be joined to the end by a middle, which is the effect of ſomething that went before it, and the cauſe of what follows.

In the cauſes of an *action*, one may obſerve two oppoſite deſigns; the firſt, and principal, is that of the hero: the ſecond comprehends all their deſigns, who oppoſe the pretenſions of the hero. Theſe oppoſite cauſes do all produce oppoſite effects, viz. the endeavours of the hero to accompliſh his deſign, and the endeavours of thoſe who are againſt it.—As the cauſes and deſigns are the beginning of the *action*, ſo thoſe contrary endeavours are the middle of it, and form a difficulty, plot, or intrigue, which makes the greateſt part of the poem.

And the ſolution, or clearing up of this difficulty, makes the unravelling.

The unravelling of the plot, or intrigue, may happen two ways; either with a diſcovery, or without.

The ſeveral effects which the unravelling produces, and the different ſtates to which it reduces the perſons, divides the *action* into ſo many kinds.—If it change the fortune of the principal perſon, it is ſaid to be with a peripetia; and the *action* is denominated *implex*, or mixed: if there be no peripetia, but the unravelling be a mere paſſing from trouble to repoſe, the *action* is ſimple.

For the duration of the epic *action*, Ariſtotle obſerves, it is not ſo limited as that of the tragic *action*: the latter is confined to a natural day; but the epopea, according to that critic, has no fixed time.—In effect, tragedy being full of paſſion, and, conſequently of violence, which cannot be ſuppoſed to laſt long, requires a ſhorter time; and the epic poem, being for the habits which proceed more ſlowly, requires a longer time, either for them to take hold, or to be rooted up; and hence the difference between the epic and dramatic *action*, in point of duration. Boſſu lays it down as a rule, that the more vehement the manners of the principal perſonages are, the leſs time ought the *action* to laſt: accordingly, the *action* of the Iliad, containing the wrath of Achilles, &c. holds but forty-ſeven days; whereas that of the Odyſſey, where prudence is the reigning quality, laſts eight years and a half; and that of the Æneid, where the prevailing character of the hero is piety and mildneſs, nearly ſeven years.

As to the importance of the epic *action*, there are two ways of providing for it: the firſt, by the dignity and importance of the perſons. This way alone Homer makes uſe of; there being, otherwiſe, nothing great and important in his models, but what might have happened to ordinary perſons.—The ſecond, by the importance of the *action* itſelf; ſuch as the eſtabliſhment, or downfall of a religion, or a ſtate; which is Virgil's *action*, and in which he has much the advantage of Homer.

Boſſu mentions a third way of making the *action* important, viz. by giving a higher idea of the perſonages, than what the readers conceive of all that is great among men.—This is done by comparing the characters of the poem with thoſe of the preſent time.

Action is alſo uſed in *Painting* and *Sculpture*, for the poſture of a figure; or the *action* it is ſuppoſed to be in; expreſſed by the diſpoſition of the body, or the paſſion appearing in the face.

Action *of the Mouth*, in the *Manege*, denotes the agitation of a horſe's tongue, and mandible, or his champing on the bit; diſcoverable by a white, ropy foam.—This, with the maſters, paſſes for a ſign of health, vigour, and mettle.

Action, in the *Military* art, is an engagement between two armies, or between different bodies of troops belonging to them. This term is likewiſe uſed to ſignify ſome memorable act done by an officer, or commander of a body of troops.

Action, in *Law*, is a right of demanding, and purſuing, in a court of judicature, what is any man's due.

Or, *action* is any kind of PROCESS which a perſon enters for the recovery of his right. See CAUSE.

Actions are divided, by Juſtinian, into two general kinds; *real*, or thoſe againſt the thing; and *perſonal*, or thoſe againſt the perſon.—For whoever brings an *action*, either does it againſt one obnoxious to him, in reſpect either of contract, or of offence: in which caſe ariſe *actions* againſt the perſon, which require the party to do, or give ſomething: or, he does it againſt one not obnoxious, yet with whom a controverſy is riſen touching ſome matter; as, if Caius hold a field, which Julius claims as his property, and brings his *action* for the ſame. See the Inſtit. lib. iv. tit. 4. where the principal *actions*, introduced by the Roman law, are ſummarily explained.

In common law, from the two claſſes of *real* and *perſonal actions*, ariſes a third, called a *mixed action*; which regards both the *perſon* and the *thing*.

Action, *Real*, is that whereby the defendant claims title to lands, or tenements, rents, or commons, in fee-ſimple, fee-tail, or for life.

But *real actions*, formerly ſo numerous and conſiderable, as writs of right, of entry, &c. with their appendages, as *grand cape*, *petit cape*, receipt, view, aid-prayer, voucher, counter-plea of voucher, counter-plea of warrantry, and recovery of value, are now much out of uſe: by reaſon of the uſual admixture of perſonal matters therewith, which change them into *mixed actions*.

Action, *Perſonal*, is that which one man hath againſt another, on account of a contract for money or goods; or of an offence done by him, or ſome other perſon, for whoſe fact he is anſwerable.

Action, *Mixt*, is that laid indifferently for the *thing* detained, or againſt the *perſon* of the detainer; being thus called, becauſe it has a mixed reſpect, both to the *thing*, and to the *perſon*.

Others better define it, a ſuit given by law to recover the thing demanded, and damages for the wrong done.

Such is, aſſize of *novel diſſeiſin*, which, if the diſſeiſor make a feoffment to another, the diſſeiſee ſhall have againſt the diſſeiſor, and the feoffee, or other ter-tenant; to recover not only the land, but damages alſo.—And the like in *action* of waſte, *Quare impedit*, &c. See ASSIZE.

Actions are alſo divided into CIVIL and PENAL.

Action, *Civil*, is that which only tends to the recovery of what, by reaſon of a contract, or other like cauſe, is a man's due.—As, if a perſon by *action* ſeek to recover a ſum of money formerly lent, &c.

Action, *Penal*, aims at ſome penalty upon the party ſued, either corporal, or pecuniary.

Such is the *Actio Legis Aquiliæ*, in the *Civil Law*; and with us, the next friends of a man feloniouſly ſlain, or wounded, ſhall purſue the law againſt the offender, and bring him to condign puniſhment.

Action is alſo diſtinguiſhed, as it lies for the recovery either of the ſimple value of the thing challenged; or of the double, triple, quadruple, &c.

Thus, a *Decies tantum* lies againſt embracers; and againſt jurors that take money for their verdict, of either, or both parties.

To this claſs alſo belong all *actions* on a ſtatute that puniſhes an offence by reſtitution, or fine, proportionable to the tranſgreſſion.

Action, again, is divided into *prejudicial*, called alſo *preparatory*, and *principal*.

Action, *Prejudicial*, is that which ariſes from ſome queſtion, or doubtful point in the principal one.

As, if a man ſue his younger brother, for land deſcended from his father; and it be objected, he is a baſtard: this point of baſtardy muſt be tried, before the cauſe can proceed: whence the *action* is termed *præjudicialis, quia prius judicanda*.

Action, again, is either *anceſtrel*, or *poſſeſſory*.—*Anceſtrel action*, is that which we have by ſome right deſcending from our anceſtor.—*Poſſeſſory*, ſometimes alſo called *perſonal action*, is that which hath its beginning in and from ourſelves.

Action *upon the Caſe*, *Actio ſuper caſum*, is a general *action*, given for the redreſs of a wrong done any man without force, and not eſpecially provided for by law.

This, of all others, is now moſt in uſe.—Where there ariſes an occaſion of ſuit, that has neither fit name, nor certain form already preſcribed; the clerks of the chancery, anciently, conceived a proper form of *action* for the thing in queſtion: which was called an *Action upon the caſe*, by the civilians *Actio in factum*.

Action *upon the Statute*, *Actio ſuper ſtatutum*, is a writ or *action*, brought againſt a man, upon an offence againſt a STATUTE, whereby an *action* is given that did not lie before.

Thus, where one commits perjury to the prejudice of another, he who is damaged ſhall have a writ upon the ſtatute, and a cauſe accordingly.

Action, *Popular*, only differs from an *action* upon the ſtatute, in that, where the ſtatute gives the ſuit or *action* to the party grieved; or otherwiſe, to one ſingle perſon certain, it is called *action* upon the ſtatute; and where the authority is given by the ſtatute to every one that will ſo ſue, it is an *action popular*.

Action is alſo divided into *perpetual* and *temporal*.

Action, *Perpetual*, is that whoſe force is not determined by any period or term of time.

Of this kind were all civil *actions* among the ancient Romans; viz. ſuch as aroſe from laws, decrees of the ſenate, and conſtitutions of the emperors; whereas *actions* granted by the prætor died within the year.

We have alſo *perpetual* and *temporary actions* now in England; all being perpetual, which are not expreſly limited.

Divers ſtatutes give *actions*, on condition they be purſued within the time preſcribed.—Thus the ſtatute of 1 Edw. VI. gives *action* for three years after the offences committed, and no longer; and the ſtatute of 7 Hen. VIII. cap. 3. does the like for four years; and that of 31 Eliz. cap. 5. for one year, and no more.

But, as by the civil law no *actions* were ſo perpetual, but that by time they might be preſcribed againſt; ſo, in our law, though *actions* be called *perpetual*, in compariſon of thoſe that are expreſly limited by ſtatute; yet is there a means to preſcribe againſt real *actions*, after five years, by a fine levied, or a recovery ſuffered. See PRESCRIPTION.

Again, *actions* are either *local*, as ejectment, waſte, &c. which muſt be brought in the county, where the land lies; or *tranſitory*, ſuch as debt, detinue, &c. which may be brought in any county.

Action *of a Writ*, is when a perſon pleads ſome matter, whereby he ſhews, that the plaintiff had no juſt cauſe to have the writ he brought, though it be poſſible he might have another writ or *action* for the ſame matter.—Such plea is called, a *Plea to the action of the* WRIT.

When by the plea it appears, that the plaintiff has no cauſe of any *action* for the thing demanded, it is called, a *Plea to the action*.

Action, in affairs of *Commerce*, or **Action** *of a* COMPANY, is a part or ſhare in the company's ſtock or CAPITAL, which conſiſts of a number of ſuch *actions*.

Actions in France and Holland, amount to the ſame with *ſhares*, or *ſubſcriptions*, in England.

Thus, the capital of a company, which has three hundred *actions* of a thouſand livres each, conſiſts of three hundred thouſand livres. Hence, a perſon is ſaid to have four or ſix *actions* in ſuch company, if he hath contributed to the capital, and be intereſted in it for four or ſix thouſand livres.

A proprietor cannot have a deliberate vote in the aſſemblies of a company, unleſs he has a certain number of *actions*, fixed by the letter-patent of its eſtabliſhment; nor can he be a director, unleſs he has a ſtill greater number of *actions*.

Action alſo denotes an obligation or inſtrument, which the directors of ſuch companies deliver to thoſe who pay money into their ſtock. See BANK and ACTIONARY.

Actions are always riſing and falling, according as the company's credit gains or loſes. The ſmalleſt whiſper of an approaching war or peace, true or falſe, ſhall frequently occaſion a conſiderable alteration in it. In the year 1719, the French company of the Weſt, ſince called the India Company, arrived at ſuch an immenſe degree of credit, that in ſix months time its *actions* roſe to eighteen hundred *per cent.* a degree of temporary credit which no other company ever attained.

In 1672, the *actions* of the Dutch Eaſt India company were at ſix hundred and fifty *per cent.* and they were never known to be higher.—But the war with France then coming on, they fell 250 *per cent.* in a few months. After the peace of Nimeguen, they roſe again; and in 1718 were 600 *per cent.*

The French have three kinds of *actions*.—*Simple*, which are intitled to a ſhare in all, both the profits and loſſes of the company.—*Rentieres*, intitled only to a profit of two *per cent.* ſure; for which the king is ſecurity.—And *intereſted actions*, which claim the two *per cent.* ſecured by the king; and are alſo to ſhare the exceſs of the dividend with the ſimple *actions*.

There were ſeveral other kinds of *actions* introduced by the brokers, in the buſy days of the *Rue Quinquempoix*; but they have ſince ſunk into oblivion; theſe were called mother *actions*, daughter, grand-mother, grand-daughter *actions*, &c.

To *melt* or *liquidate* an *action*, is to ſell, or turn it into money, &c.

To *feed* an *action* is to pay exactly when they become due, the ſeveral ſums ſubſcribed to the ſtock of the company, according to the ſeveral orders of council, made for the creation of the new *actions*.

ACTIONARY, or **Actionist**, a term frequent in foreign news-papers; denoting the proprietor of an *action*, or ſhare in a company's ſtock.

ACTIVE, **Activus**, ſomething that communicates motion, or action, to another.

In this ſenſe, the word ſtands oppoſed to *paſſive*.

Thus we ſay, an *active* cauſe, *active* principles, &c.

The quantity of motion in the world, Sir Iſaac Newton ſhews, muſt be always decreaſing, in virtue of the vis inertiæ, &c. So that there is a neceſſity for certain *active* principles to recruit it: ſuch he takes the cauſe of gravity to be, and the cauſe of fermentation. Adding, that we ſee but little motion in the univerſe, except what is owing to theſe *active* principles.

Active *Principles*, in *Chemiſtry*, are thoſe which are ſuppoſed to act of themſelves, and do not need to be put in action by others.

Salt, ſulphur, and mercury, are uſually conſidered by the chemiſts as *active principles*; and phlegm and earth as paſſive ones.

M. Homberg, and ſome late chemiſts after him, only make one *active* principle, viz. ſulphur, or fire; which they take to be the ſource or principle of all the motion and action of the univerſe.

The term *active principles*, ſays Dr. Quincy, has been uſed to expreſs certain diviſions of matter, that are, by ſome particular modifications, comparatively *active*, in reſpect of others: ſuch are ſpirit, oil, and ſalt, whoſe parts are better fitted for motion than thoſe of earth and water; but with how much impropriety, will eaſily appear.

For, in a ſtrict ſenſe, all motion in matter is rather paſſion; and there is no *active* principle, unleſs we thus call the known powers of gravitation, attraction, and repulſion, on which the Newtonian philoſophy is founded: ſo that let bodies exiſt under what modifications ſoever, there can be no alteration made of theſe univerſal properties.—Hence, the diviſion of matter into what, for diſtinction ſake, may be called *ſpirit*, does not give it any properties inconſiſtent with this general law.

Active, in *Grammar*, denotes a word having a ſignification that ſerves to explain or denote an action.

Thus we ſay, a verb *active*, a conjugation *active*, &c. or an *active* participle.

Active, *Verbs*, are ſuch as do not only ſignify doing, or acting, but have alſo nouns following them, to be the ſubject of the action or impreſſion.

Thus, *to love*, *to teach*, are verbs *active*; becauſe we can ſay, *to love a thing*, *to teach a man*.

Verbs *neuter* alſo denote an action, but are diſtinguiſhed from verbs *active*, in that they cannot have a noun following them.—Such are, *to ſleep*, *to go*, &c.

Some grammarians, however, make three kinds of verbs *active*: the *tranſitive*, where the action paſſes into a ſubject different from the agent; *reflected*, where the action returns upon the agent; and *reciprocal*, where the action turns mutually upon the two agents who produced it.

ACTIVITY, the power of acting, or the active faculty.

The *activity* of fire exceeds all imagination.—The *activity* of an acid, a poiſon, &c.—Bodies, according to Sir Iſaac Newton, derive their *activity* from the principle of **attraction**.

Activity *of a Body, the Sphere of*, is the ſpace which ſurrounds it, ſo far as its efficacy or virtue extends to produce any ſenſible effect.

ACTON *Water*, a purging water of a well in a town near London, noted for the pungency of its ſalt. Its colour is whitiſh, its taſte is ſweetiſh, with a mixture of the ſame bitter which is in the **Epsom** *water*. Its ſalt is not quite ſo ſoft, and is more calcareous than that of the Epſom *water*, being more of the nature of the ſalt of lime; it is however more nitrous than the other. A quantity of it being boiled high, and mixed with a ſolution of ſublimate in pure water, throws down a yellow ſediment. It ſtrikes a deep red or purple with the tincture of logwood in brandy, as is uſual with nitrous ſalts. It does not precipitate ſilver out of the ſpirit of nitre, as common ſalt does; a pint and a half of the water yield forty-eight grains of ſalt. See Allen's Hiſtory of purging Waters.

ACTOR, one that acts in the *Drama*, one who repreſents ſome perſon, or character, upon the theatre.

The drama, in its original, only conſiſted of a ſimple chorus, who ſung hymns in honour of Bacchus: ſo that the primitive actors were no more than ſinging men. Theſpis was the firſt who took upon him to introduce a perſona, or *actor*; who was to eaſe the chorus, by reciting the adventures of ſome of their heroes. Thus came the recitation, or declamation in uſe.

Æſchylus finding a ſingle perſon tireſome, thought to entertain the audience more agreeably by the introduction of a ſecond perſon, who ſhould converſe and make dialogue with the firſt. He likewiſe dreſſed his *actors* a little more decently than they had been before, and put them on the **buskin**.

Sophocles, finding the two perſons of Æſchylus too few for the variety of incidents, added a third; and here the Greeks ſtopped; at leaſt, we do not find, in any of their tragedies, above three perſons in the ſame ſcene: though, in their comedies, they took a greater liberty.

The moderns have brought a much greater number of *actors* upon the ſtage.—This heightens the trouble and diſtreſs that ſhould reign there, and makes a diverſity, in which the ſpectator is ſure to be intereſted.

Horace ſpeaks of a kind of ſecondary *actors*, in his time, whoſe buſineſs was to imitate the firſt; and leſſen themſelves, to become better foils to their principals. The proper buſineſs of theſe ſubaltern *actors* is unknown to us.

Actor, among *Civilians*, the proctor or advocate in civil courts or cauſes: as *actor eccleſiæ* has been ſometimes uſed for the advocate of the church; *actor dominicus* for the lord's attorney; *actor villæ* the ſteward, or head bailiff of a village.

ACTRESS, **Actrix**, a female who *acts*, or does the office of an *actor*.

Actreſſes, or women actors, were unknown to the ancients, among whom men always performed the part of women; and hence one reaſon for the uſe of maſks among them.

Actreſſes are ſaid not to have been introduced on the Engliſh ſtage, till after the reſtoration of king Charles II. who has been charged with contributing to the corruption of our manners, by importing this uſage from abroad. But this can be but partly true: the queen of James I. acted a part in a paſtoral; and Prynn, in his Hiſtriomaſtix, ſpeaks of women actors in his time as whores; which was one occaſion of the ſevere proſecution brought againſt him for that book.

ACTUAL, ſomething that is real and effective; or that exiſts truly and abſolutely.

In *Philoſophy*, we ſay, *actual* heat, or *cold*; in oppoſition to *virtual* or *potential*.

Actual heat, conſidered actively, is the act of producing heat: paſſively taken, it is the quality whereby a body is denominated *hot*.—Virtual or potential heat, actively taken, is the power or faculty of producing heat; paſſively taken, it ſhould be the power or faculty of being heated, or of receiving *actual heat*.

In medicinal language, *actual* is alſo oppoſed to *potential*, and is applied to any thing endued with a quality which operates by an immediate power inherent in it. For example: a red-hot iron, or fire, is called an *actual* cautery, in contradiſtinction from cauteries, which have a power of producing the ſame effects on animal ſolids, as *actual* fire; and which are called *potential* cauteries or cauſtics. Boiling water is *actually* hot, and brandy is *potentially* hot.

Actual ſin is that committed knowingly, by a perſon arrived at years of diſcretion.

Original ſin, in *Theology*, is that which, according to ſome divines, we contract by deſcent, as being the children of Adam.

ACTUARIÆ *Naves*, in *Antiquity*, a ſort of long ſhips, thus denominated, as being particularly contrived for ſwiftneſs and expedition; they anſwer to what the French call *brigantines*.

Cicero, in an epiſtle to Atticus, calls a ſhip *decem ſcalmorum*, of ten banks of rowers, *actuariola*.

ACTUARIUS, or **Actarius**, primarily denotes a notary, or officer appointed to write down the acts or proceedings of a court, aſſembly, or the like.

In the eaſtern empire, the *actuarii* were properly officers who kept the military accounts, received the corn from the *ſuſceptores*, or ſtore-keepers, and diſtributed it to the ſoldiers.

Theſe acted as a kind of brokers with the ſoldiers; made bargains with them for receiving their pay before it became due; for which there were fixed rates.

Actuarius was alſo a title of dignity, in the court of Conſtantinople, peculiar to phyſicians.

From an appellative, the word has become a proper name of a celebrated Greek phyſician, author of a treatiſe, ſtill extant, on urines.

Actuarius, or **Actuary**, alſo means the clerk who regiſtered the acts and conſtitutions of the convocation.

ACTUATE, to bring into act; or put a thing in action.

Thus an agent is ſaid, by the ſchoolmen, to *actuate* a power, when it produces an act in a ſubject.—And thus the mind may be ſaid to *actuate* the body.

ACTUATIO, actuation, ſignifies the change wrought on a medicine, or any thing elſe taken into the body, by the vital heat, which is neceſſary to make it act, and produce its effect.

ACTUS, in the ancient *Agriculture*, the length of one furrow; or as far as a plough goes before it turns. Plin. lib. xviii. cap. 3.

In Engliſh it may be rendered by a *furlong*.—It is alſo uſed as a determinate meaſure, where it contains 120 Roman feet.

Actus *minimus*, was 120 feet in length, and 4 in breadth; being equal to the SEXTANS, or ſixth part of the JUGERUM, or INTEGER.

Actus *major*, called alſo *actus quadratus*, was the ſquare of 120 feet, or 14400, being the *ſemis*, or half of the JUGERUM.—This was alſo denominated *modius*, and *mina*. Varro de Re Ruſt. lib. i. cap. 10.

ACUANITES, **Acuanitæ**, in *Eccleſiaſtical Hiſtory*, called more frequently MANICHEES.

They took the name from Acua, a diſciple of Thomas, one of the twelve apoſtles.

ACUBENE, in *Aſtronomy*, a name given by ſome to a ſtar on the ſouthern claw of CANCER.

ACUHYATLI, in *Zoology*, the name of a very large ſerpent, of a poiſonous quality, in America, more uſually known by its name of CUCURUCU, or CURUCUCA.

ACUITION, in *Grammar* and *Proſody*. See ACUTITION.

In *medicine*, it ſignifies increaſing the force of any thing by adding to it ſomething of the ſame ſort.

ACULEATE, **Aculeated**, ſomething that has ACULEI, or prickles.

Naturaliſts divide fiſhes into thoſe with *aculeated*, and non-*aculeated* fins. Phil. Tranſ. N° 204.

ACULEATUS *longus*, in *Zoology*, a name given by ſome to the PUGNITIUS *marinus longus*, a ſmall prickly Weſt-India fiſh.

ACULEI, among *Botaniſts*, &c. denote the prickles or ſpines of plants of the thorny kind.

The word is Latin, formed from *acus*, *a needle*.

Among *Zoologiſts*, *aculeus* is alſo uſed for the ſting of a bee, ſcorpion, or the like.

The word *aculeus* is alſo uſed for certain parts of the ECHINI *marini*. See *Tab. of Foſſils*, *Claſs* 10.

Aculei *pinnarum*. See PINNÆ.

ACULEOSA, a name of the CARDUUS *polyacanthos*.

ACULER, in the *Manege*, is uſed for the motion of a horſe, when in working upon volts he does not go far enough forward, at every time or motion, ſo that his ſhoulders embrace or take in too little ground, and his croupe comes too near the center of the volt. Horſes are naturally inclined to this fault, in making demi-volts.

ACUMEN, οξυτης, in the *Ancient Muſic*, was uſed to ſignify a ſound produced by the *intention*, or raiſing of the voice.

Acumen differs from *intention*, as the *effect* from the *cauſe*.

ACUMINA, among the ancients, denoted a kind of military omen, or auſpice, ſuppoſed to have been taken from the points or edges of darts, javelins, ſwords, or other weapons; viz. by examining whether they were bright or ſolid, ſharp or blunted.

ACUPUNCTURE, or **Acupuncturation**, a method of curing many diſeaſes, by pricking ſeveral parts of the body with a needle, or inſtrument of that form.

This is practiſed every day by the Chineſe and Japaneſe, and other nations in that part of the world. They perform the operation with a large gold, or ſilver needle, which they ſtrike into the ſeveral parts of the body, either with their hand, or with a hammer made on purpoſe. It is extremely ſurpriſing that ſo ſevere and deſperate an operation ſhould be practiſed ſo much by a people otherwiſe judicious, and that too in the head and breaſt, as well as in the abdomen, arms, legs, thighs, and many other parts of the body, nay even in the abdomen of women with child, when the fœtus is reſtleſs.

We ſometimes alſo find mention of an *acupuncture* practiſed in Europe; but this amounts to no more than the perforating or opening a part, e. g the cornea, with the point of a needle; which has been done with good ſucceſs, for the cure of an *hydropthalmia* and *hypopyon*.

It is chiefly uſed in diſeaſes of the head and lower belly: it is applied to the head, in head-aches, lethargies, convulſions, epilepſies, diſeaſes of the eyes, &c. To the abdomen in colics, dyſenteries, want of appetite, hyſterical diſorders, ſurfeits, pains of the belly and joints, obſtructions of the liver and ſpleen, &c.

Surgeons are furniſhed with images, wherein all the places in the body proper for the needle are deſigned by marks.

M. Ten Ryne was an eye-witneſs of the uſe of this puncture on a ſoldier, who being afflicted with violent diſorders of the ſtomach, and frequent vomitings at ſea, ſuddenly relieved himſelf by pricking a thumb's breadth deep into four different places about the region of his PYLORUS. Ten. Ryn. Diſſ. de Acupunct. ap. Phil. Tranſ. N° 148. p. 231, ſeq.

ACURON, a name given to the ALISMA.

ACUS, in *Ichthyology*, the name of a long and ſlender ſea-fiſh, of which there are two ſpecies, a larger and a ſmaller.

The larger is often a cubit long, and not thicker than a finger; its ſnout is long, tubular, and not ſlit all the way up, but only open at the end; its eyes are prominent. From the head to the anus it is of an hexagonal figure, and from the anus to the tail it is ſquare. The anus is nearly in the middle of the body, and near it is a long longitudinal fiſſure for the eggs of the female. In all theſe reſpects, it very much reſembles the hippocampus. It has two fins at the gills, and another on the back; theſe are all very ſmall, and the laſt, in particular, ſcarce diſcernible, unleſs when the fiſh is alive and in motion. Its tail is a ſmall ſingle fin. It has a hard variegated ſkin, and has ſo little fleſh about it, that it is not regarded as eatable. It is common in the Mediterranean, and is called by the Venetian fiſhermen *biſcia*, that is, the viper fiſh. Its mouth is of a ſtrange figure, opening upward at the end of the ſnout. See *Tab. of Fiſhes*, N° 25.

Acus ſignifies alſo, with other authors, the *belone* or *paphix*, called in Engliſh the GAR-fiſh, and by ſome the HORN-fiſh. The two diſtinct kinds underſtood by this too general term, are diſtinguiſhed by the names of the authors who firſt named them; the TOBACCO-pipe fiſh, or that with the tubular noſe, being called the *acus* of Ariſtotle; and the GAR-fiſh, or that with the horizontal open mouth, the *acus* of Oppian.

This laſt is in ſhape ſomewhat like the former, being very long and ſlender, with a round back, and a flat belly. Its noſe or ſnout is very long, pointed and ſharp, and its head flat. The back is of a greeniſh colour, and the ſides and belly of a ſilvery white. The head is of a bluiſh green, and there is an obſcurely purple dotted line, which runs all along the back. The under jaw is longer than the upper, and both are thick ſet with ſharp teeth. It has only one back fin, and its tail is forked. See Phil. Tranſ. vol. lxiii. part 1. N° 21. from which it appears, that though the ACUS *maxima ſquamoſa* be a fiſh that is a ſtranger to our ſeas, yet its *exuviæ* are common here.

Bellonius has deſcribed another ſpecies of this fiſh, which is ſcaly, and has broader teeth, and is conſiderably larger than the common one, which either has no ſcales, or extremely minute ones. Its dotted line on the back is ſaid by ſome to be a ſingle row of ſcales; and theſe authors affirm, that the fiſh has no other. See LACERTUS.

Acus is alſo uſed by ſome authors for the AMMODYTES, or SAND-eel; a ſmall EEL caught in the ſands.

Acus alſo ſignifies chaff.

Acus *paſtoris*, a name of the SCANOIX.

Acus *moſchata*, a name of the GERANIUM *moſchatum*.

ACUTE, *ſharp*, ſomething that terminates in a point, or edge; diſpoſed either for piercing, or cutting.

In this ſenſe, the word uſually ſtands oppoſed to *obtuſe*.

Acute *angle*, in *Geometry*, is that which is leſs than a right angle; or which does not *ſubtend* 90 degrees.

Such is the angle ACB (*Tab. Geometry*, *fig*. 68.)

Acute-*angled triangle*, is that whoſe three angles are all *acute*; called alſo an *oxygonus triangle*.

Such is the triangle ACB (*Tab. Geometry*, *fig*. 68.)

Acute-*angular-ſection* of a cone, is uſed, by the ancient *Geometricians*, for the ELLIPSIS.

Acute-*angled cone*, ſee CONE.

Acute, in *Muſic*, is underſtood of a ſound, or tone, which is ſharp, ſhrill, or high, in reſpect of ſome other.

In which ſenſe, the word ſtands oppoſed to *grave*; and both theſe properties of ſound depend on the quickneſs or ſlowneſs of the vibrations by which they are produced.

Sounds conſidered as *acute*, and grave, that is, in the relation of gravity and *acuteneſs*, conſtitute what we call *tune*, the foundation of all HARMONY.

Acute *accent*, in *Grammar*. See ACCENT.

Acute *diſeaſe*. See DISEASE.

ACUTELLA, in *Botany*, a name uſed by ſome to expreſs the common ANONIS, or REST-harrow, a ſmall prickly plant, with red or white flowers, and famous for its ſpreading and tough root.

ACUTIATOR, in writers of the barbarous ages, denotes a perſon that whets, or grinds cutting inſtruments;

called alſo in ancient gloſſaries, *acutor*, *ακονητης*, *ſamiarius*, *cobarius*; &c.

In the ancient armies there were *acutiatores*, a kind of ſmiths, retained for whetting or keeping the arms ſharp.

ACUTITION, or ACUITION, in a general ſenſe, the ſame with acuating or ſharpening.

ACUTITION. in *Grammar*, denotes the pronouncing, or marking a ſyllable with an acute ACCENT.

ACUTITION, or *acuition*, in *Medicine* and *Chemiſtry*, is uſed for ſharpening or increaſing the force of any medicine.

ACYROLOGIA, denotes an improper acceptation, or expreſſion, wherein a word or phraſe is uſed in ſome unuſual or oblique ſenſe, hardly reducible to the rules of language.

The word is compounded of *ακυρος*, *improper*, and *λογος*, *ſermo*.

Such, e. g. is the word *ſpero*, ſometimes uſed in Roman writers for *timeo*.

The *acyrologia* bears a near affinity to the *catachreſis*, inſomuch that divers terms and expreſſions, alledged as inſtances of the latter, are by others brought as examples of the former.

AD *beſtias*, in *Antiquity*, is underſtood of a kind of puniſhment of criminals, condemned to be thrown to wild beaſts.

The term was alſo applied to a ſort of gladiators hired to fight with wild beaſts.

Theſe are otherwiſe called *beſtiarii*.

AD *extra*, a term uſed among *School Divines*, in ſpeaking of the eternal operations of the Godhead.

Acts or operations *ad extra*, are properly thoſe whoſe term or effect is not within the divine eſſence; by which they ſtand oppoſed to operations *ad intra*. Creation, preſervation, regeneration, converſion, renovation, &c. are actions of God *ad extra*.

AD *intra*, among *School Divines*, is underſtood of thoſe acts of the Divine Being, whoſe term and effect is within his own eſſence. In which ſenſe, acts or operations *ad intra*, ſtand oppoſed to thoſe *ad extra*.

AD *hominem*, among *Logicians*, is underſtood of a kind of ARGUMENT drawn from the belief or principles of thoſe we argue with, and which of conſequence muſt be concluſive to them, though otherwiſe diſbelieved by us; or, it is where a diſputant quits his own language and ſyſtem, and borrows that of his opponent to convince him, by turning his own prejudices or errors againſt himſelf.

This the ſchoolmen call *argumentum ad hominem*.

AD *libitum*, is ſometimes uſed in *Muſic*, for *ſe piace*, *at diſcretion*. It is alſo uſed, in general, for whatever is left to diſcretion.

AD *ludos*, in *Antiquity*, a Roman ſentence, whereby criminals were condemned to entertain the people, either by fighting with beaſts, or with each other, and thus executing juſtice on themſelves.

AD *metalla*, in *Antiquity*, the puniſhment of being doomed to work in the mines. Criminals condemned to this, were called *metallici*.

It were to be wiſhed that puniſhments of this kind could be ſubſtituted in lieu of our frequent executions; which are as repugnant to the principles of humanity, as to thoſe of ſound policy.

AD *quiddities*, among ſchoolmen, include the relations, analogies, agreements, diſagreements, ſimilitudes, and diſſimilitudes of things.

Ad quiddities are properly thoſe attributes of things, which anſwer to the queſtion, *ad quid? to what?* By which they differ from mere QUIDDITIES, which anſwer to the queſtion, *quid ſit? What is it?* The latter inquire what things are in themſelves; the former what they are, *ad alia*.

AD *valorem*, is uſed in ſpeaking of the duties, or cuſtoms, paid for certain commodities; ſome things are rated by the weight, meaſure, tale, or the like; others pay *ad valorem*, according to the value, or worth ſworn to by the owner.

ADAGE, ADAGIUM, a proverb, or popular ſaying.

Eraſmus has made a large and valuable collection of Greek and Roman *adages*, from their poets, orators, philoſophers, &c.

Adage, proverb, and parœmia, are the ſame thing; but they differ from *gnome*, *ſentence*, and *apophthegm*.

ADAGIO, in *Muſic*, one of the words uſed by the Italians to denote a degree or diſtinction of time.

Adagio expreſſes a ſlow time; the ſloweſt of any, except grave. Uſed ſubſtantively, it ſignifies a ſlow movement. Sometimes this word is repeated, as *adagio, adagio*, to denote a ſtill greater retardation in the time of the muſic.

ADAL, in the ſenſe of Paracelſus, ſignifies that part of plants, in which their medicinal virtue conſiſts; or the pure and active parts of plants, ſeparated from the impure and inert.

ADALIDES, in the Spaniſh policy, are officers of juſtice, for matters touching the military forces.

In the laws of king Alphonſus, the *adalides* are ſpoken of, as officers appointed to guide and direct the marching of the forces in time of war.—Lopez repreſents them as a ſort of judges, who take cognizance of the differences ariſing upon excurſions, the diſtribution of plunder, &c.

ADAMANT, ADAMAS, in *Natural Hiſtory*, &c. an ancient name for a precious ſtone, by us called a DIAMOND.

Adamas is uſed by ſome ancient *Naturaliſts*, for the ſpume or *ſcoria* of gold; which is caſt away, as not being malleable.

This is particularly called *χρυσι αδαμαντα*; and is miſtaken by Pliny for the gem of that name.

ADAMANT is alſo uſed for a ſpecies of iron, denoting the hardeſt, or higheſt tempered part thereof.

This is ſometimes called the *adamantine* part of iron.

Mr. Boyle more particularly gives the denomination *adamus lucidus*, to a diamond in his poſſeſſion, which had the faculty of ſhining in the dark; a property ſince diſcovered in many others, at leaſt when excited by friction. Vid. Boyle, Phil. Work. Abr. t. i. p. 494. It. t. iii. p. 155.

ADAMANT is ſometimes alſo uſed for the MAGNET, or load-ſtone.

In which ſenſe Skinner thinks it may be beſt derived from the French *aimant*, which ſignifies the ſame.

ADAMANTII, in *Church Hiſtory*, a name given by ſome Chriſtian hiſtorians to the followers of Origen, ſurnamed *Adamantius*, becauſe of his unwearied pains in reading and writing, or the ſtrength and acuteneſs of his reaſoning, according to ſome; or rather, as Heuman ſays, whoſe name was *Adamantius*: however, Euſebius ſays, this was a common name given to Origen, without aſſigning any reaſon for it. Euſ. lib. vi. cap. 14.

ADAMAS, in *Aſtrology*, a name given to the moon.

ADAMI *Pomum*, in *Anatomy*, a protuberance in the forepart of the throat.

Some fancy it is thus called upon a ſtrange conceit, that a piece of the forbidden apple, which Adam eat, ſtuck by the way, and was the occaſion of it.

In reality, it is only the convex part of the firſt cartilage of the *larynx*, called *ſcutiformis*.

The name, Adam's apple, is alſo given to a kind of fruit frequent in Italy, reſembling a lemon, ſaid to be a good remedy againſt the itch.

ADAMIC *earth*, is a name ſome have given to common clay; called alſo *terra zoica*, *rubella*, and *lutum*.

The occaſion of the name we ſuppoſe to be, that this is taken for the *adamah*, or ruddy earth, of which the firſt man was formed.

This appellation is likewiſe given to the mud depoſited by ſea-water, which is a ſediment of the moſt ſlimy and unctuous parts contained in it.

ADAMITES, ADAMITÆ, a ſect who took upon them to imitate the nakedneſs of Adam: as if man had been reinſtated in his original innocence.

The critics explain the name Adam, אדם, from whence the term ariſes, variouſly; ſome by *earth*, others by *red*, others by *acquieſcence*.

Prodicus was their author, according to the account given by Theodoret.—They were, in reality, a branch ſprung out of the CARPOCRATIANS and BASILIDIANS.

This ſect is ſaid to have ſtarted up afreſh in the fifteenth century, under Picard, their leader; who pretended to re-eſtabliſh the law of nature, which, according to him, conſiſted in two things, viz. community of women, and nakedneſs.—Theſe laſt walked naked in the public places; whereas the former only put off their cloaths in their aſſemblies.

An ingenious writer, viz. Beauſobre, has ſhewn, that the *Adamitiſm*, i. e. the nakedneſs of theſe people, is a mere calumny, forged by their adverſaries, the Calixtines and Papiſts, at the time when the Vaudois firſt ſhewed themſelves in that country.

Jovet and Moreri ſpeak of *Adamites* in England; and indeed the Romaniſts and reformed mutually reproach each other with having *Adamites* among them.

ADAMITES, in *Church Hiſtory*, a name given by ſome writers to the firſt patriarchs, the ſons or deſcendants of Adam by Seth. In which ſenſe *Adamites* amount to the ſame with *Sethites*, and ſtand diſtinguiſhed from *Cainites*.

There are divers traditions concerning the quarrels, wars, &c. between the *Adamites* and the *Cainites*.

ADAMITES, *Præ*. See PRE-ADAMITES.

ADAMITUM and *Adamita*, the hardeſt white ſtones, and ſtones in the bladder. The former, Paracelſus ſays, are a ſpecies of TARTAR.

ADAMUS, *Adam*. This is uſed in an *alchemiſtical* ſenſe, to ſignify the philoſopher's ſtone, which they call an animal, and ſay it has carried its inviſible *Eve* in its body, ever ſince the moment they were united by the Creator.

ADAR, in the Hebrew *Chronology*, the twelfth month of their eccleſiaſtical year, and the ſixth of their civil year. It contains only nine and twenty days, and anſwers to our February, and ſometimes enters into the month of March, according to the courſe of the moon.

ADARCE, in the *Materia Medica* of the ancients, a ſaltiſh humour concreting about the ſtalks of reeds, and other vegetable matter, in form of incruſtations.

The ancients ſpeak of *adarce*, as chiefly produced in Cappadocia and Galatia, though we alſo read of it in Italy; and of a native kind produced in Indian reeds, much as ſugar in the cane.

Its colour is like that of the fine powder of the Aſſian ſtone, or *ſarcophagus*, and its ſubſtance all lax and porous, much like the baſtard ſponge; ſo that it might be called the baſtard ſponge of the marſhes.

It is a *topic* adapted to rub and ſcour the ſkin in a leproſy, ſun-burning, tetters, freckles, and ſuch like blemiſhes, being on the whole of an acrimonious quality. Dr. Plott deſcribes it in his Natural Hiſtory of Oxfordſhire.

Though ſome have ſuppoſed the incruſtations, often ſeen about our ſprings, to be the ſame with the *adarce* of the Greek phyſicians; this ſeems a miſtake, as theſe incruſtations poſſeſs none of the virtues or properties of that ſubſtance; it being principally compoſed of ſea-ſalt, of which thoſe contain no particle, being merely a mixture of earth and ſpar.

ADARCON, *adarconim*, an ancient coin, mentioned in Scripture, uſually of gold, derived, as ſome think, from thoſe gold pieces coined by Darius, called δαρειχοι.

Hoſtus makes the *adarcon* only equal to the Attic *drachma*; but biſhop Cumberland, after the ſcholiaſts of Ariſtophanes and Harpocration, twice as much.

ADARIGES, a name for SAL *armoniac*.

ADARME, in *Commerce*, a ſmall Spaniſh weight uſed through their American provinces, equal to the ſixteenth part of an ounce.

Stephens renders it in Engliſh by a dram.

ADARNECH, a name for ORPIMENT.

ADARTICULATION, is uſed, by ſome phyſicians, for *αρθρωδια*, by others, for *διαρθρωσις*. See ARTHRODIA, and DIARTHROSIS.

ADATAIS, or ADATYS, a muſlin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. This muſlin comes from the Eaſt Indies, and the fineſt from Bengal.

ADCHER, in the *Materia Medica*, a name given by Avicenna and Serapion, to the SCÆNANTH, or camel's hay. This ſeems to have been, at that time, the common Arabian name of this drug; but Garcias tells us, that in his time the Arabs called it *adher*.

It is to be obſerved, however, that the Arabians have not confined this word to the SCÆNANTH alone, but expreſs by it all the kinds of *ruſhes*. Thus, Avicenna tells us, that the *adcher* is of two kinds, the one bearing no fruit, the other bearing a hard black fruit: this plainly belongs not to the *ſcænanth*, but the common *ruſh*, of which Dioſcorides has, in the ſame manner, deſcribed two kinds, thus differing from one another.

ADCORDABILES *denarii*, in ancient *Law-books*, denote money paid by the vaſſal to his lord, in the nature of a fine, upon the ſelling or exchanging of a FEUD.

The word is formed from *accorder*, *to agree*.

ADCRESCENTES, in the Roman *Empire*, the ſame with ACCENSI.

ADDACE, in *Natural Hiſtory*, the name by which the Africans call the common ANTELOPE. See GAZELLA.

ADDEPHAGIA, in *Medicine*, a term uſed by ſome phyſicians, to denote a greedineſs in children, whereby they load themſelves with new food, ere the old is digeſted. This is ſometimes alſo written corruptly, *adephagia*.

The word is compounded of *αδδην*, *much*, and *φαγω*, *I eat*. Some uſe *addephagia* in a more extenſive ſenſe, for voraciousneſs in general, ſo as to comprehend the BULIMIA, PICA, and MALACIA.

ADDER, in *Nrtural Hiſtory*, a venomous reptile of the ſerpent kind, more uſually called a VIPER.

ADDER is alſo ſometimes confounded with *aſp*; thus the deaf *adder*, ſpoken of in the Engliſh Bible, is not properly the *adder*, but the *aſp*.

The *adder* differs from the ſnake, in that the former is much ſhorter for its bigneſs, eſpecially his tail below the vent; that it is marked on the back with black lines or ſpots, which the ſnake wants; that its belly is blackiſh, and of one colour, whereas the ſnake's is particoloured, of a pale yellow and blue; that it never grows to the bigneſs which ſome ſnakes attain to; and laſtly, that it is *viviparous*, whereas the ſnake is *oviparous*.

ADDER, *Sea*, the Engliſh name of a ſpecies of SYNGNATHUS, with a round body, and no pectoral or tail fins.

ADDER, *Water*, in *Zoology*, a name given to the NATRIX.

ADDER-*Bolts*. See DRAGON-FLIES.

ADDER-STUNG, is uſed in reſpect of cattle, when ſtung with any kind of venomous reptiles; as adders, ſcorpions, &c. or bit by a hedge-hog, or ſhrew.

For the cure of ſuch bites, ſome uſe an ointment made of dragon's blood, with a little barley-meal, and the whites of eggs.

ADDER'S-TONGUE, in *Botany*, a medicinal plant, ſo called either from its reſembling or its curing the bite of a viper. It is more commonly called *ophioglоſſum*.

No part of the fructification of this plant is viſible, except the fruit. This is an oblong, double, or diſtichous capſule, divided by a great number of tranſverſe articulations, into many cells, each of which, when mature, opens tranſverſly, and is found to contain a great number of ſmall ſeeds of a ſubovate figure.

Caſpar Bauhine deſcribes what he calls three ſpecies of this plant.

Tournefort makes eight ſpecies of OPHIOGLOSSUM, which are only the varieties of the common European kind, mentioned above.

This is a ſpring plant, and is only to be found in April and May. It is not uncommon in wet meadows, and is eaſily diſtinguiſhed among the other ſpring plants by its ſpike, or tongue.

It is eſteemed one of the beſt vulnerary herbs this country produces; but it is more in uſe among the common people than in the ſhops. They give its juice internally, and uſe the herb bruiſed, or an ointment prepared from it, with lard, or May-butter, externally, at the ſame time.

Farriers, &c. prepare an ointment of this herb, called ADDER's-*tongue ointment*, uſed as a remedy againſt the bites of venomous beaſts. Phil. Tranſ. vol. xlix. part 2, N° 112.

ADDER'S *Wort*. See BISTORT.

ADDEXTRATORES, or ADDEXTRARII, in the court of Rome, denote the pope's MITRE-bearers.

Some ſuppoſe them thus called, on account of their walking at the pope's right-hand, when he rides to viſit the churches.

ADDICE, ſee ADZE.

ADDICO, ſee ADDICTIO.

ADDICTI, in *Antiquity*, inſolvent perſons, or thoſe who being ſentenced to pay a debt, but unable to do it, were adjudged to a kind of temporary ſervitude to the creditor.

In this ſenſe, *addicti* were a ſpecies of *ſervi*; from whom, however, they differed in this, that a ſlave, when diſcharged, became a *libertus*; whereas an *addictus* became *ingenuus*. Again, a ſlave could not be diſcharged without the conſent of his maſter; whereas the *addictus* was diſcharged of courſe, when his debt was ſatisfied.

ADDICTIO, ADDICTION, in the Roman law, a transferring, or paſſing over goods to another; whether by ſentence of a court, or in the way of ſale, to him that bids moſt for them.

The word ſtands oppoſed to *abdictio*, or ABDICATION.

It is formed of *addico*, one of the ſtated words uſed by the Roman judges, when they allowed the delivery of the thing or perſon on whom judgment had paſſed.

Hence, goods thus adjudged by the prætor, to the right owner, were called *bona addicta*; and the debtors delivered up, in like manner, to their creditors, to work out their debt, were called *ſervi addicti*.

ADDICTIO *in diem*, denoted the adjudging of a thing to a perſon for a certain price; unleſs by ſuch a day the owner, or ſome other perſon, gave more for it.

ADDITAMENT, ADDITAMENTUM, a thing added to another. It ſignifies the ſame as EPIPHYSIS.

Additaments, in *Phyſick* and *Chemiſtry*, are things ſuperadded to the ordinary ingredients of any compoſition.

ADDITION, the act of joining one thing to another, or of augmenting a thing, by the acceſſion of others.

ADDITION is alſo uſed for the thing added with itſelf.

ADDITION, in *Arithmetic*, is the firſt of the four fundamental rules, or operations, of that art.

Addition conſiſts in finding the amount of ſeveral numbers, or quantities, ſeverally added one to another.—Or, *addition* is the invention of a number, from two or more homogeneous ones given, which is equal to the given numbers taken jointly, or together.

The number, thus found, is called the *ſum*, or aggregate of the numbers given.

The character of *addition* is +, which we uſually expreſs by *plus*. Thus $3+4$ denotes the ſum of 3 and 4; and is read 3 *plus* 4.

The *addition* of ſimple numbers is eaſy. Thus it is readily perceived that 7 and 9, or $7+9$, make 16; and $11+15$ make 26.

In longer, or compounded numbers, the buſineſs is performed by writing the given numbers in a row downwards; homogeneous under homogeneous, i. e. units under units, tens under tens, &c. and ſingly collecting the ſums of the reſpective columns.

To do this, we begin at the bottom of the outmoſt row or column to the right; and if the amount of this column do not exceed 9, we write it down at the foot of the ſame column: if it do exceed 9, the exceſs is only to be written down, and the reſt reſerved to be carried to the next row, and added thereto; as being of the ſame kind or denomination.

Suppoſe, e. g. the numbers 1357 and 172 were given to be added: write either of them, v. gr. 172, under the other 1357; ſo as the units of the one, viz. 2, ſtand under the units of the other, viz. 7; and the other numbers of the one, under the correſpondent ones of the other, viz. the place of tens under tens, as 7 under 5; and that of hundreds, viz. 1, under the place of hundreds of the other, 3.—Then, beginning, ſay, 2 and 7 make 9; which write underneath; alſo 7 and 5 make 12; the laſt of which two numbers, viz. 2, is to be written, and the other one reſerved in your mind to be added to the next row, 1 and 3: then ſay, 1 and 1 make 2, which added to 3 make 5: this write underneath, and there will remain only 1, the firſt figure of the upper row of numbers, which alſo muſt be writ underneath; and thus you have the whole ſum, viz. 1529. The ſame method will extend to any number of ſums, which are required to be united in one.

$$\begin{array}{r} 1357 \\ 172 \\ \hline 1529 \end{array}$$

Addition *of numbers of different denominations*, for inſtance, of pounds, ſhillings, and pence, is performed by adding or ſumming up each denomination by itſelf, always beginning with the loweſt; and if, after the *addition*, there be enough to make one of the next higher denomination, for inſtance, pence enough to make one or more ſhillings, they muſt be added to the figures of that denomination, that is, to the ſhillings; only reſerving the odd remaining pence to be put down in the place of pence.—And the ſame rule is to be obſerved in ſhillings with regard to pounds.

For an inſtance, 5 pence and 9 pence make 14 pence; now in 14 there is once 12, or a ſhilling, and two remaining pence; the pence ſet down, and reſerve 1 ſhilling to be added to the next column, which conſiſts of ſhillings. Then 1 and 8 and 2 and 5 make 16: the 6 put down, and carry the 1 to the column of tens; 1 and 1 and 1 make three tens of ſhillings, or 30 ſhillings: in 30 ſhillings there is once 20 ſhillings, or a pound, and 10 over: write 1 in the column of tens of ſhillings, and carry 1 to the columns of pounds; and continue the *addition* of pounds, according to the former rules.

l.	*s.*	*d.*
120	15	9
65	12	5
9	8	0
195	16	2

So, half of an even ſum of ſhillings will be carried to the pounds; and the odd one (where it ſo happens) ſet under the tens of the ſhillings.

Addition *of Decimals*, is performed after the ſame manner as that of whole numbers; as may be ſeen in the following example.

$$\begin{array}{r} 630.953 \\ 51.0807 \\ 305.27 \\ \hline 987.3037 \end{array}$$

Addition *of Vulgar Fractions*, ſee under FRACTION.

Addition *of Ratios* is uſed by ſome authors in the ſame ſenſe with COMPOSITION OF RATIOS, which ſee.

Addition, in *Algebra*, or the ADDITION *of Species*, is performed by connecting the quantities to be added, by their proper ſigns; and alſo by uniting into one ſum, thoſe that can be ſo united. See QUANTITY, SPECIES, &c. Thus a and b make $a+b$; a and $-b$ make $a-b$; $-a$ and $-b$ make $-a-b$; $7a$ and $9a$ make $7a+9a$; $-a\sqrt{ac}$ and $b\sqrt{ac}$ make $-a\sqrt{ac}+b\sqrt{ac}$, or $b\sqrt{ac}-a\sqrt{ac}$; for the order in which they are written, makes no alteration in their value.

But, particularly, 1°, Affirmative quantities of the ſame ſpecies, or kind, are united by adding the prefixed numbers whereby the ſpecies are multiplied.

Thus, $7a+9a$ make $16a$. And $11bc+15bc$ make $26bc$. Alſo $3\frac{a}{c}+5\frac{a}{c}$ make $8\frac{a}{c}$; and $2\sqrt{ac}+7\sqrt{ac}$ make $9\sqrt{ac}$; $6\sqrt{ab-xx}+7\sqrt{ab-xx}$ make $13\sqrt{ab-xx}$. And in like manner $6\sqrt{3}+7\sqrt{3}$ make $13\sqrt{3}$. Again, $a\sqrt{ac}+b\sqrt{ac}$ make $\overline{a+b}\sqrt{ac}$, by adding together a and b, as numbers multiplying $\sqrt{ac}$. And ſo $\frac{\overline{2a+3c}\sqrt{3axx-x^3}}{a+x}+\frac{3a\sqrt{3axx-x^3}}{a+x}$ make $\frac{\overline{5a+3c}\sqrt{3axx-x^3}}{a+x}$, ſince $2a+3c$ and $3a$ make $5a+3c$.

2°, Affirmative fractions, which have the ſame denominator, are added together by adding their numerators.

Thus $\frac{1}{5}+\frac{2}{5}$ make $\frac{3}{5}$, and $\frac{2ax}{b}+\frac{3ax}{b}$ make $\frac{5ax}{b}$; and thus $\frac{8a\sqrt{cx}}{2a+\sqrt{cx}}+\frac{17a\sqrt{cx}}{2a+\sqrt{cx}}$ make $\frac{25a\sqrt{cx}}{2a+\sqrt{cx}}$ and $\frac{aa}{c}+\frac{bx}{c}$ make $\frac{aa+bx}{c}$.

3°, Negative quantities are added after the ſame manner as affirmative. See NEGATIVE.

Thus, -2 and -3 make -5; $-\frac{4ax}{b}$ and $-\frac{11ax}{b}$ make $-\frac{15ax}{b}$; $-a\sqrt{ax}$ and $-b\sqrt{ax}$ make $\overline{-a-b}\sqrt{ax}$.

When a negative quantity is to be added to an affirmative one, the affirmative muſt be diminiſhed by the negative one.

Thus, 3 and -2 make 1; $\frac{11ax}{b}$ and $-\frac{4ax}{b}$ make $\frac{7ax}{b}$; $-a\sqrt{ac}$ and $b\sqrt{ac}$ make $b-a\sqrt{ac}$.

And note, that when the negative quantity is greater than the affirmative, the aggregate ſum will be negative. Thus, 2 and -3 make -1; $-\frac{11ax}{b}$ and $\frac{4ax}{b}$ make $-\frac{7ax}{b}$; and $2\sqrt{ac}$ and $-7\sqrt{ac}$ make $-5\sqrt{ac}$.

Addition *of irrational Quantities*.—If they be of different denominations, reduce them to the ſame denomination; and if they be then commenſurable, add the rational quantities without the vinculum; and to their ſum prefix the radical ſign.—The reſt as in the addition of rationals.

Thus, we ſhall find $\sqrt{8}+\sqrt{18}=2\sqrt{2}+3\sqrt{2}=5\sqrt{2}=\sqrt{50}$. On the contrary, $\sqrt{7}$ and $\sqrt{5}$ being incommenſurable, their ſum will be $\sqrt{7}+\sqrt{5}$.

Addition, in *Law*, is that name, or title, which is given to a man over and above his proper name, and ſurname; to ſhew of what eſtate, degree, or myſtery he is; and of what town, village, or country.

Additions of Eſtate, or quality, are yeoman, gentleman, eſquire, and ſuch like.

Additions of Degree, are thoſe we call names of dignity; as knignt, lord, earl, marquis, and duke.

Additions of Myſtery, are ſuch as ſcrivener, painter, maſon, and the like. See CHOPCHURCH.

Additions of Place, are, of Thorp, of Dale, of Woodſtock.—Where a man hath houſhold in two places, he ſhall be ſaid to dwell in both; ſo that his *addition* in either may ſuffice. Knave was anciently a regular *addition*.

By ſtat. 1 Hen. V. cap. 5. it was ordained, that in ſuch ſuits or actions where proceſs of outlawry lies; ſuch *addition* ſhould be made to the name of the defendant, to ſhew his eſtate, myſtery, and place where he dwells; and that the writs, not having ſuch *additions*, ſhall abate, if the defendant take exception thereto; but not by the office of the court.—The reaſon of this ordinance was, that one man might not be troubled by the outlawry of another; but by reaſon of the certain *addition*, every perſon might bear his own burden.

If one be of the degree of a duke, earl, &c. he ſhall have the *addition* of the moſt worthy dignity. 2 Inſt. 669.

Such titles, however, are not properly *additions*, but names of dignity. The title of knight or baronet is part of the party's name, and ought to be rightly uſed; but the titles of eſquire, gentleman, or yeoman, &c. being no part of the name, but *additions*, as people pleaſe to call them, may be uſed, or not uſed, or if varied, it is not material. 1 Lill. 34.

An earl of Ireland is not an *addition* of honour here in England; but ſuch a perſon muſt be written by his Chriſtian and ſurname, with the *addition* of eſquire only; and the ſons of Engliſh noblemen, although they have given them titles of nobility, in reſpect to their families, if you ſue them, they muſt be named by their Chriſtian and ſurnames, with the *addition* of eſquire; as—ſuch-a-one, eſquire, commonly called lord A, &c. 2 Inſt. 596, 666.

No *addition* is neceſſary, where proceſs of outlawry doth not lie. 1 Salk. 5. If a city be a county of itſeif, wherein are ſeveral pariſhes, *addition* thereof, as *de London*, is ſufficient; but *addition* of a pariſh not in a city, muſt mention the county, or it will not be good. 1 Danv. 237.

Addition, in *Muſic*.—The note or mark of *addition* is a dot placed on the right ſide of a note, to ſignify, that the time of the ſound of ſuch note, is to be lengthened half as much more, as it would otherwiſe be.

A note of *addition* amounts to the ſame with what is by ſome old Engliſh authors, called *prick of perfection*.

Thus a ſemibreve, when marked with a dot, is to be as long as three minims; the minim, with the like dot, to be as long as three crotchets; the crotchet as three quavers, &c. See CHARACTER.

Additions, in *Heraldry*, denote a kind of bearings, in coat of arms, wherein are placed rewards, or additional marks of honour.

In which ſenſe, *additions* ſtand oppoſed to ABATEMENTS, or DIMINUTIONS. See DIFFERENCE.

Additions reſemble, but differ from ordinaries. To the claſs of *additions* belong a bordure, quarter, canton, gyron, pile, flaſques, hanches, voiders, ermine, and an ineſcutcheon gules, called alſo an *eſcutcheon of pretence.* On any of theſe may an *addition* of honour be placed, according to the pleaſure of the prince, or the fancy of the herald; which reward deſcends to none of the family, except the perſon's own direct line. In this manner the arms of a kingdom have been ſometimes given, by way of *addition*, to a private ſubject.

ADDITIONS, in *Diſtilling*, a name given to ſuch things as are added to the waſh, or liquor, while in a ſtate of fermentation, in order to improve the vinoſity of the ſpirit, procure a larger quantity of it, or give it a particular flavour.

All things of whatever kind, thus added in the time of fermentation, are called by thoſe of the buſineſs, who ſpeak moſt intelligently, *additions*; but many confound them with things of a very different nature, under the name of FERMENTS.

The *additions* uſed in the diſtillery, may be reduced to four general heads. 1. *Salts*, 2. *Acids*, 3. *Aromatics*, and 4. *Oils*. A little tartar, nitre, or common ſalt finely powdered, may be added to the liquor while fermenting, eſpecially in the beginning of the operation; or in their ſtead, a little of the vegetable, or finer mineral acids, may be dropped in at different times, when found neceſſary. Theſe are of great uſe, eſpecially in the fermenting ſolutions of treacle, honey, and the like ſweet and rich vegetable juices, which either wholly want an acid in themſelves, or have it in too ſmall a proportion, or have been robbed or diveſted of it. The proper acids for this purpoſe are, the juice of Seville oranges, or lemons, or the ſpirit of ſulphur, or Glauber's ſpirit of ſalt, or, what is greatly preferable to all theſe, a particular aqueous ſolution of tartar, a ſuccedaneum for which may be tamarinds, or the robs of ſome very acid fruits, or the *media ſubſtantia vini*. On this foundation ſtands that ingenious practice of uſing a ſuitable proportion of the ſtill bottoms, or the remaining waſh, in the ſubſequent brewing.

After the ſame manner, a very conſiderable quantity of any eſſential vegetable oil, may by proper management be converted into a ſurpriſingly large quantity of inflammable ſpirit; but great care in this caſe muſt be had not to drop it in too faſt, nor too much at a time; this might damp the fermentation: and, indeed, the adding a large quantity of oil at once, is the common way of ſtopping the fermentation at any point required.

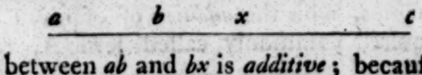
The beſt method, of all others, of introducing the oil, ſo as to avoid all inconvenience, is to reduce it firſt to an elæoſaccharum, by grinding it in a mortar, with a due quantity of fine ſugar in powder. The oil thus added, with its particles diſunited, and in form of powder, will readily mix with the liquor, and immediately ferment with it.

A large proportion of rectified ſpirit, or of any other ſpirit, may, by prudent management, be alſo introduced into the fermenting liquor; and this will always come back with a large *addition* to the quantity of ſpirit, that would otherwiſe have riſen from the diſtillation.

ADDITIVE, denotes ſomething to be added to another.

Geometricians ſpeak of *additive ratios*; aſtronomers of *additive equations*, &c.

ADDITIVE *ratio* is uſed, by ſome writers, for that whoſe terms are diſpoſed to addition, that is, to compoſition, in oppoſition to *ſubſtractive ratio*, whoſe terms are diſpoſed to ſubſtraction, i. e. to diviſion. Phil. Tranſ. N° 257. Suppoſe the line *ac* divided in the points *b* and *x*,



the ratio between *ab* and *bx* is *additive*; becauſe the terms *ab* and *bx* compoſe the whole *ax*. But the ratio between *ax* and *bx* is ſubſtractive, becauſe *ax* and *bx* differ by the line *ab*.

ADDITIVE EQUATIONS, in *Aſtronomy*, thoſe which are to be added to the ſun's mean ANOMALY, in order to find the true one. V. Hiſt. Acad. Roy. des Scienc. 1720, p. 118.

ADDOUBORS, in *Law*, ſee REDUBBORS.

ADDRESS, in a general ſenſe, is uſed for ſkill and good management, and of late has been adopted from the French, and is uſed in genteel phraſe, and alſo in *Commerce*, as ſynonymous with direction to a perſon or place. The word is formed of the French verb *addreſſer, to direct any thing to a perſon.*

ADDRESS, means alſo a diſcourſe preſented to the king, in the name of a conſiderable body of his people; to expreſs or notify their ſentiments of joy, ſatisfaction, or the like, on ſome extraordinary occaſion.

We ſay, the lords *addreſs*, the commons *addreſs*.—*Addreſſes* were firſt ſet on foot under the adminiſtration of Oliver Cromwell.—At Paris, their office of intelligence is called *bureau d'adreſſe.*

ADDUCENT *Muſcles*, or ADDUCTORS, are thoſe which bring forward, cloſe, or draw together, the parts of the body whereto they are annexed.

The word is compounded of *ad*, *to*; and *ducere, to draw* or *bring.*

Adducents, or *adductors*, ſtand oppoſed to *abducents*, or *abductors.*

ADDUCTION, in *Anatomy*, the motion, or action, of the ADDUCENT muſcles. See ADDUCTOR.

ADDUCTOR *oculi*, a muſcle of the eye, ſo called, becauſe it inclines its pupil towards the noſe.

It is alſo called *bibitorius*; becauſe it directs the eye toward the cup in drinking.

ADDUCTOR *pollicis*, is a muſcle of the thumb, which ariſes tendinous, and aſcends obliquely towards a broad termination, at the ſuperior part of the firſt bone of the thumb.—*See Tab. Anat.* (*Myol.*) *fig.* I. *n.* 31. & *fig.* VII. *n.* 7.—Its office is to bring the thumb near the fore-finger.

This muſcle is called by Albinus, and the generality of writers, the *abductor indicis*; and by Winſlow, the *ſemi-interoſſeus indicis.*

ADDUCTOR *pollicis pedis*, called alſo *antithenar*, is a muſcle of the great toe, which ariſes from the inferior part of the *os cuneiforme tertium*, and is inſerted into the internal part of the *oſſa ſeſamoidea* of the great toe; which it draws nearer the reſt.

ADDUCTOR *indicis*, is a muſcle of the fore-finger, ariſing from the inſide of the bone of the thumb, and inſerted into the firſt bone of the fore-finger, which it draws towards the thumb.

ADDUCTOR *minimi digiti pedis*; the ſame as TRANSVERSALIS *pedis.*

ADDUCTOR *proſtatæ*, a name given by Santorini to a muſcle, which he alſo calls *levator proſtatæ*; and which Winſlow calls *proſtaticus ſuperior*. Albinus, from its office, has very properly called it *compreſſor proſtatæ.*

ADDUCTOR *brachii* ſerves to draw the arm toward the trunk of the body; though Winſlow finds its office more complicated, and that it acts in concurrence with the flexors and extenſors, in bending and extending the arm.

ADEB, in *Commerce*, the name of a large Ægyptian weight, uſed principally for rice, and conſiſting of two hundred and ten okes, each of three rotolos, a weight of about two drams leſs than the Engliſh pound. But this is no certain weight; for at Roſetto the *adeb* is only one hundred and fifty okes.

ADEC ſignifies ſour milk.

ADECTOS, an epithet applied to a medicine that allays the ſenſe of pain, or the uneaſineſs created by ſtimulants.

ADEL-*fiſh*, a name given by ſome nations to the *lavaretus*, or *albula nobilis.*

Theſe are generally treated of by authors as two different kinds of fiſh. But Artedi contends, that they are the ſame ſpecies, and diſtinguiſhes them by the name of the *coregonus*, with the upper jaw flat, and longer than the under; and with fourteen rays in the back fin.

ADELING. See ATHELING.

ADELPHIANI, in *Church Hiſtory*, a ſect ſo called from their leader *Adelphius.*

They were ſingular in this, that they kept the Sabbath as a faſt.

ADELSCALC, in *Ancient Cuſtoms*, denotes a ſervant of the king.

The word is alſo written *adelſcalche*, and *adelſcalcus*. It is compounded of the German *adel*, or *edel*, *noble*, and *ſcalc*, *ſervant*. Among the Bavarians, *adelſcalcs* appear to have been the ſame with royal *thanes* among the Saxons, and thoſe called *miniſtri regis* in ancient charters.

ADEMPTION, ADEMPTIO, in the *Civil Law*, the REVOCATION of a grant, donation, or the like.

The *ademption* of a legacy may be either *expreſs*; as when the teſtator declares in form, that he revokes what he had bequeathed: or *tacit*, as when he only revokes it indirectly, or implicitly. See RECISSION.

Thus if A by will gives his daughter M 1000*l.* to be firſt paid after his debts, beſide a ſhare out of the dividend of his eſtate; and afterward, on her marriage, an agreement be made for what ſhe ſhould have out of A's eſtate, that it ſhould be only 1100*l.* which ſhould be in full of what was intended thereout; this agreement is an *ademption* of the legacy.

ADEN, a gland. See GLANDULA.

ADENANTHERA, in *Botany*, the name of a genus of plants belonging to the claſs of *decandria monogynia*, the characters of which are theſe: the perianthium is very ſmall, and is compoſed only of one leaf divided into five ſegments at the edge. The flower conſiſts of five leaves, and is of a campanulated form. The petals are pointed and ſeſſile, and they turn inwards, and are hollowed underneath. The ſtamina are ten erect tubulated filaments, a little ſhorter than the flower; and the antheræ are roundiſh and incumbent, and bear on their exterior apex a globoſe glandule. The germen of the piſtil is oblong and gibbous on the back in the lower part. The ſtyle is tubulated, and of the length of the ſtamina, and the ſtigma is ſimple. The fruit is a long compreſſed pod, in which are ſeveral round ſeeds.

ADENOGRAPHY, that branch of *Anatomy* which deſcribes the glands, and glandular parts of the body.

The word is compounded of *αδην*, *gland*, and *γραφω*, *I deſcribe.*

Adenography is the ſame with what ſome others call *adenology*, or the adenological part of *Anatomy.*

ADENOS, a kind of cotton, otherwiſe called marine cotton. It comes from Aleppo by the way of Marſeilles, where it pays 20 *per cent.* duty, according to the TARIFF of the year 1706. Its valuation, by the ſame *tariff*, is of 76 livres, 16 ſols.

ADENOSUS *abſceſſus*, in *Medicine*, a crude hard tubercle, difficult of diſcuſſion, and reſembling the appearance of a gland.

ADEPS, among *Phyſicians*, fat. This is an animal oil, ſecreted from the blood, and contained in the *membrana adipoſa*, or, as Boerhaave calls it, the *membrana celluloſa*; which is not a ſingle membrane, but a *congeries* of a great number of membraneous *laminæ*, joined irregularly to each other at different diſtances, ſo as to form numerous interſtices of different capacities, which communicate with each other. Theſe interſtices have been named *cellulæ*, and the ſubſtance made up of them, the cellulous ſubſtance.

Theſe cellular interſtices are ſo many little bags or ſatchels, filled with an unctuous or oily juice, more or leſs liquid, which is called *fat*; the different conſiſtence of which depends not only on that of the oily ſubſtance, but on the ſize, extent, and ſubdiviſion of the cells.

Neumann divides *fats*, from their conſiſtence, into three kinds; the firſt, called *pinguedo*, is ſoft and thin, and becomes liquid in a very ſmall heat; ſuch is that which we meet with in birds, reptiles, and fiſhes (the very large fiſhes excepted.) The ſecond is thick, liquifies leſs readily, and is denominated *axungia*. The third is more hard and firm; when taken from the animal it is called *adeps*, and when freed from the ſkins, &c. *ſevum*. The two laſt kinds of *fat* are chiefly found in quadrupeds.

In ſome parts of the body, the fat ſerves for a cuſhion, pillow, or mattreſs; as on the *nates*, where the *laminæ* and cells are very numerous. In other parts this membrane has few or no *laminæ*, and conſequently little or no fat; as on the forehead, elbows, &c.

In the young *fœtus* there is ſcarce any *fat*; but in the older *fœtus*, *fat* begins to appear. When the child is born, and for ſome years after, it hath much *fat* immediately beneath the ſkin; in men, the *fat* is moſt abundantly ſpread on the *glutei* muſcles.

Fats taken freely as food are difficult of digeſtion; relax and weaken the tone of the ſtomach and inteſtines, and are ſuppoſed likewiſe to render the juices tenacious, and to increaſe the bile.

The medical virtues of *fats*, as manifeſted by experience, are ſuch as ariſe from their uſe in external applications, for ſoftening and ſuppling, for abating pains and ſpaſms, and for promoting maturation. Thoſe that are principally uſed are the *fat* of *vipers*, *hog's lard*, and *mutton ſuet*.

ADEPTS, ADEPTI, a denomination given to the proficients in *Alchemy*; particularly to thoſe who pretend to the ſecrets of the philoſophers ſtone, and the univerſal medicine.

The word is formed from the verb *adipiſci*, *to obtain.*

Ripley, Lully, Paracelſus, Helmont, Hollandus, Sendivogius, &c. are the principal among the *adepti.*

It is a ſort of tradition among the *Alchemiſts*, that there are always twelve *adepti*; and that their places are immediately ſupplied by others, whenever any of the fraternity die.

The term *adepts* is ſometimes more generally applied to thoſe who are proficients in any kind of ſcience.

ADEQUATE, ADÆQUATUM, ſomething equal to, or coextended with, another; and filling the whole meaſure and capacity thereof.

In this ſenſe the word ſtands oppoſed to INADEQUATE.

ADEQUATE, or total, in *Logic*, is applied to the objects of ſcience. The *adequate* object of a ſcience includes the *material* and *formal* object: the *material* object of a ſcience, is that part which is common to it with other ſciences; the *formal* is that which is peculiar to itſelf.

ADEQUATE *ideas*, or *notions*, in *Metaphyſics*, are ſuch images or conceptions of an object, as perfectly repreſent it, or anſwer to all the parts and properties of it.

M. Leibnitz defines an *adequate notion* to be that, of whoſe ſeveral characters we have diſtinct ideas.—Thus, a circle being defined a figure bounded by a curve line which returns into itſelf, and whoſe points are all equally diſtant from a certain intermediate point therein; our notion of a circle is *adequate*, if we have diſtinct ideas of all theſe circumſtances, viz. a curve returning upon itſelf, a middle point, an equality of diſtance, &c.

All SIMPLE ideas are *adequate* and perfect; and the faculty, be it what it will, that excites them, repreſents them entire.

The ideas of modes are likewiſe *adequate*, or perfect; except of thoſe modes which occaſionally become ſubſtances; for when we ſpeak of modes ſeparately exiſting, we only conſider them ſeparate from the ſubſtance by way of abſtraction.

All abſtract ideas are alſo *adequate* and perfect; ſince they repreſent all that part of the ſubject which we then conſider.—Thus, the idea of roundneſs is perfect, or *adequate*, becauſe it offers to the mind all that is in roundneſs, in general.

Of the ſame kind are all ideas, of which we know no original, or external object really exiſting out of the mind, by occaſion of which they were excited in us, and of which we think them the images. Thus, when a dog is before us, it is the external object without us which raiſes the idea in our mind; but the idea of an animal, in general, has no external object to excite it: it is created by the mind itſelf, and muſt of neceſſity be *adequate* or perfect.

On the contrary, the ideas of all ſubſtances are *inadequate* and imperfect, which are not formed at the pleaſure of the mind, but gathered from certain properties, which experience diſcovers in them.

This is evident, becauſe our knowledge of ſubſtance is very defective; and we are only acquainted with ſome of their properties: thus, we know that ſilver is white, that it is malleable, that it melts, &c. but we do not know what farther properties it may have; and we are wholly ignorant of the inward texture of the particles whereof it conſiſts.—Our idea of ſilver therefore not repreſenting to the mind all the properties of ſilver, is *inadequate* and imperfect.

ADERAIMIN, ſee ALDERAIMIN.

ADES, or HADES, *αδης*, from *α* and *ιδω*, denotes the inviſible ſtate. In the heathen mythology, it comprehends all thoſe regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elyſium. See HELL.

ADESSENARII, a name given to thoſe who hold that Jeſus Chriſt is really preſent in the euchariſt; but in a manner different from what the Romaniſts hold.

From the Latin verb *adeſſe*, *to be preſent.*

The *Adeſſenarii*, called alſo *Impanatores*, are divided into four different opinions touching the point.—Some hold that the body of Jeſus Chriſt is in the bread; others, that it is about the bread; others, that it is with the bread; and, laſtly, others, that it is under the bread. See IMPANATION.

ADFECTED *equation* is that where the unknown quantity is found in two or more different degrees, or powers. E. gr. $x^3-px^2+qx=a^2b$; where there are three different powers of x; viz. x^3, x^2, and x^1. See EQUATION.

ADFILIATION, ADFILIATIO, is uſed to ſignify a Gothic cuſtom; where a perſon remarrying, who has children by a former bed, renders them capable of inheriting equally with the common children of both parties.

This is done by agreement, and is otherwiſe called, by ſome, *adoptio per matrimonium.*

This cuſtom is ſtill retained in Germany, under the name *einkindſchafft*, and *unio prolium.*

But the learned Heineccius obſerves, that the *unio prolium* is not an ADOPTION.

ADHATODA, in *Botany*, the Malabar nut. See JUSTICIA.

Tournefort enumerates four ſpecies of this plant, which by Houſton and Linnæus is called JUSTICIA, a name given to it in the Zeylanic tongue, from its virtue of expelling the dead fœtus, which it ſignifies.

ADHESION, ADHERENCE, in *Phyſics*, the act of two bodies which are joined or faſtened to each other, either by the mutual impreſſion of their own parts; or the compreſſion of external bodies. See COHESION.

The word is compounded of *ad*, *to*; and *hærere*, *to ſtick.*

Anatomiſts ſometimes obſerve proſphyſes, or *adheſions* of the lungs to the ſide of the thorax, the pleura, and diaphragm, which give occaſion to various diſorders.

The *adheſions* of two poliſhed planes, and two hemiſpheres, are phænomena urged in behalf of the weight and preſſure of the ATMOSPHERE.

The argument drawn from the *adheſion* of two poliſhed planes, urged in behalf of the weight and preſſure of the atmoſphere, might be objected to, as this preſſure is not ſufficient to produce the effect, and that poliſhed bodies will adhere very ſtrongly, even in an exhauſted receiver.

However, it is certain, that the air contributes in part to this ADHESION.

Dr. Deſaguliers has given experiments of the *adheſion* of leaden bullets to each other: the cauſe of which is reſolved into the principle of ATTRACTION. Phil. Tranſ. N° 389.

We alſo read of *adheſions* of the dura mater to the cranium; of the ſtone to the bladder; though ſome combat this laſt as a chimera; at leaſt the inſtances of it appear to be rare.

We have alſo ſeveral caſes of *adheſions* of the inteſtines, mentioned in the Philoſophical Tranſactions, Number 481.

Adhesion, in *Logic.* The ſchoolmen diſtinguiſh two kinds of *certitude*; the one of *ſpeculation*, which ariſes from the evidence of the thing; and the other of *adheſion*, or attachment, which does not depend on the evidence, but on the importance of the matter, and the intereſt we have in its truth.

Adhesion, or Adherence, is alſo uſed for the perſiſting in a former opinion or reſolution.—After the free conference between the two houſes, concerning the bill for preventing occaſional conformity, when the lords retired, and it came to the final vote of *adhering*, they were ſo equally divided, that in three queſtions put on different heads, the *adhering* was carried but by one vote in every one, and by a different perſon each time.—The commons likewiſe *adhered*; and thus the bill was loſt.

ADHIL, in *Aſtronomy*, a ſtar, of the ſixth magnitude, upon the garment of Andromeda, under the laſt ſtar in her foot.

ADHOA, in *Ancient Cuſtoms*, denotes what we otherwiſe call RELIEF.

In which ſenſe, we ſometimes alſo find the word written *adoha*, *adhoamentum*, and *adhogamentum*.

ADJACENT, or Adjoining, ſomething ſituate near, or aſide of another; of *ad*, *to*, and *jacere*, *to lie.*

ADIANTUM, *Maidenhair*, in *Botany*, the name of a genus of plants, the characters of which are theſe: the flowers are not diſcovered. The ſeeds are contained in ſpherical capſules, placed in the ſinuſes and complications of the leaves, and ſurrounded each with an elaſtic ring, which contracting, burſts the capſule, and ſcatters abroad the minute ſeeds. To this it is to be added, that the leaves of the maidenhairs have all one general appearance, by which they are eaſily diſtinguiſhed at ſight, from the other plants of the fern kind. See *Tab.* 1 *of Botany*, *Claſs* 16.

Tournefort enumerates twenty ſpecies of this plant.

In the Linnæan ſyſtem of *Botany*, the general character of the *adianta* is, their having the fructifications in form of oval ſpots, diſpoſed in cluſters under the reflected tops of the leaves; and they are claſſed with the *cryptogamia filices.*

The *adiantum* is eſteemed a great pectoral, and gives name to a ſyrup much in uſe for that intention. It is alſo ſaid to be a remover of obſtructions, both of the kidneys and the menſes, though little uſed in thoſe intentions. Its eſſence is by ſome commended in hypochondriac and hyſteric complaints.

Adiantum *aureum*, called alſo *muſcus capillaris*, *polytrichum aureum medium*, C. B. *polytrichum nobile*, *vel primum*, *polytrichum apulei aureum*, &c. in Engliſh, *golden maiden*-HAIR, is of the moſs kind. It grows in heathy and boggy ground. It is a good ſudorific, and its infuſion drank hot is recommended againſt pleuriſies. Camerarius gives a relation of this plant riſing ſpontaneouſly out of the ruins of a town burnt down in Germany; as the *eriſymum vulgare* did from the ruins of London.

The various ſpecies of this plant abound with a neutral ſaponaceous quality, approaching to nitre; with their mucilage they impart all their virtue to boiling water. The beſt preparation, therefore, of the plant, is a ſtrong infuſion made with boiling water, and ſweetened with liquorice root. The French make a ſyrup of the *adiantum verum*, and flavour it with orange flower water; and a ſyrup is made in America of the *adiantum Canadenſe*, with maple ſugar. Our confectioners prepare a ſyrup of it, which they ſell under the name of *capillaire.* Theſe ſyrups are eſteemed in diſorders of the breaſt; as they allay tickling coughs from defluxions of thin rheum, and aſſiſt the expectoration of phlegm.

ADIAPHORISTS, Adiaphoristæ, or Adiaphorites, a name given in the ſixteenth century to the moderate LUTHERANS, who adhered to the ſentiments of Melanchthon; and afterwards to thoſe who ſubſcribed the interim of Charles V.

The word is compounded of the privative *α*, and διαφορος, *different.*

ADIAPHOROUS, Adiaphorus, is a name given by Mr. Boyle to a kind of ſpirit diſtilled from tartar, and ſome other vegetable bodies; and which is neither acid, vinous, nor urinous; but in many reſpects different from any other ſort of ſpirit.

ADIAPNEUSTIA, ſignifies defective perſpiration, from denſe pores, &c.

ADIAPTOTOS; the Greek word ſignifies *firm*; but it is a name given by phyſicians to a remedy for the cholic, which is ſtone parſley, henbane-ſeed, white pepper, &c. made into an electary.

ADIARRHOEA, in *Medicine*, ſignifies a total ſuppreſſion of all the neceſſary evacuations.

ADICE, ſee NETTLE.

ADJECTIVE, in *Grammar*, a kind of noun joined with a ſubſtantive, either expreſſed or implied, to ſhew its qualities, or accidents.

The word is formed of the Latin *adjicere*, *to add to*; as deſigned to be added to a ſubſtantive, without which it has no preciſe ſignification.

Father Buffier defines *adjectives* in a manner ſomewhat different from other grammarians.—Nouns, according to him, are ſubſtantives, when the objects which they repreſent are conſidered ſimply, and in themſelves, without any regard to their qualities: on the contrary, they are *adjectives*, when they expreſs the quality of an object. Thus, when I ſay ſimply, *an heart*, the word *heart* is a ſubſtantive, becauſe none of its qualities are expreſſed; but when I ſay, *a generous heart*, the word *generous* is an *adjective*; becauſe it adds a quality, or attribute, to the heart. *Adjectives*, then, appear to be nothing elſe but modificatives.

In effect, the end of an *adjective* being only to expreſs the quality of an object; if that quality be the object itſelf whereof we ſpeak, it becomes a ſubſtantive; e. gr. if I ſay, *this book is good*; *good*, here, is an *adjective*; but if I ſay, *good is always to be choſen*, it is evident *good* is the ſubject I ſpeak of; and conſequently, *good*, there, is the ſubſtantive.

On the contrary, it often happens in other languages, and ſometimes in our own, that a ſubſtantive becomes an *adjective*; as, for inſtance, in theſe words: *the king, hero as he is, remembers he is a man*; where the word *hero*, though ordinarily a ſubſtantive, is yet apparently an *adjective.*

From this idea of an *adjective*, it appears that many of the nouns, which, in the common grammars, are accounted ſubſtantives, are really *adjectives*, and *vice verſa*; grammar in this, and a thouſand other inſtances, depending upon cuſtom.

Some diſtinguiſh *adjectives* into *phyſical* and *metaphyſical*; the former being uſed to diſtinguiſh phyſical eſſences, in conſequence of the immediate impreſſions they make upon us; the latter to denote thoſe which are metaphyſical and abſtracted, in conſequence of ſome operation of our minds with regard to them.—Again,

Adjectives, in *Logic*, are divided into four kinds; the *nominal*, the *verbal*, the *numeral*, and the *pro-nominal.* The *nominal* are thoſe which diſtinguiſh certain ſpecies by ſome inherent and permanent quality, which ariſes either from the nature of the thing, or from its form or ſituation; ſuch as *good*, *black*, *round*, *external*, &c. The *verbal*, are thoſe which denote ſome accidental or adventitious quality, which appears to be the effect of an action which paſſes, or has paſſed, in the thing under conſideration; ſuch as *rampant*, *domineering*, *careſſing*, *embelliſhed*, &c. *Numeral adjectives* are thoſe which rank any ſubject in numerical order, as, *firſt*, *ſecond*, *laſt*, &c. *Pro-nominal* are thoſe which do not concern either ſpecies, action, or arrangement, but are merely indications of individuality; theſe *adjectives* are either *perſonal*, as *mine*, *thine*, &c. or they have a vague and indeterminate meaning, ſuch as, *ſome*, *one*, *many*, &c. or laſtly, they ſerve the purpoſe of mere indication, ſuch as, *this*, *that*, *ſuch*, &c.

Verbal and *nominal adjectives*, are alſo called CONCRETES.

AD INQUIRENDUM, a judicial writ, commanding inquiry to be made of any thing touching a cauſe depending in the king's court, for the better execution of juſtice; as of baſtardy, or the like. Reg. Judic.

ADJOINING is particularly uſed for the aſſociating of a perſon to another; or appointing him a collegue, or ADJUNCT.

ADJOURNMENT, in *Law*, the putting off a COURT, or meeting; and appointing it to be kept at another time or place.

The word is formed of the Latin *ad*, *to*; and the French *jour*, *day*, q. d. another day.

In which ſenſe, we meet with the phraſe *adjournment in eyre*, for an appointment of a day when the juſtices in eyre intend to ſit again.

Adjournments in parliament differ from *prorogations.*

And each houſe has the privilege of *adjourning* itſelf.

ADIPOSUS, fat, or fatty. The word is chiefly uſed in *Anatomy*, as an epithet of certain cells, ducts, membranes, and veſſels, e. g. MEMBRANA & VASA *adipoſa* CELLULÆ *adipoſæ*, DUCTUS *adipoſi*, &c. See ADEPS.

ADIPSON, from the privative α, and διψα, *thirſt*; a name given by Hippocrates to oxymel; who ſays alſo that the *ptiſſana*, by its glutinouſneſs, prevents or cures thirſt. Medicines adminiſtered for allaying thirſt are called by this name.

ADIPSOS ſignifies the Egyptian palm-tree, liquorice, and a pill, or catapotium, compoſed by Aſclepiades, and mentioned by Galen.

ADIRATUS, a price or value ſet upon things ſtolen or loſt, as a recompence to the owner.

ADIRIGE ſignifies *ſal ammoniacum*.

ADIT, in a general ſenſe, denotes the approach to, or entrance of any thing.

The word is originally Latin, *aditus*, formed from *adire*, *to go to*.

In which ſenſe, we meet with *adit* of a houſe, *adit* of a theatre, of the circus, &c.

ADIT *of a* MINE, the hole, or aperture, whereby it is entered and dug, and by which the water and ores are carried away.

Adit of a mine amounts to the ſame with *cuniculus*, or *drift*, and is diſtinguiſhed from AIR-*ſhaft*. Phil. Tranſ. N° 69.

The *adit* is uſually made on the ſide of a hill, towards the bottom thereof, about 4, 5, or 6 feet high, and 8 wide, in form of an arch; ſometimes cut in the rock, and ſometimes ſupported with timber, ſo conducted, as that the ſole or bottom of the *adit* may anſwer to the bottom of the ſhaft, only ſomewhat lower, that the water may have a ſufficient current to paſs away, without the uſe of the pump.

Damps, and the impurity of the air, are the great impediments againſt driving *adits* above 20 or 30 fathoms, by reaſon of the neceſſity, in this caſe, of letting down air-ſhafts from the day to meet the *adit*, which are often very expenſive, both on account of the great depth of mines, and the hardneſs of the mineral ſtrata to be cut through. The beſt remedy againſt this, is that practiſed in the coal-mines near Liege, where they work their *adits* without air-ſhafts: the manner of which is deſcribed by Sir Robert Moray. Vid. Phil. Tranſ. N° 5.

Adit of a mine, is ſometimes uſed for the AIR-*ſhaft* itſelf, being a hole driven perpendicularly from the ſurface of the earth into ſome part of a mine, to give entrance to the air.

In this ſenſe we ſometimes find it improperly written *addit*. Phil. Tranſ. N° 200.

To draw off the ſtanding water in winter, in deep mines, they drive up an *adit*, or AIR-*ſhaft*, upon which the air diſengages itſelf from the water, when it begins to run, with ſuch violence, as produces a noiſe equal to the burſting of a cannon, daſhes every thing in the way againſt the ſides of the mine, and looſens the very rocks at a diſtance. Ibid. N° 26.

ADIT *in ſhips*, in *Antiquity*, was a ſpace in the upper part, where the ſhip was wideſt, at which people entered, anciently called *agea*.

ADITS *of a theatre*, *aditus theatri*, in *Antiquity*, were doors on the ſtairs, whereby perſons entered from the outer porticos, and deſcended into the ſeats.

ADJUDGING, in *Law*, the act of paſſing a determinate ſentence in behalf of a perſon.

ADJUDICATION, the act of adjudging the property of a thing to a perſon by a legal ſentence, decree, or judgment.

ADJUDICATION is more particularly uſed for the addiction, or conſigning a thing ſold by auction, or the like, to the higheſt bidder.

ADJUNCT, ADJUNCTUM, in *Philoſophy*, ſomething joined or ſuperadded to a being from without. See ADJUNCTION.

Or, an *adjunct* is an additament or acceſſion to a thing, not eſſentially belonging to it, but only accidental thereto.

There are two kinds of *adjuncts*; the one, a ſubſtance (whether ſpirit or body) accidentally ſuperadded to another, as its ſubject.—Such is water in a ſponge, or veſſel, and ſuch is the ſoul in the body.

The ſecond an attribute or mode, accidentally likewiſe ſuperadded to a ſubſtance, whether body or ſpirit.—Such is figure in a body, knowledge in the mind, &c.

Some divide *adjuncts* into *abſolute*; which agree to the whole thing, without any limitation: thus, paſſions are *abſolute adjuncts* of a man:—and *limited*, which only agree to their ſubject in reſpect of ſome certain part thereof: thus, man only thinks, conſidered as to his mind; only grows, as to his body, &c.

In ethics, we uſually reckon ſeven *adjuncts*, popularly called *circumſtances*; *quis*, *quid*, *ubi*, *quibus auxiliis*, *cur*, *quomodo*, *quando*.

ADJUNCTS, in *Rhetoric* and *Grammar*, are certain words or things added to others; to amplify the diſcourſe, or augment its force.

Such are adjectives, attributes, and epithets, which are added to ſubſtantives, ſubjects, &c. to expreſs their nature, qualities, accidents, &c.

Arguments drawn from *adjuncts*, are ſupplements or enforcements of the proof ariſing from the circumſtances of the fact.

ADJUNCT is alſo uſed in civil concerns, for a COLLEGUE, or fellow-officer, aſſociated to another, to aſſiſt him in his miniſtry.

ADJUNCT *gods*, or ADJUNCTS *of the gods*, in *Mythology*, among the Romans, were a kind of inferior deities, added as aſſiſtants to the principal ones, to eaſe them in their functions.

Thus, to Mars was adjoined Bellona and Nemeſis; to Neptune, Salacia; to Vulcan, the Cabiri; to the good Genius, the Lares; to the Evil, the Lemures, &c.

ADJUNCTS, or ADJOINTS, in the *Royal Academy of Sciences at Paris*, denote a claſs of members, attached to the purſuits of particular ſciences.

The claſs of *adjuncts* was created in 1716, in lieu of the *eleves*: they are twelve in number; two for geometry, two for mechanics, two for aſtronomy, two for anatomy, two for chemiſtry, and two for botany.—The *eleves* not taken into this eſtabliſhment were admitted on the foot of ſupernumerary *adjuncts*. See ACADEMY.

ADJUNCTION, the act of joining, or adding, of one thing to another.

All *adjunction* implies a ſubordination.—The *adjunct* is for the ſake of a thing it is joined to, not contrary-wiſe; as, the cloaths for the man; not the man for the cloaths.—Whatever is part of a thing, cannot be called an *adjunct* of it.

There are various ſpecies of *adjunction*; viz. by ADHESION, by APPOSITION, ADJACENCY, ACCUBATION, INCUBATION, IMPOSITION, ASSESSION, &c.

AD JURA REGIS, is a writ that lies for the king's clerk againſt him who endeavoured to eject him, to the prejudice of the king's title in right of his crown.

ADJURATION, a part of exorciſm, wherein the devil is commanded, in the name of God, to depart out of the body of the poſſeſſed, or to declare ſomething.

ADJUTAGE. See AJUTAGE.

ADJUTANT, in the *Military Art*, an officer in the army, whoſe buſineſs it is to aid and aſſiſt the major.

Adjutant is the ſame that we otherwiſe call *Aid-Major*.

In the cavalry, each regiment has an *adjutant*, and in the infantry, each battalion.

The *adjutant* receives the orders every night from the brigade-major, which, after he has carried to the colonel, he delivers out to the ſerjeants. Where detachments are to be made, he gives the number each company muſt furniſh, and aſſigns the hour and place of rendezvous. He alſo places the guards, receives and diſtributes ammunition to the companies, and, by the major's orders, regulates the price of bread, beer, &c.

ADJUTANT is ſometimes alſo uſed by the French for an *aid de camp*.

The word is formed of the Latin *adjutare*, *to aſſiſt*.

ADJUTANT, among the *Jeſuits*. The general of the Jeſuits had a ſelect number of fathers of that order reſiding with him, under the denomination of *adjutants-general*; who had each their ſeveral province, or country, under their care, as France, England, &c. Their buſineſs was to inform the father-general of the occurrences of ſtate in ſuch countries; to which end, each of them had their correſpondents, delegated emiſſaries, viſitors, regents, provincials, &c. See JESUITS.

ADJUTORIUM, in *Anatomy*, the *humerus*, or ſhoulder-bone.

It is thus called from *adjuvare*, *to help*.

Some authors uſe this word for a medicine intended only as auxiliary, or ſubſervient to another of greater efficacy: in particular, after a due uſe of internals, for an external remedy, applied to a part affected, to aſſiſt in, and complete the cure.

ADJUVANTIA, ſee JUVANTIA.

ADLE *egg*, that which is not fecundified by the cock's tread.

Adle egg is the ſame with what is otherwiſe called a *ſubventaneous* one.

Adle eggs, after incubation, are found to contain a ſhapeleſs, globoſe, aſh-coloured body, not unlike a *mola*. Phil. Tranſ. N° 87.

ADLEGATION, in the *Public Law* of the German empire, a right claimed by the ſtates of the empire of adjoining plenipotentiaries, in public treaties and negociations, to thoſe of the emperor, for the tranſacting of matters which relate to the empire in general.

In which ſenſe *adlegation* differs from *legation*, which is the right of ſending ambaſſadors on a perſon's own account.

Several princes and ſtates of the empire enjoy the right of *legation*, who have not that of *adlegation*, and *vice verſa*. The biſhops, for inſtance, have the right of *adlegation* in treaties which concern the common intereſt, but no right of *legation* for their own private affairs. The like had the duke of Mantua.

The emperor allows the princes of Germany the privilege of *legation*, but diſputes that of *adlegation*. They challenge it as belonging to them *jure regni*, which they enjoy in common with the emperor himſelf. Ludwig has a diſcourſe on the ſubject, wherein the controverſy is treated at large.

ADLOCUTION, ADLOCUTIO, in *Antiquity*, is chiefly underſtood of ſpeeches made by Roman generals to their armies, to encourage them before a battle. We frequently find theſe *adlocutions* expreſſed on medals, by the abbreviature ADLOCUT. COH.

The general is ſometimes repreſented as placed on a tribunal; often on a bank or mount of turf, with the cohorts ranged orderly round him, in *manipuli* and *turmæ*. The uſual formula in *adlocutions* was, *fortis eſſet ac fidus*.

ADMANUENSES, in ancient *Law* books, denote perſons who ſwore by laying their hands on the book.

The word is compounded of the Latin *ad*, *to*, and *manus*, *hand*.

In which ſenſe, *admanuenſes* amount to the ſame with laymen, and ſtand oppoſed to clerks, who were forbid to ſwear on the book, their word being to be reputed as their oath; whence they were alſo denominated *fide digni*.

ADMEASUREMENT, ADMENSURATIO, in *Law*, a writ which lies for the bringing thoſe to reaſon, or mediocrity, who uſurp more of any thing than their ſhare.

This writ lies in two caſes; termed,

ADMEASUREMENT *of Dower*, *Admenſuratio dotis*, where the widow of the deceaſed holds more from the heir, or his guardian, on account of her dower, than of right belongs to her. And,

ADMEASUREMENT *of Paſture*, *Admenſuratio paſturæ*; this lies between thoſe who have COMMON of paſtures appendant to their freehold, or common by vicinage, in caſe any of them ſurcharge the common with more cattle than they ought.

ADMINICLE, or ADMINICULE, ADMINICULUM, a term uſed in ſome ancient ſtatutes, for aid, help, or ſupport. Stat. 1 Edw. IV. cap. 1.

ADMINICULATOR, in *Eccleſiaſtical Writers*, denotes an ancient officer of the church, whoſe buſineſs was to defend the cauſe of widows, orphans, and others deſtitute of help. The *adminiculator* is the ſame with what is otherwiſe called ADVOCATE of the poor.

ADMINICULES, among *Antiquaries*, are applied to the attributes, or ornaments, wherewith Juno and ſome other figures are repreſented on medals.

ADMINICULUM, in the French *Juriſprudence*, ſignifies the beginning of a proof; an imperfect proof; or a circumſtance or conjecture, tending to form or fortify a proof.

ADMINISTRATION imports the government or direction of affairs; and particularly the exerciſe of diſtributive juſtice.

Indolent princes confide the *adminiſtration* of public affairs to their miniſters.—Civil wars are uſually raiſed on pretence of *male-adminiſtration*, or of abuſes committed in the exerciſe of juſtice, &c.

The two criterions of a good *adminiſtration* in England, according to Trenchard, are, the keeping the nation out of foreign broils, and paying off the public debts; the latter of which depends on the former.

ADMINISTRATION, in the Engliſh *Law*, ſignifies the act, or office, of an adminiſtrator, in managing and diſpoſing of a man's goods, or eſtate, that died inteſtate, or without any will; with an intent to give an account thereof.

In this caſe, inſtruments, or powers, called letters of *adminiſtration*, are taken out in the prerogative court.

Theſe letters muſt be granted, 1. to the huſband of the wife's goods and chattels; 2. to the wife of the huſband's goods and chattels; 3. if there is no huſband or wife, to the children, ſons or daughters; 4. if there be no children alive, to the father or mother; 5. then to a brother or ſiſter of the whole blood, or of the half blood, (who, for this purpoſe, are of equal degree with the whole blood); 6. and if there are none ſuch, to the next of kin, as uncle, aunt, or couſin; 7. then to a creditor of the deceaſed; 8. and for want of all theſe, to any other perſon, at the diſcretion of the ordinary; or the ordinary may grant to a ſtranger letters *ad colligendum bona defuncti*, to gather up the goods of the deceaſed; or may take them into his own hands to pay the deceaſed's debts, in ſuch order as an executor or adminiſtrator ought to pay them. But it is ſaid he or the ſtranger, who hath letters *ad colligendum*, cannot ſell them, without making themſelves executors of their own wrong, and action lies only againſt the ordinary, &c. Wood's Inſt. 333.

By Stat. 21 Hen. VIII. widows, and next of kin, are to be appointed adminiſtrators, and a mother is to have *adminiſtration* of goods of a child, before a brother or ſiſter, &c. But an *adminiſtration* may be granted to the father before a widow; and a reſiduary legatee ought to be preferred before the widow in an *adminiſtration cum teſtamento annexo*. 3 Salk. 21.

On granting *adminiſtration*, bonds with ſureties are to be taken for the adminiſtrator, to make and exhibit an inventory of the goods of the deceaſed, to render a juſt account thereof, and to make a diſtribution of the ſurpluſage after debts paid, according to law, &c. Stat. 22 and 23 Car. II. cap. 10. See ADMINISTRATOR, EXECUTOR, INTESTATE, KINDRED.

ADMINISTRATION is ſometimes alſo uſed for the direction of the affairs of a minor, a pupil, a lunatic, or the like.

ADMINISTRATION is alſo uſed in reſpect of eccleſiaſtical functions.—The parſon has the *adminiſtration* of the ſacraments in his pariſh.—*Adminiſtration* of the euchariſt is prohibited to perſons excommunicate.

In beneficiary matters they diſtinguiſh two kinds of *adminiſtration*; *temporal*, which relates to the temporalities of a benefice, dioceſe, &c. and *ſpiritual*, to which belong the power of excommunicating, &c.

ADMINISTRATION, in *Anatomy*, is uſed for the manner of diſſecting the parts of the body, particularly the MUSCLES.

In which ſenſe, *adminiſtration* is ſynonymous with *encheireſis*, *exerciſe*, &c.

Anatomical *adminiſtrations* are not to be learned by oral precepts, but require ocular inſpection.—Galen, Harvey, and others, have diſcourſes expreſs under the title of anatomical *adminiſtrations*.

ADMINISTRATION, in *Commerce*, is alſo uſed for a Spaniſh ſtaple at Calao in Peru, a city on the coaſts of the South Sea, where all ſhips, allowed to trade on the coaſt, are obliged to unload their European goods, and pay certain duties.

ADMINISTRATOR, in *Law*, he to whom the ordinary commits the *adminiſtration* of the goods of a perſon deceaſed, in default of an executor.

An action lies for, or againſt, an *adminiſtrator*, as for, or againſt, an executor; and he ſhall be accountable to the value of the goods of the deceaſed, and no farther:—unleſs there be waſte, or other abuſe chargeable on him: If the *adminiſtrator* die, his executors are not *adminiſtrators*; but the court is to grant a new adminiſtration.—If a ſtranger, who is neither *adminiſtrator*, nor executor, take the goods of the deceaſed, and adminiſter, he ſhall be charged, and ſued as an executor, not as an *adminiſtrator*.

The origin of *adminiſtrators* is derived from the civil law. Their eſtabliſhment in England is owing to a ſtatute made in the thirty-firſt year of Edward III. Till then, no office of this kind was known, beſide that of executor: in caſe of a want of which, the ordinary had the diſpoſal of goods of perſons inteſtate, &c.

There are divers ſorts of *adminiſtrators*.

Adminiſtrator durante minore ætate, is where an infant is entitled to adminiſtration of the goods of an inteſtate; in which caſe adminiſtration is granted to another, until he is of the age of twenty-one years. Though where the infant is made executor, ſuch adminiſtration, during his minority, ceaſing at his coming to the age of ſeventeen. 5 Rep. 29. 6 Rep. 27.

Adminiſtrator cum teſtamento annexo, is one to whom adminiſtration, with the will annexed, is granted, upon an executor's refuſal to prove the teſtament, or upon his dying before the probate. 1 Inſt. 113.

Adminiſtrator de bonis non, &c. is one to whom adminiſtration is granted of the goods of a teſtator remaining unadminiſtered, by reaſon of his executor's dying inteſtate. 2 Roll. Abr. 907. There is alſo

Adminiſtrator pendente lite; and *durante abſentia extra regnum*.

If a woman have goods thus committed to her charge, or adminiſtration, ſhe is called *adminiſtratrix*; and is accountable, &c. in like manner as an *adminiſtrator*.

ADMINISTRATOR is alſo uſed for the advocate of a church.

ADMINISTRATOR is alſo uſed for a perſon appointed to receive, manage, and diſtribute the revenues of an hoſpital, or religious houſe.

ADMINISTRATOR is alſo uſed for a prince who enjoys the revenues of a ſecularized biſhoprick.

Yet this title does not hold univerſally: the king of England, as elector of Brunſwic-Lunenburg, for inſtance, is not called *adminiſtrator*, but duke of Bremen and Verden; and the king of Pruſſia is not *adminiſtrator*, but duke of Magdeburg, and prince of Halberſtadt.

ADMINISTRATOR is alſo uſed for the regent or protector of a kingdom, during the minority of its proper prince, or even a vacancy of the throne.

The pope pretends to the *adminiſtration* of the empire, during a vacancy, by cenſure, or ſuſpenſion.

ADMINISTRATOR is ſometimes uſed for the preſident of a province.

ADMINISTRATRIX, ſee ADMINISTRATOR.

ADMIRAL, ADMIRALIUS, ADMIRALLUS, a great officer, who commands the naval forces of a kingdom or ſtate, and takes cognizance by himſelf, or officers appointed by him, of all maritime cauſes.

Authors are divided about the origin and denomination of this important officer, whom we find eſtabliſhed, with ſome variation, in moſt kingdoms that border on the ſea.

Du Cange aſſures, that the Sicilians were the firſt, and the Genoeſe the next after them, who gave the denomination *admiral* to the commanders of their naval armaments; and that they took it from the Saracen, or Arabic *amir*, a general name for any commanding officer.—The firſt *admiral* we read of in Engliſh hiſtory was under Edward I. But the firſt title of *admiral* of England conferred upon a ſubject, was given by patent of Rich. II. to the earl of Arundel and Surrey.

ADMIRAL *of England, the lord high*, in ſome ancient records called *capitaneus marinorum*, is judge, or preſident, of the court of admiralty.

He takes cognizance, by himſelf, his lieutenant, or deputies, of all crimes committed on the ſea, or the coaſt thereof; and all the civil and marine tranſactions relating thereto: as alſo of what is done in all great ſhips, riding in any great river, beneath the bridges thereof next the ſea.

Anciently, the *admiral* had alſo juriſdiction in all cauſes of merchants and mariners; not only on the ſea, but in all foreign parts.—We have had no *high admiral* for ſome years; the office being put in COMMISSION, or under the adminiſtration of the lords *commiſſioners of the admiralty*.

ADMIRAL is alſo uſed for the commander in chief of a ſingle fleet, or SQUADRON; and is diſtinguiſhed by a flag diſplayed at his main-top-maſt-head.

Thus, we ſay, the *admiral* of the *red*; the *admiral* of the *white*, and *admiral* of the *blue*. See NAVY and SQUADRON.

The term *admiral* is alſo applied to all flag-officers; in which ſenſe it includes *vice-admirals*, and *rear-admirals*.

ADMIRAL, *Rear*, is the *admiral* of the third, and laſt ſquadron of the royal fleet, and carries his flag at the mizen-top-maſt-head.

ADMIRAL, *Vice*, is one of the three principal officers of the royal navy; who commands the ſecond ſquadron, and has his flag ſet up at the fore-top-maſt-head.

ADMIRAL, *Vice*, is alſo an officer appointed by the lord *high admiral*, in divers parts of the kingdom, with judges and marſhals ſubordinate to him; for the exerciſing of juriſdiction in maritime affairs, within his reſpective limits.

There are upwards of twenty *vice admirals*.—From their deciſions and ſentences, appeal lies to the court of *admiralty* in London.

There are alſo *admirals of the galleys*.

Monſtrelet makes mention of an *admiral of the archers*, or croſs-bow-men. See ARBALET.

ADMIRAL is likewiſe the name of the principal veſſel of a fleet, on board of which is the *admiral*.

When two ſhips of war, bearing the ſame colours, meet in the ſame port, that which arrived firſt, has the title and prerogative of *admiral*; and the other, though of greater ſtrength and rate, ſhall only be accounted *vice-admiral*.—It is pretty much the ſame with the veſſels in the cod and whale fiſhery. That which arrives firſt, in any harbour or creek of Newfoundland, takes the title and quality of *admiral*, which it retains during the whole fiſhing ſeaſon.—Such ſhip may ſecure to herſelf ſo much beech, or flakes, or both, as are neceſſary for the number of boats ſhe ſhall uſe, with an overplus of one boat only more than ſhe uſes.—The maſter of the ſecond ſhip is *vice-admiral*; and the maſter of the third *rear-admiral*. See FISHERY.

ADMIRAL's *Court*, or the *High Court of Admiralty*. See COURT *of* ADMIRALTY.

ADMIRAL, in *Conchology*, the name given by authors to a very beautiful, and very precious ſhell, of the *voluta* kind. See *Tab. of Shells*, N° 10.

Of theſe the curious reckon four ſpecies. 1. The grand *admiral*. 2. The vice-*admiral*. 3. The orange-*admiral*. And, 4. The extra-*admiral*.

The firſt of theſe is the moſt eſteemed, and a ſingle ſhell has been ſold, in Holland, for five hundred florins. It is of a very elegant and bright white enamel, and is variegated with bands of yellow, repreſenting, in ſome degree, the colours of the flags of a man of war at ſea; hence it obtained its name. It is of a very curious ſhape, and formed with particular elegance about the head; the clavicle being exerted. There runs along the center of the large yellow band in this ſhell, a fine denticulated line, which is its diſtinguiſhing character.

The vice-*admiral* is an elegant ſhell, but its head is leſs beautifully wrought than in the *admiral*, and its broad band wants the dentated line, ſo remarkable in that.

The orange-*admiral* has more yellow than either of the others.

The extra-*admiral* has the ſame bands with theſe, but they run one into another, and form a more mixed clouding.

ADMIRATION, in *Grammar*, a note or character, intimating ſomething worthy to be admired, or wondered at.—It is expreſſed thus (!). See CHARACTER.

ADMISSION, ADMISSIO, in the *Eccleſiaſtical Law*, an act whereby a biſhop, upon examination, *admits* or allows a clerk to be able, or competently qualified for the office; which is done by the formula *admitto te habilem*.

All perſons are to have epiſcopal ordination before they are admitted to any parſonage or benefice; and if any ſhall preſume to be admitted, not having ſuch ordination, &c. he ſhall forfeit 100*l.* Stat. 14. Car. II.

No perſon is to be admitted into a benefice with cure of 30*l. per ann.* in the king's books, unleſs he is a bachelor in divinity at leaſt, or a preacher lawfully allowed by ſome biſhop, &c.

ADMITTENDO *Clerico*, is a writ granted to him who hath recovered his right of preſentation againſt the biſhop in the common pleas.

ADMITTENDO *in Socium*, is a writ for the aſſociation of certain perſons to JUSTICES of ASSIZE formerly appointed.

ADMONITION, in *Eccleſiaſtical Affairs*, a part of diſcipline much uſed in the ancient church. It was the firſt act, or ſtep, towards the puniſhment, or expulſion of delinquents. In caſe of private offences, it was performed according to the evangelical rule, privately: in caſe of public offence, openly, before the church. If either of thoſe took effect, for the recovery of the fallen perſon, all farther proceedings, in the way of cenſure, ceaſed: if they did not, recourſe was had to EXCOMMUNICATION. By the ancient canons, nine monitories, or *admonitions*, at due diſtance, are required before excommunication.

ADMONITION is alſo uſed, in writers of the barbarous age, for the CITATION, or ſummoning a perſon to appear in a court of juſtice. See SUMMONS, &c.

ADMONITIO FUSTIUM, a military puniſhment, among the Romans, reſembling, in ſome reſpects, our whipping or laſhing, but performed with a vine-branch.

ADMORTIZATION, among *Feudal Writers*, the act of reducing lands to MORTMAIN.

ADNATA, in *Anatomy*, a thick white membrane, inveſting the ball of the eye; and making the outermoſt coat thereof: called alſo *circumoſſalis & circumcalvalis*.

It is the *tunica adnata* that makes what we commonly call the *white* of the EYE; whence it is alſo called the ALBUGINEA.

The *adnata* ſprings from the *pericranium*, and grows to the exterior part of the *tunica cornea*, ſerving to connect the whole eye both to the *palpebræ*, and the adjacent bones, and thus keep it faſt in the ſocket; whence it is alſo called *conjunctiva*.

To leave room for the viſible ſpecies to paſs through it, a little round aperture is left in the fore-part, called the ſight, through which the IRIS and PUPILLA appear.

The *adnata* abounds with veins and arteries, which, though ordinarily not viſible, are conſpicuous in ophthalmies, which are properly inflammations of this part. The academiſts *Naturæ Curioſi* give the hiſtory of a dropſy of the *adnata*, and its cure. Ephem. Germ. Dec. 3. An. 3. Obſ. 3. p. 4.

ADNATA, or *Adnaſcentia*, among *Gardeners*, denote thoſe off-ſets, which by a new germination under the earth, proceed from the lily, narciſſus, hyacinth, and other flowers, and afterwards grow to true roots. The French call them *cayeux*, *ſtalks*.

ADNATA is alſo a term uſed for ſuch things as grow upon animal or vegetable bodies, whether inſeparably as hair, wool, horns, &c. or accidentally, as the ſeveral epiſtical plants.

ADNOUN, ADNOMEN, or ADNAME, is uſed by ſome *Grammarians* to expreſs what we more uſually call an ADJECTIVE.

ADOLESCENS ſignifies the iron bars that ſupport the fire in a grate or furnace.

AD OCTO, q. d. to the eighth number; a term uſed by ſome ancient philoſophers, to denote the higheſt, or ſuperlative degree: becauſe, in their way of diſtinguiſhing qualities, they reckoned no degree above the eighth.

ADOLESCENCE, ADOLESCENTIA, the ſtate of growing youth; or that period of a perſon's age commencing from his infancy, and terminating at his full ſtature, or manhood.

The word is formed of the Latin *adoleſcere*, *to grow.*

The ſtate of *adoleſcence* laſts ſo long as the fibres continue to grow, either in magnitude or firmneſs.

It is commonly computed to be between 15 and 25, or even 30 years of age; though in different conſtitutions its terms are very different.—The Romans uſually reckoned it from 12 to 25 in boys; and to 21 in girls, &c. —And yet, among their writers, *juvenis* and *adoleſcens* are frequently uſed indifferently, for any perſon under 45 years.

The fibres, being arrived at a degree of firmneſs and tenſion ſufficient to ſuſtain the parts, no longer yield and give way to the efforts of the nutritious matter, to extend them: ſo that their farther accretion is ſtopped from the very law of their nutrition.

ADONAI, one of the names of God in Scripture: this word ſignifies properly *my lords*, in the plural number, as *Adoni*, ſignifies *my lord*, in the ſingular number. The Jews, who either out of reſpect, or ſuperſtition, do not pronounce the name of *Jehovah*, read *Adonai* in the room of it, as often as they meet with *Jehovah* in the Hebrew text. But the ancient Jews were not ſo nice; there is no law which forbids them to pronounce the name of God.

ADONIA, in *Antiquity*, ſolemn feaſts, in honour of Venus, and in memory of her beloved Adonis.

They were begun by the women, who imitated the cries and lamentations of Venus, for the death of her paramour.—When they were weary of lamenting his death, they changed their note, and ſung his praiſes, and made rejoicings, as if he were raiſed to life again: or rather, according to Meurſius, theſe two offices made two diſtinct feaſts, which were held at different times of the year, the one ſix months after the other; Adonis being ſuppoſed to paſs half the year with Proſerpine, and half with Venus.

The *adonia* were obſerved with great ſolemnity by moſt nations, Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. To theſe the prophet Ezekiel is ſuppoſed to refer, chap. viii. ver. 14.

The *adonia* were otherwiſe called *ſalambo*. The abbé Banier has a memoir on the hiſtory of the ADONIA. Mem. Acad. Inſcript. tom. iv.

ADONIC, in *Poetry*, denotes a ſhort kind of verſe, conſiſting of a dactyl, and a ſpondee, or a trochee.—As *rara juventus.*

It takes its name from Adonis; as having been originally uſed in the Threnæ, or lamentations for that favourite.

The chief uſe of the *Adonic* verſe is at the end of each ſtrophe of Sapphic verſe; or among Ariſtophanic anapæſts in the ancient tragedy. But we meet with *Adonics* by themſelves without Sapphics, as alſo Sapphics without *Adonics.*

ADONIDES, in *Botany*, are thoſe writers, who have given hiſtories, or catalogues of the plants cultivated in ſome particular place.

ADONION, among the *Ancient Botaniſts*, a ſpecies of *ſouthernwood* according to Gorræus, which uſed to be ſet in pots, and ſerved as an ornament for gardens.

ADONIS, in *Zoology*, the name of a ſmall fiſh, of the anguilliform kind, of a cylindric ſhape, and about ſix inches long; it is of a gold colour, mixt with a greeniſh hue in ſome parts, and in others with a reddiſh. It has, on each ſide, a white ſtraight line running from the gills to the tail. Its gills are very remarkable ſmall, and many have ſuppoſed thence that it had none. It is remarkable for ſleeping on the ſurface of the water, and near the ſhores; and Rondeletius affirms, that he has ſeen them ſleeping upon the dry rocks.

Mr. Ray ſuſpects this fiſh, which is alſo called *exocœtus*, to be the ſame with the EXOCOETUS of Bellonius, or the GOTTORUGINE.

Adonis *flos*, ſee PHEASANT'S *Eye.*

Adonis *potio*, an ancient beverage or drink made of wine, mixed with flour of roaſted *ador*; the ſame with what was otherwiſe called CYCEON.

ADONISTS, a ſect or party, among *Divines* and *Critics*, who maintain, that the Hebrew points ordinarily annexed to the conſonants of the word Jehovah, are not the natural points belonging to that word, nor expreſs the true pronunciation of it, but are the vowel-points, belonging to the words *Adonai* and *Elohim*, applied to the conſonants of the ineffable name Jehovah; to warn the readers, that inſtead of the word Jehovah, which the Jews were forbid to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read *Adonai.*

ADOPTER, in *Chemiſtry*, ſee RECEIVER.

ADOPTIANI, in *Church Hiſtory*, a ſect in the eighth century, whoſe diſtinguiſhing tenet was, that Chriſt, as to his human nature, was not the proper, or natural, but only the adoptive ſon of God.

ADOPTION, ADOPTIO, an act by which any one takes another into his family, owns him for his ſon, and appoints him his heir.

The word is derived from *adoptare*; whence the Latin barbarous *adobare*, *to make a knight.*

The cuſtom of *adopting* was very familiar among the ancient Romans, who had an expreſs formula for it.—They firſt learnt it from the Greeks, among whom it was called ὑιοτης, *filiation.*

As *adoption* was a ſort of imitation of nature, intended for the comfort of thoſe who had no children, eunuchs were not allowed to adopt; as being under an actual impotency of begetting children.

Neither was it lawful for a young man to *adopt* an elder; becauſe that would have been contrary to the order of nature; but it was even required, that the perſon who *adopted*, ſhould be eighteen years older than his adoptive ſon, that there might at leaſt appear a probability of his being the natural father.

The Romans had two forms of *adoption*; the one before the pretor; the other at an aſſembly of the people, in the times of the commonwealth, and afterwards by a reſcript of the emperor.

In the firſt, the natural father addreſſed himſelf to the pretor, declaring that he emancipated his ſon, reſigned all his authority over him, and conſented he ſhould be tranſlated into the family of the adopter.

The latter manner of *adoption* was practiſed, where the party to be *adopted* was already free; and this was called *adrogation.*

The perſon *adopted* changed all his names; aſſuming the prename, name, and ſurname, of the perſon who *adopted* him.

Beſides the formalities preſcribed by the Roman law, divers other methods have taken place; which have given denominations to divers ſpecies of *adoptions*, among the Gothic nations, in different ages. As,

Adoption *by arms* was when a prince made a preſent of arms to a perſon, in conſideration of his merit and valour.—Thus it was that the king of the Heruli was *adopted* by Theodoric; Athalaric by the emperor Juſtinian; and Coſroes, nephew of the king of Perſia, by the emperor Juſtin.

This method of *adoption*, practiſed in Germany, was called *barbarous*, by way of oppoſition to the Roman cuſtom.

The obligation here laid on the *adoptive* ſon was, to protect and defend the father from injuries, affronts, &c. —And hence the ceremony of dubbing knights took its origin, as well as name.

Adoption *by baptiſm* is that ſpiritual affinity which is contracted by god-fathers and god-children in the ceremony of baptiſm.

This kind of *adoption* was introduced into the Greek church, and came afterwards into uſe among the ancient Franks, as appears by the Capitulars of Charlemaign.

In reality, the god-father was ſo far conſidered as *adoptive* father, that his god-children were ſuppoſed to be entitled to a ſhare in the inheritance of his eſtate.

Adoption *by hair*, *adoptio per capillum*, or *crinem*, was performed by cutting off the hair of a perſon, and giving it to the *adoptive* father. It was thus that pope John VIII. *adopted* Boſon king of Arles; which, perhaps, is the only inſtance in hiſtory, of *adoption*, in the order of eccleſiaſtics; a law that profeſſes to imitate nature, not daring to give children to thoſe in whom it would be thought a crime to beget any.

Adoption *by matrimony* is the taking the children of a wife or huſband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the ſame footing with thoſe of the preſent marriage. This is a practice peculiar to the Germans; among whom, it is more particularly known by the name of *einkindſchaft*; among their writers in Latin, by that of *unio prolium*, or *union of iſſues.* But the more accurate writers obſerve, that this is no *adoption.* See ADFILIATION.

Adoption *by teſtament*, that performed by appointing a perſon heir by will, on condition of his aſſuming the name, arms, &c. of the *adopter.*

Of which kind, we meet with divers inſtances in the Roman hiſtory.

Adoption was allowed among the Greeks to ſuch as had no iſſue of their own; excepting thoſe who were not κυριοι εαυτων, *their own maſters*, e. g. ſlaves, women, madmen, infants, or perſons under twenty years of age; who being incapable of making wills, or managing their own eſtates, were not allowed to *adopt* heirs to them. Foreigners being incapable of inheriting at Athens, if any ſuch were *adopted*, it was neceſſary firſt to make them free of the city. The ceremony of *adoption* being over, the *adopted* had his name inrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the feſtival Θαργηλια.

To prevent raſh and inconſiderate *adoptions*, the Lacedæmonians had a law, that *adoptions* ſhould be tranſacted, or at leaſt confirmed, in the preſence of their kings. The children *adopted* were inveſted with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceaſed to have any claim of inheritance, or kindred, in the family which they had left, unleſs they firſt renounced their *adoption*; which, by the laws of Solon, they were not allowed to do, unleſs they had firſt begotten children, to bear the name of the perſon who had *adopted* them: thus providing againſt the ruin of families, which would otherwiſe have been extinguiſhed by the deſertion of thoſe who had been *adopted* to preſerve them. If the children *adopted* happened to die without children, the inheritance could not be alienated from the family into which they had been *adopted*, but returned to the relations of the *adopter*. It ſhould ſeem, that by the Athenian law, a perſon, after having *adopted* another, was not allowed to marry, without permiſſion from the magiſtrate: in effect, there are inſtances of perſons, who being ill uſed by their *adoptive* children, petitioned for ſuch leave. However this be, it is certain ſome men married after they had *adopted* ſons: in which caſe, if they begat legitimate children, their eſtates were equally ſhared between the begotten and *adopted*.

Among the Turks, by the law of Mahomet, *adoption* is no impediment of marriage. The ceremony of *adoption* is performed by obliging the perſon *adopted* to paſs through the ſhirt of the *adopter*. Hence, among that people, to *adopt* is expreſſed by the phraſe, *to draw another through my ſhirt*.

It is ſaid that ſomething like this has alſo been obſerved among the Hebrews; where the prophet Elijah *adopted* Eliſha for his ſon and ſucceſſor, and communicated to him the gift of propheey, by letting fall his cloke, or mantle on him.

But *adoption*, properly ſo called, does not appear to have been practiſed among the ancient Jews.

Adoption is now in moſt countries aboliſhed, though it has been ſaid to ſubſiſt in Saintonge in France.

ADOPTION is alſo uſed, in *Theology*, for a federal act of God's free grace; whereby thoſe that are regenerate by faith, are admitted into his houſhold, and intitled to a ſhare in the inheritance of the kingdom of heaven.

ADOPTION is ſometimes alſo uſed, in ſpeaking of the ancient clergy, who had a cuſtom of taking a maid or widow into their houſes, under the denomination of an *adoptive* or ſpiritual ſiſter, or niece.

ADOPTION is alſo uſed in ſpeaking of the admiſſion of perſons into certain hoſpitals, particularly that of Lyons; the adminiſtrators whereof have all the power and rights of parents over the children admitted.

ADOPTION is alſo uſed for the reception of a new academy into the body of an old one.

In which ſenſe, *adoption* amounts to much the ſame with *incorporation*.

The French academy of Marſeilles was *adopted* by that of Paris; on which account, we find a volume of ſpeeches extant, made by ſeveral members of the academy of Marſeilles, deputed to return thanks to that of Paris, for the honour.

In a ſenſe, not unlike this, *adoption* is alſo applied by the Greeks, to the admitting a monk, or brother, into a monaſtic community; ſometimes called ſpiritual *adoption*.

ADOPTIVE, **ADOPTIVUS**, or **ADOPTITIUS**, denotes a perſon *adopted* by another.

Adoptive children, among the Romans, were on the ſame footing with natural ones; for which reaſon, they were either to be inſtituted heirs, or expreſly diſinherited; otherwiſe the teſtament was null.

The emperor Adrian preferred *adoptive* children to natural ones; by reaſon we chooſe the former, but are obliged to take the latter at random.

M. Menage has publiſhed a book of eloges, or verſes addreſſed to him; which he calls *Liber Adoptivus*, an *adoptive* book; and adds it to his other works.—Heinſius, and Furſtemburg of Munſter, have likewiſe publiſhed *adoptive* books.

ADOPTIVE; in *Eccleſiaſtical Writers* we find *adoptive* women, or ſiſters, *adoptivæ fœminæ*, or *ſorores*, uſed for thoſe handmaids of the ancient clergy, otherwiſe called *ſubintroductæ*.

ADOPTIVE *arms* are thoſe which a perſon enjoys by the gift or conceſſion of another, and to which he was not otherwiſe intitled. They ſtand contradiſtinguiſhed from arms of *alliance*.

ADOPTIVE is alſo uſed to expreſs a thing borrowed or taken from another. In which ſenſe we ſometimes meet with *adoptive hair*, by way of oppoſition to natural hair; and *adoptive gods*, by way of contradiſtinction to domeſtic ones. The Romans, notwithſtanding the number of their domeſtic, had their *adoptive* gods, taken chiefly from the Egyptians: ſuch were Iſis, Oſiris, Anubis, Apis, Harpocrates, and Canopus.

ADOPTIVI, in *Church Hiſtory*. See **ADOPTIANI**.

ADOR ſignifies a ſpecies of corn called SPELTA and ZEA.

ADORATION, the act of rendering divine honours; or of addreſſing GOD, or a being, as ſuppoſing it a god. See **WORSHIP**.

The word is compounded of *ad*, *to*; and *os*, *mouth*; and literally ſignifies to apply the hands to the mouth; *manum ad os admovere*, q. d. *to kiſs the hand*; this being, in the eaſtern countries, one of the great marks of reſpect and ſubmiſſion.

The ceremony of *adoration* among the ancient Romans was thus: the devotee having his head covered, applied his right hand to his lips, the fore-finger reſting on the thumb, which was erect, and thus bowing his head, turned himſelf round from left to right. The kiſs thus given was called *oſculum labratum*; for ordinarily they were afraid to touch the images of their gods themſelves with their profane lips. Sometimes, however, they would kiſs their feet, or even knees, it being held an incivility to touch their mouths; ſo that the affair paſſed at ſome diſtance. Others pretend, that they firſt ſtretched out the hand, and afterwards drew it back to their lips; but it rather appears, that the contrary order was obſerved. Saturn, however, and Hercules, were *adored* with the head bare; whence the worſhip of the laſt was called *inſtitutum peregrinum*, and *ritus Græcanicus*, as departing from the cuſtomary Roman method, which was to ſacrifice and *adore*, with the face veiled, and the cloaths drawn up to the ears, to prevent any interruption in the ceremony, by the ſight of unlucky objects.

Sometimes alſo proſtration, or falling on the face, and ſometimes kneeling, were practiſed; ſometimes they turned towards the ſun, and ſometimes to the eaſt.

Other circumſtances of *adoration* were the putting crowns, garlands, and the like, on the ſtatues or images *adored*; ſitting down by them, praying to them, in ſoft trembling murmurs, to be favourable, *faveas mihi*.

The Romans practiſed *adoration* at ſacrifices, and other ſolemnities; in paſſing by temples, altars, groves, &c. at the ſight of ſtatues, images, or the like, whether of ſtone or wood, wherein any thing of divinity was ſuppoſed to reſide. Uſually there were images of the gods placed at the gates of cities, for thoſe who went in, or out, to pay their reſpects to.

The Gauls, inſtead of turning about to the right hand, after the Roman manner, thought it more religious to turn to the left.

In the ſymbols of Pythagoras, *adoration* is enjoined to be performed in a ſitting poſture, genuflexion being then unknown.

The Jewiſh manner of *adoration* was by proſtration, bowing and kneeling. Pinchon has a diſcourſe expreſs on the form of the Jewiſh *adoration*. The Chriſtians adopted the Grecian rather than the Roman method, and *adored* always uncovered. The ordinary poſture of the ancient Chriſtians was kneeling, but on Sundays, ſtanding. In this they conformed to the heathens, that a peculiar regard was had to the eaſt, to which point they ordinarily directed their prayers; which occaſioned a belief among the heathens, as if they *adored* the ſun. Something of this uſage is ſtill retained, as appears by the poſition of our churches. A late author has diſcovered an error of the builders in this reſpect; many of our ancient churches being found to vary ſeveral degrees from the true eaſt and weſt.

ADORATION is alſo uſed for certain extraordinary civil honours, or reſpects, which reſemble thoſe paid to the Deity, yet are given to men.

We read of *adorations* paid to kings, princes, emperors, popes, biſhops, abbots, &c. *Adorations* paid to the purple, to the perſon. *Adoration* by kneeling, by falling proſtrate, kiſſing feet, hand, garment, &c.

The Perſian manner of *adoration*, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, ſtriking the earth with the forehead, and kiſſing the ground. This ceremony, which the Greeks called προσκυνειν, Conon refuſed to perform to Artaxerxes, and Caliſthenes to Alexander the Great, as reputing it impious and unlawful.

The *adoration* performed to the Roman and Grecian emperors, conſiſted in bowing, or kneeling at the prince's feet, laying hold of his purple robe, and preſently withdrawing the hand, and clapping it to the lips. Some attribute the origin of this practice to Conſtantius. It was only perſons of ſome rank or dignity that were intitled to the honour. Bare kneeling before the emperor to deliver a petition, was alſo called *adoration*.

It is particularly ſaid of Diocleſian, that he had gems faſtened to his ſhoes, that divine honours might be more willingly paid him, by kiſſing his feet. The like uſage was afterwards adopted by the popes, and is obſerved to this day.

ADORATION is alſo uſed in the court of Rome, for the ceremony of kiſſing the pope's feet.

Theſe prelates finding a vehement diſpoſition in the people to fall down before them, and kiſs their feet, procured crucifixes to be faſtened on their ſlippers; by which ſtratagem, the *adoration* intended for the pope's perſon, is ſuppoſed to be transferred to Chriſt. Divers acts of this *adoration* we find offered even by princes to the pope. We are told, that in the ancient church the ſame ceremony was practiſed to all biſhops; people kiſſed their feet, and ſaluted them with the phraſe ϖροσκυνω σε, *I adore thee.*

The practice of *adoration* may be ſaid to be ſtill ſubſiſting in England, in the ceremony of kiſſing the king's or queen's hand, and in ſerving them at table, both being performed kneeling.

ADORATION is alſo particularly uſed for the ceremony of owning, or paying homage to a new elected pope.

Adoration properly is paid only to the pope when placed on the altar, in which poſture the cardinals, conclaviſts alone, are admitted to kiſs his feet. The people are afterwards admitted to do the like at St. Peter's church: the ceremony is deſcribed at large by Guicciardin.

ADORATION is alſo uſed for a method of electing a pope without ſcrutiny, or voting.—In the election by *adoration*, the cardinals ruſh haſtily, as if agitated by ſome ſpirit, and fall without more ado to the *adoration* of ſome one among them, and proclaim him pope.

In the election by ſcrutiny, *adoration* is the laſt thing, and follows the election; as in the other it is the election itſelf, or rather ſuperſedes the election.

ADORATION is more particularly uſed for kiſſing one's hand in preſence of another, as a token of reverence.

The Jews *adored* by kiſſing their hands, and bowing down their heads; whence in their language *kiſſing* is properly uſed for *adoration*.

ADORATION is alſo uſed among Roman writers, for a high ſpecies of applauſe given to perſons, who had ſpoken or performed well in public. The method of expreſſing it was, by riſing, putting both hands to their mouth, and then returning them towards the perſon intended to be honoured.

ADORATION is of divers kinds and qualities; *ſupreme* and *ſubordinate*; *mediate* and *immediate*; *abſolute* and *relative*; *internal* and *external*; *ſecret* and *open*.

ADORATION, *external*, coincides with what is otherwiſe called *ritual adoration*.

ADORATION, *internal*, coincides with ſpiritual *adoration*, called alſo *adoration* in ſpirit and in truth.

ADORATION, *ſolemn*, that performed in public, with ſtated ceremonies preſcribed by authority: in oppoſition to private, or tacit, or implicit *adoration*.

ADORATION, *ſupreme*, the higheſt degree of religious honour or worſhip rendered to a being, as ſuppoſing him the ſupreme God; in oppoſition to ſubordinate worſhip given to inferior beings.

ADORATION, *abſolute*, that rendered immediately to a being in conſideration of his own eſſential perfections, and terminating in himſelf. This coincides with immediate *adoration*, and ſtands oppoſed to relative or mediate *adoration*. Olearius has an expreſs diſſertation on the *adoration* of the Father by the Son.

ADORATION, *relative*, is that worſhip paid to an object, as belonging to, or repreſentative of another.

In which ſenſe the Romaniſts profeſs to adore the croſs, not ſimply or immediately, which they allow would be idolatry, but in reſpect of Jeſus Chriſt, whom they ſuppoſe to be on it. The Jeſuits in China carry an image of Chriſt under their cloaths, and to this refer mentally the public *adorations* they offer to Chacinchoan. Vid. Paſcal. Lettr. Provinc. 5.

ADORATION, *perpetual*, is a kind of ſociety or aſſociation of devout perſons eſtabliſhed in Romiſh countries, who take their turns to pray before the euchariſt, regularly relieving each other, ſo that the ſervice never ceaſes day nor night.

The members of the perpetual *adoration* anſwer to the ACOEMITI in the eaſtern church.

We find ſocieties under this denomination in France, Germany, Italy, &c.

ADORATION, *barbarous*, is a term uſed in the laws of king Canute, for that performed after the heathen manner, who *adored* idols.

The Phœnicians *adored* the winds, on account of the terrible effects produced by them; the ſame was adopted by moſt of the other nations, Perſians, Greeks, Romans, &c.

The Troglodytes *adored* tortoiſes, as ſomething peculiarly ſacred; ſeveral people *adored* weapons, and inſtruments of war. The Scythians, &c. *adored* ſwords, the Romans axes, the Arabs ſtones, the Indians *adored* vipers, the Bengaleſe and Canadeſe the ſun; the latter of which nations is alſo ſaid to *adore* the croſs. The Manta, a Peruvian people in the iſland of Puna, anciently *adored* a huge emerald, of the bigneſs of an oſtrich's egg, by offering it to other emeralds of a leſſer ſize. All which the prieſts kept for their own uſe; the doctrine, as Garcilaſſo obſerves, being founded on their avarice.

The Perſians chiefly paid their *adorations* to the ſun and fire, ſome ſay alſo to rivers, the wind, &c. The motive of *adoring* the ſun was the benefits they received from that glorious luminary, which of all creatures, has doubtleſs the beſt pretenſions to ſuch homage; the inſtitution of the fire-worſhip is uſually referred to Zoroaſter. The retainers to it are called IGNICOLÆ; by the Perſians, Ghebr, Ateſch, Pereſh.

Dr. Hyde reduces the Perſian fire-worſhip to a ſubordinate kind of honour, or ſervice, which he calls *pyrodulia*, defending that people from any charge of *pyrolatria*, or idolatry of fire. A late traveller into theſe parts does the ſame.

The Greeks and Romans alſo *adored* fire under the name of VESTA. Pliny mentions the method of *adoring* lightning, which was by poppiſms, or gentle clappings of the hands.

The Jews have been charged by heathens with *adoring* the vine, an aſs's head, &c. By Chriſtians, with *adoring* the book of the law; a charge which one of their rabbies has been at the pains to remove. The *adoration* of the golden calf, into which they fell in the wilderneſs, ſeems to have been borrowed, like many other of their ceremonies, from the Egyptians.

The Egyptians are ſaid to have paid *adoration* to divers animals, plants, fiſhes, &c. the crocodile, the ibis, onions, &c. But thoſe were only ſymbolical, or relative acts of homage; they *adored* the ſun in a more peculiar manner, under the name of Oſiris.

It is diſputed, whether the Chineſe pay divine or only civil honours to the ſtatues of Confucius, and their anceſtors. That people, however, appear to *adore* heaven; whence the inſcription in all their temples, and which even the Chriſtians are ſaid to have retained in their churches, *king tien*, i. e. *adore heaven*.

The Indians are ſaid to *adore* the devil. Some charge the ſame on the Bramins.

ADOREA, in Roman *Antiquity*, a word uſed in different ſenſes; ſometimes for all manner of grain, ſometimes for a kind of cakes made of fine flour, and offered in ſacrifice; and finally for a dole or diſtribution of corn, as a reward for ſome ſervice; whence by metonymy it is put for praiſe or rewards in general.

ADOS ſignifies water, in which red-hot iron has been extinguiſhed.

ADOSCULATION is uſed by ſome *Naturaliſts*, for a ſpecies of copulation, or impregnation, by mere external contact between the genital parts of the two ſexes, without intromiſſion.

Such is that of plants, by the falling of the *farina fœcundans* on the piſtil, or uterus.

Divers kinds of birds and fiſhes are alſo impregnated by *adoſculation*.

ADOSSEE is uſed, in *Heraldry*, to denote two figures or bearings, placed back to back.

The arms of the duchy of Bar are two bars *adoſſée*.

ADOXA, in *Botany*, a name given by Linnæus to the genus of plants, called by other writers MOSCHATELLINA. They are claſſed among the *octandria tetragynia*.

ADPERCEPTION, in the Leibnitzian ſtyle, denotes the act whereby the mind becomes conſcious to itſelf of a perception.

AD PONDUS *Omnium*, to the weight of the whole; an abbreviation among *Phyſicians*, &c. ſignifying, that the laſt preſcribed ingredient is to weigh as much as all the others put together.

ADQUISITUS, in ſome ancient Latin writers of *Muſic*, is uſed for the note, or chord, which the Greeks called ϖροσλαμϐανομενος. See DIAGRAM.

AD QUOD *Damnum*, a writ directed to the ſheriff, commanding him to inquire what hurt may befal the king by granting a fair, or market, in any town, or place.

The ſame writ alſo iſſues for an inquiry to be made of what the king, or other perſon, may ſuffer, by granting lands in fee-ſimple to a convent, chapter, or other body politic; by reaſon ſuch land falls into MORTMAIN.

The writ *Ad quod damnum* is alſo had for the turning and changing of ancient highways; which may not be done without the king's licence obtained by this writ, on inquiſition found that ſuch change will not be detrimental to the public. Vaugh. Rep. 341. Ways turned without this authority are not eſteemed highways, ſo as to oblige the inhabitants of the hundred to make amends for robberies; nor have the ſubjects an intereſt therein to juſtify going there. 3 Cro. 267. If any one change a highway without this authority, he may ſtop the way at his pleaſure. But ſee the ſtatute 8 and 9 W. III. cap. 16. for enlarging of highways by order of juſtices of peace, &c. Where any common way ſhall be encloſed after a writ of *Ad quod damnum* executed, any perſon aggrieved

grieved by ſuch encloſure, may complain to the juſtices at the next quarter ſeſſions; but if no ſuch complaint or appeal be made, then the inquiſition and return, recorded by the clerk of the peace, ſhall be for ever binding. 8 and 9 W. III.

ADRACHNE, in *Botany*, the ſtrawberry bay. It grows plentifully in the iſland of Candy, on the hills of Leuce, and in other places among the rocks, more like a ſhrub than a tree. It flowers and bears fruit twice in the year, as does the arbutus ſtrawberry-tree. It is alſo called *adracla*, and ANDRACHNE.

ADRACLA, another name for the preceding ſhrub. See ANDRACHNE.

ADRAGANTH, ſee TRAGACANTH, the ſame as gum DRAGANT.

ADRAM, a name given to SAL gem.

ADRASTIA, or ADRASTEA, in *Antiquity*, an epithet given to the goddeſs Nemeſis, or Revenge.

It was taken from king Adraſtus, who firſt erected a temple to that deity.

ADRASTIA *certamina*, in *Antiquity*, a kind of Pythian games, inſtituted by Adraſtus king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon.

Theſe are to be diſtinguiſhed from the Pythian games celebrated at Delphi.

ADRIANISTS, a branch of *Anabaptiſts*, the diſciples of Adrian Hamſtedius, in the ſixteenth century, who taught firſt in Zealand, and afterwards in England.

The *Adrianiſts*, beſides the common *dogma* of anabaptiſm, are ſaid to have had ſome peculiar notions relating to the perſon of Chriſt.

ADRIFT; a veſſel broke from her moorings, and driven by the wind or waves, is ſaid to be *adrift*.

ADRIUNE, in *Botany*, a name given by the Arabian writers to the plant known at this time by the name of *cyclamen*, or ſow-bread.

ADROBOLON, another name for the Indian BDELLIUM.

ADROGATION, in *Antiquity*, a ſpecies of adoption, whereby a perſon who was capable of chooſing for himſelf, was admitted by another into the relation of a ſon.

The word is compounded of *ad*, *to*, and *rogare*, *to aſk*; on account of a queſtion put in the ceremony of it, whether the adopter would take ſuch a perſon for his ſon? and another to the adoptive, whether he conſented to become ſuch a perſon's ſon?

ADROP, among *Alchemiſts*, denotes either that preciſe matter, as lead, out of which the mercury is to be extracted for the philoſophers ſtone; or it denotes the philoſophers ſtone itſelf, inaſmuch as this is alſo called *ſaturn* and *plumbum*, or lead, *azar*, *azane*, and *lapis ipſe*.

ADROTERON, ſee ALICA.

ADSAMAR, ſee URINE.

ADSCRIPTS is uſed by ſome *Mathematicians*, for the natural tangents, called alſo, by Vieta, *proſines*.

ADSIDELA, in *Antiquity*, a table at which the flamens ſat, when they offered ſacrifice.

ADSIGNIFICATION, among *Schoolmen*, the act of noting or ſignifying a thing, with the addition of the time when it happened.

ADSTRICTION, among *Phyſicians*, is uſed to denote the too great rigidity and cloſeneſs of the emunctories of the body; particularly the pores of the ſkin: alſo to ſignify the ſtyptic quality of medicines. See ASTRINGENTS.

AD TERMINUM *qui præteriit*, is a writ of entry, which lies where a man, having leaſed lands or tenements for terms of life, or years, is, after the term expired, held from them by the tenant, or other ſtranger, who enjoys the ſame, and deforceth the leſſor.—The ſame writ alſo lies for the leſſor's heir.

ADVANCE, in *Commerce*, denotes money paid before goods are delivered, work done, or buſineſs performed. To pay a note of hand or bill by *advance*, is to pay the value before it becomes due, in which caſe it is uſual to allow a diſcount for the time it is pre-advanced.

ADUAR, a kind of ambulatory village, wherein Arab families inhabit, in a ſort of tents, moveable on occaſion, as forage and proviſions ſuit. Some alſo write the word *adouar*, and *adouard*. There are reckoned thirty thouſand *aduars* in the kingdom of Algiers.

ADVANCE-FOSSE, or DITCH, in *Fortification*, denotes a ditch of water round the *eſplanade*, or GLACIS of a place; to prevent its being ſurpriſed by the beſiegers. See FOSSE.

ADVANCE-GUARD, or VAN-GUARD, in the *Military Art*, is the firſt line, or diviſion of an army ranged, or marching in battle-array; or that part of it which is next the enemy, or which marches firſt toward them.

The whole body of an army is divided into *advance-guard*, arrear-guard, and main-body.

The word is ſometimes alſo applied to a ſmall party of horſe, viz. 15, or 20, commanded by a lieutenant, beyond, and in ſight of, the main-guard.

ADVANCER, among *Hunters*, is one of the ſtarts, or branches of a buck's attire, between the back antler and the palm.

ADVENT, ADVENTUS, in the calendar, the time immediately preceding Chriſtmas; anciently employed in pious preparation for the *adventus*, or coming on, of the feaſt of the Nativity.

Advent includes four Sundays, or weeks; commencing either from the Sunday which falls on St. Andrew's day, or that next before or after it, i. e. from the Sunday which falls between the 27th of November, and the third of December incluſive.—But it is to be noted, this rule has not always obtained.—In the Ambroſian office, there are ſix weeks marked for *Advent*; and St. Gregory, in his Sacramentary, allows five.

The firſt week of *Advent*, in our way of reckoning, is that wherein it begins; but it was anciently otherwiſe; the week next Chriſtmas being reputed the firſt; and the numeration carried backwards.

Great auſterity was practiſed in the ancient church during this ſeaſon.—At firſt they faſted three days a week; but they were afterwards obliged to faſt every day; whence the ſeaſon is frequently called in ancient writers, *Lent*, and *Quadrageſima S. Martini*.

The courts of juſtice were at one time all ſhut.

ADVENT is alſo one of the times, from the beginning whereof, to the end of the octaves of the Epiphany, the ſolemnizing of MARRIAGE is forbid, without expreſs licence.

ADVENTITIA *cœna*, in *Antiquity*, an entertainment made by the friends of a perſon who had been travelling, by way of welcome at his return. This was otherwiſe called *cœna adventoria*.

ADVENTITIOUS, ſomething accruing or befalling a perſon, or thing, from without.

Thus, *adventitious* matter is ſuch matter as doth not properly belong to any body, but is caſually joined to it.

ADVENTITIOUS, in the *Civil Law*, is applied to ſuch goods as fall to a man, either by mere fortune, or by the liberality of a ſtranger, or by collateral, not direct ſucceſſion.

In this ſenſe, the word ſtands oppoſed to *profectitious*; by which are ſignified ſuch goods as deſcend in a direct line, from father to ſon.

ADVENTITIOUS *foſſils*, are foreign or extraneous ones, found incorporated with others, to which they do not properly belong. Such are ſea-ſhells, &c.

AD VENTREM *inſpiciendum*, in *Law*. See VENTRE *inſpiciendo*.

ADVENTURE, an extraordinary and ſurpriſing enterprize, or accident, either real, or fictitious.

The word is French, and literally denotes an event, or accident.

Novels, romances, &c. are chiefly taken up in relating the *adventures* of cavaliers, lovers, &c.

ADVENTURE, in *Commerce*; a bill of *adventure* is a writing ſigned by a merchant, atteſting that the property of goods ſhipped, or ſent away in his name, belongs to another, the *adventure* or chance whereof the ſaid perſon is to ſtand, with a covenant to account to him for the produce of it.

ADVENTURE. See MINE-*Adventurer*.

ADVENTURERS is particularly uſed for an ancient company of merchants and traders, erected for the diſcovery of lands, territories, trades, &c. unknown.

The ſociety of *adventurers* had its riſe in Burgundy, and its firſt eſtabliſhment from John, duke of Brabant, in 1248; being known by the name of *the Brotherhood of St. Thomas à Becket*. It was afterwards tranſlated into England, and ſucceſſively confirmed by Edward III. and IV. Richard III. Henry IV. V. VI. and VII. who gave it the appellation of MERCHANT-*adventurers*.

By our ſtatutes, *adventurers* making ſettlements in any part of America belonging to the enemy, may obtain a charter from the king. Stat. 13 Georg. II. cap. 4. ſect. 13.

ADVERB, ADVERBIUM, in *Grammar*, a particle joined to a verb, adjective, or participle, to explain their manner of acting or ſuffering; or to mark ſome circumſtance or quality ſignified by them.

The word is formed from the prepoſition *ad*, *to*, and *verbum*, *a verb*; and ſignifies literally a word joined to a verb, to ſhew how, or when, or where, one is, does, or ſuffers; as, the boy paints *neatly*, writes *ill*; the houſe ſtands *there*, &c.

Not that the *adverb* is confined purely to the verbs; but becauſe that is its moſt ordinary uſe. Whence it becomes ſo denominated κατ' ἐξοχην. We frequently find it joined to adjectives, and ſometimes even to ſubſtantives, particularly where thoſe ſubſtantives ſignify an attribute, or quality of the thing ſpoken of; v. gr. he is *very* ſick; he is *truly* king.

An *adverb* is likewiſe joined ſometimes to another *adverb*, to modify its meaning; v. gr. *very devoutly*, &c. Whence ſome grammarians chooſe rather to call *adverbs* modificatives; compriſing under this one general term, *adverbs*, conjunctions, prepoſitions, and even adjectives.

Adverbs are very numerous; but they may be reduced under the general claſſes of *adverbs* of time, of place, of order, of quantity, of quality, of manner, of interrogation, of affirmation, of denegation, of diminution, of doubting, of exception, and of compariſon.

Adverbs are denominated by Mr. Harris attributes of attributes, or attributives of the ſecond order. Hermes, p. 192.

ADVERBIAL, ſomething relating to *adverbs*. We ſay an *adverbial* phraſe, *adverbial* expreſſion, &c.

Adverbial *numbers* are ſometimes uſed to denote once, twice, thrice, &c.

ADVERSARIA, among the ancients, was uſed for a book of accounts, like our journal or day-book.

Hence, **adversaria** is ſometimes alſo uſed among us for a *common-place book*.

Adverſaria amounts to the ſame with *Opiſthographia*, *ὑπομνηματα*, or *memoriale*; and ſtands oppoſed to *codex*; the former being for occaſional matters which were taken down haſtily, from which they were afterwards tranſcribed into the latter, in a fair regular manner, for ſtanding uſe.

Adversaria is alſo a title given to divers books, containing collections of miſcellaneous obſervations, remarks, &c.

In which ſenſe, *adverſaria* amounts to much the ſame with *variæ lectiones*, *variæ obſervationes*, *commentarii*, *lectiones antiquæ*, *loci communes*, *geniales dies*, *veſperæ*, *electa*, *miſcellanea*, &c.

Adversaria is alſo uſed for a commentary on ſome text or writing.

This was ſo called, becauſe the notes were written on the *adverſe* or oppoſite page.

ADVERSARY. See **Antagonist.**

The word is formed of the Latin prepoſition *adverſus*, *againſt*; and *vertere*, *to turn*.

ADVERSATIVE, in *Grammar*.—A particle *adverſative*, is that which expreſſes ſome difference, or oppoſition, between what goes before, and what follows.

Thus, in the phraſe, *he loves knowledge*, but *has no application*; the word *but* is an *adverſative* conjunction; between which and a disjunctive one there is this difference, that the firſt ſenſe may hold good, without the ſecond oppoſed to it, which is otherwiſe in regard to *disjunctive* conjunctions.

Adverſatives of this kind may be called *abſolute*; beſide theſe, there are ſeveral others recited by Harris: ſuch as *adverſatives* of *compariſon*, expreſſed by the words *than* and *as*, which mark not only oppoſition, but that equality or exceſs which ariſes among ſubjects from their being compared; ſuch likewiſe are *adverſatives adequate* and *inadequate*, the former of which is expreſſed by the word *unleſs*, and the latter by *although*. Hermes, p. 254, &c.

ADVERSATOR, in *Antiquity*, a ſervant ſent to wait his maſter's returning from ſupper, and attending him home. The rich had ſervants in this quality, to apprize them of any danger.

ADVERTISEMENT, an intelligence or information given to perſons intereſted in an affair.

The word is formed from *advertere*, *to conſider*.

Advertisement is more particularly uſed for a brief account of articles of private concern, inſerted in the daily, or other public papers.

By the ſtatute of 25 Geo. II. cap. 36, and 28 Geo. II cap. 19. the penalty of 50*l.* is inflicted on perſons advertiſing a reward, with no queſtions to be aſked, for the return of things loſt or ſtolen; and likewiſe on the printer.

ADVICE-*Boat*, a ſmall veſſel employed to carry expreſſes or orders with diſpatch.

ADULT, **Adultus**, one who is arrived at years of diſcretion, and entered upon manhood, or the age of **Adolescence**; and is old enough to have underſtanding and diſcernment.

The word is formed from the verb *adoleſcere*, *to grow up*.

There is a notable difference between the proportions of infants and *adults*.—A man, Mr. Dodart obſerves, formed like a fœtus, would be a monſter, and would ſcarce be acknowledged for one of the ſpecies.—The Anabaptiſts confer the ſacrament of baptiſm upon none but **adults**.

We find many things in authors concerning the diſeaſes, the regimen, the diet, &c. of *adults*.—The Chineſe have a peculiar ſchool of *adults*.

Adult is alſo uſed in *Civil Law Writers*, for a youth between fourteen and twenty-five years of age.

In which ſenſe *adultus* is ſynonymous with *juvenis*, *adoleſcens*, or *adoleſcens*.

Adult *plants*, a late author obſerves, differ from immature ones, in that they contain more oil, and leſs ſalt; and the ſame he judges will hold of men; but this requires farther examination.

ADULTERATION, in a general ſenſe, the act of corrupting, or debaſing a thing that was pure, by ſome improper admixture.

The word is Latin, formed of the verb *adulterare*, *to corrupt*, by mingling ſomething foreign to any ſubſtance.

We have laws againſt the *adulteration* of coffee, tea, tobacco, ſnuff, wine, beer, bread, wax, hair-powder, &c. See Stat. 13 W. III. cap. 5.—11 Geo. I. cap. 30.—1 Geo. I. cap. 46.—1 W. and M. cap. 34.—23 El. cap. 8.—10 Ann, cap. 26.—3 Geo. III. cap. 11.

For the method of detecting *adulteration* of liquors, ſee **Proof**, **Essay**, &c.

Adulteration *of coin* properly imports the making, or caſting of a wrong metal, or with too baſe or too much alloy.

Adulterations of coins are effected divers ways, as, by forging another ſtamp, or inſcription; by mixing impurer metals with the gold or ſilver: moſt properly, by making uſe of a wrong metal, or an undue alloy, or too great an admixture of the baſer metals with gold, or ſilver. Counterfeiting the ſtamp, or clipping and leſſening the weight, do not ſo properly come under the denomination of *adulterating*.

Evelyn gives rules and methods, both of *adulterating* and detecting *adulterated* metals, &c.

Adulterating is ſomewhat leſs extenſive than *debaſing*, which includes diminiſhing, clipping, &c.

To adulterate or debaſe the current coin, is a capital crime in all nations.—The ancients puniſhed it with great ſeverity: among the Egyptians both hands were cut off; and by the *Civil Law*, the offender was thrown to wild beaſts. The emperor Tacitus enacted, that counterfeiting the coin ſhould be capital; and under Conſtantine it was made treaſon, as it is alſo among us.

The *adulterating* of gems is a curious art, and the methods of detecting it no leſs uſeful.

Adulteration, in *Pharmacy*, denotes a fraudulent corruption of drugs, or medicines, by ſubſtituting ingredients of leſs value, for the ſake of greater gain.

This practice the dealers in all the parts of medicine are but too well acquainted with. Pharmaceutical authors give numerous inſtances of *adulterations*, both in ſimple and compound medicines.

ADULTERESS, a woman who commits *adultery*. See **Adultery.**

ADULTERINE, in a general ſenſe, denotes any thing which has been adulterated, or that is ſpurious, or counterfeited; and it is thus applied to a fraudulent balance, to debaſed and counterfeit coins, to a falſe key, and to ſuppoſititious writings.

Adulterine, in the *Civil Law*, is particularly applied to a child iſſued from an adulterous amour, or commerce.

Adulterine children are more odious than the illegitimate offspring of ſingle perſons.—The Roman law even refuſes them the title of natural children; as if nature diſowned them.

Adulterine children are not eaſily diſpenſed with for admiſſion to orders. Thoſe are not deemed *adulterine*, who are begotten of a woman openly married, through ignorance of a former wife being alive.

By a decree of the parliament of Paris, *adulterine* children are declared not legitimated by the ſubſequent marriage of the parties, even though a papal diſpenſation be had for ſuch marriage, wherein is a clauſe of legitimation.

Adulterine *marriages*, in St. Auguſtine's ſenſe, denote ſecond marriages, contracted after a divorce.

ADULTERY, **Adulterium**, (in ancient *Law-books* called **Advowtry**) a crime committed by married perſons, againſt the faith pledged to each other in marriage, by having carnal commerce with ſome other; or even by a perſon not married, who has the ſame intercourſe with another that is.

Moraliſts and canoniſts, and divines, have diſtinguiſhed ſeveral ſpecies of *adultery*, as,

Adultery, *manifeſt*, that wherein the parties are caught *εν εργῳ*, *in the fact*, or, as ſome expreſs it, *res in re*.

On ſuch occaſions, ſtrangers, or people not intereſted in the family, have been allowed to accuſe, and proſecute women for *adultery*, either if committed during a huſband's long abſence, or through his connivance.

Adultery, *occult or ſecret*, that kept concealed from the knowledge of the world, and only divulged to a confeſſor or the like.—In the canon law this is moſt favourably dealt with; perſons were admitted to penance for this, and abſolved, who were refuſed it for the open kind.

Adultery, *preſumptive*, that which is only diſcovered or inferred from certain ſigns, or indications. Such are the parties being found in bed together, *nudus cum nuda*.

Adultery, *interpretative, or reputed*, denotes an act which though properly not included under the denomination, yet is reputed as equivalent to it, and puniſhed as ſuch.

Thus mixed marriages between Chriſtians and Jews, e. g. between a Chriſtian man and a Jewiſh woman, are put by the laws of Arcadius and Honorius, on the footing of *adultery*.

So alſo ſecond marriages are called by ſome, as Athenagoras, and St. Ambroſe, an honourable or better ſort of *adulteries*.

Adultery, *improper*, includes other extraordinary caſes and ſpecies; ſuch are the commerce with a woman only eſpouſed, not actually married; with a married woman, who lives as a common whore; with a married woman, taking her for ſingle; with a putative wife, or concubine, taking her for a real wife; and with a nun, who by her vows is doomed eſpouſed.

Adultery, *figurative*, that intended only to repreſent, or prefigure another fact, or convey ſome other inſtruction. This coincides with typical, or allegorical *adultery*, and ſtands oppoſed to actual. So the *adultery* of Mars and Venus is turned into an allegory by naturaliſts, moraliſts, alchemiſts, &c.

Adultery, *ſingle*, is that where only one of the parties is married, in contradiſtinction from double *adultery*, which is, where both parties are married.

Adultery, *inceſtuous*, that wherein the parties are related within the third degree of conſanguinity.

Adultery, *licit*, that not prohibited by any expreſs or known law.

It has been diſputed whether *adultery* be *malum in ſe*, or only *malum prohibitum*, i. e. evil in itſelf, or only rendered evil, by virtue of poſitive laws and prohibitions. St. Ambroſe and ſome others have maintained, that *adultery* was not criminal before the Moſaic law.

It has been controverted, whether *adultery* may be lawfully committed in war, with the enemies wives? The anſwer is in the negative, and the authoriſed practice of civiliſed nations is agreeable to this. It has alſo been a famous queſtion, whether it be lawful for a woman to commit *adultery* with the conſent of her huſband, and for the procuring ſome great good to him? St. Auſtin apparently allows of it; at leaſt, does not condemn it.

It has likewiſe been a diſpute, whether it be lawful for one of the parties married to commit *adultery*, with the conſent of the other, for the ſake of having children? Of which we have inſtances in Abraham, who, on this account, converſed with Hagar; and likewiſe among the Greeks and Romans.

Pollman, a German profeſſor, has a diſſertation on the huſband's right to alienate his wife's body to another's uſe.

Adultery, *illicit*, that which is expreſly contrary to ſome obligatory law: ſuch, according to the generality of caſuiſts, is all *adultery*, proper, improper, ſingle, double, open, and occult; by reaſon of a natural baſeneſs or turpitude in the thing, as well as its being a violation of conjugal faith, and injury to our neighbour.

In effect, puniſhments have been annexed to *adultery* in moſt ages and nations, though of different degrees of ſeverity. In many it has been capital, in others venial, and attended only with ſlight pecuniary mulcts. Some of the penalties are ſerious, and even cruel; others of a jocoſe and humorous kind.

Among the Egyptians, *adultery* by conſent, was puniſhed in the man, by a thouſand laſhes, given with rods; and in the woman, with the loſs of her noſe. Nevertheleſs *adulteries* were not unfrequent among the Egyptians.

The Grecian laws expreſs great indignation againſt *adultery*. In the earlier times of Athens, the puniſhment of *adultery* ſeems to have been arbitrary. In other parts of Greece, *adultery* was ſeverely puniſhed.

In the later times of Greece it was ordered by Draco, that he who catched an *adulterer* in the fact, might impoſe on him any arbitrary puniſhment; and this law was confirmed by Solon. Nevertheleſs it appears to have been highly impolitic, as it gave full ſcope to private revenge, inſtead of leaving the puniſhment to the ſtate.

It was by the Grecian law farther ordained, that if any one was injuriouſly confined upon ſuſpicion of *adultery*, he ſhould make his complaint by appeal to the *Theſmothetæ*, which, if they found juſtifiable, he ſhould be acquitted, and his ſureties diſcharged from their bail; but in caſe he were found guilty, the judges were to inflict on him what puniſhment they would, death only excepted; and the offender was obliged to procure friends to be reſponſible for his future chaſtity.

There were other remarkable puniſhments for *adulterers* among the Grecians; ſuch, particularly, as putting out their eyes. And the Locrians obſerved this cuſtom in later ages, being compelled to the obſervance of it by Zaleucus, their lawgiver, whoſe rigour in executing this law is very remarkable; for having caught his ſon in *adultery*, he reſolved to deprive him of his ſight, and remained a long time inexorable, notwithſtanding the whole city was willing to remit the puniſhment, and requeſted him to ſpare the youth. At length, unable to reſiſt the people's importunity, he mitigated his ſentence, and redeemed one of his ſon's eyes, by cauſing one of his own to be put out; by this glorious act ſetting a memorable example both of *juſtice* and of *mercy*.

At Gortyn in Crete, they puniſhed *adulterers* after another manner; they were covered with wool, an emblem of the ſoftneſs and effeminacy of their diſpoſition, and in that dreſs they were carried through the city to the magiſtrate's houſe, who ſentenced them to ignominy, whereby they were in a manner deprived of all their privileges, and their ſhare in adminiſtering the public buſineſs.

The Spartans, indeed, may in one ſenſe be ſaid to have tolerated *adultery*, ſince they laughed at thoſe who thought the violation of the marriage bed an unſupportable affront: they allowed other men the liberty of embracing their wives, which freedom they took with others in their turn. Nay even ſtrangers, as well as citizens of Sparta, were allowed the ſame freedom with their wives. Yet we find that their kings were exempt from this cuſtom, that the royal blood might be preſerved unmixed, and the government remain in the ſame lineal deſcent.

But notwithſtanding this liberty, which was founded on mutual conſent, they accounted all other *adulteries* the moſt heinous crime in the world; and while they adhered to their ancient laws, they were wholly ſtrangers to them. See Potter's Arch. lib. iv. cap. 12. Plutarch tells us that if any perſon diſcovered his ſiſter or daughter, while unmarried, in this crime, he was allowed by Solon's laws to ſell her for a ſlave. *Adultereſſes* were never after permitted to adorn themſelves with fine cloaths; and in caſe they appeared to do ſo, were liable to have them torn off by any that met them, and likewiſe be beaten. The ſame liberty was permitted to any that found them in the temples, which were thought to be polluted by the admiſſion of perſons ſo infamous and deteſtable. Laſtly, their huſbands, though willing, were forbidden to cohabit any longer with them, upon pain of ignominy *ατιμια*; but perſons who proſtituted women, were adjudged to die.

There are various conjectures concerning the ancient puniſhment of *adultery* among the Romans.

By a law of Romulus, of which Plutarch makes mention, a man had the liberty of turning away his wife, either for poiſoning his children, counterfeiting his private keys, or for *adultery*. Though ſome maintain that it was made capital, by a law of Romulus, and again by the Twelve Tables. Others, that it was firſt made capital by Auguſtus; and others, not before the emperor Conſtantine. The truth is, the puniſhment in ancient times was very various, much being left to the diſcretion of the huſband and parents of the *adulterous* wife, who exerciſed it differently, rather with the ſilence and countenance of the magiſtrate, than any formal authority from him. Thus we are told the wife's father was allowed to kill both parties when caught in the fact, provided he did it immediately, killed both together, and, as it were, with one blow. The ſame power ordinarily was not indulged the huſband, except the crime were committed with ſome mean, or infamous perſon; though, in other caſes, if his rage carried him to put them to death, he was not puniſhed as a murderer. On many occaſions, however, revenge was not carried ſo far, but mutilating, caſtrating, cutting off the ears, noſes, &c. were deemed ſufficient. The puniſhment allotted by the *lex Julia*, was not, as many have imagined, death; but rather baniſhment, or deportation, being interdicted fire and water: though Octavius appears, in ſeveral inſtances, to have gone beyond his own law, and to have put *adulterers* to death. But though the Julian law left the accuſation of *adultery* open to every body, yet ſtrangers were ſeldom ſuffered to proſecute, where the huſband made no complaint. But where the huſband made a trade of his wife's infamy, or having ſeen her ſhame with his own eyes, patiently ſuffered the affront; in theſe caſes, *adultery* became a crime of public concern; and the Julian law provides a puniſhment for ſuch huſbands as well as for their wives.

Under Macrinus *adulterers* were burnt at a ſtake. Conſtantine firſt by law made the crime capital. Under Conſtantius and Conſtans, *adulterers* were burnt, or ſewed in ſacks, and thrown into the ſea. Under Leo and Marcian, the penalty was abated to perpetual puniſhment, or cutting off the noſe.

By the civil law, as altered by Juſtinian, who, at the inſtance of his wife Theodora, mitigated the ſeverity of the *lex Julia*, *adultery* is puniſhed with whipping, and ſhutting up in a convent for two years: during which time, if the huſband do not conſent to take her back again, ſhe is ſhaven, and ſhut up for life.—This is called *authenticating*, as having been eſtabliſhed by an authentic.

In France, however, the whipping is omitted, that the huſband may be the leſs averſe to the taking her back within the two years.

Under Theodoſius women convicted of this crime were puniſhed after a very ſingular manner, viz. by a public conſtupration; being locked up in a narrow cell, and forced to admit all the men to their embraces that would offer themſelves. This cuſtom was again aboliſhed by the ſame prince.

It is controverted whether, among the Romans, *adultery* was allowed to be compounded?

By an edict of the emperor Antoninus, the huſband was not allowed to bring an action of *adultery* againſt his wife, unleſs he himſelf were innocent; the reaſon given for it is very natural, *periniquum enim videtur eſſe ut pudicitiam vir et uxore exigat, quam ipſe non exhibeat.*

By the Jewiſh law, *adultery* was puniſhed by death in both parties, where they were both married, or only the woman.

The Jews had a particular method of trying, or rather purging an *adultereſs*, or a woman ſuſpected of the crime, by making her drink the bitter waters of jealouſy; which, if ſhe were guilty, made her ſwell.

Among the Mingrelians, *adultery* is puniſhed with the forfeiture of a hog, which is uſually eaten in good friendſhip between the gallant, the adultereſs, and the cuckold.

In ſome parts of the Indies, it is ſaid any man's wife is permitted to proſtitute herſelf to him who will give an elephant for the uſe of her; and it is reputed no ſmall glory to her, to have been rated ſo high.

Adultery is ſaid to be ſo frequent at Ceylon, that not a woman but practiſes it, notwithſtanding its being puniſhable with death.

Among the Japaneſe, and divers other nations, *adultery* is only penal in the woman. Among the Abyſſinians, the crime of the huſband is ſaid to be only puniſhed on the innocent wife. In the Marian iſlands, on the contrary, the woman is not puniſhable for *adultery*; but if the man go aſtray, he pays ſeverely: the wife and her relations waſte his lands, turn him out of his houſe, &c.

Among the Chineſe there is reaſon to conclude, that *adultery* is not capital; for it is ſaid that fond parents will make a contract for their daughters future huſbands, to allow them the indulgence of a gallant.

In Spain, they puniſhed *adultery* in men by cutting off that part which had been the inſtrument of the crime.

In Poland, before Chriſtianity was eſtabliſhed, they puniſhed *adultery* and fornication in a very particular manner: the criminal they carried to the market-place, and there faſtened him by the teſticles with a nail; laying a razor within his reach, and leaving him under a neceſſity, either of doing juſtice upon himſelf, or of periſhing in that condition.

By the old law of Scotland, notorious or double *adultery* is puniſhed by death; ſingle *adultery* by baniſhment, fining, &c. though by the opinion of ſome Scotch lawyers, it may be puniſhed by death.

The Saxons formerly burnt the *adultereſs*, and over her aſhes erected a gibbet, whereon the *adulterer* was hanged.

In this kingdom, likewiſe, *adultery* by the ancient laws was ſeverely puniſhed. King Edmund the Saxon, ordered *adultery* to be puniſhed in the ſame manner as homicide; and Canute the Dane ordered that a man who committed *adultery* ſhould be baniſhed, and that the woman ſhould have her noſe and ears cut off. In the time of Henry I. it was puniſhed with the loſs of eyes and genitals. Lib. Hen. I. cap. 12. Doomſday Tit. Ceſtre. Civit.

Adultery at preſent is only puniſhed by fine and penance in the ſpiritual court; or by an action at common law for damages. Though ſome of our law-books ſpeak of *adultery* as a thing temporal againſt the peace. As to the *adultereſs*, by our law, ſhe undergoes no temporal puniſhment whatever, except the loſs of her dower; and ſhe does not loſe even that, if her huſband is weak enough to be reconciled to her, and cohabit with her after the offence committed. 13 Ed. I. cap. 34.

But it is to be obſerved, that *adultereſſes* are ſuch either by the *Canon*, or *Civil Law*.

According to the former, a woman is an *adultereſs*, who either being herſelf married converſes carnally with another man; or being ſingle herſelf, converſes with a man that is married.

According to the latter, ſhe is not an *adultereſs*, if ſhe be not herſelf in the married ſtate, though ſhe converſes with a man that is. The crime, in this caſe, was more properly called *ſtuprum* than *adulterium*.

Hence, among the Romans, the word *adultera*, *adultereſs*, differed from *pellex*, which denoted a ſingle woman, who cohabited with a married man: and *pellex* differed from *concubina*, which ſignified her who had only intercourſe with an unmarried man. The former was reputed infamous, and the latter innocent.

It is much diſputed, whether *adultery* diſſolves the bond of matrimony, and be a ſufficient cauſe of divorce, ſo that the parties may marry again. This was allowed in the ancient church, and is ſtill continued in the Greek, as well as the Lutheran and Calviniſt churches. Romaniſts, however, diſallow of it, and the council of Trent even anathematized thoſe who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in ſome of whoſe dominions, as Zant, Cephalonia, &c. the contrary uſage obtains.

The eccleſiaſtical courts in England ſo far agree with the papiſts, that they only grant a divorce *à menſa & thoro*, in caſe of *adultery*; ſo that a complete divorce, to enable the parties to marry again, cannot be had without an act of parliament.

By a council of Nantes, marriage was declared diſſolved by *adultery*, but the innocent party was not allowed ſecond marriage. In after times, leave was given to the innocent party alone; and afterwards the ſame was allowed the criminal party.

ADULTERY is alſo uſed in *Ancient Cuſtoms*, for the puniſhment, or fine impoſed for that offence, or the privilege of proſecuting for it.

In which ſenſe, *adulterium* amounts to the ſame with what the Saxons called *legerwita*.

ADULTERY is ſometimes uſed, in a more extenſive ſenſe, for any ſpecies of impurity, or crime, againſt the virtue of chaſtity; and in this ſenſe divines underſtand the ſeventh commandment.

ADULTERY is alſo uſed, eſpecially in Scripture, for idolatry, or departing from the true God, to the worſhip of a falſe one.

ADULTERY is alſo uſed, in *Eccleſiaſtical Writers*, for a perſon's invading, or intruding into a biſhopric, during the former biſhop's life. The reaſon of the appellation is, that a biſhop is ſuppoſed to contract a kind of ſpiritual marriage with his church.

The tranſlation of a biſhop from one ſee to another was alſo reputed a ſpecies of *adultery*; on the ſuppoſition of its being a kind of ſecond marriage, which, in thoſe days, was eſteemed a degree of *adultery*. This concluſion was founded on that text of St. Paul, *Let a biſhop be the huſband of one wife*, by a forced conſtruction of church for wife, and of biſhop for huſband.

ADULTERY is alſo uſed, in *Ancient Naturaliſts*, for the act of ingrafting one plant upon another.

In which ſenſe, Pliny ſpeaks of the *adulteries* of trees, *arborum adulteria*, which he repreſents as contrary to nature, and a piece of luxury, or needleſs refinement.

ADULTERY is alſo uſed by ſome fanciful *Aſtronomers* and *Aſtrologers*, for an eclipſe of the ſun, or moon, happening in an unuſual, and, as they ſuppoſe, irregular manner: as in the caſe of horizontal eclipſes, where, though the ſun and moon be diametrically oppoſite, yet they appear as if both above the horizon at the ſame time.

ADVOCARIA, in middle age writers, a tax paid the lord for his protection; ſometimes alſo called *ſalvamentum*.

ADVOCATE, ADVOCATUS, among the Romans, a perſon ſkilled in their law, and who undertook the defence of cauſes at the bar.

The word is compounded of *ad*, *to*, and *vocare*, *to call*; q. d. *I call to my aid or defence*.

The Roman *advocates* anſwered to one part of the office of a barriſter among us, viz. the pleading part; for as to the giving counſel, they never meddled with it; that being the buſineſs of the *juriſconſulti*.

The Romans, in the firſt ages of their ſtate, held the profeſſion of an *advocate* in great honour; and the ſeats of their bar were crouded with ſenators and conſuls; they, whoſe voices commanded the people, thinking it an honour to be employed in defending them.

They were ſtyled, *comites*, *honorati*, *clariſſimi*, and even *patroni*; as if their CLIENTS were not leſs obliged to them, than freed men to their maſters. See PATRON.

The bar was not at that time venal.—Thoſe who aſpired to honours and offices, took this way of gaining an intereſt in the people, and always pleaded *gratis*.

But no ſooner were luxury and corruption brought into the commonwealth, than the bar became a ſharer in them.—Then it was that the ſenators lett out their voices for pay, and zeal and eloquence were ſold to the higheſt bidder.—To put a ſtop to this abuſe, the tribune Cincius procured a law to be paſſed, called from him *Lex Cincia*, whereby the *advocates* were forbid to take any money of their clients.—Fred. Brunerus has publiſhed an ample comment upon this law.

It had before this been prohibited the *advocates* to take any preſents or gratuities for their pleading.—The emperor Auguſtus added a penalty to it: notwithſtanding which, the *advocates* played their part ſo well, that the emperor Claudius thought it an extraordinary circumſtance, when he obliged them not to take above eight great ſeſterces, which are equivalent to 64 pounds ſterling, or upwards, for pleading each cauſe.

Advocate is ſtill uſed in countries, and courts, where the civil law obtains, for thoſe who plead and defend the cauſes of clients truſted to them.

In Scotland they have a college, or *Faculty of Advocates*, 180 in number, appointed to plead in all actions before the lords of ſeſſion.—They have a dean, treaſurer, clerks, examinators, and a curator of their library.

By the articles of the Union, none are to be named ordinary lords of ſeſſion, except thoſe who have been *advocates*, or principal clerks of ſeſſion for five years, &c.

In France, they have two kinds of *advocates*, viz. pleading *advocates*, *avocats plaidants*; and counſel *advocates*, *avocats conſultants*.

This diſtinction was formed with a view to the two branches among the Romans, *advocati*, and *juriſconſulti*.—Yet there is this difference, that the function of the *juriſconſulti*, who only gave their advice, was of a different kind from that of the *advocati*; being a ſort of private and perpetual magiſtrature, principally under the firſt emperors; and the *advocati* never became *juriſconſulti*. Whereas, on the other hand, in France, after the *advocates* have attained to reputation, and experience enough at the bar, they quit ſo buſy a province, and become a kind of chamber-counſel.—They have alſo their *advocate* general, and king's *advocate*, *avocat du roy*.

Advocate, *lord*, in Scotland, one of the officers of ſtate, whoſe buſineſs is to give his advice about the making and executing of laws; to defend the king's right and intereſt in all public meetings; to proſecute all capital crimes before the juſticiary; and to concur in all purſuits before ſovereign courts for breaches of the peace; and alſo in all matters wherein the king, or his donator, has intereſt.—He intents no proceſſes of treaſon, except by warrant of privy-council.

The *lord advocate* is ſometimes an ordinary lord of ſeſſion; in which caſe, he only pleads in the king's cauſes; otherwiſe, he is at liberty to plead in all cauſes.

Advocate *of a city*, or *town*, is a magiſtrate eſtabliſhed in ſeveral places of Germany, for the adminiſtration of juſtice in that city, in the emperor's name. See Advouee.

Advocate is more particularly uſed, in *Church Hiſtory*, for a perſon appointed to defend the rights and revenues of a church, or religious houſe.

The word *advocatus*, or *advowee*, is ſtill retained, for what we uſually call the *patron*, or he who has the advowſon, or right of preſentation, in his own name.

The abbeys and monaſteries had alſo all their *advocates*, or *advowees*. See Adminiculator.

There are ſeveral other kinds of *advocates*; as,

Advocate, *conſiſtorial*, is an officer of the court of Rome, whoſe buſineſs it is to plead on the oppoſitions made to the provisions of benefices in that court. There are ten of theſe in number.

Advocates, *elective*, thoſe choſen by the abbot, biſhop, or chapter, a particular licence being had from the king, or prince, for that purpoſe. The elections were originally made in the preſence of the count of the province.

Advocates, *feudal*. Theſe were of the military kind, who, to make them the more zealous for the intereſt of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the biſhop or abbot. Theſe were to lead the vaſſals of the church to war, not only in private quarrels of the church itſelf, but in military expeditions for the king's ſervice, in which they were the ſtandard-bearers of their churches.

Advocate, *fiſcal*, *fiſci* Advocatus, was an officer inſtituted by the emperor Adrian, to defend the cauſe and intereſts of the fiscus, or private treaſury, in the ſeveral tribunals where that might be concerned.

Advocates, *juridical*, in the middle age, were thoſe who from attending cauſes in the court of the comes, or count of the province, became judges themſelves, and held courts of their vaſſals thrice a year, under the name of the *tria placita generalia*.

In conſideration of this further ſervice, they had a particular allowance of one third part of all fines, or mulcts, impoſed on defaulters, &c. which was called *tertia bannorum pars*, *tertius denarius*, *tertia pars compoſitionum*, *tertia pars legum*, or *emendarum*, &c. Beſides a proportion of diet for themſelves and ſervants.

Advocates, *matricular*, were the *advocates* of the mother, or cathedral, churches.

Advocates, *military*, thoſe appointed for the defence of the church, rather by arms and authority, than by pleading and eloquence.

Theſe were introduced in the times of confuſion, when every perſon was obliged to maintain their own property by force; biſhops and abbots not being permitted to bear arms, and the ſcholaſtic or gowned *advocates*, being equally unacquainted with them, recourſe was had to knights, noblemen, ſoldiers, or even to princes.

Advocates, *nominative*, thoſe appointed by a king, or pope. Sometimes the churches petitioned kings, &c. to appoint them an *advocate*; at other times, this was done of their own accord. By ſome regulations, no perſon was capable of being elected *advocate*, unleſs he had an eſtate in land in the ſame county.

Advocates, *regular*, thoſe duly formed and qualified for their profeſſion, by a proper courſe of ſtudy, the requiſite oath, ſubſcription, licence, &c.

Advocates, *ſubordinate*, thoſe appointed by other ſuperior ones, acting under them, and accountable to them.

There were divers reaſons for the creation of theſe ſubordinate *advocates*; as, the ſuperior quality of the principal *advocate*, his being detained in war, or being involved in other affairs; but chiefly the too great diſtance of ſome of the church lands, and their lying in the dominions of foreign princes.

Advocates, *ſupreme* or *ſovereign*, were thoſe, who had the authority in chief, but acted by deputies, or ſubordinate *advocates*. Theſe were alſo called principal, greater, and ſometimes general *advocates*.—Such in many caſes were kings, &c. when either they had been choſen *advocates*, or became ſuch by being founders, or endowers of churches.—Princes had alſo another title to *advocateſhip*, ſome of them pretending to be *advocati nati* of the churches within their dominions.

ADVOCATIA, in the *Feudal Law*, the procuration of ſome public buſineſs, committed by a ſuperior to his ſubſtitute.

Advocatia is alſo uſed for the patronage and protection of a church, college, monaſtery, and the like.

In which ſenſe it amounts to the ſame with advowson.

Advocatia is alſo uſed for the protection or defence of lay perſons, eſtates, &c.

ADVOCATION, *advocatio*, in the *Civil Law*, the act of calling another to our aid, relief, or defence.

Advocation, *letters of*, in the law of Scotland, thoſe granted by the lords of ſeſſion, upon complaint of a perſon ſued before an incompetent judge. By theſe letters, the lords of ſeſſion *advocate*, that is, call that cauſe from the incompetent judge to themſelves.

If after letters of *advocation* are intimated to that judge, he yet proceeds, his decree will be null, as given *ſpreto mandato*.

ADVOCATIONE *Decimarum*, a writ which lies for the claim of the fourth part, or upward, of the tithes that belong to any church. Reg. Orig. 29.

ADVOCATURA, in writers of the middle and barbarous age, denotes an inferior kind of juriſdiction, exerciſed by advocates within the diſtricts of their reſpective churches, &c. The word is ſometimes uſed as ſynonymous with advocatia.

ADVOWEE, in *Ancient Cuſtoms*, and *Law-books*, denotes the advocate of a church, religious houſe, or the like.

The word is otherwiſe written *avouee*, *advouee*, and *avowee*; ſometimes *advouer*; being derived from *avouer*, *to own*, or *acknowledge*.

There were *advowees* of cathedrals, abbies, monaſteries, &c. Thus, Charlemaign had the title of *advowee* of St. Peters; king Hugh, of St. Riquier; and Bolandus mentions ſome letters of pope Nicholas, by which he conſtituted king Edward the Confeſſor, and his ſucceſſors, *advowees* of the monaſtery at Weſtminſter, and of all the churches in England.

Theſe *advowees* were the guardians, protectors, and adminiſtrators of the temporal concerns of the churches, &c. and under their authority, were paſſed all contracts which related to them.

It appears alſo, from the moſt ancient charters, that the donations made to churches were conferred on the perſons of the *advowees*.—They always pleaded the cauſes of the churches in court, and diſtributed juſtice for them, in the places under their juriſdiction.—They alſo commanded the forces furniſhed by their monaſteries, &c. for the war; and even were their champions, and ſometimes maintained duels for them.

This office is ſaid to have been firſt introduced in the fourth century, in the time of Stillico; though the Benedictines do not fix its origin before the eighth century.

By degrees, men of the firſt rank were brought into it, as it was found neceſſary, either to defend with arms, or to protect with power and authority. In ſome monaſteries, they were only called *conſervators*; but theſe, without the name, had all the functions of *advowees*.

There were alſo ſometimes ſeveral *ſub-advowees*, or ſub-advocates, in each monaſtery, who officiated inſtead of the *advowees* themſelves; which, however, proved the ruin of monaſteries; thoſe inferior officers running into great abuſes.

Hence alſo, huſbands, tutors, and every perſon in general, who took upon him the defence of another, were denominated *advowees*, or advocates.—Hence ſeveral cities had their *advowees*; which were eſtabliſhed long after the eccleſiaſtical ones, and doubtleſs from their example.—Thus, we read in hiſtory of the *advowees* of Augſburg, of Arras, &c.

The VIDAMES aſſumed the quality of *advowees*; and hence it is, that ſeveral hiſtorians of the eighth century confound the two functions together.

Hence alſo it is, that ſeveral ſecular lords in Germany bear mitres for their creſts, as having anciently been *advowees* of the great churches.

Spelman diſtinguiſhes two kinds of eccleſiaſtical *advowees*.—The one, of cauſes, or proceſſes, *advocati cauſarum*; the other, of territory, or lands, *advocati ſoli*.

The former were nominated by the king, and were uſually lawyers, who undertook to plead the cauſes of the monaſteries.

The other, which ſtill ſubſiſt, and are ſometimes called by their primitive name, *advowees*, though more uſually PATRONS, were hereditary; as being the founders and endowers of churches, &c. or their heirs.

Women were ſometimes *advowees*, *advocatiſſæ*. And, in effect, the canon law mentions ſome who had this title, and who had the ſame right of preſentation, &c. in their churches, which the *advowees* themſelves had.

In a Stat. 25 Edw. III. we meet with *advowee paramount*, for the higheſt patron; that is, the king.

There were alſo *advowees* of countries and provinces.—In a charter of the year 1187, Berthold duke of Zeringhen is called *advowee* of Thuringia; and in the *Notitia* of the Belgic churches, publiſhed by Miræus, the count of Louvain is ſtyled count and *advowee* of Brabant.—In the eleventh and twelfth centuries, we alſo meet with the *advowees* of Alſatia, of Suabia, &c.

ADVOWING, or AVOWING, ADVOCARE, in *Law*, ſee AVOWRY.

ADVOWSON, ADVOCATIO, the quality or office of an *advowee*, or advocate.

ADVOWSON, or ADVOUZEN, in *Common Law*, ſignifies a right to preſent to a vacant benefice.

Advowſon is ſo called, becauſe the right of preſenting to the church was firſt gained by ſuch as were founders, benefactors, or maintainers of the church, viz. *ratione fundationis*, as where the anceſtor was founder of the church; or *ratione donationis*, where he endowed the church; or *ratione fundi*, as where he gave the ſoil whereupon the church was built; and therefore they were called *advocati*. They were alſo called *patroni*, and thereupon the *advowſon* is called *jus patronatus*. 1 Inſt. 119. Fleta, lib. v. cap. 14.

Though the nomination of fit perſons to officiate in every dioceſe was originally in the biſhop, yet they were content to let the founders of churches have the nomination of the perſons to the churches ſo founded, reſerving to themſelves a right to judge of the fitneſs of the perſons ſo nominated. Gibſ. 2 ed. 756.

Advowſons are of two kinds. 1. *Advowſon in groſs*, is a right ſubſiſting in itſelf, belonging to a perſon, and not adhering to any manor or lands as parcels thereof. 2. *Advowſon appendant*, which depends on a manor, as appurtenant to it.—This, Kitchen calls an *incident*, which may be ſeparated from its ſubject.

Advowſons formerly were moſt of them appendant to manors, and the patrons were parochial barons: the lordſhip of the manor, and patronage of the church, were ſeldom in different hands, until *advowſons* were given to religious houſes. But of late times the lordſhip of the manor, and *advowſon* of the church, have been divided.

Advowſons are alſo *preſentative*, *collative*, or *donative*: *preſentative*, where the patron preſents or offers his clerk to the biſhop of the dioceſe, to be inſtituted in his church; *collative*, where the benefice is given by the biſhop, as original patron thereof, or by means of a right he has acquired by *lapſe*; *donative*, as where the king, or other patron does, by a ſingle donation in writing, put the clerk into poſſeſſion, without *preſentation*, *inſtitution*, or *induction*.

Sometimes, anciently, the patron had the ſole nomination of the prelate, abbot, or prior; either by inveſtiture (i. e. delivery of a paſtoral ſtaff), or by direct preſentation to the dioceſan; and if a free election was left to the religious, yet a *conge d'elire*, or licence of election, was firſt to be obtained of the patron, and the perſon elected was confirmed by him.

If the founder's family became extinct, the patronage of the convent went to the lord of the manor.—Unleſs the ſeveral colleges in the univerſities be reſtrained in the number of *advowſons* they may receive; it is argued they will in time acquire ſuch a ſtock, as to fruſtrate the deſign of their foundation (which is the education of youth) by creating too quick a ſucceſſion of fellows; ſo that there will not be in the colleges a ſufficient number of perſons of competent age, knowlege, and experience, to inſtruct and form the minds of the youth.—In ſome colleges the number of *advowſons* is ſaid to be already two thirds, or more, of the number of fellows.—It is objected, on the other ſide, that the ſucceſſion of fellows may be too ſlow, as well as too quick; whereby perſons well qualified may be detained ſo long in colleges, as not to have ſtrength or activity enough left for the diſcharge of parochial functions.

Colleges holding more *advowſons* in number, than a moiety of the fellows, are not capable of purchaſing more. Grants of *advowſons* by papiſts are void.

Advowſons are temporal inheritances, and lay fees; they may be granted by deed or will, and are aſſets in the hands of heirs or executors.

Preſentations to *advowſons*, for money, or other reward, are void. 31 Eliz. cap. 6. See Burn's Eccl. Law, vol. i.

ADVOWTRY. See ADULTERY.

ADUST, ADUSTUS, among *Phyſicians*, &c. is applied to ſuch humours, as by long heat become of a hot and fiery nature.

The word is formed of the Latin *adurere*, *to burn*.

Such is choler ſuppoſed to be.—Melancholy is uſually conſidered as black, and *aduſt* bile.

Blood is ſaid to be *aduſt*, when, by reaſon of ſome extraordinary heat, its more ſubtile parts are all evaporated, leaving the groſſer, with all the impurities therein, half torrified.

ADUSTION, among *Phyſicians*, is uſed for an inflammation of the parts about the brain, and its membranes, attended with a hollowneſs of the *ſinciput* and eyes, a pale colour, and dryneſs of the body; in which caſe the yolk of an egg, with oil of roſes, applied by way of cataplaſm, is recommended; as are the leaves of turnſol, the parings of a gourd, the pulp of a pompion, applied in the ſame manner with oil of roſes.

ADY, in *Natural Hiſtory*, a name given to the palm-tree of the iſland of St. Thomas. It is a tall tree, with a thick, bare, upright ſtem, growing ſingle on its root, of a thin light timber, and full of juice. The head of this tree ſhoots into a vaſt number of branches, which being cut off, or an inciſion being made therein, afford a great quantity of ſweet juice, which fermenting, ſupplies the place of wine, among the Indians.

The fruit of this tree is called by the Portugueſe *caryoces*, and *carioſſe*; and by the black natives, ABANGA. This fruit is of the ſize and ſhape of a lemon, and contains a kernel, which is good to eat. The fruit itſelf is eat roaſted, and the raw kernels are often mixed with mandioc meal. Theſe kernels are ſuppoſed very cordial. An oil is alſo prepared from this fruit, which anſwers the purpoſe of oil, or butter, in Europe.

This oil is alſo uſed for anointing ſtiff and contracted parts of the body.

ADYNAMIA, in *Medicine*, debility, weakneſs from ſickneſs. It is formed of the privative α, and δυναμις, *ſtrength*.

ADYNAMON, among ancient *Phyſicians*, a kind of weak factitious wine, prepared with muſt boiled down with water; to be given patients, to whom genuine wine might be hurtful.

ADYTUM, a ſecret or retired place in the pagan temples, where oracles were given, and into which none but the prieſts were admitted.

The word originally ſignifies inacceſſible; being compounded of α, *not*, and δυω, or δυνω, *to enter*.

The *Sanctum Sanctorum* of the temple of Solomon was of the nature of the pagan *adytum*, none but the high prieſt being admitted into it, and he but once a year.

ADZE, or ADDICE, a cutting tool, of the ax-kind; having its blade made thin, and arching; and its edge at right angles to the handle; chiefly uſed for taking thin chips of timber or boards, and for paring away certain irregularities which the ax cannot come at.

The *adze* is uſed by carpenters, but more by coopers, as being convenient for cutting the hollow ſides of boards, &c. It is ground from a baſe on its inſide to its outer edge; ſo that, when it is blunt, they cannot conveniently grind it, without taking its helve out of the eye.

AE, or **Æ**, a dipthong, or double vowel, compounded of A and E.

Authors are by no means agreed as to the uſe of the *æ* in Engliſh words.—Some, out of regard to *Etymology*, inſiſt on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a conſideration that it is no proper diphthong in our language, its ſound being no other than that of the ſimple *e*, contend, that it ought to be entirely diſuſed; and, in fact, the ſimple *e* has of late been adopted, inſtead of the Roman *æ*; as in the word *equator*, &c.

ÆACEA, in *Antiquity*, ſolemn feaſts and combats, celebrated in Ægina, in honour of Æacus, who had been their king, and who, on account of his ſingular juſtice upon earth, was ſuppoſed to have a commiſſion given him, to be a prince or judge, whoſe office it was to preſide over Elyſium, or the region of bliſs.

ÆCHMALOTARCHA, in *Antiquity*, a Greek term, ſignifying the chief, or leader of the Jewiſh captives in Babylonia.

The Jews, who refuſed to follow Zorobabel, and return with him to Jeruſalem, after the Babyloniſh captivity, created an *æchmalotarch* to govern them.—Not that the Jews themſelves called them by this name, as ſome authors have aſſerted; for that people ſpoke Hebrew, or Chaldee, not Greek. But Origen, and others, who wrote in the Greek tongue, rendered the Hebrew name ראש גלות *Roſch galuth*, q. d. *chief of the captivity*, by a Greek name of the like import, αιχμαλωταρχος, formed from αιχμαλωτος, *captive*; of αιχμη, *point*, *ſpear*, or *war*; and αρχων, *commander*, *chief*.

However, the Jews ſeemed to have had officers of this kind before the return from Babylon; witneſs the hiſtory of Suſannah; the two elders, who condemned her, being ſuppoſed to have been *æchmalotarchæ* that year.—The Jewiſh writers aſſure us, that the *æchmalotarchæ* were only to be choſen out of the tribe of Judah.

The eaſtern Jews had their princes of the captivity, as the weſtern Jews their patriarchs. The Jews are ſtill ſaid to have an *æchmalotarcha* at Babylon, but without the authority of the ancient ones.

ÆDES, in *Antiquity*, a chapel, or inferior kind of temple, diſtinguiſhed by this, that it was not conſecrated by the Augurs, as thoſe properly called TEMPLES were.

Such was the *ærarium*, or treaſury; called *Ædes Saturni.*

ÆDILE, Ædilis, in *Antiquity*, a Roman magiſtrate, veſted with divers functions, chiefly that of ſuperintending the buildings, both public and private; as baths, aqueducts, roads, bridges, cauſeways, &c.

The word is formed of *ædes*, *temple*, or *houſe*; on account of their having the care of temples, houſes, &c.

The *ædiles* at Rome correſponded to what the Greeks called *agoranomi*, and *aſtynomi*: they differed from *oeconomi* and *arcarii*, who were rather receivers of the revenues; alſo from *logiſtæ*, *curatores & patres civitatis.*

To the *ædiles* belonged the inſpection of the weights and meaſures. They fixed the rates of proviſions, and took care the people ſuffered no exactions. The inquiry and cognizance of debauchees, and diſorders in public houſes, likewiſe belonged to them: they were alſo to reviſe comedies; and it belonged to them to treat the people with grand games and ſpectacles, at their own expence. They were likewiſe to attend on the tribunes of the people.

To the *ædiles* alſo belonged the cuſtody of the plebiſcita, and the cenſure and examination of books. They had the power, on certain occaſions, of iſſuing edicts; and, by degrees, they procured to themſelves a conſiderable juriſdiction, the cognizance of various cauſes, &c.—This office ruined numbers, by its expenſiveneſs; ſo that, in Auguſtus's time, even many ſenators declined it, on that account.

All theſe functions, which rendered the *ædiles* ſo conſiderable, belonged at firſt to the *ædiles* of the people, *ædiles plebeii*, or *minores*: theſe were only two in number, and were firſt created in the ſame year as the tribunes: for the tribunes, finding themſelves oppreſſed with the multiplicity of affairs, demanded of the ſenate to have officers, with whom they might intruſt matters of leſs importance; and, accordingly, two *ædiles* were created; and hence it was, that the *ædiles* were elected every year, at the ſame aſſembly as the tribunes. But theſe plebeian *ædiles* having refuſed, on a ſignal occaſion, to treat the people with ſhews, as pleading themſelves unable to ſupport the expence thereof; the patricians made an offer to do it, provided they would admit them to the honours of the *ædilate*.

On this occaſion, there were two new *ædiles* created, of the number of the patricians, in the year of Rome 388; they were called *ædiles curules*, or *majores*; as having a right to ſit on a CURULE chair, enriched with ivory, when they gave audience; whereas the plebeian *ædiles* only ſat on benches.

Beſides that the *curule ædiles* ſhared all the ordinary functions with the plebeian, their chief employ was, to procure the celebration of the grand Roman games, and to exhibit comedies, ſhews of gladiators, &c. to the people; and they were alſo appointed judges in all caſes relating to the ſelling or exchanging eſtates.

To eaſe theſe four firſt *ædiles*, Cæſar created a new kind, called *ædiles cereales*, as being deputed chiefly to take care of the corn, which was called *donum Cereris*; for the heathens honoured Ceres as the goddeſs who preſided over corn, and attributed to her the invention of agriculture. Theſe *ædiles cereales* were alſo taken out of the order of patricians. In the municipal cities there were *ædiles*, with the ſame authority as at Rome.

We alſo read of an *ædilis alimentarius*, expreſſed in abbreviature by *Ædil. alim.* whoſe buſineſs ſeems to have been to provide diet for thoſe who were maintained at the public charge, though others aſſign him a different office.

In an ancient inſcription we alſo meet with *ædile* of the camp, *ædilis caſtrorum*.

ÆDILATE, Ædilatus, in *Antiquity*, the dignity or magiſtracy of the Roman ÆDILES.

This is otherwiſe called *ædilitas*, *ædility*. In inſcriptions we find it repreſented by the abbreviature AED.

ÆDILITIUM *edictum*, among the Romans, was that whereby a remedy was given a buyer, in caſe a vicious, or unſound beaſt, or ſlave, was ſold him. It was called *ædilitium*, becauſe the preventing of frauds in ſales and contracts belonged eſpecially to the curule *ædiles*.

ÆDITUUS, in *Antiquity*, the keeper of a ſacred manſion, who had the care of the offerings and ornaments of the deity to whom it was peculiarly devoted.

The word is compounded of *ædes* and *tueor*, *I defend*; q. d. *à tuendis ædibus*; originally it was written, *æditimus*.

The *æditus* is the ſame with what Scævola calls *hierophylax*, the Latins ſometimes *ædilis*, and the Greeks νεωκορος; anſwering to the ſexton among us.

The *æditui*, among the Romans, were officers of diſtinction, being the depoſitaries not only of the treaſure, but of the public acts, or records.—The *æditui* had their ſeveral cells, near the temples, the cuſtody of which was committed to them.

The female deities had a woman officer of the ſame kind, under the denomination *æditua*.

ÆDOIA, the ſame as PUDENDA.

ÆGAGROPILA, or Ægagropilus, in *Natural Hiſtory*, a ball generated in the ſtomach of the *rupicapra*, or *chamois goat*, hard on the outſide, and conſiſting of a ſubſtance like hair. See Ball, and *Hair* Ball.

The word is Greek, from αιγαγρος, the *rupicapra*, or rock-goat, and πιλος, *a ball*. The *ægagropilus* is ſometimes called *bezoar Germanicum*, or the German bezoard.

ÆGELETHRON, in *Botany*, is a name uſed by ſome authors for the common *mercurialis*, or Engliſh mercury, an eatable wild herb.

ÆGIAS, in ancient Greek *Phyſicians*, denotes a white ſpeck on the pupil of the eye, occaſioning a dimneſs of ſight, either ariſing from an excrementitious humour, or from the relics of the *cicatricular* of an ulcer on the part.

This is the ſame with what others write *ægis* and *æglia*.

ÆGIDES, a diſorder of the eyes mentioned by Hippocrates. It ſignifies ſmall white cicatrices in the eye, cauſed by an afflux of corroſive humour. See Albugo.

ÆGIDION, a name given to a *collyrium* for inflammations and defluxions of the eyes. It is alſo called *ægoproſopon*.

ÆGILOPS, is a tumor, or rather ulcer, in the great angle of the eye; either with, or without, an inflammation.

The word is compounded of αιξ, *goat*, and ωψ, *eye*; as goats are ſuppoſed extremely liable to this diſtemper. Authors frequently uſe the words *ægilops*, *anchilops*, and *fiſtula lachrymalis*, promiſcuouſly; but the more accurate, after Ægineta, make a difference.—The tumour, ere it becomes ulcerous, is properly called *anchilops*; and, after it is got into the lachrymal paſſages, and has rendered the *os lachrymale* carious, *fiſtula lachrymalis*.

If the *ægilops* be accompanied with an inflammation, it is ſuppoſed to take its riſe from the abundance of blood, which a plethoric habit diſcharges on the corner of the eye.—If it be without an inflammation, it is ſuppoſed to proceed from a viſcous pituitous humour, thrown upon this part. The method of cure is the ſame as that of the *ophthalmia*. But before it has reached the lachrymal paſſages, it is managed like other ulcers.

If the *ægilops* be neglected, it burſts, and degenerates into a FISTULA, which eats into the bone.

Ægilops is alſo a name given to a kind of oat, called alſo Cerris, and by the Latins Festuca, the flour of which, mixed with honey, has been reputed a remedy for this diſeaſe.

The *ægilops* ſignifies alſo *avena ſylveſtris*, the wild oat, common among corn, called Bromus; a decoction of the root of which kills worms. See Oat.

The *ægilops* is alſo a genus of the *polygamia monoecia* claſs of plants: the corolla of the hermaphrodite flower conſiſts of a bivalve glume, terminated by a double or triple ariſta or awn; the ſeed is ſingle and oblong; the corolla of the male flower is alſo a bivalve, ariſtated glume, as in the hermaphrodite flower.

ÆGILOPS is alſo uſed for the *holm* OAK, with great acorns; the CERRUS *mas majore glande, quercus calyce echinato, glande majore,* αιγιλωψ *idæorum, aſpris maurorum, cerrus latinorum.*

At Venice, they make cups of the acorns of this tree; which is alſo uſed, as we do oak-bark, to dreſs leather.

The cup of this acorn is an inch and an half in diameter, and ſomewhat leſs in depth. Theſe cups are alſo uſed, inſtead of galls, to dye woollen cloth black.

ÆGINETA, in *Botany*, the name given by Linnæus to a genus of plants, belonging to the claſs of *didynamia angioſpermia*; the characters of which are theſe: the cup is an oval, inflated, and coloured ſpatha; it is univalve, and opens longitudinally near the top. The flower conſiſts of one petal. Its baſe is large, round, and inflated. The tube is ſhort, cylindric, and open; and the mouth is ſmall, but expanded, and turns back at the edge. The ſtamina are four crooked filaments; two of them are of the length of the flower, and the other two a little ſhorter. The antheræ are oblong, and ſtand cloſe to one another at their tops. The germen of the piſtil is oval; the ſtyle is ſubulated, and of the length of the ſtamina; and the ſtigma is large, round, and bending. The Hortus Malabaricus is the only work in which we have a deſcription of this plant.

ÆGIPAN, in *Antiquity*, a denomination given to Pan, and the Panes.

The ancients alſo give the name *ægipans* to a ſort of monſters mentioned by Pliny, Solinus, and Pomp. Mela. Salmaſius, in his notes on Solinus, takes *ægipan* to have ſignified the ſame, in Libya, with *ſylvanus* among the Romans.

Voſſius rejects the opinion, and ſhews, that the *ægipans* had not faces like men, as the ſylvans had; but like goats. In effect, the whole upper part of the body reſembled that animal; and as to the lower, they painted it with a fiſh's tail. The monſter repreſented on ſome medals of Auguſtus, by antiquaries called *Capricornus*, appears to be the true *ægipan*.

The word is derived from αιξ, *a goat*; Pan being repreſented with the horns, feet, and legs of that animal.

ÆGIS, in the *Ancient Mythology*, a name given to the ſhield, or buckler, of Jupiter and Pallas.

The goat Amalthea, which had ſuckled Jove, being dead; that god is ſaid to have covered his buckler with the ſkin thereof; whence the appellation *ægis*, from αιξ, αιγος, *ſhe-goat*.

Jupiter, afterwards reſtoring the beaſt to life again, covered it with a new ſkin, and placed it among the ſtars.

As to his buckler, he made a preſent of it to Minerva; whence that goddeſs's buckler is alſo called *ægis*.

Minerva, having killed the Gorgon Meduſa, nailed her head in the middle of the *ægis*, which henceforth had the faculty of converting into ſtone all thoſe who looked thereon; as Meduſa herſelf had done during her life.

Others take the *ægis* not to have been a buckler, but a cuiraſs, or breaſt-plate; and it is certain, the *ægis* of Pallas, deſcribed by Virgil, Æn. lib. viii. ver. 435, muſt have been a cuiraſs; ſince that poet ſays expreſly, that Meduſa's head was on the breaſt of the goddeſs. But the *ægis* of Jupiter, mentioned a little higher, ver. 354, ſeems to have been a buckler. The words

Cum ſæpe nigrantem
Ægida *concuteret dextra*,

agreeing very well to a buckler; but not at all to a cuiraſs, or breaſt-plate.

Servius makes the ſame diſtinction on the two paſſages of Virgil; for on verſe 354, he takes the *ægis* for the buckler of Jupiter, made, as above-mentioned, of the ſkin of the goat Amalthea; and on verſe 435, he deſcribes the *ægis* as the armour which covers the breaſt; and which, in ſpeaking of men, is called *cuiraſs*; and *ægis*, in ſpeaking of the gods. Many authors have overlooked theſe diſtinctions for want of going to the ſources.

ÆGLEFINUS, in *Zoology*, the name given, by the generality of authors, to the haddock, called by others the *onos*, or ASINUS *antiquorum*. It is a well-known fiſh, and ſeems of a middle nature between the cod and the whiting.

ÆGLEUS, in *Botany*, a term of diſtinction for the white chamæleon-thiſtle. It is derived from the Greek αιγληεις of Galen; by which word he diſtinguiſhes the white chamæleon, which was an eſculent and medicinal plant, from the *erebennus*, or ἐρεϐεννος, which was what we call the black chamæleon-thiſtle, and was eſteemed poiſonous.

ÆGOBOLIUM, in *Antiquity*, the ſacrifice of a goat offered to Cybele.

The *ægobolium* was an expiatory ſacrifice, which bore a near reſemblance to the *taurobolium* and *criobolium*, and ſeems to have been ſometimes joined with them.

ÆGOCEPHALUS, in *Zoology*, the name by which the generality of authors call the bird, known in England by the name of the GODWIT, or in ſome places the *ſtone-*PLOVER, the *yarwhep*, or *yarwhip*.

ÆGOCERAS, a name given to FENUGREEK, and alſo to BOUCERAS, becauſe of its corniculated fruit, the word originally ſignifying *goat's-horn*.

ÆGOLETHRON, a plant deſcribed by Pliny; which appears to be the ſame with what Tournefort deſcribes under the name of *chamærododendros pontica maxima meſpili folio, floreo luteo*. The ancients attribute dangerous qualities to it.

ÆGOMANTIA, in *Antiquity*, a ſpecies of divination performed by means of a goat.

ÆGONYCHUS, in *Natural Hiſtory*, a name mentioned by Pliny, as a ſynonym of the *lithoſpermum*, or GROMWEL.

It had this name given it, by the Greek writers, from the words αιγος ὄνυξ, *the claw* or *hoof of a goat*.

The ancients had another name for this plant, of the ſame ſort or origin, which was *exonychon*: by this they expreſſed its being like the exterior part of the human nails on the fingers. The hardneſs and ſcaly nature of the ſeeds gave the idea of the reſemblance of a nail, or hoof.

ÆGOPHTHALMUS, the *goat's eye-ſtone*, a name given, by ſome authors, to thoſe pieces of agat, or other ſemipellucid gems, as have circular ſpots in them reſembling the eyes of that animal in colour, and in their round figure.

ÆGOPODIUM, GOUT-WEED, in *Botany*, a genus of the *pentandria digynia* claſs of plants; the general corolla whereof are uniform; the ſingle flowers conſiſt each of five oval, concave, and nearly equal petals; the fruit is naked, ovato-oblong, ſtriated, and ſeparated into two parts; the ſeeds are two, ovato-oblong and ſtriated, convex on one ſide, and plain on the other.

ÆGOPOGON, in *Botany*, a name uſed by Tragus, and ſome others, to expreſs the *common* MEADOWSWEET, or ULMARIA.

ÆGREFINUS, ſee ÆGLEFINUS.

ÆGRITUDO *bovina*. See BOVINA *affectio*.

ÆGYPTIACA ſignifies the PAPYRUS.

ÆGYPTIACUM, in *Medicine*, a name given to divers unguents of the detergent, or corroſive kind.

We meet with a *black*, a *red*, a *white*, a *ſimple*, a *compound*, and a magiſtral *Ægyptiacum*.

The *ſimple Ægyptiacum*, which is that uſually found in our ſhops, is a compoſition of verdigriſe, vinegar, and honey, boiled to a conſiſtence: the preſcription is Meſue's. —It is uſually ſuppoſed to take its name from its duſky colour, wherein it reſembles that of the natives of Ægypt. —It is improperly called an unguent; as there is no oil, or rather fat, in it. Some chuſe to call it *Mel Ægyptiacum*. It is chiefly uſed for eating off rotten fleſh, and cleanſing foul ulcers; particularly venereal ones in the throat, &c. It alſo deſtroys thoſe cancerous eroſions apt to grow in childrens mouths.

The German diſpenſaries have another compoſition called *Ægyptiacum compoſitum magiſtrale*, or *Hildani*, wherein treacle, mithridate, camphor, &c. are ingredients.

White *Ægyptiacum* is a compoſition of lily roots mixed up with aromatics: it is mentioned by Hippocrates, and is the ſame with what other ancients call CICINUM. It was uſed by the ladies of thoſe days to ſmear over their faces, to preſerve their complexions.

Hippocrates alſo ſpeaks of another unguent under the ſame name, compoſed of the flowers of the Egyptian thorn.

Farriers make a red, as well as black kind, of much the ſame ingredients, only with ſome difference in the proportions; uſed eſpecially to ſoften the hoofs of a horſe, when too hard.

ÆGYPTILLA, in *Natural Hiſtory*, the name of a ſtone deſcribed by the ancients, and ſaid, by ſome authors, to have the remarkable quality of giving water the colour and taſte of wine.

ÆGYPTION, the name of a topic uſed by the ancients in uterine diſorders.

ÆGYPTIUM *pharmacum ad aures*, Aetius Tetrab. ii. Serm. 2. cap. 83, ſpeaks of this as excellent for deterging fœtid ulcers of the ears, which he ſays it cures, though the patient were born with them.

ÆHOITULLA, in *Zoology*, the name of an Eaſt Indian ſpecies of ſerpent, found frequently in the iſland of Ceylon; it is a very long and ſlender ſnake, ſometimes wholly of a fine green, ſometimes green and white, and lives principally on trees, and among buſhes.

ÆICHRYSON is a name given to the SEDUM *majus*, called alſo *æithales*.

ÆINAUTÆ, in *Antiquity*, ſenators of Miletus, who held their deliberations on board a ſhip, far from ſhore, and till matters were reſolved upon, never returned to land.

The word is Greek, αειναυται; q. d. *ſemper nautæ, always mariners.*

AELQUAPPE, in *Zoology*, the common name, among the German nations, of a fiſh of the MUSTELA kind, the viviparous eelpout, called by Schonefeldt *muſtela vivipara*, and in ſome places *aelpute*, *aelmoder*, and *aelmutter*. It is uſually of a foot long or more. Its ſkin is perfectly ſmooth, and the colour of its back and head a browniſh yellow, marked with blotches of black; the colour of the back grows paler on the ſides, and on the belly is whitiſh. It has four gills on a ſide, and the head is ſhaped like that of the eel; the back fin reaches the whole length of the body, terminating near the tail. The belly fin begins at the anus, and reaches to the extremity of the fiſh, ending in a fine, ſlender, and ſomewhat reddiſh tail. Beſides theſe, it has two pair of fins, one at the bottom of the gills, which are ſomewhat broad, and the other very fine and ſlender under the throat. The young of this ſpecies are often found alive, to the number of three hundred in one individual: they are found of two fingers breadth long, and live ſome time after they are taken out.

ÆIZOON, αειζωον, from αει, *always*, and ζωη, *life*. *Sempervivum*, SEDUM, HOUSELEEK.

ÆLUROPO, a name given to a ſyrup made of the herb *cats-foot*, which is a ſpecies of GNAPHALIUM.

ÆLURUS, in *Mythology*, the god of the cats; he is repreſented by the ancient Egyptians, ſometimes as a cat, ſometimes as a man, with a cat's head.

ÆMOBOLIUM, in *Antiquity*, the blood of a bull, or ram, offered in the ſacrifices, called *taurobolia* and *criobolia*.

In which ſenſe the word occurs in ancient inſcriptions. Reineſius and Vandale take it for a corruption, and alter it to ÆGOBOLIUM. M. de Boze defends the *æmobolium*.

ÆNEATORES, in *Antiquity*, the muſicians in an army; including thoſe who played trumpets, horns, *litui*, *buccinæ*, &c.

The word is formed from *æneus*, on account of the brazen inſtruments uſed by them.

ÆNIGMA, a propoſition put in obſcure, ambiguous, and generally contradictory terms, to puzzle, or exerciſe the wit, in finding out its meaning; or, an obſcure diſcourſe, covering ſome common and well known thing, under remote and common terms.

The word is formed of αινιττεσθαι, *obſcurè innuere, to hint a thing darkly*; of αινος, *an obſcure ſpeech, diſcourſe.* The Latins ſometimes call it *ſcirpus*, *ſirpus*, or *ſcrupus*. The populace with us name it *riddle*; from the Belgic *raeden*, or the Saxon *araethan*, *to interpret.*

Fran. Junius defines an *ænigma* to be an obſcure parable, or allegory; and makes two kinds: the one *greater*, rendering the ſentence more intricate and knotty, by a multitude of words; the other *leſſer*, conſiſting of only one or two remote words, or alluſions; as in Iſaiah, ch. xi. 1. where Jeſus Chriſt is called נצר, *ſurculus*, *rod*, or *branch*. Fa. Bouhours, in the memoirs of Trevoux, defines an *ænigma*, a diſcourſe, or painting, including ſome hidden meaning, which is propoſed to be gueſſed.

ÆNIGMAS, *painted*, are repreſentations of the works of nature, or art, concealed under human figures, drawn from hiſtory, or fable. Thus Jeſus Chriſt, in the middle of the doctors, repreſents the Bible, &c.

A *verbal ænigma* is a witty, artful, and abſtruſe deſcription of any thing.

The uſe of *ænigmas* was very great among the Egyptians. Gale thinks, they might borrow their cuſtom from the Hebrews, among whom, it is certain, *ænigmas* were not leſs in uſe. Witneſs Samſon's riddle, Judg. xiv. 12, 13. *I will now put forth a riddle to you*, &c. חידה, i. e. according to Vatable, an *ænigmatical problem:* the LXX. render it, προβλημα. Solomon is ſaid to have been particularly ſkilful in the ſolution of *ænigmas*. Joſeph. Antiq. lib. v. cap. 2. Clemens aſſures us, that the Egyptians placed *ſphinges* before their temples; to intimate that the doctrines of God and religion were *ænigmatical* and obſcure. See HIEROGLYPHIC.

Some repreſent the *ænigma* as the ſame with *gryphus*; but the more exact writers make a diſtinction; though wherein the difference lies is not agreed on. Some make it conſiſt in this, that the *ænigma* properly imports ſomething merry or jocoſe, and *gryphus* a ſubject more grave and profound. Others reduce the difference to this, that in the *gryphus* there is ſomething captious, and capable of leading into a ſnare, which is not found in the *ænigma*.

The REBUS is alſo ranked by ſome in the number of *ænigmas*.

In a general ſenſe, every dark ſaying, every difficult queſtion, every parable, may paſs for an *ænigma*. Hence obſcure laws are called *Ænigmata Juris*.

The alchemiſts are great dealers in the ænigmatic language, their proceſſes for the philoſophers ſtone, being generally wrapped up in riddles; e. gr. *Fac ex mare et fœmina circulum, inde quadrangulum, hinc triangulum, fac circulum et habebis lapidem philoſophorum.* Barchuſen has publiſhed an explication of the riddles of chemiſts, alchemiſts, phyſicians, &c.

Among the *ænigmas* of chemiſts, that called the ſibylline *ænigma* is famous, of which we find a copy in a MS. of Stephanus Alexandrinus.

Εννέα γράμματ᾽ ἔχω, τετρασύλλαβός εἰμι, νόειμι.
Αἱ τρεῖς αἱ πρῶται δυὸ γράμματ᾽ ἔχουσιν ἑκάστη,
Ἡ λοιπὴ δὲ τὰ λοιπὰ, καὶ εἰσὶν ἄφωνα τὰ πέντε.
Τοῦ παντὸς δ᾽ ἀριθμοῦ ἑκατοντάδες εἰσὶ δὶς ἑπτά,
Καὶ τρεῖς τρὶς δεκάδες καὶ δὶς τρία. Γνοὺς δὲ τίς εἰμι,
Ουκ ἀμύητος ἔσῃ τῆς παρ᾽ ἐμοῦ σοφίης.

Thus tranſlated by M. Leibnitz.

Literulis noſcor quadriſyllabus ipſe novenis:
Syllaba habet binas, niſi quod tenet ultima ternas.
Vocales quatuor, quinis non propria vox eſt.
Bis ſeptem vicibus numerum centuria totum
Ingreditur, decadeſque novem, tum bis tria. Si me
Noveris, hinc aditus ad ſacra noſtra patent.

Stephanus gives a myſtical ſolution of this *ænigma*. Moret will have it ſignify the name Jehovah, which, according to him, comprehends the number 1696, abating one, the number contained in the *ænigma*. Brentius maintains that the whole ſum amounts to 1711, and that it repreſents the word φωσφορος. The generality underſtand it of the word arſenic, or ΑΡΣΕΝΙΚΟΝ. M. Leibnitz gives a very artful ſolution of it in this ſenſe, by only ſuppoſing the A to ſtand for a thouſand, and I for unity, as we ſometimes find them uſed by grammarians. F. Meneſtrier has attempted to reduce the compoſition and reſolution of *ænigmas* to a kind of art, with fixed rules, and principles, which he calls the philoſophy of *ænigmatic* images.

ÆNIGMA. The *ſubject* of an *ænigma* ſhould be ſomething eaſily conceived, and generally known.

ÆNIGMAS, *the form of*, conſiſts in the words, which, whether they be in proſe or verſe, contain either ſome deſcription, a queſtion, or a proſopopœia. The laſt kind are the moſt pleaſing, inaſmuch as they give life and action to things, which otherwiſe have them not. To make an *ænigma*, therefore, two things are to be pitched on, which bear ſome reſemblance to each other; as the ſun, and a monarch; or a ſhip, and a houſe; and on this reſemblance is to be raiſed a ſuperſtructure of contrarieties to amuſe and perplex. It is eaſier to find great ſubjects for *ænigmas* in figures than in words, inaſmuch as painting attracts the eyes, and excites the attention to diſcover the ſenſe. The ſubjects of *ænigmas* in painting, are to be taken either from hiſtory or fable; the compoſition here is a kind of metamorphoſis, wherein, e. gr. human figures are changed into trees, and rivers into metals. This converſion, however, does not depend merely on caprice; there muſt be ſomething of ſuitableneſs, and even erudition, to authorize it. Thus the battle of Conſtantine againſt Maxentius may be taken for the ſubject of an *ænigma*, to repreſent the game of cheſs: the ſign which appeared in the heavens with the words, *in hoc ſigno vinces*, may properly enough repreſent the ſecret of this game, which conſiſts in ſaving the king. It is much eaſier to turn *mythology* into *ænigmas*, than *hiſtory*. Accordingly ſeveral have imagined, that the conqueſt of the golden fleece, was no other than the tranſmutation of metals; and that the fable of Circe was the art of chemiſtry in *ænigma*.

ÆNIGMAS of pure invention are a kind of *poetry*, and more ſubtle than thoſe drawn from mythology; ſince here the matter itſelf is to be created: inſtead of adopting ſome hiſtory or received fable, ſomething probable is feigned, the chief action whereof is known, e. gr. a ſhipwreck, a conflagration, an amphitheatre, or the like. It is eſſential to *ænigmas*, that the hiſtory or fable, under which they are preſented, be known to every body; otherwiſe it will comprehend two *ænigmas* inſtead of one; the firſt of the hiſtory or fable, the ſecond of the ſenſe it is to be taken in. Another eſſential rule of the *ænigma* is, that it only admit of one ſenſe. Every *ænigma* which is ſuſceptive of different interpretations, all equally natural, is ſo far imperfect.

ÆNIGMATICAL, ſomething that relates to, or partakes of the nature of *ænigmas*.

The philoſophy of the DRUIDS was altogether *ænigmatical*. The ancient ſages in general affected an *ænigmatical* way of writing, to conceal their doctrines from the populace. The Romans in Nero's time were obliged to have recourſe

courſe to the like method, though for different reaſons.

The *ænigmatical* characters of the Egyptians were a ſpecies of HIEROGLYPHICS, conſiſting of ſuch as bore no natural reſemblance to the things they repreſented. Such was the beetle, uſed to expreſs the ſun; the ſerpent, to repreſent the ſtars.

We read of an *ænigmatical* medal preſented by the Huguenots to Henry III. Schott has publiſhed an explication of an *ænigmatical* coin of the emperor Auguſtus, concerning which, antiquaries have been long divided.

ÆNIGMATOGRAPHER, or ÆNIGMATIST, a maker or explainer of *ænigmas*.

Hardouin, Vander Hardt, &c. are great *ænigmatiſts*.

ÆNIGMATOGRAPHY, ÆNIGMATOGRAPHIA, the art of making and reſolving, or of collecting ÆNIGMAS.

The word is compounded of *αινιγμα*, and *γραφειν*, *to deſcribe*.

ÆNIGMATOGRAPHY, otherwiſe called *ænigmatology*, may be divided into general and particular. The firſt gives rules concerning the nature, kinds, compoſition, and uſe of *ænigmas*; the ſecond conſiders the *ænigmas* in particular ſciences, or languages, Greek, Latin, Hebrew, philological, philoſophical, theological, &c.

Nic. Reuſner has a treatiſe, under the title of ÆNIGMATOGRAPHIA.

ÆNITTOLOGIUS, in *Poetry*, a kind of verſe, conſiſting of two *dactyls*, and three *trochæi*. Such is,

Prælia dira placent truci juventæ.

ÆOLIC, or ÆOLIAN, in *Grammar*, denotes one of the five dialects of the Greek tongue.

It was firſt uſed in Bœotia; whence it paſſed into Æolia, and was that which Sappho and Alcæus wrote in.

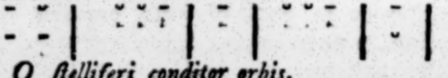
The *Æolic* dialect generally throws out the aſpirate or ſharp ſpirit, and agrees in ſo many things with the DORIC dialect, that the two are uſually confounded together.

The *Æolic digamma* is a name given to the letter F, which the Æolians uſed to prefix to words beginning with vowels, as Fοινος, for οινος; alſo to inſert between vowels, as οFις, for οις.

ÆOLIC *verſe*, *carmen Æolicum*, a kind of meaſure, conſiſting firſt of an *iambic*, or *ſpondee*, then of two *anapeſts*, divided by a ſyllable, and laſtly, a ſyllable common.

This is otherwiſe called *eulogic*, and, from the chief poets who uſed it, *Archilochian* and *Pindaric*.

Its type is



E. gr. *O ſtelliferi conditor orbis.*

ÆOLIPILE, ÆOLIPILA, an hydraulic inſtrument, conſiſting of a hollow metalline ball, with a ſlender neck, or pipe, ariſing from the ſame. This, being filled with water, and thus expoſed to the fire, produces a vehement blaſt of WIND.

This inſtrument, Des Cartes, and others, have made uſe of, to account for the natural cauſe, and generation, of wind.—And hence its name, *Æolipila*, q. d. *pila Æoli*, *Æolus's ball*; or Αιολȣ πυλαι, *the gates of Æolus*; Æolus being reputed the god of the winds.

Sometimes the neck is made to ſcrew into the ball, which is the moſt commodious way; becauſe, then, the cavity may the more readily be filled with water. If there be no ſcrew, it may be filled thus:—Heat the ball red hot, and throw it into a veſſel of water; the water will run in at the ſmall hole, and fill about two thirds of the cavity.

If, after this, the *Æolipile* be laid on, or before the fire, ſo that the water and veſſel become very much heated; the water, being rarefied into a kind of momentary air, will be forced out with very great noiſe and violence; but it will be by fits, and not with a conſtant and uniform blaſt. Great care ſhould be taken that the aperture of the pipe be not ſtopped, when the inſtrument is put on the fire, otherwiſe the *Æolipile* will burſt with a vaſt exploſion, and may occaſion great miſchief.

Theſe phænomena the reader will be eaſily enabled to ſolve, from what is ſhewn under the articles, AIR, WATER, and RAREFACTION.

The air or vapour iſſuing out of the *Æolipile* is found ſenſibly hot near the orifice; but, at a farther diſtance, cold; like what we obſerve of our own breath: the cauſe of which is controverted.—The Corpuſcularians account for it hence; that the FIRE contained in the rarefied vapour, though ſufficient to be felt near the orifice, diſengages itſelf in the progreſs of the ſtream, and becomes inſenſible ere it be arrived at the journey's end.—The mechanical philoſophers, on the other hand, hold, that the vapour, at its exit from the ball, is endued with that peculiar ſpecies of circular motion which conſtitutes the quality HEAT; and that the farther it recedes therefrom, the more is this motion deſtroyed, by the reaction of the contiguous AIR; till the heat, at length, becomes inſenſible.

Chauvin ſuggeſts ſome farther uſes of the *Æolipile*.—1. He thinks it might be applied, inſtead of a bellows, to blow the fire, where a very intenſe heat is required. Dr. Lewis condemns ſubſtituting the *Æolipile* inſtead of a bellows, and ſays, that upon trial he always found that inſtead of exciting, it extinguiſhed the fire. Com. Phil. Techn. p. 21.—2. If a trumpet, horn, or other ſonorous inſtrument, were fitted to its neck, it might be made to yield muſic. 3. If the neck were turned perpendicularly upwards, and prolonged by a tube or hollow cylinder fitted to it, and a hollow ball laid on the orifice of the tube, the ball would be blown up, and kept fluctuating, or playing up and down, as in the ſtream of a FOUNTAIN. And, 4. It might ſerve to ſcent or fumigate a room, if filled with perfumed, inſtead of common water. An *Æliopile* has been ſometimes placed in a chimney, where it can be heated, the vapour of which ſerves to drive the ſmoak up the chimney.

Dr. Plott gives an inſtance where the *Æolipile* is actually uſed to blow the fire: the lord of the manor of Eſſington is bound by his tenure to drive a gooſe every New-year's day three times round the hall of the lord of Hilton, while Jack of Hilton (a brazen figure having the ſtructure of an *Æolipile*) blows the fire.

In Italy it is ſaid, that the *Æliopile* is commonly made uſe of to cure ſmoaky chimnies: for being hung over the fire, the blaſt ariſing from it carries up the loitering ſmoak along with it.

F. Merſennus, and ſome others, have made uſe of this machine, to meaſure the gravity and degree of rarefaction of the air. But this method is liable to conſiderable objections.

Some late authors have diſcovered a ſtill more extraordinary uſe, to which the frauds of the heathen prieſthood applied the *Æolipile*, viz. the working of ſham miracles. Beſides Jack of Hilton, which had been an ancient Saxon image, or idol, Mr. Weber ſhews, that *Pluſter*, a celebrated German idol, is alſo of the *Æolipile* kind; and in virtue thereof, could do noble feats; being filled with a fluid, and thus ſet on the fire, it would be covered with ſweat; and as the heat increaſed, would at length burſt out into flames.

ÆOLUS, in the *Heathen Theology*, the god of the winds, painted with ſwoln cheeks, like one who with main force endeavours to blow a blaſt; alſo with two wings on his ſhoulders, and a high-coloured fiery countenance.

ÆOLUS alſo, in *Mechanics*, denotes a portable machine, not long ſince invented by Mr. Tidd, for refreſhing and changing the air in rooms.

This machine is adapted in its dimenſions to ſupply the place of a ſquare of glaſs in a ſaſh-window, and is executed in ſo ſmall a compaſs, as to project but a little way from the ſaſh, and in ſo neat a manner, ſays the inventor, as to be an elegant ornament to the place where it is fixed. It works without the leaſt noiſe, requires no attendance, and occaſions neither trouble nor expence to keep it in order. It throws in only ſuch a quantity of air as is agreeable; and leaves off working, of its own accord, whenever the door or window is opened.

ÆOLUS's *Harp*, an inſtrument ſo named, from its producing an agreeable melody, merely by the action of the wind. It is thus conſtructed.—Let a box be made of as thin deal as poſſible, (*Table Miſcellany*, *fig.* 18.) of the exact length anſwering to the width of the window in which it is intended to be placed; five or ſix inches deep, and ſeven or eight inches wide. Let there be glued upon it at *aa*, two pieces of wainſcot about half an inch high, and a quarter of an inch thick, to ſerve as bridges for the ſtrings; and within ſide, at each end, under *b b*, glue two pieces of beech, about an inch ſquare, of length equal to the width of the box, which are to ſuſtain the pegs. Into theſe fix as many pins, ſuch as are uſed in a harpſichord, as there are to be ſtrings in the inſtrument, half at one end, and half at the other, at equal diſtances. It now remains to ſtring it with ſmall catgut, or blue firſt fiddle ſtrings, fixing one end to a ſmall braſs pin, as at *e e*, (*fig.* 19.) and twiſting the other round the oppoſite pin at *b b*.

When theſe ſtrings are tuned uniſon, and the inſtrument placed with the ſtrings outward, in the window to which it is fitted, it will, provided the air blows on that window, give a ſound like a diſtant choir, increaſing or decreaſing, according to the ſtrength of the wind.

The roſes in the middle only repreſent ſound-holes; the thinner the top is, the better will the inſtrument perform.

Mr. Thompſon, in a note to his celebrated Ode on this inſtrument, aſcribes the invention of it to Mr. Oſwald; whereas it was known to Kircher above an hundred years ago; and the method of conſtructing and uſing it is deſcribed by him in a book intitled, Magia Phonotactica & Phonurgia.

ÆON, ΑΙΩΝ, *age*; literally ſignifies the duration of a thing.

Some have affixed another IDEA to the word *æon*; in order to which, they have made uſe of the philoſophy of Plato, giving reality to the ideas which that philoſopher had imagined in God; and even perſonifying them, and feigning them diſtinct from God, and to have been produced by him; ſome male, others female. See PLATONISM.

Theſe ideas they call *æons*; of an aſſembly whereof they compoſe their deity, calling it πληρωμα, a Greek word, ſignifying *fulneſs*.

Simon Magus is ſaid to have been the firſt inventor of theſe *æons*, which were afterwards brought to perfection by Valentinus; who, refining on thoſe who preceded him in this way, produced a long genealogy of *æons*, to the number of 30. The firſt, and moſt perfect, he particularly denominates Προων, *Proon*, that is, *pre-exiſtent*; beſide other names, the moſt uſual whereof was that of *Bythos*, Βυθος, *depth*.

This *Bythos*, he ſays, continued long alone with Εννοια, *Ennœa*, *Thought*; whom Valentinus alſo called Χαρις, *Grace*, and Σιγη, *Silence*. At length, *Bythos*, with *Sige*, produced *Nous*, Νȣς, *Underſtanding*; and Αληθεια, *Truth*, her ſiſter. *Nous* begat two *æons*; *Logos*, Λογος, *Word*; and *Zoe*, Ζωη, *Life*; which begot two others; *Anthropos*, Ανθρωπος, *Man*; and Εκκλησια, *Church*. And theſe eight *æons* were the chief of all the reſt.

The *Word*, Λογος, and *Life*, Ζωη, begat ten other *æons*; *Man* and the *Church*, begat twelve more; among whom were, the *Paraclete*, *Faith*, *Hope*, *Charity*, the *Perfect*, Τελειος, and *Wiſdom*, Σοφια. And thus were thirty *æons* made up; which, all together, made the *Pleroma*, Πληρωμα, or *ſpiritual and inviſible plenitude*. See GNOSTICS.

ÆON alſo ſignifies ſpinal marrow.

ÆON likewiſe, in the *Phœnician Theology*, was the firſt created woman.

ÆORA, in the *Medical Writings* of the ancients, is uſed for geſtation; which ſort of exerciſe was often preſcribed by the phyſicians of thoſe days. Other exerciſes conſiſted principally in the motion of the body, bnt in the *æora* the limbs were at reſt, while the body was carried about and moved from place to place, in ſuch a manner as the phyſician preſcribed. It had therefore the advantages of exerciſe, without the fatigue of it.

This exerciſe was promoted ſeveral ways: ſometimes the patient was laid in a ſort of hammoc, ſupported by ropes, and moved backward and forward; ſometimes his bed run nimbly on its feet. And beſide theſe, the ſeveral ways of travelling were accounted ſpecies of the *æora*, whether in the litter, in a boat or ſhip, or on even ground in a chariot.

Aſclepiades was the firſt who brought geſtation into practice, which was uſed as a means to recover ſtrength after a fever, &c.

ÆRA, in *Chronology*, a fixed point of time, from whence to begin a computation of the years enſuing.

The word is ſometimes alſo written in ancient authors, *era*. Its origin is conteſted, though it is generally allowed to have had its riſe in Spain. Sepulveda ſuppoſes it formed from A. ER. A. the notæ or abbreviatures of the words, *annus erat Auguſti*, occaſioned by the Spaniards beginning their computation from the time their country came under the dominion of Auguſtus, or that of their receiving the Roman calendar. This opinion, however ingenious, is rejected by Scaliger, not only on account that in the ancient abbreviatures *A* never ſtood for *annus*, unleſs when preceded by *V* for *vixit*; and that it ſeems improbable they ſhould put *ER* for *erat*, and the letter *A*, without any diſcrimination, both for *annus* and *Auguſtus*. Voſſius nevertheleſs favours the conjecture, and judges it at leaſt as probable, as either that of Iſidore, who derives *æra* from *æs*, the tribute-money, wherewith Auguſtus taxed the world: or that of Scaliger himſelf, who deduces it likewiſe from *æs*, though in a different manner. *Æs*, he obſerves, was uſed among the ancients for an *article*, or *item*, in an account; and hence it came alſo to ſtand for a ſum or number itſelf. From the plural *æra*, came by corruption *æra*, *æram*, in the ſingular; much as *Oſtia*, *Oſtiam*, the name of a place, from *Oſtia*, *the mouths of the Tyber*.

ÆRA amounts to the ſame with EPOCHA; though ſome authors make a difference between them; but wherein it conſiſts, they do not agree. A late critic aſſigns this difference, that in ſtrictneſs of ſpeech, *epocha* is that fixed point where an *æra* made uſe of commences. Thus the 26th of February, 747 (abating fifty-ſeven days) before the Chriſtian *æra*, may be ſaid to be the *epocha* of the *æra* of Nabonaſſar. Within this *æra* other *epochas* may be noted; as that of the death of Auguſtus, that of the death of Alexander, &c. But theſe cannot properly be called *epochas* of the *æra* of Nabonaſſar.

Vallemont makes another difference, viz. that an *epocha* is a point fixed by chronologers, and an *æra* a like point, only fixed by the popular uſage of a country, or nation. Perhaps it might not be amiſs, if chronologers would keep to this difference; but it is certain moſt of them hitherto uſe the two words promiſcuouſly. The particular *æras* are mentioned under EPOCHA.

ÆRA, *Spaniſh*, otherwiſe called the year of Cæſar, was introduced after the ſecond diviſion of the Roman provinces, between Auguſtus, Anthony, and Lepidus, in the year of Rome 714, the 4676th year of the Julian period, and the 38th year before Chriſt. In the 447th year of this *æra*, the Alani, the Vandals, Suevi, &c. entered Spain. We find frequent mention of it in the Spaniſh affairs; their councils, and other public acts, being all dated according to it. Some ſay it was aboliſhed under Peter IV. king of Arragon, in the year of Chriſt 1358, and the Chriſtian *æra* ſubſtituted in its place. Mariana obſerves, that it ceaſed in the year of Chriſt 1383, under John I. king of Caſtile. The like was afterwards done in Portugal.

If to any year of the Spaniſh *æra* we add the number 4675, the ſum is the Julian year; or if from the ſame year we ſubtract 38, the remainder is the year of the Chriſtian *æra*.

ÆRA, *Chriſtian*. It is generally allowed by chronologers, that the computation of time from the birth of Chriſt, was not introduced till the ſixth century, in the reign of Juſtinian, and is commonly aſcribed to Dionyſius Exiguus. This computation then came in uſe in deeds, &c. before which time either the Olympiads, the year of Rome, or that of the reign of the emperors, were uſed for thoſe ends.

ÆRA is alſo uſed, in ſome writers of the barbarous age, for any year.

In which ſenſe, we meet with *entering down the æra*, the *eleven hundred and eighth æra*, &c.

ÆRA ſignifies alſo *cockle* or *darnel*.

ÆRARIUM, the public treaſury of the Roman ſtate.

The temple of Saturn at Rome, being the great treaſury of the ſtate, was firſt called *ærarium*; from *æs*, *æris*, *copper*; that being the only money in uſe before the year of Rome 484, when ſilver began to be coined.

It was firſt erected under Auguſtus, and maintained by a yearly voluntarily contribution; but that proving inſufficient, the twentieth part of all legacies and inheritances, except of ſuch as fell to the next of kin, or to the poor, were conſigned to this treaſury.

For the cuſtody hereof, three of the emperor's life-guard were conſtituted *præfecti ærarii*.

ÆRARIUM differs from *fiſcus*, as the firſt contained the public money, the ſecond that of the prince. Yet the two are ſometimes uſed indiſcriminately for each other.

ÆRARIUM *ſanctius* was an appendage to the former, added on occaſion of the growth of the Roman ſtate, when there was not room enough for lodging all the public monies, and the public acts, which were depoſited with it.

It was called *ſanctius*, becauſe placed in an inner and ſafer part of the temple; or becauſe in it was lodged the *aurum viceſimarium*, or twentieth, which was kept as a fund, or reſerve, for extreme neceſſity of the ſtate. On which account it was alſo called *ærarium viceſimarium*.

ÆRARIUM *Ilithiæ*, or of *Juno Lucina*, was erected by Servius Tullius, ſixth king of the Romans, and compoſed of money paid in by parents, for the birth of each child.

ÆRARIUM *privatum*, or the privy-purſe, contained the money and effects which the prince was maſter of before his acceſſion to the empire. This was under the care of the COMES *rerum privatarum*.—We meet alſo with *ærarium juventutis*, *Veneris*, *libitinæ*, and other leſſer treaſuries, *æraria minora*, in the provinces.

ÆRARIUS, in *Antiquity*, an officer inſtituted by Alexander Severus, for the diſtribution of the money given in largeſſes to the ſoldiery, or people.

ÆRARIUS was alſo uſed for a perſon whoſe name was ſtruck out by the cenſors from the *album*, or liſt of his century, and was only conſidered as a citizen ſo far as to make him ſubject to pay taxes, *æra*, without being entitled to any privileges, or advantages, from the common-wealth.

Hence the phraſes, *ærarium facere*, *inter ærarios referre*, *ærariis eximere*, &c.—Not only plebeians, to whom ſome have reſtrained it, but alſo knights and ſenators were ſubject to this kind of degradation.

The *ærarii* were incapable of making a will, of inheriting, of voting in aſſemblies, of enjoying any poſt of honour or profit; in effect were only ſubject to the burdens, without the benefits of ſociety; yet they retained their freedom, and were not reduced to the condition of ſlaves. To be made an *ærarius* was a puniſhment inflicted for ſome offence, and reputed one degree more ſevere than to be expelled a tribe, *tribu moveri*.

Ærarius is alſo uſed for a perſon employed in coining, or working braſs.

Theſe are ſometimes called *ærarii fuſores*: at other times, *ærarius* is diſtinguiſhed from *fuſor*; the former anſwering to what we now call copper-ſmiths, the latter to founders.

Ærarius is alſo applied to a ſoldier, who receives pay.

ÆRATA *Aqua*. See ZIMENT-*Water*.

ÆREOLUS, anſwering to the Greek χαλκος, was a weight, according to Diodorus and Suidas equal to $\frac{1}{6}$th, and according to others equal to $\frac{1}{8}$th of the OBOLUS, which was $9\frac{3}{28}$ grains.

AERIAL, AERIUS, ſomething that conſiſts of, or has relation to, air.

The Eſſeni, the moſt refined and rational ſect among the Jews, held that the human ſoul conſiſted of an *aerial* ſubſtance.

And the Roſicrucians, and other viſionaries, fill the atmoſphere with *aerial* inhabitants.

Aerial *perſpective*, is that which repreſents bodies weakened and diminiſhed, in proportion to their diſtance from the eye.

Aerial perſpective chiefly reſpects the colours of objects, whoſe force and luſtre it takes off more, or leſs, to make them appear as if more, or leſs, remote.

It is founded on this, that the longer column of air an object is ſeen through, the more feebly do the viſual rays emitted from it affect the eye.

AERIANS, AERIANI, in *Antiquity*, a religious ſect denominated from Aerius, an Armenian prieſt of the fourth century.

The *Aerians* had much the ſame ſentiments, in reſpect of the Trinity, as the Arians; beſide which, they condemned prayers for the dead, ſtated faſts, the celebration of Eaſter, and other rites of the ſame nature; and they held that there is no difference between prieſts and biſhops, but that the prieſthood and epiſcopate are abſolutely one and the ſame order, or dignity: an opinion ſince ſtrenuouſly aſſerted by many modern divines.

Aerius built his doctrine chiefly on ſome paſſages in St. Paul; and, among others, that in the Firſt Epiſtle to Timothy, chap. iv. ver. 14. where that apoſtle exhorts him not to neglect *the gift he had received by the laying on of the hands of the preſbytery*. Here, obſerves Aerius, is no mention of biſhops; but Timothy evidently received his ordination from the preſbyters or prieſts.

Epiphanius zealouſly maintains the ſuperiority of biſhops, againſt the Aerians.—The word *preſbytery*, uſed by St. Paul, he obſerves, includes both biſhops and prieſts; the whole ſenate, or aſſembly, of the eccleſiaſtics of the place.

ÆRICA, or *Erica*, in *Natural Hiſtory*, a name given by Gaza, and others, to the common herring.

ÆRIRUSA, the ancient name for the ſky-coloured JASPER.

ÆRITIS is a name given to what is more commonly called ANAGALLIS.

AEROGRAPHY, a deſcription of the air, or atmoſphere, its limits, dimenſions, properties, &c.

This amounts to much the ſame with aerology, unleſs we ſuppoſe the latter to enter into the rational, and the former to confine itſelf to a deſcription of the more obvious affections thereof.

AEROLOGY, the doctrine or ſcience of the air, and its phænomena, its properties, good and bad qualities, &c.

Aerology, called alſo the *aerologica*, makes a part of the regimen of health, or the branch of medicine called by ſome *diaſoſtica*, or the NON-NATURALS, which treats of air, its properties and uſe in the animal œconomy, and its efficacy in preſerving and reſtoring health.

AEROMANCY, AEROMANTIA, an ancient ſpecies of divination, performed by the means of the air, and phænomena happening therein.

The word is compounded of αηρ, *air*, and μαντεια, *divination*.

Aeromancy included the buſineſs of AUGURY, and *auſpicia*; the rules of prediction from uncommon winds, ſtorms, ſhowers, and other prodigies.

Modern authors ſpeak of a more rational *aeromancy*, meaning by it, the art of foretelling the changes and variations in the air and weather, winds, ſtorms, and the like.

Morhof advances conſiderations for reducing *aeromancy* to a certainty, by means of a regular ſeries of meteorological obſervations. But though many ſuch have been inſtituted with great care in many parts, this art has hitherto made a very ſmall progreſs. Of this kind is Huxham's book De Aere.

Barometers, thermometers, hygrometers, and anemometers, are of conſiderable uſe in this kind of *aeromancy*.

Mizoldus has publiſhed a body of rules for foretelling ſtorms, &c. drawn partly from vulgar obſervation, and the experience of mariners, partly from aſtrological conſiderations; under the title of AEROMANTIA.

ÆROMELI, a name given to HONEY, and alſo to MANNA. See DROSOMELI.

AEROMETRY, AEROMETRIA, the art of meaſuring the AIR, its powers, and properties.

The word is compounded of αηρ, *air*; and μετρειν, *to meaſure*.

Aerometry includes the laws of the motion, gravitation, preſſure, elaſticity, rarefaction, condenſation, &c. of the atmoſpherical fluid.

The word *aerometry* is but little uſed: in lieu hereof, we commonly call this branch of philoſophy, PNEUMATICS.

C. Wolfius, profeſſor of mathematics at Hall, having reduced many of the affections of this fluid to geometrical demonſtration, firſt publiſhed Elements of Aerometry, at Leipſic, 1709, in High Dutch, and afterwards more largely in Latin.—Thus is the doctrine of the air incorporated into the mathematical ſciences.

AERONAUTICA, the pretended art of ſailing in a veſſel through the air, or atmoſphere, ſuſtained as a ſhip in the ſea.

AEROPHYLACEA, in *Natural Hiſtory*, denotes ſubterraneous receptacles of air or wind.

The word is compounded of αηρ, *air*, and φυλακη, *cuſtodia, keeping*.—In which ſenſe *aerophylacea* ſtands contradiſtinguiſhed from *hydrophylacea*, *pyrophilacea*, &c.

Kircher ſpeaks much of *aerophylacea*, or huge caverns, replete with air, diſpoſed under ground, from whence through numerous occult paſſages, that element is conveyed either to ſubterraneous receptacles of water, which are hereby raiſed into ſprings or rivers, or into the funds of ſubterraneous fire, which are hereby fed and kept alive for the reparation of metals, minerals, and the like.

AEROSIS, among the *Ancient Phyſicians*, denotes the act whereby the blood is attenuated and converted into an *aura*, for the ſupport of the vital ſpirits, and the maintenance of the flame of life.

AEROSTATICA, is uſed by ſome authors for the ſcience called by others AEROMETRY.

Aerostatica is properly the doctrine of the weight, preſſure, and balance of the AIR and ATMOSPHERE.

ÆRUGINOUS, ſomething partaking of, or like to, the ruſt of copper.

Authors do not ſeem perfectly agreed about the colour to be expreſſed by this word, ſome expreſſing by it green, others brown.

ÆRUGO denotes RUST, eſpecially that of copper.

Grew will have the TURCOIS-*ſtone* to be only a kind of petrified *ærugo*.

Naturaliſts ſpeak of two kinds of *ærugo*, one *native*, and the other *factitious*.

Ærugo, *native*, is only the ſuperficial particles of the metal diſſolved, and intimately mixed with acid ſalts; in which form it is ordinarily found in copper-mines, and other moiſt places.

Ærugo, *artificial*, is what we more vulgarly call VERDIGREASE.

One ſpecies of *natural ærugo* is a greeniſh marcaſite, like the drops of iron; it is found in copper-mines, but is of no uſe. There is alſo on ſome mountains in Moravia a ſort of green grains, like ſand, that is of a graſs green, when uſed in painting. It is called the Hungarian, *mountain*, or *ſea* VERDIGREASE.

Ærugo *raſilis*, is a ruſt formed on copper, by hanging a plate of it over the ſtrongeſt vinegar for ten days, without ſuffering it to touch it.

Ærugo *ſalis*, in *Natural Hiſtory*, a name given by Pliny, and ſeveral other ancient authors, to a reddiſh ſlimy matter, ſeparated from the Egyptian ſalt, called NATRUM, in purifying it. We find this matter remain in the filter, on diſſolving and filtring the Egyptian nitre, at this time; it ſeems to be a mixture of a bituminous matter, and a red earth, which had mixed themſelves among the cakes of the ſalt, during the time of their concreting from the water.

ÆRUSCATORES, in *Antiquity*, a kind of ſharping ſtrollers, who got their living by tricks, telling fortunes, and the like, much like modern gypſies. Alſo, oppreſſive tax-gatherers.

The word is formed from *æruſcari*, *to beg*, *mump*, &c.

The *Galli*, or prieſts of Cybele, were called *æruſcatores magnæ matris*, on account of their begging, or collecting alms in the ſtreets. To which end they had little bells, whereby to draw people's attention to them, much like ſome orders of mendicants abroad.

AERY, or AIRY, in ſpeaking of hawks, eagles, or the like, anſwers to the NEST of other birds.

ÆS, in *Antiquity*, has various ſignifications; but it properly denotes *braſs* or *copper*; and as *copper* was the firſt metal uſed in coinage by the Romans, the word *as* was uſed in their language to ſignify money in general. It likewiſe denoted a particular coin made of that metal.

Æs *caldarium*, or *caſt* BRASS, otherwiſe called *æs olarium*, or *pot* BRASS, is a ſpecies of *braſs* mentioned by Pliny, which was not capable of being hammered. This is likewiſe a term uſed by the German *mineraliſts*, for a ſubſtance which ſometimes occurs to thoſe who work upon COBALT, and is uſed for making the fine blue colour called SMALT.

Æs *candidum*, among the ancients, was different from that which we call *white* BRASS; it is a purer and whiter kind of metal found, it is ſaid, under the veins of ſilver, ſomewhat analogous to Venetian TALC. They had probably a method of making COPPER *white* as well as *yellow*, equal, if not ſuperior, to that now in uſe. The phraſes of *trichalcum album* in Virgil, and of λευκον κραμα, among the Greeks, ſtrictly ſignify *white* BRASS.

Æs *Corinthium*, a precious metallic compoſition, of a much finer colour than common braſs, and for its beauty little inferior to gold. Pliny ſays, that this was an accidental mixture of metals at the ſack and conflagration of Corinth by L. Mummius, 146 years before Chriſt; when the gold, ſilver, and braſs ſtatues, and all metallic ſubſtances, melting and mingling together, formed this maſs. But ſome refiners, who have ſtrictly examined this metal, find no gold in it; a circumſtance which, if true, ſuggeſts one reaſon, among others, for concluding, that this account is fabulous. However, the fable has been interpreted by ſome to ſignify, that the art of making COPPER into BRASS was firſt diſcovered by the Corinthians, who found the CALAMINE ſtone on the plains of Peloponneſus, or at leaſt that they brought this art to perfection.

Æs *coronarium* is uſed by Pliny to denote BRASS worked into thin plates.

Æs *Cyprium* was a kind of COPPER produced in the iſland of Cyprus.

Æs *flavum*, *yellow copper*. All the Roman authors have mentioned the method of making BRASS with *calamine* and *copper*; but their fineſt kind, which they called *orichalcum*, or *aurichalcum*, they diſtinguiſhed from the inferior ſorts, which had only the name of *æs flavum*.

Æs *grave* denoted money among the Romans, which was paid by weight, and not by tale. In this ſenſe it is uſed by Buddæus and Scaliger.

But others by *æs grave* underſtand large pieces of copper coined, containing, for inſtance, an *as*, or pound of that metal; ſuch as we find current in Sweden. Theſe they aſſert bore the title *æs grave*, till ſuch time as they were reduced to a ſmaller ſtandard.—Gronovius, on the contrary, maintains, that the *as*, or pound weight, did not acquire the appellation, *æs grave*, till after their reduction. Phil. Tranſ. N° 19.

Kuſter rejects all theſe opinions, and aſſerts, that the expreſſion is uſed to denote any kind of copper-money, compared with gold or ſilver; which, with regard to the bulk and ſize of the pieces, was much lighter, though of greater value.

But this ſyſtem, however plauſible, is rejected by ſeveral learned men, particularly Perizonius, and Mr. Ward. The former has a diſſertation on the ſubject, wherein the opinion of Gronovius is further examined and defended.

Æs *hepaticon* was of a ſilveriſh colour, and probably what the moderns call BRONZE; though ſome confound it with the *æs Corinthium*.

Æs *pauperum* is a name given to *copper ore*, diveſted of its ſilver, when it contains any.

Æs *rude*, that unſhaped, or not faſhioned for any particular purpoſe.—Some will have this to be the ſame with *æs grave*.—The money during the firſt ages of Rome was all of this kind.

Others, by *æs rude*, underſtand metal unſtamped; in oppoſition to *æs ſignatum*, that ſtamped, or coined.

Æs *uſtum*, among *Chemiſts*, is the ſame with what ſome call *æs veneris*, or ſaffron of Venus; others, *æs crematum*. If good, it is of an iron grey on the outſide, of a reddiſh grey within; and if two pieces are rubbed together, a vermillion red is produced; it muſt alſo be brittle, and glittering when broken.

There are various ways of preparing *æs uſtum*: the moſt frequent is, by expoſing the plates to a reverberatory, or a potter's furnace, ſo long, till they will crumble into a powder. Another is, by heating a long ſlip of copper in a vehement fire, till it ſparkles, then pulling it ſuddenly out, and applying a piece of ſulphur on it; this immediately liquifies the copper, which drops down into a veſſel of cold water, placed to receive it. A third is, by cutting thin plates of copper, which are put into a crucible with ſulphur and ſalt, *ſtratum ſuper ſtratum*, and ſet in a hot charcoal fire, until the ſulphur be conſumed. A fourth is, by ſteeping the metal in a ſolution of ſalt, or ſtrong vinegar; then ſtratifying it with ſulphur, as above. After this, it is put in vinegar impregnated with ſal ammoniac. The like is repeated till the plates are conſumed. The vinegar being diſtilled from it, what remains is *æs uſtum*.

Æs uſtum is very drying and deterſive, and, on that account, mixed with plaſters and unguents, for drying up fiſtulous ulcers, and the imbibing acrimonious humours, or ſanies. It alſo ſerves to eat off dead fleſh; to which end, it is ſaid, they heat it red-hot in the furnace nine times, and quench it as often in linſeed oil. It is then called SAFFRON of COPPER. But it is apt to render the bones carious. It is likewiſe uſed for colouring glaſs.

Æs *uxorium*, in *Antiquity*, a ſum paid, by bachelors, as a penalty, for living ſingle to old age.

This tax for not marrying ſeems to have been firſt impoſed in the year of Rome 350, under the cenſorſhip of M. Furius Camillus, and M. Poſthumus.

At the *cenſus*, or review of the people, each perſon was aſked, *Et tu ex animi ſententia uxorem habes liberûm quærendorum cauſâ?* He who had no wife, was hereupon fined after a certain rate, called *æs uxorium*.

Æs; *flos* ÆRIS, called by the Greeks, χαλκου ανθος (ſometimes confounded by moderns with *chalcanthum*) is prepared of COPPER melted, and removed into other furnaces, wherein being expoſed to a further and greater heat, and vehemently agitated by bellows, it depoſites an infinite number of ſmall ſcales, like millet grains, which being ſeparated by lotion, make the *flos æris*. The cold water is poured on the copper, as it runs out of the furnace into the receiver.

Æs; *ſquama* ÆRIS properly denotes flakes of that metal ſtruck off by the hammer, in the operations of the forge, &c. Theſe, from the Cyprian copper-works, are called HELITIS.

Æs; *per* Æs *&* *libram* was a *formula* in the Roman law, whereby purchaſes and ſales were ratified.

Originally the phraſe ſeems to have been only uſed in ſpeaking of things ſold by weight, or by the ſcales; but it afterwards was uſed on other occaſions. Hence even in ADOPTIONS, as there was a kind of imaginary purchaſe, the formula thereof expreſſed, that the perſon adopted was bought *per æs & libram*.

ÆSALON, in *Zoology*, the name of a ſpecies of hawk of the long-winged kind, called in Engliſh the MERLIN. It is the ſmalleſt of all the hawk-kind, uſed in the diverſion of hawking. It is of about the ſize of the blackbird. Its beak is blue, and its eyes hazel; it has a wreath of whitiſh yellow feathers behind its head; its chin is white, and its back and wings of a duſky blackiſh brown. Its larger wing feathers are black, with brown ſpots; and its tail long, and variegated with tranſverſe ſtreaks of black and whitiſh brown. Its breaſt and belly are of a whitiſh brown, variegated with blackiſh brown ſpots. Its legs are long and yellow. It feeds on partridges and other birds.

ÆSCH, in *Zoology*, a name by which ſome have called the grayling, or tumbler, a fiſh of the truttaceous kind, called in Latin THYMALLUS.

ÆSCHNA, in *Natural Hiſtory*, the name of a ſpecies of water-fly, of an aſh colour, with four wings, and a long body, hairy near the tail.

ÆSCHYNOMENE, in *Botany*, a genus of the *diadelphia decandria* claſs of plants, the corolla of which is papilionaceous; the fruit conſiſts of a long compreſſo-plane, articulated, unilocular pod, containing a ſingle kidney-ſhaped ſeed. See SENSITIVE-*Plant*.

ÆSCHYNOMENOUS *plants*, among *Botaniſts*, are thoſe popularly called SENSITIVE PLANTS.

ÆSCULAPII *anguis*, in *Zoology*, the name of a harmleſs ſpecies of ſerpent, common in Spain and Italy, called alſo PARÆA.

ÆSCULAPIUS, the ancient name for the conſtellation OPHIUCUS.

ÆSCULUS, *horſe-cheſnut*, in *Botany*, a genus of the *heptandria monogynia*. See CHESNUT.

ÆSNECY, in *Law*, priority of age, among copartners.

ÆSPING, in *Zoology*, a ſpecies of COLUBER.

ÆSTHPHARA, incineration, or burning of the fleſh, or any other part of the body.

ÆSTIMATIO *Capitis*, in our ancient law-books. See WERE, and WERELADE.

King Athelſtan, in a great aſſembly held at Exeter, declared what mulcts were to be paid *pro æſtimatione capitis*, for offence committed againſt ſeveral perſons according to their degrees: the *eſtimation* of the king's head to be 30000 thrymſæ; of an archbiſhop, or ſatapra, or prince, 15000; of a biſhop, or a ſenator, 8000; of a prieſt, or a thane, 2000, &c.

ÆSTIVAL, or ESTIVAL, of or belonging to ſummer.

Thus, we ſay, the *æſtival* SOLSTICE, &c. in oppoſition to *brumal*.

ÆSTIVAL *point* is that whereby the ſun's aſcent above the equator is determined.

Æstival *ſigns* are thoſe extended from the ſummer ſolſtitial point, i. e. the ſun's greateſt declination northward, to the interſection of the ecliptic and equinoctial ſouthward, including Cancer, Leo, Virgo.

ÆSTRUS, a name given to a particular ſpecies of the BEETLE.

ÆSTUARY, Æstuarium, in *Geography*, an ARM of the SEA, running up a good way into the land.

Such is Briſtol channel, many of the friths of Scotland, &c. See Bay.

Æstuary, is ſometimes alſo uſed in pharmacy, for a vapour-bath, *balneum vaporoſum.*

Æstuary, in the ancient baths, was applied to the occult paſſages, or openings from the *hypocauſtum*, or ſtove, penetrating into the chambers.

ÆSYMNETIC *monarchy*, among ancient writers on government, denotes a limited elective monarchy.

The word is formed from *αισυμναω*, *regno*, *I govern.*—An *æſymnetic* ſtate ſtands oppoſed to a barbaric, or hereditary one.

ÆTATE *probanda*, in *Law*, a writ that lay to inquire whether the king's tenant, holding in chief by chivalry, were of full age to receive his lands into his own hands. It was directed to the eſcheator of the county; but is now diſuſed, ſince wards and liveries are taken away by the ſtatute Car. II. Reg. Orig. 294.

ÆTHALE, in *Natural Hiſtory*, a name given by ſome writers to the *cadmia fornacum*, or TUTTY.

It had this name from its being the concreted ſoot, or vapour, of the *lapis calaminaris*, and copper, melted together, in the making of braſs.

ÆTHER, in *Phyſiology*, is uſually underſtood of a thin, ſubtile matter, or medium, much finer and rarer than air; which commencing from the limits of our atmoſphere, poſſeſſes the whole heavenly ſpace.

The word is ſuppoſed to be formed from the verb *αιθειν*, *to burn*, *to flame*; ſome of the ancients, particularly Anaxagoras, ſuppoſing it of the nature of fire.

The philoſophers cannot conceive that the largeſt part of the creation ſhould be perfectly void; and therefore fill it with a ſpecies of matter under the denomination of *æther.*—But they vary extremely as to the nature and character of this *æther.*—Some conceive it as a body *ſui generis*, appointed only to fill up the vacuities between the heavenly bodies; and therefore confined to the regions above our atmoſphere.—Others ſuppoſe it of ſo ſubtle and penetrating a nature, as to pervade the air, and other bodies; and poſſeſs the pores and intervals thereof.—Others deny the exiſtence of any ſuch ſpecific matter; and think the air itſelf, by that immenſe tenuity and expanſion it is found capable of, may diffuſe itſelf through the interſtellar ſpaces, and be the only matter found in them. In effect, *æther* being no object of our ſenſe, but the mere work of imagination, introduced only for the ſake of hypotheſis, or to ſolve ſome phænomenon, real or imaginary; authors take the liberty to modify it how they pleaſe.—Some ſuppoſe it of an elementary nature, like other bodies, and only diſtinguiſhed by its tenuity, and the other affections reſulting from it; which is the philoſophical *æther.*—Others will have it of another ſpecies, and not elementary; but rather a ſort of fifth element, of a pure, more refined, and ſpirituous nature, than the ſubſtances about our earth; and void of the common properties of matter, as gravity, &c. —Such is the ancient idea of *æther*, or *ætherial* matter.

The term *æther* being thus embarraſſed with a variety of ideas, and arbitrarily applied to ſo many different things, the later philoſophers chooſe to ſet it aſide; and accordingly, the Carteſians uſe the term *materia ſubtilis*; which is their *æther*; and Sir Iſaac Newton ſometimes a *ſubtile ſpirit*, as in the cloſe of his Principia; and ſometimes a *ſubtile* or *ætherial medium*; as in his Optics.

The truth is, there are abundance of conſiderations, which ſeem to evince the exiſtence of ſome matter in the air, much finer than the air itſelf. There is an unknown ſomething, which remains behind when the air is taken away; as appears from certain effects which we ſee produced *in vacuo.*—Heat, Sir Iſaac Newton obſerves, is communicated through a vacuum, almoſt as readily as through air: but ſuch communication cannot be without ſome interjacent body, to act as a medium. And ſuch body muſt be ſubtile enough to penetrate the pores of glaſs; and may be very well concluded to penetrate thoſe of all other bodies, and conſequently be diffuſed through all the parts of ſpace; which anſwers to the full character of an *æther.*

The exiſtence of ſuch an ætherial medium being ſettled, that author proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elaſtic and active: in virtue of which properties, he ſhews, that a great part of the phænomena of nature may be produced by it.—To the weight, e. gr. of this medium he attributes gravitation, or the weight of all other bodies; and to its elaſticity, the elaſtic force of the air, and of nervous fibres, and the emiſſion, refraction, reflexion, and other phænomena of light; as alſo ſenſation, muſcular motion, &c.—In fine, this ſame matter ſeems the *primum mobile*, the firſt ſource or ſpring of phyſical action in the modern ſyſtem.

The Carteſian *æther* is ſuppoſed not only to pervade, but adequately to fill all the vacuities of bodies; and thus to make an abſolute *plenum* in the univerſe. See Materia *ſubtilis.*

But Sir Iſaac Newton overturns this opinion, from divers conſiderations; by ſhewing, that the celeſtial ſpaces are void of all ſenſible reſiſtance: for, hence it follows, that the matter contained in them muſt be immenſely rare, becauſe the reſiſtance of bodies is chiefly as their denſity; ſo that if the heavens were thus adequately filled with a medium or matter, how ſubtile ſoever, they would reſiſt the motion of the planets and comets much more than quickſilver or gold.

Some repreſent the *æther* as 7200 times more rare than air. Others make it more denſe than gold itſelf. See farther concerning the exiſtence of *æther*, Boyl. Philoſ. Works abr. tom. ii. p. 504. Vater, Phyſ. Exper. cap. 2. p. 72, ſeq. Its fluidity, circulation, elaſticity, &c. Vater, ib. p. 75, ſeq. Verdries, p. 2. cap. 3. § 1. p. 293. Hook, loc. cit. p. 171. Its being the *primum mobile*, or ſource of all motion, Verdries, p. 6, 63, & 107. Its influence on the air, Hook, ib. p. 380. Impediment to the moon's motion, Id. ib. p. 191. Its being the cauſe of the planetary motions, Giorn. de Letter. d'Ital. tom. x. p. 6, ſeq. Of colours and refrangibility, &c. Ib. tom. xxiii. p. 132. Of ſound, Ib. tom. ix. p. 315. and Mem. Acad. Scienc. Ann. 1720, p. 50. Philoſ. Tranſ. N° 100. p. 15.

Æther, in *Chemiſtry*, called alſo *ætherial ſpirits* of Frobenius, *dulcified ſpirit of vitriol*, *acidum vitrioli vinoſum*, by Pott, and *liquor anodynus mineralis*, by Hoffman, is a very ſubtile and penetrating fluid, produced by diſtillation from a mixture of rectified ſpirit of wine and the vitriolic acid. M. Macquer ſuppoſes, that, as ſpirit of wine conſiſts chiefly of an oil, exquiſitely attenuated by fermentation, and intimately combined with water, *æther* is no other than this ſubtilized oil, extricated by the vitriolic acid; which acid, having a ſtrong affinity or attraction to water, abſorbs the watery element of the ſpirit, and thus ſets the oily one at liberty.

Æther is the lighteſt, moſt volatile, and moſt inflammable of all known liquids: it ſwims upon the moſt highly rectified ſpirit of wine, as oil does upon water; and if dropped on a warm hand, it inſtantly exhales, diffuſing a penetrating fragrance, and leaving no moiſture behind. It takes fire on the approach of a candle, and goes off in a flaſh like lightning. As it is the moſt volatile and evaporable of all known liquors, it produces a proportionable degree of cold; inſomuch that M. Beaume has made the mercury of Reaumur's thermometer ſink to 40 degrees below the freezing point, by applying linens ſoaked in *æther* to the ball containing the mercury.

Æther does not eaſily mix with water; *ten* parts of water being neceſſary to diſſolve *one* part of *æther.* It diſcovers a remarkable attraction to gold, though it has no effect on other metals. *Æther*, mixed with a ſolution of gold made in acids, imbibes the gold from the acid, keeps it perfectly diſſolved and ſuſpended, and becomes of a yellow colour. This property renders it of great uſe in extracting gold from other metals, and in aſcertaining the ſmalleſt portions of it in liquids. Thus we may likewiſe very expeditiouſly obtain a tincture of gold, or *aurum potabile.*

Æther has been ſucceſsfully employed in medicine. Dr. Morris recites ſeveral inſtances, in which he has applied it externally as a remedy for head-achs, for the tooth-ach, and for rheumatic complaints; and he has likewiſe preſcribed it internally for the hooping-cough, and in hyſterical caſes; and he apprehends, that it may be adminiſtered in large quantities with ſafety, and prove an uſeful medicine in a *ſyncope* and lethargy. He has given the following ſafe, eaſy, and certain proceſs, for preparing it.

Take of rectified ſpirit of wine, three pounds; put it into a two gallon ſtone bottle; add to it by two ounces at a time, allowing the interval of a quarter of an hour between each addition, three pounds and ſix ounces of the ſtrong vitriolic acid; let the mixture digeſt without heat for the ſpace of a night: in the morning, decant it from one veſſel to another three or four times; convey it through a glaſs funnel, and long tube, into a retort, capable of containing three times the quantity; place it in an iron pot, with an inch of ſand at bottom; add more ſand round the retort, to the height of the mixture; ſet it over a quick fire; lute a large receiver to the retort, leaving a pin-hole in the luting, unleſs the receiver is perforated; continue the fire, till an ebullition, accompanied with large bubbles, is obſerved in the mixture; then remove the fire entirely: the heat of the ſand will be ſufficient to complete the diſtillation of the *æther*. The diſtilled liquor muſt then be put into a clean retort, with two or three ounces of fixed alkaline ſalt; about half the liquor ſhould be drawn off, by a very gentle heat, into a large receiver; and this being ſhaken with an equal quantity of pump-water, the pure *æther* will riſe immediately to the top. See Med. Obſ. and Inq. vol. ii. p. 177.

The nature and uſe of this ſubſtance were very little known to the ancient chemiſts. Mr. Boyle, and Sir Iſaac Newton, indeed, were not intirely unacquainted with it; but it firſt began to excite general attention, in conſequence of ſome experiments of Frobenius, the feigned name of a German chemiſt, publiſhed in the Philoſophical Tranſactions for the year 1730; and it was by him denominated *æther*. See Phil. Tranſ. Abr. vol. viii. p. 744; vol. ix. p. 372, 379.

Æther, though originally obtained from ſpirit of wine, by means of the vitriolic acid, has ſince been produced by means of the other acids; and it has been found, that the acid of vinegar is eſſentially fitter to produce *æther*, than the vitriolic acid. The firſt diſcovery of this kind of *æther* was made by the count de Lauraguais.

The marine acid unites with vinous ſpirits very ſlowly, and with great difficulty. Proceſſes for this purpoſe have been diſcovered by the marquis de Courtanvaux, M. Beaumè, and M. le Baron de Bormes. The marquis employed the *ſmoaking ſpirit of* Libavius; but M. de Bormes made uſe of *zinc*, as a medium for concentrating the marine acid. M. Navier, in a proceſs communicated to the Academy of Sciences in 1742, ſhews how to procure *æther* by means of ſpirit of nitre, and ſpirit of wine, without diſtillation. He directs to mix them together in a bottle, which is to be exactly cloſed and left at reſt, till the *æther* is formed, and collected like an oil upon the ſurface of the liquor. Other methods have been ſince publiſhed by M. Rouelle, and M. Beaumè.

See more on this ſubject in Macquer's Dictionary of Chemiſtry, under the article ETHER.

ÆTHERIA *Herba*, is a name given to ERINGO.

ÆTHERIAL, ÆTHERIUS, ſomething that belongs to, or partakes of the nature of *æther*.

Thus, we ſay, the *ætherial* ſpace, *ætherial* regions, &c.—Some of the ancients divided the univerſe, with reſpect to the matter contained in it, into *elementary* and *ætherial*. Under *æther*, or the *ætherial* world, was included all that ſpace above the uppermoſt element, viz. fire. This they ſuppoſed to be perfectly homogeneous, incorruptible, unchangeable, &c. See CORRUPTION.

The ancient Platoniſts and Pythagoreans ſuppoſe different bodies united within the human ſoul, viz. the groſs, or material one; a finer aerial one; and, thirdly, the fineſt of all, which they call *ætherial*, cœleſtial, &c.

The Chaldees placed an *ætherial* world between the *empyreum* and the region of the fixed ſtars. Beſide which, they ſometimes alſo ſpeak of a ſecond *ætherial* world, meaning by it the ſtarry orb; and a third *ætherial* world, by which is meant the planetary region.

ÆTHERIAL *phoſphorus* is a name generally given, by Bernouilli, to that otherwiſe called mercurial, or barometrical PHOSPHORUS.

ÆTHERIAL *oil*, is a fine, ſubtile, ESSENTIAL OIL, approaching nearly to the nature of a ſpirit.

Thus, the pure liquor riſing next after the ſpirit, in the diſtillation of turpentine, is called the *ætherial oil* of *turpentine*.

Some chemiſts diſtinguiſh two principles in URINE; the one a volatile urinous ſalt, reſembling ſpirit of nitre; the other an *ætherial oil*, or ſulphur, partaking of the nature of ſpirit of wine.

ÆTHERIAL *Heaven*. See HEAVEN.

ÆTHIOPIAN *crown*, in *Natural Hiſtory*, the name of a ſhell-fiſh, of the genus of the *dolium*, or *concha globoſa*. It is of a brown colour, but differs from the common ſhell of this genus, in having the top, or head, dentated, ſo as to repreſent a crown.

ÆTHIOPIS, ſignifies *Ethiopian clary*; a decoction of its root is commended in pleuriſies and rheumatiſms.

ÆTHIOPS *mineral*, a preparation of mercury, uſually made by grinding equal quantities of crude quickſilver and flower of ſulphur, in a ſtone or iron mortar; till they become incorporated into a black powder.

It is preſcribed for the worms, and all crudities and acrimony of the humours; and is reputed infallible againſt the itch, and other cutaneous diſeaſes.

A new preparation of *æthiops* is given by Cruger, a German phyſician, which is white and fair; and, on that account, called *æthiops minerale ſanguine regis ablutum*: in oppoſition to which, he calls the dark, or vulgar kind, *æthiops cum ſtercore ſuo*.

Authors are not agreed as to the merits of *æthiops mineral*. Cheyne, and many more, commend it highly. Boerhaave, on the contrary, and ſome other authors, reject it as uſeleſs.

ÆTHIOPS *albus*, in *Pharmacy*, quickſilver rubbed with a double quantity of crabs-eyes, or of ſugar-candy, till it is extinguiſhed. This has been taken by ſome, without any ſenſible effect; yet a very ſmall quantity of it has raiſed a high ſalivation in others. Quickſilver extinguiſhed in prunels, has operated much the ſame way. It is the ſame as *merc. alkalizat.*

ÆTHIOPS *antimonialis*, is prepared by fluxing equal parts of antimony and ſea-ſalt, in a crucible, for an hour; the matter is then left to cool, and the *ſcoria* are obtained by breaking the crucible; equal parts of the regulus thus made, and of mercury rubbed together, till they are incorporated, will give the compoſition of this name. Different preparations of the ſame kind have been preſcribed, and highly commended by ſome phyſicians, in venereal and ſcrophulous diſorders.

ÆTHIOPS *martialis*, is a preparation firſt introduced into medicine by M. Lemery, junior, and is made in the following manner. Put filings of ſteel into an unglazed earthen veſſel, with water enough to riſe four inches above the filings; ſtir it every day, and ſupply water as it exhales, ſo as to keep the filings always covered; and continue to do this till a powder of an inky blackneſs be produced; which powder is called *martial æthiops*.

ÆTHIOPS *vegetabilis*. The ſea-weed, burnt in the open air, and reduced into a black powder, is called *vegetable æthiops*. It is ſometimes uſed to remove ſcrophulous ſwellings.

ÆTHOLICES, in *Phyſic*, derived from αιθω, *to inflame*, is a name given to ſuperficial puſtules, or boils, in the ſkin, occaſioned by heat.

ÆTHUSA, in *Botany*, leſſer hemlock, or *fool's parſley*, a genus of the *pentandria digynia*. See HEMLOCK.

ÆTHYIA, in *Zoology*, a name by which the old authors have called one of the web-footed fowls, ſeeming to be the UTAMANIA of Crete, or the common AUK, or RAZOR-BILL.

AETIANS, AETIANI, in *Church Hiſtory*, a ſect or branch of ARIANS, ſo called from their leader Aetius, in the fourth century.

The *Aetians* were of the ſtricter kind of Arians, who held that the Son and Holy Ghoſt are in every reſpect diſſimilar to the Father.

Whence alſo they are called *Anomœi* and *Heterouſiani*; ſometimes *pure Arians*.

ÆTIOLOGICAL, ſomething that aſſigns the cauſe of an effect, or appearance.

ÆTIOLOGY, in *Medicine*, a *rationale*, or diſcourſe of the cauſe of a diſeaſe. The word is compounded of αιτια, *cauſe*, and λογος, *diſcourſe*. In this ſenſe, we ſay, the *ætiology* of the ſmall-pox, of the *hydrophobia*, of the gout, the dropſy, &c.

ÆTIOLOGY is uſed for a figure in *rhetoric*, whereby, in relating an event, we aſſign alſo the cauſe of it. In which ſenſe, *ætiology* differs from *color*, as the former aſſigns the true cauſe, the latter only a feigned or ſpecious one.

The ſceptics were profeſſed opponents of all *ætiology*, or argumentation from cauſes.

ÆTITES, or *eagle-ſtone*, in *Natural Hiſtory*, a flinty or cruſtated ſtone, hollow within, and containing a *nucleus*, which, on ſhaking, rattles within. It was formerly in repute for ſeveral extraordinary *magical*, as well as *medical* powers; ſuch as preventing abortion, diſcovering thieves, and other ridiculous properties.

The word is formed from αετος, *eagle*; the popular tradition being, that it is found in the eagle's neſt, whither it is ſuppoſed to be carried while the female ſits, to prevent her eggs from being rotten.

The LAPIS *ætites* is found in ſeveral parts: near Trevoux in France, one can ſcarce dig a few feet, without finding conſiderable ſtrata or beds, of the coarſer or ferruginous kind.—They are originally ſoft, and of the colour of yellow oker.

But the fineſt and moſt valued of all the eagle-ſtones, are accidental ſtates of one or other of our common PEBBLES. Theſe are ſo far from being a peculiar ſpecies of foſſil, though uſually accounted ſuch, that they are not determinately of any one ſpecies of pebble. That, however, which moſt uſually furniſhes them, is the brown centered pebble, with whitiſh, bluiſh, and brown cruſts. The plain hiſtory of this remarkable foſſil is this: the central *nucleus* of many ſpecies of pebbles, peculiarly of this, is coarſer than the reſt of the ſtone, that is, it is made up of more earth and leſs cryſtal; the natural conſequence of which muſt be, that being of a more looſe and rare texture, it is in drying more apt to ſhrink than ſuch maſſes as are compoſed of a harder and purer matter. The central *nucleus* in this ſpecies is alſo ſurrounded with a whitiſh cruſt, of a more looſe texture, and more ſubject to ſhrink in drying than even the *nu-*

cleus itſelf; and being compoſed of more earth and leſs cryſtal, is alſo more friable and ſoft. The outer circles of this ſtone are of a much harder ſubſtance. Whenever the earthy matter in the *nucleus*, and firſt cruſt of this pebble, a little exceeds its juſt proportion, the conſequence will be, that the ſtone will become an *ætites:* for the *nucleus* ſhrinking and contracting itſelf to a ſmall ſize on the evaporation of its fluid matter, muſt ſeparate itſelf from its firſt cruſt, and that alſo ſhrinking, muſt be drawn backward toward the other cruſts; whence the cavity will become larger between that and the *nucleus*, and conſequently, the *nucleus* will rattle in it when the ſtone is ſhaken. The pebble in this ſtate having been afterwards rolled about by waters, the *nucleus* has by rolling, broken to pieces all the inner cruſt, and is uſually found in the hollow of the ſtone, buried in a large quantity of a whitiſh powder.

Theſe eagle ſtones are not uncommon in our gravel-pits, but being by their hollowneſs rendered leſs ſtrong than the ſolid pebbles, we frequently find them broken.

The *ætites* is alſo known by the names *eutocium, echites, lapis aquilæ, erodialis, aquileius, & lapis prægnans*; ſome rank it under the claſs of precious ſtones, to which it has no title. Some think it may come properly enough under that of figured ſtones.

ÆTNA-*ſalt*, SAL *Ætnæ*, a name given by ſome authors to the *ſal armoniac*, which is found on the ſurface and ſides of the openings of *Ætna*, and other burning mountains after their eruptions; and ſometimes on the ſurface of the ferruginous matter which they throw out. This ſalt makes a very various appearance in many caſes; it is ſometimes found in large and thick cakes, ſometimes only in form of a thin powder, ſcattered over the ſurface of the earth and ſtones. Some of this ſalt is yellow, ſome white, and ſome greeniſh.

This ſalt is a CONCRETE of nitre, ſulphur, and vitriol, burnt and ſublimed together; Borelli found once a vaſt quantity of this ſalt on mount *Ætna*, and tried many experiments on it; from whence he concluded, that this SALT is ſo far from occaſioning the exploſions of that mountain, as ſome have ſuppoſed, that it does not exiſt in it, but is formed during the burning. Phil. Tranſ. N° 100.

AFDELLES, in *Ichthyology*, a name given by the Cretans to the fiſh called at Rome, *donzellina* and *zigurella*. It is the *julis* of authors, and, according to the Artedian ſyſtem, is a ſpecies of the LABRUS. Artedi diſtinguiſhes it from the others, by the name of the *palmar labrus*, with variegated ſides, and two large teeth in the upper-jaw.

AFFA, a weight uſed on the Gold Coaſt of Guinea. It is equal to an ounce, and the half of it is called *eggeba*. Moſt of the blacks on the Gold Coaſt give theſe names to thoſe weights.

AFFATOMIA, in *Ancient Law*, a kind of donation made by thruſting a wand into the perſon's boſom, to whom it was made.

AFFECTIO *bovina* is a diſeaſe incident to cattle, occaſioned by a little WORM, bred between the fleſh and the ſkin; which works its way over all parts of the body.

AFFECTION, in a proper ſenſe, denotes an ATTRIBUTE peculiar to ſome ſubject, and ariſing from the very idea or eſſence of it.

The word is formed from *afficere, to affect*; the SUBJECT being here ſuppoſed in ſome meaſure *affected*, or acted on, by the thing attributed to it.

In this ſenſe, *affection* is ſynonymous with *property*, or with what the ſchoolmen call *proprium quarto modo*.

Philoſophers are divided as to the doctrine and diviſion of *affections:* according to Ariſtotle, they are either *ſubordinating*, or *ſubordinated*; under the firſt of which comes only *mode*; and under the ſecond *finiteneſs*, *place*, and *time*. The generality of Peripatetics divide *affections* into *internal*, as motion and finiteneſs; and *external*, as place and time. According to Sperlingius, *affections* are better divided into *ſimple* or *united*, and *disjunct* or *ſeparate:* under the firſt come *quantity*, *quality*, *place*, and *time*; under the ſecond, *motion*, and *reſt*.

Sperlingius then ſeems to reject finiteneſs from the number of *affections*; and Ariſtotle, and the Peripatetics, *quantity* and *quality:* but the difference is not irreconcileable; ſince Sperlingius does not deny body to be finite, nor Ariſtotle, and his followers, that it has *quantum* and *quale*. Only they have not made peculiar heads and titles for theſe.

Affections are alſo diſtinguiſhed into thoſe of *body*, and thoſe of *mind*.

Affections *of body* are certain modifications of it; occaſioned or induced by motion; in virtue of which, a body comes to be ſo and ſo diſpoſed.

The *affections of body* are ſometimes ſubdivided into *primary* and *ſecondary*.

Affections, *primary*, are thoſe which ariſe either from the idea of matter; as quantity and figure; or from that of form, as quality and power; or from both together, as motion, place, and time.

Affections, *ſecondary*, or *derivative*, are thoſe which ariſe from ſome of the primary; e. gr. from quantity, as diviſibility, continuity, contiguity, finity, impenetrability; from *figure*, as regularity and irregularity; from *quality*, as health, ſtrength, &c.

Affections *of mind*, are what we more uſually call PASSIONS.

Affections, *mechanical*. See Mechanical *affection*.

Affection, in *Phyſiology*, is ſometimes uſed to expreſs that impreſſion which is made on our minds by ſubjects either within us, or without us; but *affection* more commonly denotes that lively ſenſe of pleaſure, or of averſion, which we feel from certain objects. Thus a picture repreſenting beings ſhocking to nature, is ſaid to *affect* us diſagreeably; and thus the relation of a generous or heroic action is ſaid to *affect* us agreeably.

Affection is more peculiarly uſed, in *Medicine*, for a morbid, or preternatural ſtate of the body, or ſome of its parts. Thus we ſay, an HYPOCHONDRIACAL, an HYSTERICAL *affection*. And, in like manner, ſuch a part of the body is *affected*, i. e. indiſpoſed, or ſeized with a DISEASE. The ſick are frequently miſtaken as to the place *affected*, by reaſon of the conſent between the ſeveral parts, which often makes a diſorder in one part be felt in another.

AFFEERORS, Afferatores, in *Law*, perſons appointed in court-leets, and other places, upon oath, to ſettle and moderate the FINES of ſuch as have committed faults arbitrarily puniſhable, or which have no expreſs penalty ſet down by ſtatute. See Stat. 25 Edw. III. cap. 7.

The word is formed, according to Cowel, of the French *affier, to affirm*; by reaſon thoſe appointed to this office do affirm, upon their oaths, what penalty they think, in conſcience, the offender hath deſerved. Others better derive it from *affeurer*, a word, in the cuſtomary of Normandy, rendered, by the Latin interpreters, *taxare, to ſet the price of a thing*; as *æſtimare*, *indicare*, &c.—Kitchin joins the three words as *ſynonyma*; *affidati, amerciatores, afferares*.

AFFERI, in *Law*. See Averia.

AFFETTUOSO, or *Con* Affetto, in the Italian muſic, is uſed to denote that kind of muſic, which muſt be performed in a very tender, moving, and affecting manner; and for that reaſon rather ſlow than faſt.

AFFIANCE, in *Law*, the plighting of troth between a man and a woman, upon an agreement of marriage to be had between them.

AFFIDATIO *Dominorum*, ſignifies an oath taken by the lords in parliament; thus called in the *Rot. Parl.* Hen. VI.

AFFIDATUS, or Affidiatus, in our *Law*-books, denotes a tenant by FEALTY.

Affidati are not properly vaſſals, but *quaſi* vaſſals, or perſons who vow fealty to, and put themſelves under the protection of, another.

In this ſenſe they amount to the ſame with what are otherwiſe called *commendati*, and *recommendati*.

AFFIDAVIT, an OATH, in writing, ſworn before ſome perſon who hath authority to take ſuch oath; and made uſe of, and read in court, upon motions; though not allowed upon trials.

In the court of Chancery is an *Affidavit*-OFFICE, under the direction of *a Maſter of* CHANCERY.

AFFILIATION, Adfiliatio, in *Middle-age Writers*, the ſame with adoption.

Among the ancient Gauls, *affiliation* was a ſort of adoption only practiſed among the great.—It was performed with military ceremonies: the father preſented a battle-ax to the perſon he was to adopt for his ſon, as an intimation that he was to preſerve the effects he thus called him to ſucceed to, by arms. See Adelphia.

AFFINAGE is ſometimes uſed, in *Ancient Law-books*, for the refining of metals.

AFFINITY, properly imports a relation contracted between one of two parties married, and the kindred of the other party.

The word is originally Latin, compounded of *ad, to,* and *finis, boundary, limit*; by reaſon, as the lawyers ſay, that one of the families here approaches to the bounds of the other: *Quod duæ cognationes per nuptias copulantur, & altera ad alterius cognationis finem accedit.* Or, as another expreſſes it, *Quod utriuſque cognationis fines in unum locum conferuntur.*

In which ſenſe the word ſtands contradiſtinguiſhed from *conſanguinity*, which is a relation by blood.

In the Moſaical LAW there are ſeveral degrees of *affinity*, wherein marriage is expreſly prohibited, which yet ſeem not at all prohibited by the law of nature.

The *canoniſts* diſtinguiſh three ſpecies of *affinity*.—The *firſt*, that contracted between the huſband and the relations by blood of his wife; and between the wife and the relations by blood of her huſband.

The *ſecond*, between the huſband and thoſe related to his wife by marriage; and the wife, and thoſe ſo related to her huſband.

The *third*, between the huſband and the relations of his wife's relations; and the wife, and the relations of her huſband's relations.

By the fourth council of Lateran, held in 1213, it was decreed, that none but the firſt kind was any real *affinity*; the reſt being mere refinements, which ought to be ſet aſide.

The degrees are reckoned after the ſame manner in *affinity*, as in *conſanguinity*; and therefore differently in the *Canon Law*, from what they are in the *Civil Law*.

Whatever line or degree of conſanguinity the kindred of one of the parties married are in, they are in the ſame line and degree of *affinity* to the other. And again, in whatever line or degree of *affinity* perſons are, in the firſt kind, they are in the ſame in the ſecond and third kinds of *affinity*. Hence ariſe what we may call a direct and collateral, an aſcending and a deſcending line of *affinity*.

The Romaniſts talk of a *ſpiritual affinity*, contracted by the ſacrament of baptiſm and confirmation.—In that church, a god-father may not marry with his god-daughter, without a diſpenſation.

Affinity does not found any real kinſhip; it is no more than a kind of fiction, introduced on account of the cloſe relation between huſband and wife. It is even ſaid to ceaſe, when the cauſe of it ceaſes. Hence a woman who is not capable of being a witneſs for her huſband's brother, during his life-time, is allowed for a witneſs, when a widow, by reaſon the *affinity* is diſſolved. Yet with regard to the contracting marriage, *affinity* is not diſſolved by death, though it be in every thing elſe.

The degrees and terms of *affinity* are chiefly, father-in-law, i. e. huſband's or wife's father, in Latin *ſocer*; ſtep-father, i. e. mother's huſband, *vitricus*; mother-in law, i. e. huſband's or wife's mother, *ſocra*; ſtep-mother, i. e. father's wife, *noverca*; ſon-in-law, *gener*; daughter-in-law, *nurus*; ſtep-daughter, i. e. huſband's or wife's daughter by another marriage, *privigna*; ſtep-ſon, i. e. huſband's or wife's ſon by a former marriage, *privignus*; which two laſt, conſidered in relation to each other, are called *comprivigni*; ſon-in-law, i. e. daughter's huſband; brother-in-law, i. e. huſband's brother, or ſiſter's huſband, *levir*; wife's brother; brother's wife; ſiſter-in-law, i. e. huſband's or wife's ſiſter.

AFFINITY, in the *Civil Law*, is divided into *civil*, that between free perſons; and *ſervile*, that between ſlaves.

AFFINITY, *legitimate*, is that contracted by a proper and legal matrimony; or, between ſlaves, by *contubernium*.

AFFINITY, *illegitimate*, that contracted out of legal marriage.

Affinity may be contracted by an unlawful commerce: thus a perſon who has impregnated two ſiſters, is prohibited marrying either of them; thus an *affinity* may commence between huſband and wife, by his lying with her ſiſter.

AFFINITY, *true*, is that ſubſiſting, while the marriage between the two parties ſubſiſts.

AFFINITY, *quaſi*, that ſubſiſting either after the diſſolution of the marriage, as between a huſband, and his wife's daughter, begot by another after her being divorced from him; or before the marriage is ſolemnized, as that between a father and a daughter, only eſpouſed, or betrothed to his ſon.

AFFINITY is alſo uſed figuratively, for a conformity, or agreement, between one thing and another.

In which ſenſe the word ſtands oppoſed to diverſity, variety, oppoſition, &c.

Biſhop Wilkins gives tables, wherein things are claſſed according to their *affinities*. Vid. Real Charact. p. ii. p. 22.

Henckelius has a treatiſe on the *affinity* between *vegetables* and *minerals*.

AFFINITY is more particularly uſed in ſpeaking of the relation or ſimilitude between LANGUAGES, occaſioned by their being derived from the ſame ſource.

We uſe alſo *affinity* of words, ſounds, &c.

AFFINITY, in *Chemiſtry*, is a term which correſponds to *attraction* in the mechanical philoſophy, and denotes the tendency which the conſtituent parts of bodies have to unite, and the power by which they adhere when united. It is ſometimes called *elective attraction*, or the *power of combination*.

AFFINITY, *ſimple*, is either that power of mutual union, which ſubſiſts between the integrant and homogeneous parts of the ſame body, more properly called *attraction of coheſion*; or that which produces the union and adherence of the heterogeneous parts of two different bodies, from which reſults a new compound body, whoſe properties are different from thoſe of the two principles whereby it is formed: e. g. two bodies, each by itſelf very eaſily fuſible in fire, as lead and ſulphur, ſhall form a compound very difficult of fuſion; and two which cannot ſeparately be made to melt at all, as pure clay and chalk, can melt with eaſe when joined together. This is ſometimes denominated

AFFINITY *of compoſition*; though this term is more generally applied to the powers of union, which are diſcoverable in a *number* of heterogeneous bodies, whoſe diſſimilar parts are blended together. Chemical union, and the properties thence reſulting, are exempt from all known mechaniſm; nor can the united bodies be ſeparated by any mechanical force. But a third body may have a ſtronger *affinity* to either of the component matters, than they have to one another; in which caſe, on preſenting to the compound this third body, the former union is broken, and one of the firſt bodies coaleſces with the third, while the other is detached and ſeparated. And the reſult of the combination will be very various, according to the nature and number of the ſubſtances employed.

M. Geoffroy, and M. Gellert, have given tables of the different degrees of *affinity*, between moſt of the bodies employed in *chemiſtry*, combined in various ways; whereby we may foretel the reſult of any mixture, what will be the iſſue of the combat, which will ſurmount, and which give way to the other.

Some objections to theſe tables, with illuſtrations of them, are given in the Mem. Acad. Scienc. for the year 1720, p. 24. and in the Hiſt. p. 42. and likewiſe in an appendix to the Engliſh edition of Macquer's Chem. Dict. See alſo the tables, with two additional columns, in that of M. Geoffroy, by Dr. Black.

A TABLE OF THE SOLUTIONS OF BODIES, BY Mr. GELLERT.

1. Siliceous Earth	2. Fluors	3. Clay	4. Earth Gypſeous	5. Earth Calcareous	6. Fixed Alkali	7. Volatile Alkali	8. Acetous Acid	9. Marine Acid	10. Nitrous Acid	11. Vitriolic Acid	12. Aqua Regia	13. 			Silver					Mercury									
	Gold							Gold									

Theſe tables, though in many reſpects inaccurate and defective, may be of conſiderable uſe. Each of them conſiſts of a number of columns. At the head of each column is placed the ſubſtance, the affinities of which are to be compared with the ſeveral ſubſtances placed below it in the ſame column; and they are diſpoſed in the order of their ſtrongeſt *affinities*.

It is likewiſe to be obſerved, that any ſubſtance in any of theſe columns may be ſeparated from the ſubſtance at the head of that column, by any of the intervening ſubſtances. For a farther explication of the nature and uſe, as well as the defects of theſe tables, conſult the Dictionary above cited.

AFFION, is a name given by the Arabians to opium; and alſo to an electary, in which opium is an ingredient.

AFFIRMATION, AFFIRMATIO, in *Logic*, a poſitive propoſition, alledging the truth or reality of ſomething.

Affirmation is defined, by the *Logicians*, an act whereby we attribute one idea to another; as ſuppoſing it to belong, or agree thereto.—As when, conceiving perfection to agree to the Deity, we ſay, *God is perfect.*

This, on other occaſions, is called *enunciation*, *propoſition*, *compoſition*, and *judging*.

AFFIRMATION, in *Law*, ſignifies the ratifying or confirming a former law, or judgment.

We ſay, to *affirm* a judgment: the houſe of lords, on an appeal, *affirmed* the lord chancellor's decree.

AFFIRMATION is alſo uſed, in *Grammar*, by ſome late refiners upon that art, for what is uſually called a VERB; becauſe the office of that part of ſpeech is to expreſs what we *affirm* or attribute to any ſubject.

AFFIRMATION is alſo uſed for a ſolemn form of atteſting the truth, allowed to be uſed by the QUAKERS, inſtead of an oath, which they hold abſolutely unlawful to take. See the form of the *affirmation*, &c. under the article QUAKER.

AFFIRMATION is of divers kinds, tacit, by words, by a nod, or geſture, &c.

In a civil law ſenſe, *affirmation* may be divided into *ſimple*, which is that from which no obligation ariſes; and *qualified*, which infers an obligation.

The requiſites of this latter are, that it be, 1. deliberate and free; 2. ſincere; 3. certain and ſpecific; 4. clear and perſpicuous.

AFFIRMATIVE, in *Logic*, ſee AFFIRMATION.

There are univerſal *affirmative* propoſitions; and ſuch, uſually, are the firſt of SYLLOGISMS.

In *Algebra* we have alſo *affirmative* or poſitive QUANTITIES, which have their appropriated CHARACTERS.

AFFIRMATIVE *ſign*, or character. See CHARACTER.

Affirmative, in *Grammar*. Authors diſtinguiſh *affirmative* particles; ſuch is, *yes*.

The term *affirmative* is ſometimes alſo uſed *ſubſtantively*.—Thus we ſay, the *affirmative* is the more probable ſide of the queſtion: there were ſo many votes, or voices, for the *affirmative*.

Affirmative is particularly applied, in the Roman inquiſition, to ſuch heretics as own the errors and opinions with which they are charged; and maintain them in their examination, with firmneſs and reſolution.

AFFIX, in *Grammar*, a particle added at the beginning of a word, either to diverſify its form, or alter its ſignification.

The word is Latin, *affixus*, compounded of *ad* and *figo*, *I fix*.

In which ſenſe, *affix* amounts to much the ſame with *prefix*, and ſtands oppoſed to *ſuffix*.

We meet with *affixes* in the Saxon, the German, and other northern languages; but more eſpecially in the Hebrew, and other oriental tongues.

The Hebrew *affixes* are ſingle ſyllables, frequently ſingle letters, *prefixed* to nouns and verbs, inſtead of pronouns poſſeſſive; and contribute not a little to the brevity of that language.

The oriental languages are much the ſame as to the RADICALS; and differ chiefly from each other as to *affixes* and *ſuffixes*.

AFFLATUS literally denotes a blaſt of wind, breath, or vapour, ſtriking with force againſt another body. It ſometimes affects the body with a diſeaſe, which is a ſpecies of the *eryſipelas*.

The word is formed from *ad* and *flare*, *to blow*.

Naturaliſts ſometimes ſpeak of the *afflatus* of ſerpents.

Tully uſes the word *figuratively*, for a divine INSPIRATION. In which ſenſe, he aſcribes all great and eminent accompliſhments, to a divine *afflatus*.

AFFLICTION, is not itſelf, in propriety of medical ſpeech, a diſeaſe, but it produces many; for whatever excites envy, anger, or hatred, produces diſeaſes from tenſe fibres; as whatever excites fear, grief, joy, or delight, begets diſeaſes from relaxation.

Many chronical diſeaſes, particularly the *pthiſia*, ſpring from *affliction*. For a very remarkable hiſtory of the effect of *affliction*, ſee Hiſt. de l'Acad. Roy. des Scienc. An. 1732.

AFFLUX, in *Electricity*, is oppoſed to *efflux*; and both terms were uſed by the abbé Nollet, and alſo by Dr. Watſon, previous to the diſcovery of poſitive and negative electrics. They apprehended, that in all electrical operations, there was both an *afflux* of electrical matter to the globe and the conductor, and likewiſe an *efflux* of the ſame matter from them. Dr. Watſon ſoon corrected this miſtaken opinion; but the abbé Nollet was more tenacious; and he was confirmed in his attachment to this favourite theory by obſerving, that bodies not inſulated, plunged in electric atmoſpheres, ſhewed ſigns of electricity; not perceiving, that the electricity of ſuch bodies was in its nature and effects different from, and directly oppoſite to that of the electrified body, in the atmoſphere of which they were involved. See Electricity.

AFFORAGE, in the French *Cuſtoms*, a duty paid to the lord of a diſtrict, for permiſſion to ſell wine, or other liquors, within his ſeignory.

Afforage is alſo uſed for the rate or price of proviſions laid and fixed, by the provoſt, or ſheriffs, of Paris.

AFFORCEMENT, Afforciamentum, in ſome ancient charters, denotes a FORTRESS, or work of FORTIFICATION and DEFENCE.

The word is derived from the barbarous Latin *afforciare*, *to ſtrengthen*, *confirm*.

AFFORESTING, Afforestatio, the turning ground into FOREST.

In this ſenſe, the word ſtands oppoſed to DEAFFORESTING.

The Conqueror, and his ſucceſſors, continued *afforeſting* the lands of the ſubject, for many reigns; till the grievance became ſo notorious, that the people of all degrees and denominations, were brought to ſue for relief; which was, at length, obtained, and commiſſions were granted to ſurvey and perambulate the foreſt, and ſeperate all the new *afforeſted* lands, and re-convert them to the uſes of their proprietors, under the name and quality of PURLIEU or POURALLE *land*.

AFFRANCHISEMENT. See Manumission.

AFFRAY, in *Law*, is derived from the French word *effrayer*, *to affright*, and it formerly meant no more; as where perſons appeared with armour, or weapons not uſually worn, to the terror of others. Stat. 2. Edw. III. cap. 3. But now it implies a ſkirmiſh or fighting between two or more, and there muſt be a ſtroke given or offered, or a weapon drawn, otherwiſe it is not an affray. 3 Inſt. 158. It is inquirable in the court leet, and puniſhable by juſtices of peace in their ſeſſions, by fine and impriſonment; and it differs from aſſault, in that it is a wrong to the public; whereas aſſault is of a private nature. Lamb. lib. ii. A conſtable, or private perſon, may ſeize offenders where they are aſſembled in a tumultuous manner. 3 Inſt. 158. H. P. C. 135.

AFFREIGHTMENT, or Affretament, Affretamentum, in *Law*, ſignifies the FREIGHT of a ſhip.

The word is formed from the French, *fret*, which expreſſes the ſame thing.

AFRICAN *Company*. See the article Company.

AFRICANUS *flos*. Gerard mentions four ſpecies of this flower; Miller enumerates and deſcribes thirteen; but they are of no repute in medicine.

AFRICTA denotes a kind of wafers, which the ancients uſed in their ſacrifices. Arnob. lib. vii.

AFFRONTE, in *Heraldry*, is underſtood of animals borne in an ESCUTCHEON as facing, or with their heads turned toward each other.—This is otherwiſe called *confronté*; and ſtands oppoſed to *adoſſé*.

The word is French, and literally ſignifies the ſame. It is compounded of *ad*, *to*; and *frons*, *forehead*.

AFFUIAGE, Affuiagium, in *Ancient Cuſtoms*, a right of cutting fuel-wood in a foreſt, or the like, for maintaining family-fire.

The word is derived from *affoer*, q. d. *affocare*, *to make a fire*, of *ad* and *focus*.

AFFUSION, the act of pouring ſome fluid ſubſtance on another body.

Dr. Grew gives ſeveral experiments of the luctation ariſing from the *affuſion* of divers menſtruums on all ſorts of bodies.

Divines and church hiſtorians ſpeak of BAPTISM by *affuſion*; which amounts to much the ſame with what we now call ſprinkling.

AFLOAT, a ſhip is ſaid to be *afloat*, when ſhe is buoyed up by the water from the ground.

AFOBA, in *Botany*, a name given, by the natives of Guinea, to a kind of plant, of the genus of the *phaſeolus*, or kidney-bean. They uſe it pounded and mixed with oil, to cure the itch, and other cutaneous foulneſſes. It is more hairy than the common kinds, and its leaves are very ſmall. Philoſ. Tranſ. N° 232.

AFRA *avis*, in *Natural Hiſtory*. See Pintado.

AFSAGERS, perſons appointed by the burgo-maſters of Amſterdam, to preſide over the public ſales made in that city. They muſt always have a clerk of the ſecretary's office with them, to take an account of the ſale.

AFT, behind, or near the ſtern of the ſhip.

AFTER-BIRTH, among *Midwives*, the coat, or membranes, wherein the fœtus is incloſed *in utero*.

It is thus called, becauſe it comes away ſome time after the fœtus; by way of a ſecond birth, or delivery.

Phyſicians uſually call it the SECUNDINE. It alſo includes the *placenta uterina*, popularly called the *womb-cake*.

In brutes it is denominated the HEAM, or CLEANING. See Collect. Acad. P. E. tom. iii. p. 464.

Authors ſpeak of a ſtrange kind of *after-birth*, of the mole kind, frequent among Dutch women, where it is called *ſuyger*, q. d. *leech*, by naturaliſts *mola volatilis*. The ſkeleton of one of theſe is deſcribed and repreſented by Thomas Bartholine. Ephem. Germ. dec. 1. Ann. 2. Obſ. 160, p. 255.

The *after-births* of ripe children are brought away more eaſily than thoſe of abortions. See Medic. Eſſ. Edinb. vol. ii. p. 212.

After-*math*, among *Huſbandmen*, the after-graſs, or ſecond mowings of graſs; or elſe graſs or ſtubble cut after corn.

After-*noon*, the latter half of the artificial day, or that ſpace between noon and night.

The ancient Romans dedicated their *afternoons* to diverſion, as their forenoons to buſineſs; and their uſual diverſions were the game called *pila*, and other exerciſes of the body, eſpecially walking, or riding. Theſe laſted till the eighth or ninth hour, anſwering to our three o'clock, which was the time for the baths. After bathing, they anointed and perfumed themſelves; and, about the tenth hour, went to *cœna*, *ſupper*, about three hours before ſun-ſet; which done, the day was ended at the public ſpectacles, theatrical, or amphitheatrical ſports; with muſic, ſinging, and the like.

After-*ſails* uſually comprehend all thoſe which are extended on the mizen-maſt, and on the ſtays, between the mizen and main-maſts.

After-*pains*, are pains felt in the loins, the groin, &c. after the birth is brought away.

They ſeem to ariſe from a diſtention of the ligaments of the *uterus* in time of DELIVERY, and are ſeldom dangerous, unleſs aggravated by a detention of the *lochia*.—To prevent them, oil of ſweet-almonds, ſpermaceti, ſyrup of *capillus veneris*, &c. are uſually preſcribed.

After-*ſwarms*, in ſpeaking of bees, are ſecondary or poſterior ſwarms, frequently found to quit the hives within a fortnight after the firſt.

Butler tells us, that the *after-ſwarms* differ from the prime, in that the latter are directed by the vulgar, or crowd of bees, whoſe only rule is the fulneſs of the hive; whereas the former are appointed by the ruling bees, and indicated by a noiſe or call, which theſe make for the ſpace of two or three days, as it were to give warning to the common herd to prepare for a march. Within eight or ten days after the prime-ſwarm is gone, if the princeſs next in order find a competent number fledged and ready, ſhe begins to tune her treble voice, in a mournful and begging note, as if ſhe prayed the queen-mother to let them go; to which voice, if ſhe vouchſafe a reply, by tuning her baſe to the other's treble, it marks her conſent: in conſequence of which, within a day or two after, if the weather allow, the new ſwarm appears. If the *prime* ſwarm be broken, the *after* will both call and ſwarm the ſooner, perhaps the next day; in which a third, ſometimes a fourth, ſucceeds in the ſame ſeaſon; but all uſually within a fortnight after the prime ſwarm. See Swarm.

AFTO, in *Botany*, a name given, by the natives of Guinea, to a plant of the *eryſimum* kind, which they grind to powder, and take as ſnuff, to cure the head-ach. Petiver has called this plant the woody and woolly *eryſimum*, or hedge-muſtard, of the coaſts of Guinea. Phil. Tranſ. N° 302.

AGA, in the language of the Moguls, &c. ſignifies a great man, lord, or commander.

In this laſt ſenſe, the term is alſo uſed among the Turks: thus, the *aga* of the Janizaries is their colonel; and is the only perſon who is allowed to appear before the Grand Signior, without his arms acroſs his breaſt, in the poſture of a ſlave. The *capi aga*, the captain of the gate of the ſeraglio.

The title *aga* is alſo given, by way of courteſy, to ſeveral perſons of diſtinction, though not in any office, or command, to intitle them to it; as, to the eunuchs of the ſeraglio.

The chief officers under the Khan of Tartary are called by this name. And among the Algerines, we read of *agas* choſen from among the *boluk baſhis* (the firſt rank of military officers) and ſent to govern in chief the towns and garriſons of that ſtate.

On ſome occaſions, in lieu of *aga*, they ſay, *agaſi*, or *agaſſi*. Thus, the *aga*, or governor of the pages, is called *capi-agaſſi*; and the *aga* or general of the horſe, *ſpahilar agaſſi*.

Aga *Cretenſium*, ſignifies the Spaniſh milk-thiſtle.

AGAI, ſee Agio.

AGALACTIA, in *Phyſic*, ſignifies a deficiency of milk in a mother, who is therefore called by Hippocrates αγαλακτος.

AGALLOCHUM, a medicinal wood imported from the Eaſt Indies, uſually in ſmall bits, of a very fragrant ſcent.

The word is derived from the verb αγαλλομαι, *I boaſt*; in alluſion to the excellency of its odour.

Agallochum is otherwiſe called *lignum-aloes* and *xyloaloe*, q. d. *aloe-wood*, not that it is produced from the common aloe-plant, which yields the inſpiſſated juice of that name. It is the produce of a tree of a very different kind, growing in the Eaſt Indies, particularly Sumatra and Cochinchina. Some call it likewiſe Lignum *paradiſi*. It yields a concrete oil. See its chemical hiſtory in Neumann's Works, p. 420.

It is of a bluiſh purple colour, marked with veins and ſpots, very heavy and bitter; when burnt it yields drops of an aſtringent liquor, and a ſweet aromatic fume. It is hot and drying, and eſteemed a great ſtrengthener of the nerves in general, but particularly of the head and ſtomach.

The various names and accounts given of the *agallochum* are ſo very different, as well as the ſpecimens of it common in our ſhops, that it does not ſeem to be properly known amongſt us.

AGALMATA, in *Antiquity*, originally denoted the ornaments of temples and ſtatues; but came afterwards to be popularly uſed for the ſtatues and temples themſelves.

AGAPES, or Agapæ, in *Church Hiſtory*, a kind of religious feſtival, celebrated, in the ancient church, to keep up a harmony and concord among its members.

The word is formed of the Greek αγαπη, *love*.

In the primitive days the *agapes* were held without ſcandal, or offence; but, in after-times, the heathens began to tax them with impurity.—This gave occaſion to a reformation of theſe *agapæ*.

The kiſs of charity, with which the ceremony uſed to end, was no longer given between different ſexes; and it was expreſly forbidden to have any beds, or couches, for the conveniency of thoſe who ſhould be diſpoſed to eat more at their eaſe. Notwithſtanding theſe precautions, the abuſes committed in them became ſo notorious, that the holding of them (in churches at leaſt) was ſolemnly condemned, at the council of Carthage, in the year 397.

Some authors imagine the *agapæ* to have been, not a commemoration of our Saviour, but a cuſtom borrowed from the heathens: *Mos vero ille, ut referunt*, ſays Sedulius, on the XIth chapter of the Epiſtle to the Corinth. *de Gentili adhuc ſuperſtitione veniebat*. And Fauſtus, the Manichee, is repreſented, by St. Auguſtine, as reproaching the Chriſtians with converting the heathen ſacrifices into *agapæ*.

Agape ſignifies alſo an afternoon, or evening's meal.

AGAPETÆ, in *Eccleſiaſtical Hiſtory*, a name given to certain virgins and widows, who, in the ancient church, aſſociated themſelves with, and attended on, eccleſiaſtics, out of a motive of piety and charity.

In the primitive days there were women inſtituted Deaconesses; who, devoting themſelves to the ſervice of the church, took up their abode with the miniſters, and aſſiſted them in their functions.

In the fervour of the primitive piety, there was nothing ſcandalous in theſe ſocieties; but they afterwards degenerated into libertiniſm: inſomuch, that St. Jerom aſks, with indignation, *unde Agapetarum peſtis in eccleſias introiit?* This gave occaſion to councils to ſuppreſs them.—St. Athanaſius mentions a prieſt, named Leontius, who, to remove all occaſion of ſuſpicion, offered to mutilate himſelf, to preſerve his beloved companion.

AGAPIS *lapis*, in *Natural Hiſtory*, a name given by ancient writers, to a ſtone of a duſky yellow, or the colour of a lion's ſkin; it was held in great eſteem in many nations, on account of its ſuppoſed virtues, as an anodyne and vulnerary.

AGARENI, or Agarenians, a name given by ſome to the followers of the religion of Mahomet.

The word is derived from Agar, or Hagar, handmaid of Abraham, and mother of Iſhmael.

AGARIC, in *Pharmacy*, a kind of fungous excreſcence, growing on the trunks and large branches of ſeveral trees; but, chiefly, on the larch-tree, and upon ſome kinds of oak, when old and decayed. Three fourths of it conſiſt of a reſinous ſubſtance, and the remainder is a ſlimy mucilaginous earthy matter, ſo tenacious, as ſcarcely, by any method, to be diſſolved by water. It comes forth on the tree in the beginning of the ſpring, and continues to increaſe till autumn. The beſt is eaſily cut with a knife, friable betwixt the fingers, and has no hard or gritty, or coloured veins. It has no pedicle, and is internally of a ſimple uniform ſtructure throughout its whole ſubſtance.

Agaric is an ingredient in the *Theriaca Andromachi*, where it is admitted in quality of a cordial; though its cardiac virtue is excepted to as much as its purgative.

Agaric was a purge in much eſteem among the ancients, but has deſervedly fallen into diſrepute of later years, as it occaſions unſupportable nauſeas.

Tournefort enumerates 18 ſpecies of *agaric*. Tournef. Inſt. 562. But it is more generally divided into three kinds; the *male*, the *female*, and that called *falſe*, or *ſpurious agaric*.

The *male agaric*, otherwiſe called the common or heavy *agaric*, is of a yellowiſh colour, and pretty ſolid. It is commonly uſed in dying black, and is reckoned among the *not-colouring* drugs, which the dyers of the beſt woollen cloth and ſerges are obliged to uſe in France.

It is called a *not-colouring* drug, becauſe it can produce no colour of itſelf, without being mixed with other ingredients.

The *female agaric* is the moſt eſteemed, becauſe it is much uſed in medicine. To be good it ought to be white, large, light, and brittle, ſo as to be eaſily pulveriſed; of a lively and penetrating ſcent, and of a bitter taſte. This was thought efficacious as a ſtyptic, to reſtrain not only venal, but arterial hæmorrhages, without the uſe of ligatures. Its reputation, however, did not long ſubſiſt; and after repeated trial, the ſurgeons of London were obliged to diſcontinue it as inefficacious and unſafe. See Neale on the uſe of *Agaric*.

The *falſe*, or *baſtard agaric*, or *oak agaric*, is that which grows on thoſe trees. It is commonly reddiſh, and very heavy, and is very little eſteemed, which probably occaſioned its being called the *falſe agaric*. The druggiſts look only upon that which grows upon the *larch-tree* to be the right ſort.

Agaric is brought from different places; the beſt comes from the Levant; that which comes from Savoy and Dauphiny being leſs eſteemed. Holland alſo ſupplies ſome, but that is reckoned the worſt; becauſe it is grated, and whitened at top with chalk. By a chemical ſolution it paſſes almoſt wholly into oil; it yields no volatile ſalt, but abounds with a ſort of flaky earth, and acid phlegm; as to texture, it ſeems much to reſemble COLOCYNTH.

The *agaric* is either *brute*, *cleanſed*, or in *trochiſks*.

AGARIC, *brute*, is juſt as it was taken from the tree, without any other preparation than what it has received from nature.

AGARIC, *cleanſed*, is that, which being cleared and purified from all its filth and imperfections, is fit for immediate uſe.

AGARIC in *trochiſks*, is commonly the female ſort, finely pulveriſed, incorporated with ſome liquid, and made into a maſs, of which cakes of different ſizes and figures are formed, which are dried in the air and ſhade, without coming near the fire.

There is alſo another ſort of *agaric*, which is called *mineral agaric*. This is a kind of ſtone, which is found in the cliffs of rocks, in different parts of Germany. It is very white and light, whence it is called milk of the moon. It is alſo named *marrow of ſtone*, or *lithomagra*; and others call it *ſtenomagra*. Some tell us that the calcination of this ſtone is performed by the vapours of the metals within the rocks where it is found. This *agaric* is ſcarcely uſed at all, except in medicine. See LAC *Lunæ*.

It is uſed internally againſt hæmorrhages, the ſtrangury, gravel, and eſpecially dyſenteries; externally, to dry and heal old ulcers, ſtop defluxions of the eyes, &c. See the chemical hiſtory of the *agaric* of the larch-tree, &c. Neumann's Works, p. 349.

AGARICUS, in the Linnæan ſyſtem of *Botany*, called *amanita* by Dillenius, the term uſed to expreſs that genus of funguſes belonging to the *cryptogamia fungi*, which have no pedicle, but grow to trees, &c. by one ſide, and are therefore called horizontal funguſes, and are lamellated underneath: by this laſt character they are diſtinguiſhed from the *boleti* of Linnæus, which are thoſe horizontal funguſes which are porous underneath.

AGASYLLIS, in the *Materia Medica*, a name given by ſome of the ancient Greek writers, to gum ammoniac; and by Dioſcorides, to the tree which produced that gum. By their deſcriptions of this medicine, it appears not to have been the ſame which we know by this name.

AGAT, in *Natural Hiſtory*, a precious ſtone, partly tranſparent, and partly opake; uſually diverſified with variety of colours, veins, ſpots, &c. and ſometimes exhibiting figures, or appearances, of natural objects.

The word is ſometimes alſo written *achat*; by the Greeks and Latins, *αχατης*, and *achates*; a denomination taken from that of a river in Sicily, on the banks of which it was firſt found.

Agats are compoſed of cryſtal, debaſed by a large quantity of earth, and not formed, either by repeated incruſtations round a central *nucleus*, or made up of plates laid evenly on one another, but are merely the effect of one ſimple concretion, and variegated only by the diſpoſition the fluid they were formed in, gave to their differently coloured veins, or matters.

Theſe are a very numerous genus of foſſils, and ſubject to great variegations in their colours. They are, however, arranged into ſome order, according to the different colours of their ground.

Of thoſe of a *white ground*, there are three ſpecies: 1. The DENDRACHATES, or *Mocoa-ſtone*. 2. The dull milky-looking *agat*. 3. The lead-coloured *agat*, called the PHASSACHATES, by the ancients.

Of the *agats* with a *reddiſh ground*, there are four ſpecies: 1. An impure one of a fleſh-coloured white. 2. The ſecond of the red grounded *agats*, is that ſpecies of a pure blood-colour, called HÆMACHATES, or the *bloody agat*, by the ancients. 3. The third is the clouded and ſpotted *agat*, of a pale fleſh-colour, called the *cornelian agat*, or SARDACHATES, by the ancients. 4. And the fourth, the red-lead coloured one, variegated with yellow, called the *coral agat*, or CORALLO-ACHATES, by the ancients.

Of the *agats* with a *yellowiſh ground*, there are only two known ſpecies: 1. The one of the colour of yellow wax, called *cerachates* by the ancients. 2. The other a very elegant ſtone, of a yellow ground, variegated with white, black, and green, called the LEONINA, and LEONTESERES, by the ancients.

Laſtly, of the *agats*, with a *greeniſh ground*; there is only one known ſpecies, which was the JASPACHATES of the ancients.

Some have attributed great medicinal, and imaginary, virtues to the *agat*.

Oriental *agats* are ſaid to be all brought from the river Gambay.

A mine of *agats* was lately diſcovered in Tranſylvania, of divers colours, ſome of a large ſize, weighing ſeveral pounds.

Agats have been diſtinguiſhed by other names, than thoſe before mentioned. Thus we find

AGAT, *vermilion*, that of a deep vermilion-colour.

AGAT, *white ringed*, *achates* PERILEUCOS, diſtinguiſhed by black and white circles. Plott mentions this under the denomination of CROW-*ſtone*.

AGAT, *white*, LEUCACHATES, that altogether white, or at leaſt diverſified with white ſtrokes, being frequently ſemi-tranſparent, and bearing a reſemblance to the white of an egg.

AGAT, *vitreous*, or *tranſparent*, of a thin ſtone-blue colour.

AGAT, *leopardine*, *achates* PARDALIOS, that ſpotted like the ſkin of a leopard. This is otherwiſe called *pandalion*, *pantachates*.

AGAT, *ſapphirine*, that of a ſky-blue colour, tranſparent; ſometimes found with *lapis lazuli*, and called alſo SAPPHIRO-ACHATES.

AGAT, *luminated*, diſtinguiſhed by divers colours, as white, black, yellow, brown, placed over each other, at equal diſtances.

AGATS are alſo divided, with regard to the objects repreſented on them, into

AGAT, *arboreſcent*, DENDRACHATES, and DENDRITES. This ſeems to be the ſame with what ſome authors call the *achates*, with roſemary in the middle; and others, *achates*, with little branches of black leaves.

AGAT, *horned*, CERACHATES, is ſaid by ſome to be that which, by lines and ſpots, repreſents the figure of a horn.

AGAT, *aphrodiſian*, *achates* APHRODISIUS, is a term given by Velſchius to an *agat* in his cuſtody, of a fleſh-colour, on one ſide of which appears a half-moon, in great perfection, repreſented by a milky ſemicircle; on the other ſide, the phaſes of Veſper, or the evening ſtar; whence the denomination *aphrodiſius*.

AGAT, *corſoid*, repreſenting human hair.

AGAT, *arithmetical*, repreſenting the numbers 4191, 191.

AGAT, *aſtronomical*, repreſenting the hemiſphere, with its ſeveral orbs, and the earth in the middle. To which head may be alſo referred an *agat* mentioned by Borrichius, repreſenting the five orbs in great perfection.

AGAT, *elementary*, conſiſting of four colours; blue, ſuppoſed to expreſs water; white, the air; red, the fire; and brown, the earth.

AGATS, *anthropomorphous*, thoſe wherein the figures of men or women are expreſſed. Such is that mentioned by Kircher, repreſenting a heroine armed; with many others of the *anthropomorphous* kind.

To the claſs of *anthropomorphous agats*, may alſo be referred an *agat* in the library of Francfort, repreſenting the heart, lungs, and part of the veins of a man.

AGATS, *leucophthalmous*, thoſe repreſenting the figures of eyes. Such is that mentioned by Velſchius, which he calls OMMATIA, or *omphopthalmus*; or thoſe by Cardan, and others, repreſenting the eyes of birds, fiſhes, wolves, called *lycophthalmi*; of goats, *ægophthalmi*; of oxen, *boophthalmi*.

Among the more curious, we meet with Tiberian *agat*, *achates Tiberianus*, a name given by ſome, to the famous *agat* in the treaſury of the French king's chapel, repreſenting the *apotheoſis* of Auguſtus, and the ſeries and portraits of the family of Tiberius and Julia, with divers foreign nations ſubdued in war; concerning which, many different explications and conjectures have been advanced by the learned.

AGAT, *Iſiac*, *achates Iſiacus annularis*, is a curious antique *agat* at Rome, ſo called, as repreſenting the head of Iſis, and being ſet in a ring.

AGATS are alſo divided with regard to the affinities they bear to other ſtones: hence the *jaſpachates*, *ſardachates*, &c. We find alſo *onychates*, between an *onyx* and an *agat*, compoſed not of zones, or balls, but of plates perſpicuous and aſh-coloured.

AGAT, *oriental ſardonyx*, of an oval figure, and a white colour, in the middle of which appears a body of water, which, upon ſhaking, is perceived to move. This ſpecies is otherwiſe called *coccus*, *ovum ſolis*, *coccus paraquanorum*, *venter cryſtallinus*, *ætites gemmata*, &c. and may be referred to the ÆTITES kind.

To this kind may alſo be referred the *agat* of Chili, which has cryſtals ſeen in it; and another called *berylloachates*, containing pieces of beryls.

The ANTACHATES is that which in burning yields a ſmell of myrrh. This, though mentioned by Pliny among *agats*, ſeems rather to belong to the head of ambers, or bitumens. Others write it *anchachates*; others, *ſtactachates*.

Authors alſo ſpeak of Roman *agats*, Egyptian *agats*.

The ancients mention a red *agat*, ſpotted with points of gold, found in Candia.

Agat has always been eſteemed for ſeals; as being a ſtone that no wax will ſtick to.

The gold wire-drawers burniſh their gold with an *agat*; whence the inſtrument made uſe of on that occaſion, is alſo called an *agat*.

Mr. Boyle takes *agats* to have been formed of ſeparate beds, or ſtrata of fine clay or earth, brought by a petrifying liquor to coagulate into a ſtone. The ſame author obſerves, that the fire will purge away the colours of *agat*. He alſo mentions an *agat* with a moveable ſpot or cloud in it.

See farther concerning the hiſtory of *agats*, Nicolſ. Lapid. cap. 26. p. 133. Grew, Muſ. p. 287. The figures of *agats*, Mercat. Melloth, p. 375. Their ſtructure, Woodward, Nat. Hiſt. Engl. Foſſ. tom. ii. p. 16. Experiments on them in the burning-glaſs, Giorn. de Letter. d'Ital. tom. viii. The commerce and manufacture of *agats*, Hought. Coll. tom. ii. The counterfeiting of *agats* in glaſs, Neri, Art of Glaſs, lib. ii. cap. 37.

Agats may be ſtained artificially, by a ſolution of ſilver in ſpirit of nitre, and afterwards expoſing the ſtone, for ſome hours, to the ſun. This operation ſucceeds beſt in whitiſh *agats*. See on this ſubject of ſtaining *agats*, Dr. Lewis's Com. P. Techn. p. 438, & ſeq.

But it is to be obſerved, that no art has hitherto been able to imitate the fineneſs and beauty of the vegetable repreſentations, formed by nature, in ſome *agats*; ſuch as are commonly called DENDRITES. And though art ſhould attain to ſuch a perfect imitation of nature in this caſe, as to deceive the eye, yet might the difference be otherwiſe diſcovered.

For if an *agat* be coloured by art, it will loſe a great part of its colour, by heating it; and this colour may again be reſtored, by adding the ſolution of ſilver in ſpirit of nitre.

Again, by putting a little aqua fortis, or ſpirit of nitre, on the ſuſpected *agat*, without expoſing it to the ſun, the artificial colours will diſappear in a night's time; and this colour may again be reſtored, by expoſing the ſtone to the ſun for ſome days. Vid. Du Fay, in Mem. Acad. Scienc. 1728.

But Monſ. de la Condamine has ſince obſerved, that even natural *agats*, which, by the fineneſs of the lines repreſented upon them, were beyond all ſuſpicion of art, yet ſuffered a great change in their colours, by the application of aqua-fortis. Vid. Hiſt. Acad. Scienc. 1733, p. 35, 36. Edit. Amſt.

Agats, and other ſtones, may be ſtained black, by applying to them a ſolution of copper in aqua fortis, and making them red-hot in a crucible. To imitate Mocha ſtones, moiſten the ſmooth ſurface of the *agat* with a ſolution of copper, and on the middle of it ſet an iron nail upright on its head; this abſorbs the acid from the copper, and the copper makes ramifications, which, after the ſtone is carefully waſhed, may be rendered of a black colour, by a red heat. Theſe vegetations are not fixed in the ſtone, which ought therefore to be covered with a plate of cryſtal glaſs.

Beccaria obſerves, that the electric ſparks will not be conducted by the ſurface of poliſhed *agat*; and Mr. Boſe has ſhewn that the *agat* was very early known to poſſeſs electrical powers.

For the chemical properties of *agats*, ſee EARTHS *vitrifiable*.

Agat, among *Antiquaries*, denotes a ſtone of this kind, engraven by art.

In which ſenſe, *agats* make a ſpecies of *antique gems*; in the workmanſhip whereof, we find eminent proofs of the great ſkill and dexterity of the ancient ſculptors. Several *agats* of exquiſite beauty are preſerved in the cabinets of the curious. The facts, or hiſtories, repreſented in *antique agats*, with how much addreſs ſoever conducted, are become, at this diſtance of time, many of them obſcure and dubious, and their explication difficult enough; whence divers miſtakes have been committed, and numerous conjectures and diſputes raiſed.

AGATHA. See ACHATES.

AGATHODÆMON, a beneficent GENIUS, or DÆMON.

The word is compounded of ἀγαθὸς, *good*, and δαιμων, *dæmon*.

Among ancient writers, *agathodæmon* is a denomination given to a kind of ſerpents, bred up and revered by the Egyptians, from an opinion of ſome ſanctity reſiding in them.

They are alſo called dragons, DRACONES, or *dracunculi*, and fabulouſly deſcribed as having wings.—They appear to be the ſame with thoſe otherwiſe called SIRENES.

AGATY, the name of a Malabar tree, bearing a fruit in taſte and ſhape like the kidney-bean. Ray's Hiſt.

AGAVE, a genus of the *hexandria monogynia*, a name given to the common American aloe. The characters are: the flower has no empalement, is funnel-ſhaped, and of one leaf, which is cut at the brim into ſix equal ſegments; the oblong germen is ſituated below the flower, upon which reſts the ſlender ſtyle, which is extended for a conſiderable length beyond the petals, and is crowned by a three-cornered ſtigma. This is attended by ſix erect ſtamina, of the ſame length, crowned by narrow ſummits; after the flower is paſt, the germen becomes an oblong three-cornered ſeed-veſſel, having three cells, which are filled with flat ſeeds. Miller reckons eight ſpecies of this plant. The common great American aloe generally riſes upwards of twenty feet, and branches on every ſide in the ſhape of a pyramid. When this plant flowers, it makes a beautiful appearance; and if it is protected from the cold in autumn, a ſucceſſion of new flowers will be produced for near three months, in favourable ſeaſons. It has been a common error, that this plant doth not flower till it is a hundred years old; the truth is, that its flowering depends on the growth of the plant; ſo that in hot countries it will flower in a few years; but in colder climates, the growth is ſlower, and the flowering leſs frequent.

AGAUPE, in *Botany*, a name uſed by ſome authors for the common white *water* LILY.

AGE, properly denotes the natural duration of the LIFE of man.

The ordinary *age* of mankind has been occaſionally varied, in ſuch manner as to afford a fine inſtance of the wiſdom of Providence. Dr. Woodward holds, that the ages to which men arrive, are proportioned to the number of their lacteals.

Age is alſo uſed, in *Chronology*, for a CENTURY; or a ſyſtem, or a period of an hundred years.

In which ſenſe, *age* amounts to much the ſame with *ſeculum*, and differs from *generation*.

Age is alſo underſtood of a certain ſtate or portion of the ordinary life of man; which is divided into four different *ages*; viz. INFANCY, YOUTH, MANHOOD, and OLD AGE.

Infancy, or childhood, *pueritia*, extends as far as the fourteenth year.

Youth, adoleſcence, or the *age* of puberty, commences at 14, and ends at about 25.

Manhood, or the virile *age*, terminates at 50.

Old age, *ſenectus*, ſucceeds, which is the laſt: though ſome divide this into two; calling it *decrepit age* after 75. See LONGEVITY.

Age, in *Horſemanſhip*, makes a conſiderable point of knowlege; the horſe being an animal that remarkably ſhews the progreſs of his years, by correſpondent alterations in his body.

We have characteriſtics from his teeth, hoofs, coat, tail, and eyes.

The firſt year he has his foal's teeth, which are only grinders and gatherers: the ſecond, the four foremoſt change, and appear browner and bigger than the reſt: the third, he changes the teeth next to theſe; leaving no apparent foal's teeth, but two on each ſide above, and two below: the fourth year, the teeth next to theſe are changed, and no foal's teeth are left, but one on each ſide above, and below: at five years, his foremoſt teeth are all changed, and the tuſhes on each ſide are complete: thoſe which come in the places of the laſt foal's teeth, being hollow, and having a little black ſpeck in the midſt; which is called the *mark in a horſe's mouth*: this continues till eight years of *age*.—At ſix years, he puts out new tuſhes; near which appears a little circle of young fleſh, at the bottom of the tuſh; the tuſhes, withal, being white, ſmall, ſhort, and ſharp.—At ſeven years, the teeth are all at their growth, and the mark in the mouth appears very plain.—At eight, all his teeth are full, ſmooth, and plain, and the mark ſcarce diſcernible; the tuſhes looking yellowiſh.—At nine, the foremoſt teeth ſhew longer, yellower, and fouler, than before; and the tuſhes become bluntiſh.—At ten, no holes are felt on the inſide of the upper tuſhes; which till then are very ſenſible: add, that the temples begin to be crooked and hollow.—At eleven years, his teeth are very long, yellow, black, and foul; but he will cut even, and his teeth ſtand directly oppoſite to one another.—At twelve, the upper teeth hang over the nether.—At thirteen, the tuſhes are worn cloſe to his chops, if he have been much ridden; otherwiſe they will be black, foul, and long.

2. As to the hoof.—If it be ſmooth, moiſt, hollow, and well-ſounding, it is a ſign of youth: on the contrary, if rugged, and as it were ſeamed, one ſeam over another, and withal dry, foul, and ruſty, it is a mark of old *age*.

3. For the tail.—Taking him by the ſtern thereof, cloſe at the ſetting on to the buttock, and griping it between the finger and thumb; if a joint be felt to ſtick out more than the reſt, the bigneſs of a nut, the horſe is under ten: but if the joints be all plain, he may be fifteen.

4. The eyes being round, full, and ſtaring, the pits that are over them filled, ſmooth, and even with his temples, and no wrinkles to be ſeen, either under or above, are marks of youth.

5. The ſkin being plucked up in any part betwixt the finger and thumb, and let go again; if it return ſuddenly to

its place, and remain without wrinkles, he may be believed to be young.

6. A dark-coloured horſe, growing griſly above the eyebrows, or under the main; or a whitiſh horſe, growing meanelled, either with white or black, all over; may be infallibly concluded extremely aged.

Laſtly, a horſe being young, the BARS of his mouth are ſoft and ſhallow; otherwiſe they are deep, and feel hard and rough.

Age, in HUNTING, is an article of conſequence.—Deer, and other beaſts of game, have different denominations, according to their *age*.

The *age* of a hart, &c. is chiefly judged of by the furniture of his head.

The firſt HEAD, called, in fallow deer, *broches*; and, in red deer, *pricks*, does not come till the ſecond year of their *age*: the next year, they bear four or ſix ſmall branches; the fourth year, eight or ten; the fifth, ten or twelve; the ſixth, fourteen or ſixteen; the ſeventh year, they bear their heads beamed, branched, and ſumed, as much as ever they will be. The huntſmen have ſeveral other marks, whereby to know an old hart without ſeeing him; as, the ſlot, entries, abatures, foils, fewmets, gate, and fraying poſts.

Age *of neat cattle*, viz. the *ox*, *cow*, and *bull*, is known by their teeth and horns. At the end of ten months they ſhed their firſt fore-teeth, which are replaced by others, larger, but not ſo white; and in three years all the inciſive teeth are renewed. Theſe teeth are at firſt equal, long, and pretty white; but as the animals advance in years, they wear, become unequal and black. They alſo ſhed their horns at the end of three years; and theſe alſo are replaced by other horns, which, like the ſecond teeth, continue. The growth of theſe horns is not uniform; at firſt, or in the fourth year of the animal's age, two ſmall pointed horns make their appearance, neatly formed, ſmooth, and towards the head terminated by a kind of button. In the following year, this button moves from the head, being impelled by a horny cylinder, which lengthening in the ſame manner, is alſo terminated by another button, and ſo on; for theſe horns continue growing as long as the animal lives. Theſe buttons become annular joints, which are eaſily diſtinguiſhed in the horn, and by means of which the age of the animal may be eaſily known; counting three years for the point of the horn, and one for each of the joints. Buffon.

Age *of ſheep*. Theſe animals in their ſecond year have two broad teeth; in their third year they have four broad teeth before; in their fourth year ſix broad teeth; and in their fifth year eight of the ſame kind; after which their age cannot certainly be known, in this way.—But the age of the ram, and horned ſheep, may be always known by their horns, which ſhew themſelves in their firſt year, and often at the birth, and continue to grow a ring annually to the laſt period of their lives. Ellis and Buffon.

Age *of goats* is known by the ſame tokens as that of the ſheep.

Age *of the moon*, in *Aſtronomy*, is underſtood of the number of days elapſed ſince the laſt conjunction, or new moon; called alſo her QUARTER. The method for diſcovering her age, is mentioned under the article MOON.

Age, in *Chronology* and *Antiquity*, is alſo uſed in ſpeaking of the time paſſed ſince the creation of the world.

The ſeveral *ages* of the world may be reduced to three grand epochas; viz. the *age* of the law of nature, called by the Jews the *void age*, from Adam to Moſes.—The *age* of the Jewiſh law, from Moſes to Chriſt.—And the *age* of Grace, from Chriſt to the preſent year. See INCARNATION and EPOCHA.

The Romans diſtinguiſhed the time that preceded them, into three *ages*: the *obſcure* or *uncertain age*, which reached down as low as Ogyges king of Attica; in whoſe reign the deluge happened in Greece.—The *fabulous*, or *heroic age*, which ended at the firſt Olympiad; and the *hiſtorical age*, which commenced at the building of Rome.

Among the poets, the four *ages* of the world are, the *golden*, the *ſilver*, the *brazen*, and the *iron age*. See the Metamorphoſis of Ovid, lib. i. or rather Heſiod, in his poem, Ερyα και ἡμεραι, *Opera & Dies*, ver. 108, &c. He is the firſt that has deſcribed theſe four *ages*.

The Eaſt-Indians alſo reckon four *ages* ſince the beginning.—The firſt, which they repreſent as a ſort of golden *age*, laſted, according to them, 1728000 years: in this the god Brahma was born, and the men were all giants; their manners were innocent: they were exempt from diſeaſes, and lived 400 years.—In the ſecond *age*, which laſted 1296000, their rajas were born: vice now crept into the world; men's lives were fallen to 300 years, and their ſize retrenched proportionally.—Under the third *age*, which laſted 8064000 years, vice being more increaſed, men only attained to 200 years.—The laſt *age* is that wherein we now live, of which 4027213 years are already gone; and the life of man ſunk to one fourth of its original duration.

By the Roman law we find different *ages* aſcertained for different purpoſes; as,

Age, *conſular*, or that wherein a perſon might regularly hold the conſulſhip, was the forty-third year, ſo that he might ſue for it in the forty-ſecond. Where it is to be obſerved, that it was not neceſſary either of thoſe years ſhould be expired, but only begun; beſides, that men of extraordinary merits towards the republic, were in this matter exempt from the ordinary laws. Hence Corvinus was conſul at twenty-three years, Scipio Æmilianus at thirty-ſix, and Pompey at thirty-five; others broke through the laws by violence, as C. Marius the younger, and Octavius Cæſar, who procured themſelves to be made CONSULS, before twenty years of *age*.

Age, *judiciary*, or that wherein a perſon was capable of ſitting as a judge, was not always the ſame; for by the *Lex Servilia Glauciæ*, none was allowed to be choſen under thirty years of *age*, or above ſixty. By ſome other laws the *age* ſeems to have been limited to thirty-five, but reduced afterwards by Auguſtus to thirty; though Pitiſcus ſuppoſes a miſtake here in the text, and that inſtead of thirty-five and thirty, it ought to be read twenty-five, and twenty.

Age, *military*, or that wherein the Romans were obliged to enter themſelves in the army, was at ſeventeen years; at forty-five, they might demand their diſmiſſion.

Among the Lombards, the *age* of entry was between eighteen and nineteen; among the Saxons, at thirteen.

Age *for holding offices in the city*, as quæſtor, ædile, tribune of the people, &c. is not determined by the annal-laws of Villius, but appears to have been the twenty-ſeventh year.

For it was neceſſary that the perſon who claimed any urban employment, had firſt ſerved ten years without interruption in the army, commencing from the ſeventeenth year. Though ſome think the quæſtorſhip might have been held at twenty-five years.

Age, *prætorian*, or that wherein a perſon might ſolicit for the prætorſhip, was at forty; two years earlier than the *age* required for conſul.

Age, *legitimate*, denotes the age of twenty-five, ſo called, as ſome imagine, becauſe youth were then by law allowed to take the direction of their affairs into their own hands.

Age, *diſpenſation of*, *ætatis venia*, is a right which a perſon obtained from the prince, or ſovereign, of ſetting aſide a tutor or curator, and taking the adminiſtration of his affairs into his own hands, before the legitimate *age*.

Age, *adoptive*, called alſo *plena pubertas*, requires the adoptor to be eighteen years older than the perſon adopted, that there may appear a probability of his being a natural child.

We likewiſe read of other *ages*; as,

Age, *rocky* or *ſtony*, in ſome ancient northern monuments, correſponds to the *brazen age* of Heſiod, and the Greeks; being called *rocky*, on account of Noah's Ark, which reſted on mount Arrarat.

Age, *aſhen*, the fourth *age* of the northern poets; ſo called from a Gothic king, Madenis, or Mannus, who, on account of his great ſtrength, was ſaid to be made of aſh; or becauſe in his time people began to make uſe of weapons made of that wood.

Age, *hiſtorical*, that which commenced from the firſt Olympiad, in the year of the world 3228, and ſtill continues. This diviſion, it is to be obſerved, only holds good with regard to the Greeks and Romans, who had no hiſtories earlier than the firſt Olympiad. The Jews, Egyptians, Phœnicians, Chaldees, not to ſay the Indians and Chineſe, who pretend to much earlier monuments, will not be concluded by it.

Age, *preſent*, among Jewiſh *Writers*, frequently denotes all the ſpace of time before the Meſſiah, in contradiſtinction from *future age*, or *age to come*, the time after the coming of the Meſſiah.

Age, *middle*, denotes the ſpace of time commencing from Conſtantine, and ending at the taking of Conſtantinople by the Turks, in the fifteenth century.

A late author chooſes rather to date the middle *age* from the diviſion of the empire made by Theodoſius, at the cloſe of the fourth century, and extend it to the time of the emperor Maximilian I. at the beginning of the ſixteenth century, when the empire was firſt divided into circles. But this ſeems more accommodated to the ſtate of Germany in particular, than of Europe in general.

The middle is by ſome denominated the barbarous *age*, and the latter part of it, the loweſt *age*. Some divide it into

Age, *non-academical*, the ſpace of time from the ſixth to the ninth century, during which ſchools or academies were loſt in Europe.

Age, *academical*, from the ninth century, when ſchools were reſtored, and univerſities eſtabliſhed, chiefly by the care of Charlemaign.

Age, *milliary*, or *millenary*, *ſæculum milliarium*, or *millenarium*, on *Medals*, denotes the laſt year of a *millennium*, or thouſandth year.

Several medals of the emperors Philip, ſtruck in the thouſandth year from the building of Rome, have this legend.

Age, *new*, on ancient *medals*, denotes the beginning, or firſt year of a new *ſæculum*, or century of years.

Age is alſo uſed among ancient poets for the ſpace of thirty years.

In which ſenſe, *age* amounts to much the ſame with generation. Neſtor is ſaid to haxe lived three *ages*, at the time when he was ninety.

Age is differently conſidered by *Naturaliſts* from what it is by *Lawyers*; and even in each of thoſe profeſſions we find various ſyſtems and diviſions of *age*.

Age *of Medals*. See the article MEDAL.

Age, in *Law*, is particularly underſtood of a certain ſtate or time of life, wherein a perſon is qualified for certain offices of civil ſociety, which before, for want of years and diſcretion, he was incapable of.

By the common law, there are two principal *ages* in a man: at fourteen, he is at the *age of diſcretion*; at twenty-one years, at *full age*.

With reſpect to a woman, there were anciently ſix *ages* obſerved: at ſeven years, her father might diſtrain the tenants of his manor for aid to marry her; for at thoſe years ſhe may conſent to matrimony.—At nine years old ſhe is dowable; for then, or within half a year after, ſhe is ſaid to be able *promerereri dotem, & virum ſuſtinere*.—At twelve years, ſhe is able finally to ratify, and confirm her former conſent to matrimony.—At fourteen, ſhe may take her lands into her own hands; and ſhould be out of ward, if ſhe were at this *age* at her anceſtor's death.—At ſixteen, ſhe ſhould be out of ward, though at the death of her anceſtor ſhe was under fourteen: the reaſon is, that then ſhe might take a huſband able to perform knight's-ſervice.—At twenty-one years, ſhe may alienate lands and tenements.

As for a man: the age of twelve years binds to appearance before the ſheriff and coroner, for inquiry after robberies, 52 Hen. III. 14. at the *age* of fourteen he may chuſe his own guardian, and claim his lands held in ſocage. Though Bracton limits this to fifteen years; with whom Glanville agrees.—At fourteen a man may conſent to marriage, as a woman at twelve.—At that age likewiſe, he may diſpoſe of perſonal eſtate by will, though not of lands until twenty-one: at fourteen alſo perſons may be witneſſes, though in ſome caſes they have been admitted much younger. 2 Hawkſ. 434. Perſons under fourteen are not in general puniſhable for crimes; but they muſt anſwer for any treſpaſs. 1 Inſt. 247.—At fifteen he ought to be ſworn to the peace, an. 24 Edw. I. Stat. 3.—At ſeventeen he may be an executor.—At the *age* of twenty-one, a man was obliged to be a knight, if he had twenty pounds land per annum in fee, or for term of life, anno 1 Edw. II. Stat. 1. But this ſtatute is repealed, 16 Car. I. cap. 20.—The ſame *age* alſo enables him to make contracts, and manage his own eſtate; which, till that time, he cannot do with ſecurity of thoſe who deal with him.

The *age* of twenty-four years enabled a man to enter into an order of religion, without conſent of parents, anno 4 Hen. IV. cap. 17. At thirty, he may be a biſhop. Though the *age* of twenty-one is the full age of either man or woman, yet they may under that *age* contract for neceſſaries ſuitable to their quality, and it ſhall bind them. If either man or woman do any act before the time preſcribed by law, they may retract it, when they come to the proper age; but if they do not, they are ſuppoſed to ratify it, and it ſhall be deemed valid. Thus if a man marry before fourteen, or a woman before twelve, they may either agree or diſagree to the marriage, when they attain thoſe reſpective ages. But the *age* of marriage has undergone divers modifications: in princes it is allowed earlier than in private perſons; in ſome countries than in others. In Perſia girls are married at nine, boys only at thirteen; in Holland, males are not allowed to marry without conſent of parents or curators, before twenty-five, girls not before twenty; the Romans choſe to marry their wives young, for the advantage of having them innocent and tractable. Others declaim againſt premature marriages. Some have pretended to limit the other extreme of marriageable *age* to forty-five, but this too will be variable in different conſtitutions. We meet with inſtances of generation from ſixty, to one hundred and four, or even one hundred and twenty-one years of *age*.

Various methods have been in uſe for determining this *age*. One ſect of ancient Roman lawyers, called Caſſiani, fixed it by the ſtate of the body, which Juſtinian, and others after him, ſuppoſe to have been done by ſearch, or inſpection of the genital parts, at leaſt in the male ſex; for as to the female, it is pretended the twelfth year was the only guide, though others alledge that the eruption of the menſes ſerved inſtead of it. The Proculiani, on the contrary, determined the puberty of males, by the expiration of the fourteenth year. Javolenus took a middle courſe, and made uſe of both methods.

The *Canon* or *Eccleſiaſtical Law* alſo notes divers *ages*, viz. of baptiſm; of ordination to prieſthood, which is not to be before twenty-four; and to epiſcopacy.

Age is alſo uſed for the duration of vegetable matters. In which ſenſe, we ſay the *age* of roots, of leaves, of corn, of wine, &c.

Trees after a certain *age* waſte. An oak at a hundred years old ceaſes to grow. The uſual rule for judging of the *age* of wood, is by the number of circles which appear in the ſubſtance of a trunk, or ſtock, cut perpendicularly, each circle being ſuppoſed the growth of a year; though ſome reject this method as precarious, alledging, that a ſimple circle is ſometimes the produce of ſeveral years; beſides that, after a certain *age*, no new circles are formed.

Age is alſo uſed for the duration of things inanimate, and even factitious.

In which ſenſe we ſay, the *age* of a houſe, of a country, a ſtate, a commonwealth, or the like.

Age *Prier*, *ætatem precari*, a petition, or motion made in court, by one in his minority, having an action brought againſt him for lands coming to him by deſcent; requeſting that the action may reſt till he come to full *age*.—This the court, in moſt caſes, ought to grant.—But minors, as purchaſers, ſhall not have it: nor intent of aſſiſe, dower, or partition; though they may in debt. Hob. 342. D. Air. 259.

It is otherwiſe in the *Civil Law*; which obliges children in their minority to anſwer to their TUTORS, or CURATORS. See PAROL DEMURRER.

AGED *of the mountain* is a title or denomination given to the chief or prince of the people called ASSASSINS.

AGEM, in *Botany*, is a name given to the Perſian LILAC.

AGEMA, in the *Ancient Military Art*, a kind of ſoldiery, chiefly in the Macedonian armies.

The word is Greek, and literally denotes vehemence; to expreſs the ſtrength and eagerneſs of this corps.

Some will rather have *agema* to have denoted a certain number of picked men, anſwering to a legion among the Romans, which is authorized by a paſſage in Livy; Arrian, on the contrary, ſpeaks of the *agema*, as a wing of horſe; not but the term is alſo applied to foot.

AGEMOGLANS, or AZAMOGLANS, children of tribute raiſed every third year by the Grand Seignior, among the Chriſtians whom he tolerates in his dominions.

The word, in its original, ſignifies a barbarian's child; that is, a child not a Turk.—It is compounded of two Arabic words, 1. אגם, *agem*, which among the Turks ſignifies as much as *barbarous* among the Greeks; the former people dividing the world into Arabs or Turks, and *agem*: as the latter into Grecians and *barbarians*. 2. עלאם, *child*.

The commiſſioners appointed for this levy take them by force even out of the houſes of Chriſtians; always claiming one in three, and pitching upon ſuch as ſeem the handſomeſt, and promiſe to be the moſt ſerviceable.

Theſe are immediately conveyed to Gallipoli or Conſtantinople; where they are firſt circumciſed, then inſtructed in the Mahometan faith, taught the Turkiſh language, and the exerciſes of war, till ſuch time as they become of age to bear arms: and out of theſe the order of JANIZARIES is formed.

Such as are not judged proper for the army, they employ in the loweſt and moſt ſervile offices of the ſeraglio; as in the kitchen, ſtables, &c.

The *agemoglans* only differ from the *ichoglans*, as the former are bred up for the lower, and the latter reſerved for the higher offices of the empire.

AGENDA, in a general ſenſe, denotes things to be done or performed, in conſequence of a man's duty.

The word is Latin, formed from *agere, to do*; and divines ſpeak of the *agenda* of a Chriſtian, meaning the things to be practiſed, by way of contradiſtinction from *credenda*, or the things to be believed; the former imports the articles of obedience, the latter of faith.

Agenda is alſo uſed for a book containing notes, or memorandums of things neceſſary to be done.

In which ſenſe, *agenda* amounts to much the ſame with table-book, &c. An anonymous French author has publiſhed the *agenda* of a man of the world, containing maxims or rules, proper for the conduct of life. Tablettes de l'Homme de Coſmop. 1715.

Agenda is more particularly uſed, among *Eccleſiaſtical Writers*, for the ſervice, or office of the church. We meet with *agenda matutina & veſpertina*, *morning and evening prayers*; *agenda diei*, *the office of the day*, whether feaſt or faſt day; *agenda mortuorum*, called alſo ſimply *agenda*, *the ſervice for the dead.*

Agenda is alſo applied to certain church-books, compiled by public authority, preſcribing the order and manner to be obſerved by the miniſters, and people, in the principal ceremonies, and devotions of the church.

In which ſenſe, *agenda* amounts to the ſame with what is otherwiſe called, *ritual*, *liturgy*, *acalouthia*, *miſſal*, *formulary*, *directory*, &c.

AGENFRIDA, in *Ancient Cuſtoms*, denotes own lord, or one who has the abſolute property, and dominion of a thing.

The word is alſo written *agenfriga*, and *agenfrie*. It is derived from the Saxon *agen*, *own*, and *frea*, *lord*.

AGENHINE, in our *Old Writers*, ſignifies a gueſt that has lodged at an inn for three nights, after which time he is accounted one of the family; and if he offended the king's peace, his hoſt was anſwerable for him. It is alſo written HOGENHINE and HOGENHYNE.

AGENT, Agens, in *Phyſics*, that whereby a thing is done, or effected; or that which has a power whereby it acts on another; or by its action induces ſome change in it. The word *agent* is uſed promiſcuouſly with EFFICIENT; and in contradiſtinction to PATIENT.

The ſchools divide *agents* into *natural* and *free*.

Agents, *natural or phyſical*, are thoſe immediately determined by the Author of nature, to produce one ſort of effect; with an incapacity to produce the contrary thereto.

Agents, *natural*, again, are ſubdivided into *univocal*; which are ſuch as produce effects of the ſame kind and denomination with the *agents* themſelves; and *equivocal*, whoſe effects are of a different kind, &c. from the *agents*.

The ſchoolmen reckon the following circumſtances neceſſary to the being of an *agent*; viz. that it be contiguous to the object, diſtinct from it, have a power over it, a ſphere of activity, and a proportion, or rate of acting.

Agent, *free* or *voluntary*, is that which may equally do any thing, or its oppoſite; as acting not from any predetermination, but from choice.—Such is the mind ſuppoſed to be; which has a ſpontaneous power of chooſing or refuſing.

It is a celebrated queſtion among *philoſophers* and *divines*, whether man be a free, or a neceſſary *agent?* It may be thus ſtated: man is a neceſſary *agent*, if all his actions are ſo determined by the cauſe preceding each action, that no one paſt action could poſſibly not have come to paſs, or have been otherwiſe than it was; nor one future action can poſſibly not come to paſs, or be otherwiſe than it ſhall be. On the contrary, man is a free *agent*, if he be able at any time, in certain circumſtances, to do different things; or in other words, if he is not ever unavoidably determined in every point of time, by the circumſtances he is in, to do that one thing he does, and not poſſibly to do any other.

Which of theſe two definitions agrees to man, is a queſtion of fact to be determined by what we experience in ourſelves, with regard to the operations of our own minds. See LIBERTY, NECESSITY, and WILL.

The term *agent* evidently implies a power of ſelf-determination; and the epithet *neceſſary*, applied to *agent*, forms a ſoleciſm both in ſenſe and language. Price's Review, &c. p. 315, &c.

Agent is more particularly uſed for the miniſter of a prince, or ſtate, at another court.

In which ſenſe, *agents* are commonly reputed a ſpecies of public miniſters, or EMBASSADORS; but they differ eſſentially, as *agents* are not inveſted with any repreſentative character, although intruſted with the affairs, and intereſts of their princes. See ENVOY.

Agent is alſo uſed for a perſon entruſted with the management of affairs, either of a corporation, or a private perſon.—In which ſenſe, the word coincides with *deputy*, *procurator*, *ſyndic*, *factor*, &c.

Among the officers in the EXCHEQUER, there are four *agents* for taxes.

Agents *of bank and exchange*, are public officers, eſtabliſhed in the trading cities of France, to negociate matters between merchants, relating to bills of exchange, and the buying and ſelling of goods. The ſame with thoſe who, among us, are called EXCHANGE-BROKERS.

Agents *of the victualling office* are officers under the commiſſioners, appointed to buy, and contract for proviſions, &c. Some of theſe are ſettled in the ports, where they have much the ſame office and authority as the commiſſioners at London.

Agent-*victualler* is uſed in the ſame ſenſe.

Agent is more particularly uſed in *Medicine*, for a being which has motion within itſelf.

In which ſenſe it ſtands oppoſed to patient, which receives motion from another; thus medicines are conſidered as *agents*, or as acting on the body; by way of contradiſtinction from aliments, which are ſuppoſed rather to be acted on, than to act.

Agent *and patient*, in *Common Law*, is where a perſon does, or gives, ſomething to himſelf; ſo that he is at the ſame time both the doer or giver, and the receiver or party it is done to.—Such is a woman, when ſhe endows herſelf with part of her huſband's inheritance.

Agent, in *Chemiſtry*, is ſometimes attributed to menſtrua, or ſuch bodies as in mixture have the greateſt ſhare of activity and motion.

That internal *agent* in man, whereby all the vital motions neceſſary to the preſervation and reſtoration of the body are managed, is by ſome called *nature*; by others *archæus*, *callidum innatum*, animal ſoul, vital ſpirit, or principle, &c.

Agent is ſometimes alſo uſed in *Chemiſtry* for what we more uſually call *inſtrument*.

In which ſenſe, fire, water, air, earth, and menſtrua, are chemical *agents*.

Agentes *in rebus*, one of the ranks of officers, in the court of the Conſtantinopolitan emperors, whoſe buſineſs was, to collect and convey the corn both for the army, and houſhold; carry letters and meſſages from court to all parts of the empire; regulate couriers, and their vehicles; to make frequent journeys and expeditions through the provinces; inſpect any motions, diſturbances, machinations tending that way, and give early notice thereof to the emperor.

The *agentes in rebus*, are by ſome made ſynonymous with our poſt-maſters, but their function was of greater extent. They correſpond to what the Greeks call ϖυροφοροι, and the Latins, *veredarii*.

There were divers orders or degrees of *agentes in rebus*, as *tribuni*, *primicerii*, *ſenatores*, *ducenarii*, *biarchi*, *circitores*, *equites*, *tyrones*, &c. through all which they roſe *gradatim*.

Their chief was denominated *princeps*, which was a poſt of great dignity, being reckoned on a level with that of proconſul.

The *princeps agentium in rebus*, reſided at Conſtantinople, others of them were ſettled in every part of the empire. They are alſo ſaid to have ſerved as interpreters.

AGEOMETRIA, a defect in point of GEOMETRY, or a deviation from the ſtrict principles and concluſions of that ſcience.

This is otherwiſe called *ageometreſia*.

Some have complained of the *ageometria* of the Scriptures in reſpect of the proportions of the *brazen* SEA, ARK, &c.

AGER *vectigalis privatus*, in Roman *Antiquity*, that whoſe property was granted to private perſons on the reſerve of a certain rent, or tribute.

Ager *vectigalis publicus*, that whoſe property was reſerved to the public, and being let out to farm, the rents or profits accrued to the public treaſury.

Ager is alſo uſed for a certain portion or meaſure of land, anciently allowed in the diviſion of grounds to each citizen.

In the early days of the Roman ſtate, the *ager* was only two *jugera*, amounting to $1\frac{1}{4}$ Engliſh acre.—After the expulſion of the kings, ſeven *jugera* were allowed a plebeian.—Under the conſulate of C. Licinius Stolo, in the year of Rome 376, a law was made to limit eſtates to 500 *jugera*, or 330 Engliſh acres. Under Julius Cæſar another *agrarian* law was publiſhed, by which thoſe who enlarged their pittance of land, were to pay 50 *aurei* to the public.

Ager is alſo uſed, in *Middle Age Writers*, for what we now call an ACRE.

Ager *mineralium*, among *Chemiſts*, denotes the element of WATER; conſidered as the field, or ſoil, wherein MINERAL bodies have their firſt root, and from whence they ſhoot their branches upon the earth.

Ager *naturæ*, ſignifies the womb.

AGERATUM, in *Botany*, the name of a genus of plants, of the *ſyngeneſia polygamia æquali*, the characters of which are theſe: the flower is monopetalous, of the perſonated kind, and tubular in its lower part, and in the upper divided into two lips, the upper of which is bifid, and the lower divided into three ſegments. The piſtil ariſes from the cup, and finally becomes an oblong membranaceous fruit, divided into two cells, which contain a number of very fine ſeeds affixed to a placenta.

Ageratum, in *Botany*, an officinal plant, popularly called *maudlin*.

The word is compounded of the privative α, and γηρας, *old age*, on account of its flowers, which do not eaſily wither or grow old.

Ageratum bears a near reſemblance to the coſtmary, from which it only differs, in that its flowers are formed into looſe umbels; there are divers ſpecies of it. The officinal is called *ageratum foliis ſerratis*, C. B. or *ageratum luteum*, and is the ſame with the *eupatorium meſues*, ſo called on account of its virtue in diſeaſes and obſtructions of the liver.

Ageratum is of an aſtringent quality, and as ſuch recommended by Rivierius, and others, againſt incontinence of urine; Geſner has alſo diſcovered a briſk purgative power in its roots. But it is rarely preſcribed in the preſent practice.

AGERATUS *lapis*, in the *Materia Medica* of the ancients, the name of a ſtone mentioned by Galen and other writers; and ſaid to be of the nature of the Phrygian ſtone, but more aſtringent; and as that was uſed in dying, this was in dreſſing of leather. We have no account of its external appearance, but probably it contained vitriol, and perhaps alum.

The great uſe of vitriol or copperas in the management of leather, is well known; and the ſtones which contain it, or pyritæ, are every where common. The method uſed alſo in the preparation of the *Phrygius lapis*, which was the wetting and ſlightly calcining it, muſt be very proper to make the vitriol contained in this appear and exert itſelf in the working with it. This ſtone is uſed by ſhoemakers to poliſh women's ſhoes.

AGERIUM. See AGISTMENT.

AGES, ſignifies the palm, or hollow of the hand.

AGGADA, in Jewiſh *Antiquity*, an ingenious tale, or ſtory; of which kind there are many in the Talmud.

There are ſeveral books extant among the Jews under this title. R. San-Iſrael Ben Juda has publiſhed *Novellas Aggadarum*, or new explanations of the ſtories and relations in the TALMUD, diſcovering the hidden meanings thereof.

AGGER, in ancient *Latin Writers*, denotes the middle part of a military road, raiſed into a ridge, with a gentle ſlope on either ſide, to make a drain for the water, and keep the way dry.

AGGER is alſo uſed for the whole road, or military way.

Where high-ways were to be made in low grounds, as between two hills, the Romans uſed to raiſe them above the adjacent land, ſo as to make them of a level with the hills. Theſe banks they called *aggeres*. Bergier mentions ſeveral in the *Gallia Belgica*, which were thus raiſed, ten, fifteen, or twenty feet above ground, and five or ſix leagues long.

They are ſometimes alſo called *aggeres calceati*, and now generally known by the name CHAUSSEES, or CAUSEWAYS.

AGGER alſo denotes a work of fortification, uſed both for the defence and the attack of towns, camps, &c.

In which ſenſe, *agger* is the ſame with what was otherwiſe called *vallum*, and in latter times *aggeſtum*, and among the moderns *lines*; ſometimes *cavaliers*, *terraſſes*, &c.

The *agger* was uſually a bank, or elevation of earth, or other matter, bound and ſupported with timber; having ſometimes turrets on the top, wherein the workmen, engineers, and ſoldiery, were placed. It was alſo accompanied with a ditch, which ſerved as its chief defence.

The uſual materials, of which it was made, were earth, boughs, faſcines, ſtakes, and even trunks of trees, ropes, &c. variouſly croſſed, and interwoven ſomewhat in the figure of ſtars; whence they were called *ſtellati axes*. Where theſe were wanting, ſtones, bricks, tyles, ſupplied the office: on ſome occaſions, arms, utenſils, pack-ſaddles, were thrown in to fill up. What is more, we read of *aggers* formed of the carcaſſes of the ſlain; ſometimes of dead bones mixed with lime; and even with the heads of ſlaughtered citizens. For want of due binding, or ſolid materials, *aggers* have ſometimes tumbled down, with infinite miſchief to the men.

The beſiegers uſed to carry on a work of this kind nearer and nearer towards the place, till, at length, they even reached the wall. The methods taken, on the other ſide, to defeat them, were by fire, eſpecially if the *agger* were of wood; by ſapping and undermining, if of earth; and, in ſome caſes, by erecting a counter *agger*.

The height of the *agger* was frequently equal to that of the wall of the place. Cæſar tells us of one he made, which was thirty feet high, and three hundred and thirty feet broad. Beſides the uſe of *aggers* before towns, the generals uſed to fortify their camps with the ſame; for want of which precaution divers armies have been ſurpriſed and ruined.

There were vaſt *aggers* made in towns, and places on the ſea-ſide, fortified with towers, caſtles, &c. Thoſe made by Cæſar and Pompey at Brunduſium, are famous. Sometimes *aggers* were even built acroſs arms of the ſea, lakes, and moraſſes; as was done by Alexander before Tyre, and by M. Antony and Caſſius.

The wall of Severus, in the north of England, may be conſidered as a grand *agger*, to which belong ſeveral leſſer ones. Beſides the principal *agger*, or *vallum*, on the brink of the ditch, Mr. Horſley deſcribes another *agger* on the ſouth-ſide of the former, about five paces diſtant from it, which he calls the ſouth *agger*; and another larger *agger* on the north-ſide of the ditch, called the north *agger*. This latter he conjectures to have ſerved as a military way; the former, probably, was made for an inner defence, in caſe the enemy ſhould beat them from any part of the principal *vallum*, or to protect the ſoldiers againſt any ſudden attack from the provincial Britains.

AGGER *Tarquinii*, *Tarquin's agger*, was a famous fence built by Tarquinius Superbus, on the eaſt ſide of Rome, to ſtop the incurſions of the Latins, and other enemies, whereby the city might be infeſted.

AGGER is alſo uſed for the earth dug out of a trench, and thrown upon the brink of it.

In which ſenſe, the chevalier Folard thinks the word to be underſtood, when uſed in the plural number, ſince we can hardly ſuppoſe they would raiſe a number of cavaliers, or terraſſes.

AGGER is alſo uſed for a bank, or wall, erected againſt the ſea, or ſome great river, to confine or keep it within bounds.

In which ſenſe, *agger* amounts to the ſame with what the ancients called *tumulus* and *moles*; the Dutch, *dyke*; we, *dam*, *ſea-wall*.

AGGER alſo denotes a heap of earth, raiſed over the graves of the ancients.

In which ſenſe, it amounts to the ſame with *tumulus*; and is ſometimes alſo called *aggeſtum*.

AGGLESTONE, otherwiſe called *Stone-Barrow*, and vulgarly the *Devil's Night Cap*, is a remarkable monument of antiquity, ſituated in the N. E. extremity of the iſle of Purbeck. Its dimenſions are 60 feet in circumference at the bottom, in the middle 80, and at or near the top 90; and it is computed to contain 407 tons of ſtone. The name ſeems to be derived from the Saxon *halig*, or *hælig*, *holy*, and *ſtan*, *ſtone*, which expreſſes its ancient uſe; as it was probably a rock-idol in the Britiſh age.

AGGLUTINANTS, AGGLUTINANTIA, in *Medicine*, a ſpecies of ſtrengthening medicines, whoſe office and effect is to adhere to the ſolid parts of the body, and thus recruit, and ſupply the place of what is worn off, and waſted, in the animal actions.

Agglutinants are moſt of them of the glutinous kind, or ſuch as eaſily form themſelves into jellies, and gummy conſiſtencies; whence the name *agglutinant*, which is formed of *ad*, *to*, and *gluten*, *glue*.

For the operation and uſe of *agglutinants*, ſee STRENGTHENERS.

The principal ſimples which come under this claſs, found in the ſhops, are iſinglaſs, olibanum, gum Arabic, dragon's blood, caſſia, ſago, vermicelli, pulſe, comfrey, plantain, &c.

AGGLUTINATIO *Pilorum*, a healing or reducing the hairs of the eye-lids, that grow inwards, to their natural order and ſituation. This may be done by maſtich applied with a probe, which bends the hairs back into their proper order. Bitumen, the ſlime of a ſnail taken off with a needle, the juice of hawks-weed, the liquor of agglutinants, or ammoniac, produce the ſame effect.

AGGLUTINATION, literally, denotes the act of joining, or cementing two bodies together, by means of a proper *gluten*, or GLUE. See CEMENT.

In *Medicine*, the term is peculiarly uſed for the appoſition or adherence of a new ſubſtance; or the giving a greater conſiſtence to the animal fluids, to fit them the more for nouriſhment.

Some aſſign a difference between *agglutination* and *aſſimilation*: in that ſpecies of leproſy, called λευκη, there is an adheſion, or *agglutination* of the nutriment, but no *aſſimilation*. In the anaſarcous dropſy, on the contrary, there is an *adjunction*, without any *agglutination*; i. e. there is an afflux of new matter, or nouriſhment, but this ſo thin and watery, that it wants the due ſtiffneſs and tenacity to make it bind.

Some will have *agglutination* to be effected by a *ferment*; others aſſert, that by reaſon of the glutinous quality of the chyle, a mere contact ſuffices to make it adhere to the parts.

AGGLUTINATION is uſed by ſome aſtronomers to denote the meeting of two or more ſtars in the ſame part of the ZODIAC.

AGGLUTINATION is more peculiarly underſtood of the ſeeming coalition of ſeveral ſtars, ſo as to form a NEBULOUS ſtar.

AGGRAVATION, the act of augmenting a CRIME, or the PUNISHMENT thereof.

The word is compounded of *ad*, *to*; and *gravis*, *heavy*.

Aggravation, in the Romiſh *Canon Law*, is particularly uſed for an *eccleſiaſtical* cenſure, threatening an EXCOMMUNICATION, after three admonitions uſed in vain.

From *aggravation*, they proceed to *re-aggravation*; which is the laſt EXCOMMUNICATION.

AGGREGATÆ *glandulæ*, the ſmall glands in the cellular, which is next to the villous coat of the inteſtines, are ſo called. But as theſe glands are not viſible in an uninjected gut, many anatomiſts ſuſpect them to be only little bits of ſeparated wax.

AGGREGATE, the ſum, or reſult of ſeveral things *aggregated*, or added together.

The word is formed of *ad*, *to*; and *grex*, *gregis*, *a flock*.

Natural bodies are *aggregates*, or aſſemblages of particles, or corpuſcles, bound together by the principle of attraction.

Bodies politic are likewiſe ſaid to be *aggregate*; ſuch as mayor and commonalty, dean and chapter, &c. in contradiſtinction to corporations *ſole*; ſuch as the king, a biſhop, &c.

Aggregate, in general, ſignifies a body reſulting from the union of others which are ſmaller, the whole ſum of which combined is called the *aggregate*. It is particularly uſed by ſome modern *chemiſts* and *naturaliſts*, for a numerous collection of atoms, or minuteſt corpuſcles, whether homogeneous or heterogeneous, joined together by contiguity, without regard to the quality of ſuch atoms. In which ſenſe, *aggregate* differs from MIXT, as the former ſuppoſes no particular ſituation, or poſition, of the corpuſcules, other than what ariſes from their proportion, and the relation they bear to the ambient bodies, among which the coalition is formed.

Aggregate alſo differs from *mixt*, as the latter is formed immediately out of the principles of matter, ſo firmly united, as that it is very difficult, if not impoſſible, to ſeparate them.

Aggregate again differs from *compound*, as the latter is formed out of *mixts*, and is eaſily diſſolvable.

Aggregates then are the ultimate compounds, or the laſt effects of compoſition; they reſolve into compounds as their next ingredients, theſe into mixts, and mixts into ſimples, or principles; though, in ſtrictneſs, *aggregates* may reſolve alſo into mixts, and mixts into ſimples, inaſmuch as they conſiſt of heterogeneous parts.

This doctrine and diſtinction of *aggregates*, *mixts*, and *compounds*, is the foundation of the *chemical theory* of Becker and Stahl; the laſt of whom has traced it with great exactneſs. Hence has riſen a new doctrine of earths, metals, &c. which has ſince been illuſtrated and extended by the beſt modern chemiſts.

Aggregate, in *Botany*, is a term uſed to expreſs thoſe flowers, which are compoſed of parts or florets, ſo united by means either of the receptacle or calyx, that no one of them can be taken away without deſtroying the form of the whole. They are oppoſed to *ſimple* flowers, which have no ſuch common part, and are uſually divided into ſeven kinds, viz. the *aggregate*, properly ſo called, whoſe receptacle is dilated, and whoſe florets are ſupported by foot-ſtalks; ſuch are the blue daiſy, thrift, or ſea-pink, &c. the *compound*; the *umbellati*; the *cymoſe*; the *amentaceous*; the *glumoſe*, and the *ſpadiceous*.

Aggregate *fund*. See FUND.

AGGREGATION, **Aggregatio**, in *Phyſics*, a ſpecies of UNION, whereby ſeveral things, which have no natural dependence, or connection with one another, are collected together, ſo as in ſome ſenſe to conſtitute one. Thus, a heap of ſand, or a maſs of ruins, are bodies by *aggregation*.

Aggregation, in *Chemiſtry*. See AGGREGATE.

Aggregation is alſo uſed *figuratively*, for ASSOCIATION.

We ſay, to be of a company, or community, by *aggregation*.—An *aggregation* of ſeveral doctors to the faculty of laws.—In Italy, *aggregations* are frequently made of houſes, or families; by virtue whereof, they all bear the ſame name and arms.

AGGRESSOR, in *Law*, he, of two contending parties, who makes the aſſault, or attack; or who began the quarrel, encounter, or difference.

In criminal matters, it is always firſt inquired who was the *aggreſſor*.

AGIADES, a kind of Turkiſh ſoldiery, employed in fortifying of camps, ſmoothing of roads, and the like offices.

AGIAHALID, the name of an Egyptian tree, called alſo *lycio* and *lycium*; it reſembles the wild pear.

AGIASMA, among *Ancient Writers*, is ſometimes uſed for the whole church, ſometimes for the more ſacred part, or *bema*, wherein maſs was ſaid.

AGILD, or **Agilde**, in our *Ancient Cuſtoms*, a perſon ſo vile, that whoever killed him was to pay no mulct for his death.

The word comes from the privative *α*, and the Saxon *gildan*, *to pay*.

AGILENSZ, in *Botany*, a name uſed, by ſome, for the common hazel.

AGILITY, **Agilitas**, a light, and active habitude, or diſpoſition of the members and parts, deſigned for motion.

Agility. Some define *agility*, the art or habit of directing our ſtrength, i. e. of intending, or remitting it to advantage.

The improving of *agility* was one of the chief objects of the inſtitution of games and exerciſes. The *athletæ* made particular profeſſion of the ſcience of cultivating and improving *agility*.

AGILLARIUS, in ancient *Law-books*, a hayward, or keeper of a herd of cattle in a common field.

The *agillarius*, or *heyward of a town*, or *village*, was to ſuperviſe the greater cattle, or common herd of beaſts, and keep them within their due bounds; and was otherwiſe called *bubulcus*, q. d. *cow-ward*, (whence the reproachful term *coward*.)—If he were a cottager, or other ſervile tenant, he was exempted from the cuſtomary ſervices, as being preſumed to be always attending on his herd, as a ſhepherd on his flock, who had therefore the like privilege.

The *agillarius of the lord of a manor*, or a *religious houſe*, was an officer appointed to take care of the tillage and harveſt-work, to pay the labourers, and ſee there were no incroachments made, or treſpaſſes committed: the ſame in effect with what has been otherwiſe called *fieldſman*, and *tithing-man*; and among us BAILIFF.

AGIO, in *Commerce*, an Italian word ſignifying *aid*, is a term uſed, chiefly in Holland, and at Venice, for the difference between the value of bank money, and current money.

So that if a merchant who ſells his merchandiſe, ſtipulated to be paid either 100 livres bank money, or 105 caſh, or current money, in ſuch caſe the *agio* is ſaid to be 5 per cent.

The bank *agio* varies in almoſt every place. At Amſterdam it is uſually from 3 to 5 per cent.; at Rome, near 25 per 1500; at Venice 20 per cent. fixed; at Genoa from 15 to 16 per cent.

Agio is alſo uſed for the profit ariſing from diſcounting a note, bill, or the like.

Agio is alſo uſed, though with ſome impropriety, for the rate of exchange of a ſum negociated, whether to profit or loſs. It is alſo ſometimes called AGAI.

Agio *of aſſurance* is uſed, by ſome, for what we more uſually call *policy of aſſurance*.

AGIOSYMANDRUM, a wooden inſtrument uſed by the Greek and other churches, under the dominion of the Turks, to call together aſſemblies of the people.

The word is compounded of *αγιος*, *holy*, and *σημαινω*, *I ſignify*.

The *agioſymandrum* was introduced in the place of bells, which the Turks prohibited their Chriſtian ſubjects the uſe of, leſt they ſhould make them ſubſervient to ſedition.

AGIS, a name for the THIGH. See FEMUR.

AGIST, in *Law*, ſignifies to take in and feed the cattle of ſtrangers in the king's foreſt, and to gather up the money due for the ſame. Chart. de Foreſta, 9 H. III. cap. 9.

The officers appointed for this purpoſe are called *agiſters*, or *giſtakers*, and are made by the king's letters patent: there are four of them in every foreſt, wherein the king hath any pannage. Manw. For. Laws. 8vo.

The time for this is fifteen days before Michaelmas, and as many after, when the running of the cattle cannot prejudice the game.

AGISTMENT, ſuppoſed to be formed of the French *giſte*, *a bed*, or lying place: though Kennet excepts to this etymon, and chooſes rather to derive it from *ager*, the field, or feeding place for cattle; imagining *agiſtment* to have originally been the ſame with *agrarium*, *agerium*, or *agreticum*, the profit of feeding cattle on ſuch a piece of ground.

Agistment, *agiſtamentum*, is where other men's cattle are taken into any ground, at a certain rate per week. It is ſo called, becauſe the cattle are ſuffered *agiſer*, that is, to be *levant* and *couchant* there; and many great farms are employed to this purpoſe. 2 Inſt. 643. Our graziers call cattle which they thus take in to keep, *giſements*; and to *giſe*, or *juice*, the ground, is when the occupier thereof feeds it not with his own ſtock, but takes in the cattle of others, to *agiſt* or paſture it. *Agiſtment* is likewiſe the profit of ſuch feeding in a ground or field; and extends to the depaſturing of barren cattle of the owner, for which tythes ſhall be paid to the parſon.

Agistment is alſo uſed metaphorically for a charge, or burden, on any thing.

In this ſenſe we meet with *terræ ad cuſtodiam maris agiſtatæ*, i. e. *charged with a tribute to keep out the ſea*.—So *terræ agiſtatæ*, are lands whoſe owners are bound to keep up the ſea-banks.

Agistment, the duty and levy for repairing the banks and walls in Romney-marſh was particularly called *agiſtamentum*;

ſtamentum; and the act of laying ſuch a proportion of this duty on the ſeveral eſtates was called *ægiſtatio.* Spelman.

AGISTOR, or AGISTATOR, ſee AGIST and AGISTMENT.

AGITATION, AGITATIO, properly ſignifies *ſhaking*; or reciprocal MOTION of a body.

The *prophets*, *quakers*, Pythian prieſteſſes, &c. were ſubject to violent *agitations* of body. See INSPIRATION.

Among phyſiologiſts, the term is ſometimes appropriated to that ſpecies of earthquake, called *tremor*, or *arietatio.*

Among the philoſophers, it is chiefly uſed for an inteſtine commotion of the parts of any natural body.

Thus, fire is ſaid to *agitate* the minute particles of bodies. —Fermentation, and effervеſcence, are attended with a briſk *agitation* of the particles.

Heat is ſuppoſed, by ſome, to conſiſt in the *agitation* of the parts of the hot body; and ſound is produced by a tremulous *agitation*, excited firſt in the ſonorous body, and communicated thence to the ambient air.

AGITATION is likewiſe uſed for a violent hurry or perturbation of ſpirits, occaſioned by ſome predominant paſſion.

AGITATION is alſo uſed, in *Medicine*, for a ſpecies of exerciſe, popularly called *ſwinging:* and, in general, for any exerciſe which ſhakes the body.

Bartholine mentions fits of the tooth-ach, deafneſs, &c. removed by vehement *agitations* of the body; and they have been found of eſpecial uſe for preventing and diſſolving concretions.

Dr. Sydenham attributes the great benefits of riding to *agitation*, which is very efficacious in removing obſtructions of the *viſcera.* See ÆORA.

Sanguification is in great meaſure effected by the *agitation* of the parts of the blood and chyle, in their continual circulation. Digeſtion itſelf is only ſuppoſed to be an inſenſible kind of *agitation.*

AGITATION *of beaſts in the foreſt*, anciently ſignified the DRIFT of beaſts in the foreſt.

AGITATIVE, ſomething having power to agitate or ſhake another.

AGITATIVE *force* of a *pendulum*, is that which produces motion in it.

The *agitative force* of the pendulum ariſes from three things: 1. The power of gravity. 2. The weight faſtened at the end of the rod. 3. The diſtance of that weight from the point of ſuſpenſion; or, which amounts to the ſame thing, the length of the rod, or *pendulum.*

AGITATOR, in *Antiquity*, a CHARIOTEER; or he who drove or directed a chariot, or horſes in a race.

In which ſenſe, *agitator* amounts to the ſame with what the Romans called *auriga*, and we a coachman, driver, &c.

AGITATOR was more particularly uſed for him who drove in the public *curule* games in the *circus.*

The *agitators* were diſtinguiſhed, by their habits, into *ruſſati, albati*, *praſini*, and *veneti*, which gave riſe and denomination to ſo many factions. Beſides which, they had other marks, or enſigns of their family, correſponding to what we call arms.

The conquerors, beſides the ordinary rewards, *braviæ*, as crowns, &c. had ſtatues erected to them in the circus; on the baſes whereof, their titles, atchievements, &c. were inſcribed; ſeveral of which are ſtill found among ancient inſcriptions, drawn in the following formulæ: *Vicit ſejuge*, *ſeptejuge*, *bigas*, *trigas*, *uno anno*, *alieno principio*, *duobus introjugis*, &c.

It has been diſputed, whether the *agitators* were on the footing of mimes and pantomimes, and by law held infamous?

AGITATORS, *miliarian*, *agitatores miliarii*, were thoſe who drove in the forum at Conſtantinople, a place adorned with ſtatues, &c. after the manner of the circus at Rome, having a *milium*, or *miliarium*, in the middle.

AGITATORS, in our Engliſh affairs, were certain officers, created by the army in 1647, to take care of its intereſts. Cromwell leagued himſelf with the *agitators*, whom he found to have greater intereſt than the council of war.—The *agitators* undertook to make propoſals relating to the reformation of religion, and the ſtate.

AGLAIA, the name of the youngeſt of the three Graces, eſpouſed to Vulcan.

AGLAOPHOTIS, in *Botany*, a name uſed, by ſome, for PIONY.

AGLECTS, AGLEETS, or AGLEEDS, among floriſts, the APICES, or pendants hanging on the tip-ends of CHIVES, or STAMINA; as in tulips, roſes, ſpike-graſs, &c.

AGLIA, among *Ancient Phyſicians*, a whitiſh cicatrix, or ſpot in the eye, formed by a congeſtion of humours.

AGLIBOLUS. The Palmyrines worſhipped the ſun under this title.

AGLITHES, uſed by Hippocrates for a clove of garlick.

AGME, in *Surgery*, ſignifies a fracture.

AGMEN, in *Antiquity*, properly denotes a Roman army in march.

In which ſenſe, it ſtands contradiſtinguiſhed from *acies*; which denoted the army in battle array; though, on ſome occaſions, we find the two words uſed indifferently for each other.

The Roman armies, in their marches, were divided into *primum agmen*, anſwering to our vanguard; *medium agmen*, our main-battle; and *poſtremum agmen*, the rear-guard.

The order of their march was thus: after the firſt ſignal with the trumpets, &c. the tents were taken down, and the baggage packed up; at the ſecond ſignal the baggage was to be loaden on the horſes and carriages; and at the third ſignal, they were to begin their march. Firſt came the *extraordinarii*; then the auxiliaries of the firſt wing, with their baggage; theſe were followed by the legions. The cavalry marched either on each ſide, or behind.

AGMEN *pilatum*, that diſpoſed in a narrow oblong form, or column; being withal cloſe and compact; thus called, as reſembling the figure of a *pila*, or pier. Vegetius compares it to that of a broach, or ſpit. This form was chiefly uſed in marching without their baggage, through bad ways and cloſe countries.

AGMEN *quadratum*, that ranged ſomewhat in a ſquare form; being the method ordinarily obſerved in the Roman armies. This was alſo called *agmen grave*, by the Greeks τετραγωνος ταξις. The three lines, or columns, in which the army uſually marched, were conſiderably more in length, or breadth, than in depth: but as the baggage marched ſomewhat in the ſame order, the whole approached to the figure of a ſquare.

AGMEN is alſo uſed for any number of perſons, or even animals, moving or advancing in ſome regular order.

AGNACAT, *Scaligeri pyri ſpecie*; in a country of America, beyond the Terra de Labrador, toward the iſthmus of Darien, there is a tree of the figure and ſize of the pear-tree, always covered with leaves, and of an extraordinary greeneſs and luſtre. It bears a fruit alſo like a pear, but green even when it is ripe; the pulp is of the ſame colour, ſweet, fat, and taſtes like butter. It is a powerful promoter of venereal vigour. Ray's Hiſt.

AGNANTHUS, in *Botany*, the name given by Vaillant to a genus of plants, called afterwards CORNUTIA, by Plumier and Linnæus. It is of no medical uſe.

The word is formed of αγνος, *chaſte*, and ανθος, *a flower.*

AGNATI, in the Roman *Law*, the male deſcendants from the ſame father.

AGNATION, in the *Civil Law*, the kinſhip, or relation, between the deſcendants of the ſame father, being males, and iſſued only from males.

The word is formed from *ad*, *to*; and *naſci*, *to be born.*

Agnation differs from *cognation*, as the latter is an univerſal name, under which the whole family, and even the *agnati* themſelves, are contained; and *agnation*, a particular branch of *cognation*, which only includes the deſcendants in the male line. Again, *agnation* is properly only a civil name, as that of *gens*, or family; *cognation*, a natural name, or derived from blood.

By the law of the *Twelve Tables*, males and females ſucceeded one another, according to the order of proximity, and without any regard to the ſex: but the laws were afterwards changed in this reſpect, by the *Lex Voconia*; and women were excluded from the privileges of *agnation*, excepting ſuch as were within the degree of conſanguinity; i. e. excepting the ſiſters of him who died abinteſtate; and it was hence that the difference between *agnati* and *cognati* firſt took its riſe.

But this difference was again aboliſhed by Juſtinian (Inſt. 3. 10.) and the females were reinſtated in the right of *agnation*; and all the deſcendants on the father's ſide, whether males or females, were appointed to ſucceed each other indiſcriminately, according to the order of proximity.

Hence, *cognation* came to take in all the relations of the mother as well as father; and *agnation* to be reſtrained to thoſe of the father alone.

Adoptive children enjoy the privileges of *agnation*; which was called *civil* in their reſpect, in oppoſition to the other, which was *natural.*

AGNEL, an ancient French gold coin, firſt ſtruck under the reign of St. Louis, worth about twelve ſols, ſix deniers. The *agnel* is alſo called ſometimes *mouton d'or*, and *agnel d'or.* The denomination is ſuppoſed to have ariſen from the figure of a lamb, or ſheep, ſtruck on one ſide.

AGNELET, an ancient French ſilver coin, firſt ſtruck under Philip le Bel, worth about twenty ſols.

AGNIFER is an appellation applied, by ſome *Eccleſiaſtical Writers*, to John the Baptiſt, and uſed in the ſame ſenſe with *præcurſor*, or *fore-runner.*

AGNIL, ſee INDICUM.

AGNINA *membrana*, the ſame as the AMNIOS.

AGNINA *lactuca*, ſee LACTUCA.

AGNOETÆ, in *Church Hiſtory*, a ſect of ancient heretics, who maintained that Chriſt, conſidered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgment.

The word is formed of αγνοεω, *ignoro*, *to be ignorant of.* Eulogius, patriarch of Alexandria, aſcribes this doctrine to certain ſolitaries in the neighbourhood of Jeruſalem, who, in defence hereof, alledged divers texts of the New Teſtament, and, among others, this of St. Mark, ch. xiii. ver. 32. *Of that day and hour knoweth no man; no not the angels who are in heaven, neither the Son, but the Father only.*

There ſeem to have been two kinds of *agnoetæ*, though they are uſually confounded.

AGNOIA, a word uſed by phyſicians, when a perſon in a fever does not know his acquaintance. When a rigor accompanies this ſymptom, Hippocrates ſays it is dangerous.

AGNOMEN, in *Antiquity*, an epithet given to a perſon, either by way of praiſe, or diſpraiſe, or from ſome remarkable event, which became, as it were, an additional name, but peculiar to the perſon, and not deſcendible to his iſſue. Thus, one of the Scipios was named *Africanus*, and the other *Aſiaticus*, from the brave atchievements which the one performed in Africa, and the other Aſia.

The *agnomen* was the third in order of the three Roman names.—Thus in Marcus Tullius Cicero, Marcus is the *prænomen*, Tullius the *nomen*, and Cicero the *agnomen*.

Others think the *agnomen* to have been the fourth or honorary name, ſuperadded on account of ſome extraordinary action or virtue. Some imagine *agnomen* and *cognomen* to have been the ſame, as they generally are, except in caſes of ADOPTION.

It was a cuſtom among the Romans, for a perſon, when *adopted* into another family, to lay aſide all his other names, and only retain his family name, to which he added the *prænomen*, *nomen*, and *cognomen* of the adopter. Thus P. Cornelius Scipio, being adopted by Q. Cæcilius Metellus, laid aſide his *prænomen* PUBLIUS, and *nomen* CORNELIUS, and was called Q. Cæcilius Metellus Scipio.

AGNOS, in *Ichthyology*, a name given by Athenæus, and many other of the Greek writers, to that fiſh called *callyonymus*, or *uranoſcopus*. It is a ſpecies of the *trachinus*, and is diſtinguiſhed, by Artedi, from the reſt of that genus, by the name of the *trachinus*, with a great number of beards growing from the lower jaw.

AGNUS *Caſtus*, the chaſte tree, in *Botany*. Its characters are theſe: the empalement of the flower is cylindrical, and indented in five parts; the flower has one ringent petal, the brim plain, and divided into two lips, which are trifid, and the middle ſegment broadeſt in both. It has four hair-like ſtamina, two of them ſhorter than the other, terminated by moveable ſummits; and a roundiſh germen ſupporting a ſlender ſtyle, crowned by two awl-ſhaped ſpreading ſtigmas. The germen turns to a globular berry with four cells, each containing one oval ſeed. There are four ſpecies.

This plant was famous among the ancients as a ſpecific for the preſervation of chaſtity, and the preventing of all venereal deſires, pollutions, &c.

The Greeks call it αγνος, *chaſte*; to which has ſince been added the reduplicative *caſtus*, v. d. *chaſte chaſte*.

The Athenian ladies, who made profeſſion of chaſtity, lay upon leaves of *agnus caſtus*, during the feaſt of Ceres. See CEREALIA.

This ſhrub is alſo called AGNON, VITEX, ſometimes *elæagnon*, SALIX *amerina*, *lygon*, *lygus*.

There are divers ſpecies of it. Pliny mentions two, the *greater*, called alſo the *white* kind, and the *leſſer*, or *black*. Miller ſpeaks of four; only one of which, called VITEX *foliis anguſtioribus, canabis modo diſpoſitis*, is pretty common in Engliſh gardens; the reſt are rare. Its ſeed is round, about the bigneſs of pepper, and having a pungent aromatic taſte: whence the French ſometimes call it *wild pepper*. This ſeed is ſaid to be more effectual than rue, in hardneſs of the liver or ſpleen; it is of the ſize of a pepper-corn. It grows in waſte grounds, about the banks of rivers, and contains a great deal of ſalt and oil, but little phlegm. The oil of it is inſipid, and of a ſaffron colour, and is eaſily obtained by expreſſion. It is a native of Italy.

AGNUS DEI, in the Romiſh *Church*, denotes a cake of wax, ſtamped with the figure of a lamb, ſupporting the banner of the croſs, conſecrated in due form by the pope, to be diſtributed in preſents among the people, and ſuppoſed to have great virtues annexed to it.

The name literally ſignifies *Lamb of God*; this being ſuppoſed an image, or repreſentation of the Lamb of God, who took away the ſins of the world.

They cover it up with a piece of ſtuff, cut in form of a heart, and carry it very devoutly in their proceſſions.—The Romiſh prieſts, and religious, derive conſiderable pecuniary advantage from ſelling theſe *Agnus Dei's* to ſome, and preſenting them to others. The pope provides a regular ſupply, by conſecrating once in ſeven years; they are diſtributed by the maſter of the wardrobe; and received by the cardinals, and other prelates, with great reverence, in their caps and mitres.—This ceremony they pretend to derive from an ancient cuſtom of the church, wherein part of the paſchal taper, conſecrated on Holy Thurſday, was diſtributed among the people, to perfume their houſes, fields, &c. in order to drive away devils, and to preſerve them from ſtorms and tempeſts. Other imaginary virtues are likewiſe attributed to them.

See concerning the origin of *Agnus Dei's*, Jour. des Sçav. tom. xxxi. p. 252. Mem. de Trev. ann. 1722. p. 2010. Their virtues, Act. Erud. Lipſ. Supp. tom. iv. p. 224. Their myſtic meanings, Du Pin, Bibl. Eccleſ. tom. xviii. p. 68. The order of conſecrating them, Magri, Notiz. de Vocab. Eccleſ. in voc.

Some authors alſo ſpeak of a kind of metalline *Agnus Dei's*, hung to chaplets, or pater-noſters.

The *Agnus Dei* is ſaid to have been firſt brought into the miſſal, by pope Sergius I.

The *Agnus Dei* is forbidden to be brought into England under pain of incurring a *premunire*. 13 Eliz. cap. 2.

AGNUS DEI, is alſo a name popularly given to that part of the maſs, wherein the prieſt, ſtriking his breaſt three times, rehearſes, with a loud voice, a prayer beginning with the words *Agnus Dei*.

AGNUS *Scythicus*, in *Natural Hiſtory*, a kind of *zoophyte*, or plant-animal, ſaid to grow in Tartary, reſembling the figure and ſtructure of a lamb. See ZOOPHYTON.

The *Scythian lamb* is alſo called *agnus vegetabilis*, *agnus Tartaricus*, and by the people of the country, *borometz*, *boramets*, or *boranetz*.

The uſual account given of this extraordinary production is, that the Tartars ſow in their ground a ſeed reſembling that of melon, but leſs oblong; from whence ariſes a plant called by them *borometz*, i. e. *lamb*, growing almoſt to the height of three feet, and having feet, hoofs, ears, and the whole head, excepting horns, reſembling that animal. In lieu of horns it has a peculiar ſort of hair, not unlike horns; it is covered with a fine thin ſkin, which being pulled off, is worn by the natives as a cover for the head. The pulp within reſembles that of the GAMMARUS; and when wounded, a liquor oozes out like blood. It lives as long as there is graſs and herbage around it; but when theſe are conſumed, it waſtes and dies. They add, that wolves are fond of it, while no other beaſts will feed on it.

Deuſingius ſeems to have been the firſt who ſuſpected this account to be fabulous; and Kempfer, when in the country, made diligent enquiry concerning it, but could hear of nothing like it.

As to the plants ſhewn under this denomination, in ſome repoſitories of rarities, they appear to be originally the roots, or ſtalks, of certain vegetables, probably of the capillary kind, covered with a woolly moſs, which naturally bearing reſemblance to the figure of a lamb, have been helped out and brought near to it by art, and the addition of new parts.

Sir Hans Sloane, and Breynius, gives us the figures and deſcriptions of ſuch *borometzes* in their collections. It is from theſe plants that the Indian moſs is gathered, famous for its uſe in ſtaunching blood. Breynius and Libavius have written expreſly on the *Agnus Scythicus*. Phil. Tranſ. Nº 390, and Nº 287.

AGOGA, in *Natural Hiſtory*, a ditch or drain for carrying off the water from a mine.

The word ſeems derived from αγωγη, *ductus*, of αγω, *duco*, *I draw*.

AGOGE, αγωγη, in the *Ancient Muſic*, a ſpecies of modulation, wherein the ſounds or notes proceed by continuous degrees of the ſcale, both riſing and falling. As when we ſing, re, mi, fa, ſol, la; la, ſol, fa, mi, re.

Agoge anſwers to what the Latins call *ductus*, and the Italians *conducimento*, and *di grado*: it ſtands contradiſtinguiſhed from *ploce*, *petteia*, &c.

Agoge makes the firſt part of the *melopœia*, or art of modulating.

There are three ſpecies or caſes of this modulation; firſt when the ſounds follow each other from grave to acute, i. e. riſing as in ſinging, BCDE. This the Latins call *ductus rectus*, and the Italians *conducimento retto*.

The ſecond, when they go from acute to grave, i. e. falling, as in the notes EDCB, called by the ancients *ductus revertens*, and by the modern Italians *conducimento ritornante*.

The third, when they riſe by flats and fall by ſharps, as in D, E, F *ſharp*, G, or, *vice verſa*, as in G, F *natural*, E *flat*, D. This the ancients call *ductus circumcurrens*, and the Italians *conducimento circoncorrente*.

AGOMPHIASIS, or GOMPHIASIS, a diſtemper of the teeth. It conſiſts in their being looſe in their ſockets.

AGON, in *Antiquity*, a diſpute or conteſt for the maſtery, either in ſome exerciſe of the body, or of the mind.

There were *agones* on certain days, in moſt of the ancient feaſts, and other ceremonies in honour of the gods, or heroes.

There were alſo *agones* eſtabliſhed expreſly, and not attached to any other ſolemnity.—Such was the *agon gymnicus*, at Athens; the *agon Nemæus*, inſtituted by the Argians in the 53d Olympiad; the *agon olympius*, inſtituted by Hercules, 430 years before the firſt Olympiad; the *agon Adrianalis*, inſtituted at Athens, by the emperor Adrian, called Παναθηναια, Πανελληνια, and Ολυμπιω Αδριανια.

The Romans had alſo *agones* inſtituted after the example of the Greeks: the emperor Aurelian eſtabliſhed the *agon ſolis*, *agon of the ſun*; and Diocleſian, the *agon capitolinus*, which was held every fourth year, after the manner of the Olympic games.—Hence, the years, inſtead of *luſtra*, are ſometimes numbered by *agones*. The *agon iſelaſticus*, inſtituted at Puzzuoli by the emperor Antoninus Pius, and held every fifth year, was a ſacred combat, and the victors at it were called *hieronicæ*: they were to be received into the city, through a breach in the wall, made on purpoſe. The *agon muſicus*, was that wherein either poets, or muſicians, diſputed for the prize; ſuch was that dedicated by Ptolemy to Apollo and the Muſes, with rewards aſſigned to the writers who gained the victory. Of this kind were alſo found in the Pythian, Nemæan, and Iſthmian games; alſo in the Olympic games, after Nero's time, who firſt introduced a muſical *agon* here; others were founded by the emperor Domitian, and others at Rome, Naples, Alba, &c. The *agon Neronianus*, a quinquennial combat, called alſo *Neronian*, from the name of its inſtitutor, who here bore away the prize for playing on the harp, *cithara*.

Agon is alſo uſed for a place near the Tyber, otherwiſe called *circus Flamineus*, wherein Curule games and combats were celebrated.

Agon is alſo uſed, by phyſicians, for the ſtruggle of death.

Agon was alſo a miniſter of ſacrifice, whoſe buſineſs was to ſtrike the victim. The name is ſuppoſed to have been derived hence, that ſtanding ready to give the ſtroke, he aſked *agon'*, or *agone? ſhall I ſtrike?*

The *agon* was alſo called *popa*, *cultrarius*, and *victimarius*.

AGONALES, in *Antiquity*, an epithet given to the Salii, conſecrated by Numa Pompilius to the god Mars, ſurnamed *Gradivus*.

They were alſo called *Quirinales*, from the *Mons Quirinalis*, where they officiated. Roſinus calls them *Agonenſes Salii*.

AGONALIA, in *Antiquity*, feaſts celebrated by the Romans, in honour of Janus; or, as ſome will have it, in honour of the god *Agonius*, whom the Romans uſed to invoke upon their undertaking any buſineſs of importance.

They appear to have been held thrice in the year, viz. on the fifth of the ides of January, on the twelfth of the calends of June, and the third of the ides of December.

AGONE. See Henbane.

AGONISMA, in *Antiquity*, the palm or prize given the victor in a game or combat.

AGONISTARCHA, in *Antiquity*, ſeems to have been much the ſame with *agonotheta*; though ſome ſuggeſt a difference, making it the office of the former to preſide at, and direct the private exerciſes of the *athletæ*, which they went through by way of practice, before they made their appearance on the public theatres or amphitheatres.

AGONISTIC, *agoniſtica*, the ſcience of what relates to the combats, or *agones* of the ancients.

In which ſenſe, *agoniſtic* amounts to much the ſame with *athletic*, and makes a branch of *gymnaſtics*.

Agonistic, αγονιστικον, is alſo uſed among *Ancient Phyſicians*, for cold ſpring-water.

The reaſon of the denomination is taken from the plentiful uſe of that element in the ſtate of an acute eryſipelaceous fever, wherein water was ſuppoſed to combat and ſtruggle with the febrile heat.

AGONISTICI, in *Antiquity*, a name given by Donatus to thoſe of his ſect, whom he ſent into the neighbouring places, fairs, markets, &c. to preach his doctrine; for which reaſon they were alſo called *circuitores*, *circelliones*, *catropitæ*, *coropitæ*, and, at Rome, *montenſes*.

They were called *agoniſtici*, from αγων, *combat*; becauſe they were ſent, as it were, to fight, and ſubdue the people to their opinion.

AGONIUM, in Roman *Antiquity*, was uſed for the day whereon the *rex ſacrorum* ſacrificed a victim. The ſame name was alſo given to the place wherein the games were anciently celebrated.

AGONOTHETA, **Agonothetes**, in *Antiquity*, a magiſtrate choſen, among the Greeks, to preſide, and have the ſuperintendency of their ſacred games, or combats; to defray the expences thereof, and to adjudge the prizes to the conquerors.

The word is compounded of αγων, *combat*, and θετης, *he who diſpoſes*.

Among the Romans, the like officer was denominated *deſignator*, and *munerarius*.

Middle age-writers uſually confound *agoniſtæ*, the combatants at the games, with the *agonothetæ*, or preſidents of them.

The *agonothetæ* had the immediate charge of the manner of life, diſcipline, and morals of the *athletæ*. They examined, and admitted, or expelled them the ſociety, or order. During the combats, the *agonothetæ* were cloathed in purple, and rode in a triumphal manner through the circus, holding in their hands an ivory ſceptre, with an eagle on it.

Van Dale has an expreſs diſſertation on the *agonothetæ*.

The name *agonotheta* is ſtill retained in ſchools and academies for him who defrays the charge of the prizes diſtributed. The founders of prizes are perpetual *agonothetæ*.

AGONOS, in *Phyſic*, a Greek word ſignifying *barren*.

Hippocrates applies it to women who have no children, though they might have them, if the impediment were removed.

AGONUS, in *Zoology*, a name uſed by the generality of authors, for the fiſh called by ſome *ſarachus*, by others *chalcis*, and by others *ſardella*.

It is in many particulars very like the *alauſa*, or ſhad, called the mother of herrings, but ſmaller, never arriving at more than a foot in length; and is always lean and lank in ſpring, and fat in autumn. But the diſtinctions between it and the *alauſa*, if real, are ſo very ſmall, that Mr. Ray, and many of the moſt accurate naturaliſts, have ſuſpected it the ſame fiſh, only in a different ſtate.

AGONY, **Agonia**, denotes the extremity of pain, or a diſeaſe; when nature makes her laſt effort, or ſtruggle, to throw off the evil that oppreſſes her.

The word is formed from the Greek αγων, *certamen*, *combat*; this being a kind of ſtrife between life and death.

Much of the terror of death conſiſts in the pangs and convulſions wherewith the *agony* ſeems attended; though we have reaſon to believe, that the pain in ſuch caſes is ordinarily not extremely acute; a courſe of pain and ſickneſs having uſually ſtupified, and indiſpoſed the nerves for any quick ſenſations. However various means have been thought of for mitigating the *agony* of death. Lord Bacon conſiders this as part of the province of a phyſician, and that not only, when ſuch a mitigation may tend to a recovery, but alſo when there being no further hopes of a recovery, it can only tend to make the paſſage out of life more calm and eaſy. Accordingly, he ranks *euthanaſia*, or the art of dying eaſily, among the *deſiderata* of ſcience; and does not even ſeem to diſapprove of the courſe Epicurus took for that end.

Opium has been applied for this purpoſe, with the applauſe of ſome, but the condemnation of more.

Baglivi promiſed a treatiſe expreſs, De Medicina Agonizantium, or the method of treating thoſe in the agonies of death. But perhaps one of the beſt recipes for this end, is that of Mr. Patin, viz. *abſtinence from all medicines*.

AGONYCLITÆ, or **Agonyclites**, in *Antiquity*, a ſect, in the ſeventh century, whoſe diſtinguiſhing principle it was, never to kneel, but to deliver all their prayers ſtanding. See Genuflection.

The word is compounded of the privative particle α, γονυ, *knee*, and κλινω, *to bend*.

AGORÆUS, in *Antiquity*, an appellation given to thoſe deities, who had ſtatues in the public markets, or *fora*.

The word is formed of αγορα, *market*.

AGORANOMUS, in *Antiquity*, a magiſtrate of Athens, eſtabliſhed for the maintenance of good order and policy in the markets, ſettling the prices of proviſions, excepting corn, and deciding diſputes relating to buying and ſelling, inſpecting the weights, meaſures, and the like.

The word is compounded of αγορα, *market*; and νομος, *law*.

The *agoranomus* among the Greeks was much the ſame with the *curule* Ædile among the Romans.

Ariſtotle diſtinguiſhes two kinds of magiſtrates, the *agoranomi*, who had the ſuperintendence of the markets; and the *aſtynomi*, who inſpected the buildings of the (αστεα) *cities*.

The *agoranomi*, at Athens, were ten in number, five belonging to the city, and as many to the Piræeus; though others make them fifteen in all, of whom they aſſign ten to the city. To theſe a certain toll or tribute was paid, by all who brought any thing to ſell in the market.

AGOSTUS, in *Anatomy*, ſignifies the part of the arm from the fingers to the elbow; alſo the palm or hollow of the hand.

AGRA, a kind of ſweet-ſcented wood, found in the iſland of Haiman, on the coaſt of China.

AGRA-*Caramba*, is another ſweet-ſcented wood, which alſo comes from the iſland of Hainan.

AGRARIÆ *ſtationes*, in the ancient *Military Art*, corps of guards poſted in the fields, and in the open air.

AGRARIÆ *naves* was uſed for veſſels placed to keep watch, or guard.

AGRARIAN, in a general ſenſe, ſomething relating to fields or lands.

The word is originally Latin, *agrarius*, formed of *ager*, *a field*.

AGRARIAN, in the Roman *Juriſprudence*, a denomination given to ſuch laws as relate to the partition or diſtribution of lands.

There are fifteen or twenty *agrarian* laws; whereof the principal are, the *Lex Caſſia*, in the year of Rome 268; the *Lex Licinia*, in 377; the *Lex Flaminia*, in 525; two Sempronian laws, in the year 620; the *Lex Apuleia*, in the year 653; the *Lex Bæbia*; the *Lex Cornelia*, in 673; the *Lex Servilia*, in 690; the *Lex Flavia*; the *Lex Julia*, in the year 691; the *Lex Ælia Licinia*; the *Lex Livia*; the *Lex Marcia*; the *Lex Roſcia*, made after the taking of Carthage; the *Lex Floria*, and the *Lex Titia*.

By the laws of Licinius, no Roman was allowed to occupy more than ſeven *jugera* of land; and by a ſimilar law of Romulus, every Roman was limited to two *jugera*.

AGRARIAN *Law*, *Lex* AGRARIA, abſolutely, and by way of eminence, ſo called, was a celebrated law, publiſhed by Spurius Caſſius, about the year 268, for an equal diviſion of the conquered lands among all the citizens, and for limiting the quantity of ground poſſeſſed by each perſon to a certain number of acres.—Thoſe other two in the Digeſt, the one publiſhed by Cæſar, and the other by Nerva, only relate to the limits or boundaries of grounds; and have no relation to that of Spurius Caſſius.

The Roman lands were of divers kinds, ſome conquered from the enemies, and not yet brought to the public account; others brought indeed to the public, but clandeſtinely uſurped by private great men: laſtly, others purchaſed with the public money, in order to be divided. *Agrarian* laws, either for dividing lands taken from the enemy, or the public lands, or thoſe purchaſed with the public money, were eaſily paſſed without diſturbance; but thoſe whereby private rich men were to be outed of their lands, and the common people put in poſſeſſion of what had been held by the nobility, were never attempted without great diſturbances.

Several have pleaded for the neceſſity of *agrarian* laws among us. William Sprigge, or, as ſome ſay, Fr. Oſborne, has written expreſly on the ſubject. See alſo the Supplement to Dr. Price's Obſervations on reverſionary Payments, &c. p. 381.

But the author who ſeems to have entered deepeſt into the nature and uſe of *agrarian* laws, is Harrington; he ſhews, that the balance of property in a ſtate cannot be fixed but by laws, and the laws whereby ſuch a proviſion is made are *agrarian* laws. Now theſe are neceſſary to the ſtability of government, becauſe governments will, according to the diverſe balance of property, be of diverſe or contrary natures, that is, monarchical, or popular. Thus monarchy requires of the ſtandard of property, that it be vaſt or great; and of *agrarian* laws, that they hinder receſs or diminution, at leaſt in ſo much as is thereby intailed upon honour. But popular government requires, that the ſtandard be moderate, and that its *agrarian* laws prevent accumulation.

This author thinks, that in a territory not exceeding England in revenue, if the balance be in more hands than three hundred, it is declining from monarchy; and if it be in fewer than five thouſand hands, it is ſwerving from a commonwealth.

The ſame writer defines an equal *agrarian*, a perpetual law eſtabliſhing and preſerving the balance of dominion by ſuch a diſtribution that no one man, or number of men, within the compaſs of the few or ariſtocracy, can come to overpower the whole people, by their poſſeſſions in lands.

He alſo obſerves, that the people of Rome by ſtriving for an *agrarian*, ſtrove to ſave their liberty; and that commonwealth, through want of ſuch a law, or the non-obſervance of it, came to ruin.

In the Grecian cities, the defect of an *agrarian* was ſupplied by *oſtraciſm*.

In Venice, the council of ten, and the officers of pomp, reſtrain thoſe who might be too powerful; and theſe two orders in a commonwealth, where the gentry have but ſmall eſtates in land, are as much as needs be in lieu of an *agrarian*.

Some German republics have no more to ſupply the place of this law, than that eſtates deſcending are divided among the children.—And the ſame law would eſtabliſh an *agrarian* in England.

Agrarian laws may be framed different ways, as by intailing the lands upon certain families, without power of alienation in any caſe, as in Iſrael and Lacedæmon: or, except with leave of the magiſtrate, as in Spain. But this by making ſome families too ſecure, as thoſe in poſſeſſion, and others too deſpairing, as thoſe not in poſſeſſion, may make the whole people leſs induſtrious.

Therefore Harrington prefers a law regulating eſtates, ſo that no man ſhall have above two thouſand pounds a year in land; and that the eſtates of thoſe who exceed this proportion, ſhall be divided in deſcending to their children, till the greater ſhare do not exceed 2000*l.* *per annum*. This is the rule he lays down for his commonwealth of Oceana, by which he means his ſcheme for the government of England.

By this law Harrington intended that the property of land in England, ſhould never fall into fewer hands than 5000; as he computes the rents of this country to be ten millions. But if theſe rents, as is probable, amount now to twenty millions, it would follow that, by our author's rule, the land could never be in leſs than 10000 hands, which, according to his ſyſtem, muſt effectually ſecure the liberties of the people.

It would exceed the limits of our deſign, to enter into the full detail of all the reaſonings of this ingenious author, on the ſubject of *agrarian* laws; we therefore refer to his works. See alſo GOVERNMENT, PROPERTY, &c.

AGRARIUM. See AGISTMENT.

AGREDULA, is a name given to a ſpecies of the FROG.

AGREEMENT, AGREAMENTUM, in *Law*, a joining, or putting together, of two or more minds in any thing done, or to be done.

Of this there may be three ſorts.—The firſt, an *agreement executed* at the beginning, mentioned in the ſtatute of 25 Edw. III. cap. 3, which ſays, 'That the goods 'bought by foreſtallers, being thereof attainted, ſhall be 'forfeited to the king; if the buyer thereof have made '*gree* with the ſeller:' where the word *gree*, otherwiſe called *agreement executed*, ſignifies payment for the things, or ſatisfaction.

The ſecond is, an *agreement after an act*, that is, where one does an act, and another *agrees* or aſſents thereto, afterwards. The third is, an *agreement executory*, which is, when both parties at one time are *agreed* that ſuch a thing ſhall be done in time to come. It is called executory, becauſe the thing is to be done afterwards.

Agreements are to be in writing, by Stat. 29 Car. II. cap. 3. of *frauds* and *perjuries*.

AGRESSES, or OGRESSES, in *Heraldry*, the ſame as PELLETS.

AGRESTA, in *Medicine*, an unripe grape; otherwiſe called *omphax* and *uva ucerba*, by the French *verjus*.

Agreſtæ are held cooling, deterſive, and aſtringent; they temper the acrimony of the bile, and chear the heart. Eaten plentifully, they have been found to deſtroy worms.

AGRESTA is ſometimes alſo applied to the juice of this fruit, more properly called *omphacium*.

AGRIA, a name given to HOLLY; and alſo to a malignant puſtule, of which there are two ſorts. The one is ſmall, with a roughneſs, redneſs, and ſlight corroſion of the ſkin; it is of a round figure, its centre is ſmooth, and it ſpreads ſlowly. It is cured by rubbing it with faſting ſpittle. The other ſort ulcerates with a violent redneſs and corroſion, ſo as to make the hair fall off; it is of an unequal form, and turns leprous. It is cured by poultices of PELLITORY *of the wall*.

AGRIÆ, in *Natural Hiſtory*, an order of quadrupeds, which have no teeth, but have a very long cylindric tongue. Of this order there are only two known genera, the *myrmecophaga*, and the *manis*.

AGRIAMPELOS, the *wild* VINE; and according to Gerard, the *black* BRIONY.

The word is formed of αγριος, *wild*, and αμπελος, *a vine*.

AGRICULTURE, the art of tilling, or cultivating the earth, in order to render it fertile, and make it bear plants, trees, fruits, &c.

The word is formed of the Latin *ager*, *field*; and *cultura*, *tilling*; of *colere*, *to till*.

The principal and moſt general operations in *agriculture*, are, manuring, ploughing, fallowing, ſowing, harrowing; as alſo, reaping and mowing. See the articles MANURE, PLOUGHING, SEMINATION, &c.

To the operations of *agriculture* do alſo belong the management of the productions of particular countries; as hops, hemp, vines, tobacco, ſaffron, liquorice, woad, &c.

To the ſame art belong, planting, tranſplanting, pruning, engrafting; the culture of foreſts, timber, copſes, &c. See PLANTING, PRUNING, ENGRAFTING, TIMBER, TREE, &c.

Even gardening, or horticulture itſelf, is only a branch of *agriculture*. See GARDEN.

Agriculture in its moſt extenſive ſenſe, beſides tillage, comprehends feeding and the management of cattle, and the rural ſports, hunting, fiſhing, &c. Some even include under it the buſineſs of mines, coal-pits, and other ſubterraneous matter.

Among the ancients, *agriculture* is frequently called *georgica.*

This art has been cultivated by many of the greateſt men among the ancients, and has been treated of by their moſt celebrated authors. The hiſtory of its riſe and progreſs may be eaſily traced from the firſt period of time; and it has been more or leſs the ſubject of attention in every age and nation of the world. The ancient patriarchs, though principally devoted to a paſtoral life, were not altogether ignorant of this art; and their deſcendants, as ſoon as they were ſettled in Paleſtine, conſidered it as a very honourable employment. From them it was tranſmitted to the Chaldeans and Egyptians, to the Phœnicians and Carthaginians; and it was in ſuch repute among the latter, that Mago, their famous general, wrote twenty-eight books on the ſubject, which were afterwards tranſlated into Latin by an expreſs decree of the Roman ſenate; and Servius obſerves, that theſe were adopted as a model by Virgil, when he wrote his Georgics. It has been ſaid, that *agriculture* was firſt introduced among the Europeans by Ceres queen of Sicily, in memory whereof ſhe was placed among the principal divinities: a fable, which imports, that Sicily, famed for its fertility in corn, was the ſcene of conſiderable improvements. The firſt Greek writer on *agriculture* was Heſiod; and he was ſucceeded by Democritus of Abdera, Xenophon, Ariſtotle, Theophraſtus, and many others. It is well known, that this art was in very high reputation among the Romans; and that it was cultivated by their emperors, dictators, and conſuls. The firſt Latin treatiſe on the ſubject of *agriculture* was compoſed by M. Cato, the cenſor; Varro likewiſe is the author of a very elaborate work on the ſame ſubject; Columella, in the reign of the emperor Claudius, wrote twelve books on huſbandry; and in the reign of Conſtantine IV. a new work, as ſome ſay, collected by himſelf from the beſt writers, was publiſhed nnder the title of Geoponics, with a view of reviving this art, which was now in a very declining ſtate.

In England, the firſt perſon who diſtinguiſhed himſelf by his attention to the practical part of huſbandry was Fitzherbert, who publiſhed two treatiſes on this ſubject; one intitled the Book of Huſbandry, in 1534; and the ſecond, called the Book of Surveying and Improvements, in 1539.

In 1600, the French made conſiderable efforts to revive huſbandry,* and ſeveral large works appeared for this purpoſe. It was likewiſe induſtriouſly cultivated about the ſame period by the Flemings, who, portioning out their lands in ſmall tenements, and diſcovering ſeveral new ſorts of manure, brought the ſoil hereby to a proper degree of cleanlineſs, health, and ſweetneſs; ſo that they were able to raiſe the more delicate graſſes; ſuch as LUCERN, SAINTFOIN, &c.

The moſt conſiderable Engliſh writers, previous to the Reſtoration, were Sir Hugh Platt, who made many very important diſcoveries with reſpect to the nature and qualities of manure; Gab. Plattes, and S. Hartlib; and ſince that period, Evelyn, Nourſe, Mortimer, Bradley, Lawrence, Tull, Ellis, and Miller; not to mention many more among our contemporaries. The attention generally given to this art both at home and abroad, and the numerous ſocieties eſtabliſhed for encouraging improvements in the theory and practice of it, both in Europe and America, promiſe a degree of perfection, of which none in former ages could have had any conception.

In France, there are no leſs than thirteen ſocieties eſtabliſhed by royal ſanction, beſide many ſubordinate aſſociations, for promoting *agriculture.* It is likewiſe publicly taught in the Swediſh, Daniſh, and German univerſities. The ſpirit and example of Linnæus and his diſciples have very much conduced to the progreſs of this important and uſeful art; and the emulation of improving has ſpread through moſt of the nations of Europe.

In England, the Royal Society, and the Society of Arts, &c. in particular, have been ſignally uſeful in this reſpect; and the other aſſociations, which are now eſtabliſhed in many parts of the country, co-operate with them in forwarding their laudable deſign.

Among the Japaneſe, *agriculture* is in great repute; and among the Chineſe it is diſtinguiſhed and encouraged by the court beyond all other ſciences. The emperor of China yearly, at the beginning of ſpring, goes to plow in perſon, attended by all the princes and grandees of the empire. The ceremony is performed with great ſolemnity; and is accompanied with a ſacrifice, which the emperor, as high prieſt, offers to Chang-Ti, to enſure a plentiful crop in favour of his people.

The reader will find a conciſe abſtract of the principal improvements in the various branches of *agriculture,* diſpoſed, in the courſe of this work, under their proper heads.

AGRIELÆA, the *wild* OLIVE.

AGRIFOLIUM, in *Botany*, the HOLLY-*tree.* See AQUIFOLIUM.

AGRIGINTINE *ſalt*, in *Natural Hiſtory*, a kind of eatable ſalt, famous among the ancients for its not crackling in the fire as common ſalt does. It might probably owe this quality to the fineneſs of the powder, in form of which it was generally uſed.

AGRIMONOIDES, in *Botany*, a ſpecies of AGRIMONY. This plant flowers in April, and comes to perfection in May; and grows in ſome mountainous parts of Italy; it is ſometimes called PIMPINELLA *folio agrimoniæ.*

AGRIMONY, AGRIMONIA, in *Botany*, the name of a genus of plants, belonging to the claſs of *dodecandria digynia*; the characters of which are theſe: the flower is of the roſaceous kind, conſiſting of five petals, which are arranged in a circular form, indented at their extremity, and ſtand upon a cup, which finally becomes an oblong echinated fruit, containing two oblong ſeeds. In the center ariſes a double ſtyle, reſting on the germen, attended by twelve ſtamina.

Miller reckons five ſpecies, viz. 1. The common *agrimony*. 2. The white *agrimony*. 3. The ſweet-ſcented *agrimony*. 4. The eaſtern *agrimony*, with narrow primated leaves, which are ſharply ſerrated, and a thick root. 5. Three leaved *agrimony*, with ſmooth fruit. Tournefort enumerates only the three firſt ſpecies; Linnæus includes the firſt, third, and fourth, under one ſpecies.

The firſt ſpecies of this genus is frequent in dry paſtures, by the ſide of hedges, and in woods, and flowers in June. The dried leaves make a very pleaſant infuſion, in the manner of tea; and are eſteemed a very proper medicine in obſtructions of the liver and ſpleen. It is celebrated in the jaundice, and in cachectic caſes; and is given in coughs and catarrhs, and in ſuppreſſions alſo of the menſes.

It uſed to be a very common ingredient in the baths of the ancients, prepared with the decoctions of detergent and emollient herbs.

Agrimony is otherwiſe called *eupatorium veterum*, or *Græcorum.*

From Mr. Geoffroy's analyſis of *agrimony*, it appears, that this plant contains very little ſalt of the ammoniacal kind, ſince no concrete urinous ſalt is got from it, but the acid ſalt wherewith it abounds, joined with earths, forms a concrete reſembling tartar, or ſalt of coral combined with a large proportion of ſulphur.

Agrimony has a ſaline taſte, ſubaſtringent and acid; its juice turns the tincture of heliotropium to a faint red, ſo that its aſtringent and aperitive virtues ſeem both owing to the ſame auſtere ſalt. For though theſe effects ſeem contrary to one another, yet they often flow from one and the ſame principle, the ſtrengthening of the weak and lax fibres of the ſolid parts. Experience ſhews, ſays Geoffroy, that *agrimony* has the virtues ſuppoſed to ariſe from its compoſition; for it is aſtringent, detergent, reſolvent, vulnerary, and aperient.

The country people uſe the common or eſſential *agrimony* bruiſed, or its juice, in contuſions, and freſh wounds. Etmuller ſays, it removes ſwellings and inflammations of the ſcrotum; yet it is rarely found in ſhop-compoſitions, though frequently preſcribed by the ſurgeons, in diſcutient and vulnerary fomentations.

AGRIMONY, *ſweet-ſmelling*, *agrimonia odorata*, is by ſome preferred, for medicinal purpoſes, to the former, as being more grateful to infuſe for pectoral decoctions. It may be infuſed in water, or in whey; and is efficacious in diſeaſes from a lax habit.

AGRIMONY, *hemp*, *eupatorium*, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs of plants. Its characters are theſe: it has a compound flower compoſed of hermaphrodite florets, included in one common ſcaly empalement, whoſe ſcales are narrow, erect, and unequal; and the florets have each five ſhort ſtamina. In the bottom is ſituated a ſmall germen, which becomes an oblong ſeed, crowned with down, ſitting in the empalement. There are ſeveral ſpecies.

The common *hemp agrimony* is recommended as an hepatic and vulnerary, and has been alſo uſed in catarrhs; but it is at preſent very little known in the ſhops.

AGRIMONY, *water-hemp*, *bidens*, in *Botany*, belongs to the ſame claſs with the former. Its characters are theſe: it has a compound flower, the middle or diſh compoſed of hermaphrodite florets; theſe have five ſtamina, with an oblong germen. The female flowers which compoſe the border are naked, and are all ſucceeded by a ſingle angular obtuſe ſeed, having two or more briſtles or teeth. It grows in wet places, and flowers in Auguſt. Several ſpecies of this plant are common weeds; but there are five ſpecies cultivated in the gardens of the curious.

This herb is accounted hepatic and vulnerary.

AGRIOCARDAMUM, ſee CARDAMINE.

AGRIOCASTANUM, the ſame as EARTH-NUT, popularly called *pig-nut*, and *arnot*.

AGRIOCINARA, in *Botany*, a name uſed by ſome authors for that ſpecies of wild ARTICHOAK, the root of which is uſed inſtead of the *coſtus nigra*.

AGRIOCOCCIMELA, or *prunus ſylveſtris*. See PLUM-*tree*.

AGRIOMELA, a name for the *crab* APPLE.

AGRIOMELANZANION, in the *botanical* writings of the ancients, a word that has perplexed many of the later writers. The Arabian writers, Avicenna and Serapion, uſed the word *bedengian* for the fruit of the *pomum amoris*, a kind of eſculent nightſhade, or *ſolanum*, called by the old Greek writers, as Theophraſtus, &c. *ſtrychnus*, and only diſtinguiſhed from the other *ſtrychni*, or nightſhades, by its being deſcribed as wholeſome, not poiſonous. From this Arabic word *bedengian*, the Italians formed their word *melanzana*, and the late Greek writers their *melanzanion*, which they uſed as the name of the ſame fruit. This, when the plant was cultivated in gardens, was probably larger and fairer, than when it grew wild; but, in this latter ſtate, was not leſs uſed, but was diſtinguiſhed by the term *agriomelanzanion*. If the Greeks, who uſe this word, or the *melanzanion*, would have appropriated them to the *pomum amoris*, and diſtinguiſhed theſe from the other nightſhades, they would have done ſervice to the world.

AGRION ſignifies the PEUCEDANUM, called alſo *agriophyllon*.

AGRIOPHAGI, in *Antiquity*, a name given to thoſe who fed on wild beaſts.

The word is compounded of αγριος, *wild*, and φαγω, *I eat*.

AGRIORIGANUM, in *Botany*, wild *marjoram*.

AGRIOSELINUM, in *Botany*, ſignifies *wild* PARSLEY.

AGRIPALMA, in *Botany*, a name given to MOTHERWORT.

AGRIPPA, a name applied, among the ancients, to children born in an unuſual or irregular manner; particularly ſuch as come with the feet foremoſt, inſtead of the head.

They were called *agrippæ*, according to Pliny, on account of their being (*ægre parti*) *born with difficulty*.

Daventer has a particular chapter of *agrippas*, or infants coming with their feet foremoſt, which, according to him, is one of the moſt convenient and ſafe ways for a mature birth.

Agrippa gives the denomination to an unguent, deſcribed in the *Antidotarium Nicolai*, and in ſeveral other diſpenſatories, ſuppoſed, by ſome, to have been invented by Agrippa king of Judæa, but, as others ſuſpect, by Julius Agrippa, a Roman phyſician.

AGRIPPINIANS, in *Church Hiſtory*, the followers of Agrippinus biſhop of Carthage, in the third century, who firſt introduced and defended the practice of *rebaptization*.

AGRIUM, in the *Materia Medica* of the ancients, a name given to an impurer ſort of *natrum*. The purer ſort of this ſalt they called *halmyrhaga*, and the coarſer and dirtier kind *agrium*. The former of theſe they had from Media, the latter from Thrace.

AGROM, a diſeaſe frequent in Bengal, and other parts of the Indies, wherein the tongue chaps and cleaves in ſeveral places, being alſo extremely rough, and ſometimes covered with white ſpots. The Indians are very fearful of this diſeaſe, which they attribute to extreme heat of the ſtomach.

Their remedy is, to chew the black-ſeeded baſilica, drink ſome chalybeated liquor, or the juice of large mint.

AGROSTEMA, in *Botany*, the name given by Linnæus to a genus of plants of the *decandria pentagynia* claſs, uſually confounded by other authors among the ſpecies of LYCHNIS.

The characters of the genus are theſe: the *perianthium* conſiſts of one leaf, which forms an oblong tube, of a coriaceous texture, and ribbed with ten ſtriæ. The limb of this, which is of the ſame length with the flower, is divided into five ſegments, which are ſlender and permanent. The flower conſiſts of five petals, the ungues of which are as long as the tube of the cup; the limb is obtuſe and expanded. The ſtamina are ten ſubulated filaments affixed to the ungues of the flower. The antheræ are ſimple. The germen of the piſtil is oval. The ſtyles are capillary, and five in number: they are erect, and of the length of the ſtamina. The ſtigmata are ſimple. The fruit is an oblong capſule covered by the cup, and contains only one cell, in which are a number of ſpotted kidney-ſhaped ſeeds, in a looſe and free receptacle.

AGROSTIS, of the *triandria digynia*, in the Linnæan ſyſtem of *Botany*, the name of a diſtinct genus of plants, of the graſs kind; the diſtinguiſhing characteriſtics of which are theſe: the calyx is a pointed bivalve glume, containing only one flower. The flower is made of two pointed valves, ſhorter than the calyx, and has one of the valves larger than the other, and terminated by a beard or awn. The ſtamina are three capillary filaments longer than the flower; the antheræ are ſplit at their ends. The germen of the piſtil is roundiſh; the ſtyles are two, reflex and hairy; and the ſtigmata are of a like ſtructure. The flower cloſely ſhuts in the ſeed, and does not open to let it fall out. The ſeed is ſingle, roundiſh, and pointed at each end.

Agroſtis is commonly uſed for the ſpecies of graſs called *quick-graſs*, or *couch-graſs*.

This plant is ſaid to diſſolve ſtones, eſpecially bilious ones, and hence to cure oxen and ſheep that feed upon it.

AGROSTOGRAPHIA, in *Phyſiology*, the *hiſtory*, or deſcription of *gramens*, or plants of the graſſy kind.

The word is compounded of αγρωστις, *graſs*, and γραφη, *deſcription*.

AGROSTOGRAPHIA is alſo the title of a learned and laborious work of John Scheuchzer, containing an exact deſcription of about four hundred ſpecies of graſs; particularly dogs-tooth, *cyperus*, *cyperoides*, ruſhes, &c. all diſpoſed in a new method; yet the *hiſtory* is far from being complete.

A-GROUND expreſſes the ſituation of a ſhip, whoſe bottom, or any part of it, reſts upon the ground.

AGRYPNIA, ΑΓΡΥΠΝΙΑ, a privation of ſleep; otherwiſe called WATCHING, *waking*, *vigiliæ*, *pervigilium*, &c. In the Greek church, it is uſed for the vigil of any of the greater feaſt-days, obſerved by the monks and clergy.

AGUAGUIN, in *Botany*, the name of a ſhrub among the Africans, who eſteem it greatly as a balſamic and vulnerary. The leaves of this ſhrub reſemble thoſe of our common lilac; they grow alternately, and ſtand upon foot-ſtalks of half an inch long; and when held up to the light, they ſhew a fine texture of the ſmaller veins. Philoſ. Tranſact. N° 232.

AGUAPECACA, in *Zoology*, the name of a Braſilian bird of the moor-hen kind. It is of the ſize of a pigeon, very long-legged, and has a beak like that of the gallinaceous kind. Its back, and the upper part of its wings, are brown, and in each wing they have a ſharp horn, or prickle, ſerving for their defence.

AGUARA-QUIYA, in *Botany*, a Braſil plant, thought to be the *ſolanum vulgare*, or common nightſhade, by Ray.

AGUARA-PONDA, in *Botany*, a plant otherwiſe called, *viola ſpicata Braſiliana*. It grows to the height of a foot and an half, or more, with a ſmooth, round, green, and jointed ſtalk. At each joint come forth four, five, or more, narrow, ſerrated, pointed, green, and unequal leaves. The top of the ſtalk bears an ear a foot long, ſmooth, and covered with flowers of a fine violet azure, or the colour of our *viola martia*, conſiſting of five roundiſh leaves. The whole flower is not unlike the *viola martia*, and has ſomewhat of its ſmell. The root is ſtraight, of a moderate thickneſs, and ſhoots out into abundance of leſſer ones, and theſe again into filaments.

There is another kind, diſtinguiſhed by the wideneſs of its ear of flowers, which repreſents a helmet of a green colour. It is marked with cubic pits, from whence proceed azure flowers.

AGUE, a periodical diſeaſe, of the fever kind, conſiſting in a cold ſhivering fit, ſucceeded by a hot one; and going off in a diaphoreſis, or ſweating.

If the coldneſs and ſhivering be inconſiderable, and only the hot fit felt, the diſeaſe is called an *intermitting fever*.

According to the periods or times of the returns of the fit, the diſeaſe is either a QUOTIDIAN, TERTIAN, or QUARTAN *ague*, or fever.

The cauſe of *agues* ſeems to be, an obſtructed perſpiration, or whatever, by overloading the juices, retards their motion, or occaſions a *lentor* in the blood.—The *cauſa proxima* ſeems to be a corruption of the humours of the body.—The ſymptoms are, heavineſs, and reaching; a weak, ſlow pulſe; coldneſs and ſhivering felt firſt in the joints, thence creeping over the whole body; pain in the loins, and an involuntary motion of the under jaw.

A vernal *ague* is eaſily cured; but an autumnal one is more obſtinate, eſpecially in aged and cachectical perſons; and, particularly, if complicated with a dropſy, peripneumony, &c.

When an *ague* proves fatal, it is uſually in the cold fit, through the oppreſſion of the ſpirits.

The cure is uſually begun with an emetic of *ipecacuanha*, an hour before the acceſs, and completed with the *cortex Peruvianus*, adminiſtered in the interval between two fits; and continued, at times, to prevent a relapſe.

We meet with divers other methods of curing *agues*, beſides that by the *cortex*; as by means of tea, which taken an hour before the acceſs, is ſaid to remove the obſtruction,

tion, and correct the acidity; by *ſal volatile*, which acts by attenuating the blood: in the iſland of Tino, by an infuſion of flowers of little centaury. See Philoſ. Tranſ. Nº 145.

Etmuller gives divers inſtances of *agues* cured by putting the patient in a fit of paſſion. Others have been effected by a fright, a fit of drunkenneſs, &c. 'Do we not often ſee *agues* cured by amulets and *pericarpia?* I myſelf, ſays Mr. Boyle, was cured of a violent quotidian by applying to my wriſts a paſte made of bay-ſalt, new hops, and blue currants, which has alſo relieved many others both of quotidians and tertians.'

Lord Bacon ſays, 'It is often tried, that juices of ſtock-gilly-flowers, roſe-campion, garlick, and other things, applied to the wriſts, and renewed, have cured long *agues*.' He likewiſe recommends in the heats of *agues*, to hold eggs of alabaſter, and balls of cryſtal, in the hands.

Dr. Pringle accounts for them, by means of the principle of putrefaction. The heat of the body, he obſerves, varies little; and therefore the corruption produced in any of the humours muſt happen in a determinate time. If we ſuppoſe, that in the paroxyſm, the more corrupted particles of the blood do not at all paſs off through the ſkin with the ſweat, but that ſome part of them is diſcharged with the bile; their particles coming into the inteſtines, and being from thence taken up by the lacteals, and carried into the blood, may there act as a new ferment, and occaſion a return of the fit. Thus the corruption of the bile may be the cauſe of the firſt fit, as well as of thoſe that follow. He farther adds, that though all moiſt countries are ſubject to *agues* of ſome kind or other; yet if the moiſture is pure, and the ſummers are not cloſe and hot, they will moſtly be regular tertian *agues*, and admit an eaſy cure. But if the moiſture ariſes from long ſtagnating water, in which plants, fiſhes, and inſects, die and rot, then the damps, being of a putrid nature, occaſion not only more frequent, but more dangerous fevers, which more commonly appear in the form of quotidians, and double tertians, than that of ſingle ones. Accordingly they are found to vary with the ſeaſon, on which the degree of putrefaction in a great meaſure depends.

Though the bark be the moſt effectual remedy in this diſtemper, yet it has been known to cauſe worſe diſorders.

Ague-*cake*, the popular name for a hard tumour on the left ſide of the belly, lower than the falſe ribs, ſaid to be the effect of intermitting fevers.

Ague-*free* is a name given by ſome to SASSAFRAS, on account of its febrifuge virtue.

AGUGLIA, ſee OBELISK.

Aguglia is alſo the name given by the Italian fiſhermen to the ACUS of Oppian, called in Engliſh the GAR-FISH.

AGUILLANEUF, or **Augillaneuf**, a form of rejoicing uſed among the ancient Franks on the firſt day of the year.

The word is compounded of the French *a*, *to*, *gui*, *miſſleto*, and *l'an neuf*, i. e. *the new year*.

Its origin is traced from a druid ceremony: the prieſts uſed to go yearly in December, which with them was reputed a ſacred month, to gather miſsleto of the oak in great ſolemnity. The prophets marched in the front, ſinging hymns in honour of their deities; after theſe came a herald with a *caduceus* in his hand; theſe were followed by three druids a-breaſt, bearing the things neceſſary for ſacrifice. Laſt of all came the chief, or arch-druid, accompanied with the train of people.

The chief druid climbing the oak, cut off the miſsleto with a golden ſickle, and the other druids received it in a white cloth. On the firſt day of the year it was diſtributed among the people, after having bleſſed and conſecrated it by crying *au gui l'an neuf*, to proclaim the new year.

This cry is ſtill continued in Picardy, with the addition of *plantez, plantez*, to wiſh a plentiful year. In Burgundy, and ſome other parts, the children uſe the ſame word to beg a new year's gift.

Of later times the name *auguillaneuf* was alſo given to a ſort of begging, practiſed in ſome dioceſes, for church tapers, on new year's day, by a troop of young people of both ſexes, having a chief, &c. It was attended with divers ridiculous ceremonies, as dancing in the church, &c. which occaſioned the ſynods to ſuppreſs it.

AGUILLES, or **Auguilles**, cotton cloth, manufactured at Aleppo.

AGUL, in *Botany*, a ſmall ſhrub very prickly. Its leaves are longiſh, and reſemble thoſe of the knot-graſs. It abounds with flowers of a reddiſh colour. Theſe are ſucceeded by red huſks. Its root is long, and of a purple colour.

This plant is otherwiſe called *alhagi maurorum*, by Rauwolf: it grows in Arabia, Perſia, and Meſopotamia. Manna is found on its leaves, as large as the grains of coriander, of the ſame taſte and ſmell as ours, but it melts if the ſun ſhines upon it. The leaves of this plant are purgative.

AGURAH, in *Jewiſh Antiquity*, the twentieth part of an ancient ſilver SHEKEL.

The *agurah* is the ſame with what is otherwiſe called *gerah*, and *keſhitah*. The Septuagint tranſlation renders it οϐολος.

AGUSADURA, in *Ancient Cuſtoms*, a fee due from vaſſals to their lord, for ſharpening their plowing tackle.

Anciently the tenants in ſome manors were not allowed to have their rural implements ſharpened by any but whom the lord appointed; for which an acknowledgment was to be paid, called *aguſadura*, in ſome places *aguſage*, which ſome take to be the ſame with what was otherwiſe called *reillage*, from the ancient French *reille*, a *plough-ſhare*.

AGUTI, in *Zoology*, the name of an American animal, much reſembling the Guinea pig, as we call it, having the characters of the rat-kind, with the voice and hair of the hog.

The hairs are very hard, thick, and gloſſy, and are of a mixt colour, of a reddiſh and brown, with more or leſs black; thoſe on the belly however are yellowiſh; its head and whiſkers are like thoſe of the rabbit-kind, but that the noſe is ſharper, and the upper chop longer than the under one, as in the hog-kind; the upper lip is ſplit as in the hare, and the legs are naked, or have at the utmoſt only a few ſcattering hairs on them; the fore-feet have four toes, and the hinder ones ſix, and theſe are much longer than the fore-legs; its tail is very ſhort, and its eyes prominent; its voice altogether reſembles the grunting of a hog. It is a very voracious animal, devouring its food with extreme eagerneſs, and uſing its fore-feet for hands in the manner of the ſquirrel. It runs very ſwiftly, and is very expert at digging, ſo that it ſoon buries itſelf in the earth. When provoked, it raiſes all the hair of its back upright, and ſtrikes the earth with its hinder feet.

Aguti Treva *inſulæ Marignanæ*, in *Botany*, a plant mentioned by De Laet. It has the leaves of the orange-tree, only thinner, a dewy flower, a large fruit, with a greeniſh rind, which contains kernels like thoſe of the pomegranate, thin, ſweet, and not ill taſted.

AGUTIGUEPA *obi Braſilienſibus*, in *Medicine*, the name given by many authors to the arrow-root, or *ſagittaria alexipharmaca* of the Weſt-Indies.

AGYEI, in *Antiquity*, a kind of obeliſks conſecrated to Apollo, and placed in the veſtibules of houſes, for their ſecurity.

The *agyei* were no other than huge ſtones, or perhaps ſometimes timber, having either a circular or ſquare baſis, and terminating in a point at the top, ſacred to Apollo, or, as ſome ſay, to Bacchus, as protector of the high-ways. Others will have them to have been erected to both thoſe deities.

AGYNIANI, in *Church Hiſtory*, a ſect who condemned all uſe of fleſh, and marriage, as not inſtituted by God, but introduced at the inſtigation of the devil.

The word is compounded of the privative α, and γυνη, *woman*. They are ſometimes alſo called *agynnenſes* and *agynii*; and are ſaid to have appeared about the year 694.

AGYRTÆ, in *Antiquity*, a kind of ſtrolling impoſtors running about the country, to pick up money by telling fortunes at rich men's doors, pretending to cure diſeaſes, by charms, ſacrifices, and other religious myſteries; alſo to expiate the crimes of their deceaſed anceſtors, by virtue of certain odours and fumigations; to torment their enemies, by the uſe of magical verſes, and the like.

The word is formed of the verb αγυρω, *I congregate*; alluding to the practice of quacks, who gather a crowd about them.

AHALOTH, in the *Materia Medica*, a name uſed by ſome writers for the *lignum-aloes*, or *aloes-wood*. It is the Hebrew name.

AHANGIER, in *Ichthyology*, a name given by Albertus, and others, to the fiſh called by authors ACUS *vulgaris*, and by us the GARFISH. The ſhape of this fiſh, which is very long and ſlender, has cauſed it to be confounded with the *ſyngnathus*, or tobacco-pipe fiſh, called alſo *acus*; but they differ extremely when examined; that being a true ſpecies of the *ſyngnathus*, and this of the ESOX or pike.

A-HEAD, refers to any object that lies immediately before a ſhip, or towards that point of the compaſs to which her ſtem is directed.

AHICCYATLI, in *Zoology*, the name of an American ſerpent, approaching to the nature of the hæmorrhous and rattle-ſnake, but larger than the former, and wanting the rattle of the latter; it is as fatal in the effect of its poiſon as any known ſpecies of ſerpent.

AHIUS, ſee SALT-*ſtone*.

AHMELLA, in *Botany*, is a ſpecies of *bidens*, or water-hemp-agrimony. Its flowers are large, and reſemble thoſe of the marygold; they grow in large numbers on the tops of the ſtalk, and of the large branches, and are ſucceeded by oblong ſeeds, which have the ſame ſort of points at one end with thoſe of our common *bidens*, and all the other plants of that genus. The ſtalks are ſquare, and the leaves ſtand in pairs, and are in ſhape like thoſe of the common nettle. We have one ſpecies of it very common in all parts of England, about watry places; and eaſily known by its ſeeds, in Autumn, ſticking to the cloaths and ſtockings of people who go near the plant; by means of the three points at the end, which are ſharp and bearded. It would be worth while to try whether theſe ſeeds poſſeſs virtues worthy notice in phyſic, for at preſent they are neglected.

This plant, and the others of the ſame genus, are called by the name *bidens*, from the teeth or prickles at the ends of the ſeeds; but the word ſhould be *tridens*, for there are three of them. Philoſ. Tranſ. N° 257.

AHOUAI, in *Botany*, the name of a genus of plants, called by Linnæus CERBERA.

The ſpecies of *ahouai*, mentioned by Mr. Tournefort, are theſe: 1. The *ahouai* of Thevet, or the apple-leaved poiſonous *ahouai*. And, 2. The nerium-leaved *ahouai*. By inciſion into the bark a milky liquor is produced, that ſmells like garlick.

A-HULL denotes the ſituation of a ſhip, when all her ſails are furled, on account of the violence of a ſtorm, and when having laſhed her helm to the lee-ſide, ſhe lies nearly with her ſide to the wind and ſea, her head being ſomewhat inclined to the direction of the wind.

AIAIA, in *Zoology*, the name of a Braſilian bird, of the *platea*, or ſpoonbill-kind, called by the Portugueſe *colhorado*. It is exactly of the ſame ſhape, and much of the ſame ſize with the European ſpoonbill, and its beak is in the very ſame manner broad at the end. It is of a pale, but very bright and ſhining fleſh-colour, on the back and wings; the other parts of its body are perfectly white; it is common about the ſhores of rivers, and its fleſh is very well taſted.

AJAX, in *Antiquity*, a furious kind of dance, in uſe among the Grecians; intended to repreſent the madneſs of that hero, after his defeat by Ulyſſes, to whom the Greeks had given the preference in his conteſt for Achilles's arms.

Lucian, in his treatiſe of dancing, ſpeaks of dancing the *Ajax*. There was alſo an annual feaſt called *Ajantia*, Αἰάντεια, conſecrated to that prince, and obſerved with great ſolemnity in the iſland of Salamis, as well as in Attica; where, in memory of the valour of Ajax, a bier was expoſed, ſet out with a complete ſet of armour.

AICHMALOTARCHA, ſee ÆCHMALOTARCHA.

AID, or AYDE, AUXILIUM, literally denotes the help, ſuccour, or aſſiſtance, which any perſon lends another, when too weak to do, or avoid, ſomething.

The word is French; formed, according to M. Menage, from the Italian *aitare*; and that from the Latin *adjutare*, *to help* or *aſſiſt*.

AID, or AYDE, in *Law*, is when a petition is made in court, for the calling in of help from another perſon intereſted in the matter in queſtion; who, it is probable, may not only ſtrengthen the party's cauſe who thus prays for *aid*, but alſo prevent a prejudice ariſing to his own right.—This is called *aid prier*; but this courſe of proceeding is now much diſuſed.

A city, or corporation, holding a fee-farm of the king, may pray in *aid* of him, if any thing be demanded of them relating thereto.

The *aid prier* is ſometimes alſo uſed, in the king's behalf, to prevent any proceedings againſt him till his counſel be called, and heard what they have to ſay for avoiding the king's prejudice, or loſs. Jenk. Cent. 64. Terms de Ley, 35. Stat. 4. Edw. I. and 14 Edw. III.

AID *de camp*, an officer in an army, whoſe buſineſs is to attend the general officers, and receive and carry their orders, as occaſion requires.

When the king is in the field, he uſually appoints young volunteers of quality to carry his orders, who are called the king's *aids de camp*.

AID *major*, or *adjutant*, is an officer, whoſe buſineſs is to eaſe the MAJOR of part of his duty; and to perform it all in his abſence.

Some majors have ſeveral *aid majors*.—Each troop of guards has but one major, who has two *aid majors* under him, or more, according as the buſineſs requires.

Every regiment of foot has as many *aid majors* as it contains battalions.—When the battalion is drawn up, the *aid major's* poſt is on the left, beyond all the captains, and behind the lieutenant-colonel.

AID, AUXILIUM, in our *Ancient Cuſtoms*, denotes a ſubſidy or ſum of money due to the lord, from his tenants, on certain occaſions.

It differed from a *tax*, which is impoſed at any time when wanted; whereas the *aid* could only be levied where it was cuſtomary, and where the particular occaſion fell out.

Such was the *aid de relief*, due from the tenants in fee, upon the death of the lord meſn, to his heir, towards the charge of a relief of the fee, of the ſuperior lord.

Such alſo was the *aid chevel*, or *capital aid*, due by vaſſals, to the chief lord, or the king, of whom they held *in* CAPITE.—Of this there are three kinds.

The firſt, of chivalry; or, as they call it, *par faire fitz chevalier*, towards making his eldeſt ſon a knight, when arrived at the age of fifteen years: the ſecond of marriage, or *par fille marier*, towards marrying his eldeſt daughter.—Both theſe, with all charges incident thereto, are taken away by Stat. 12 Car. II. See TENURE, SERVICE, &c.—Some will have them to have been firſt eſtabliſhed in England, by William the Conqueror, and afterwards transferred to Normandy; but the more common opinion is, that the Conqueror brought them with him.—The third was of RANSOM, due when the lord was taken priſoner by the enemy.

In ſome provinces there was a fourth kind of *aid*; due whenever the lord ſhould undertake an expedition to the Holy Land.

We alſo read of *aids* paid the lord, when he was diſpoſed to purchaſe any new land, or tenement. Theſe were only granted once in his life.—Alſo *aids* for the repairing, and fortifying of caſtles, ſeats, &c.

Aids were at firſt impoſed by the lord, or king, at what rate he pleaſed; but by the ſtatute of 3 Edw. I. a reſtraint was laid on common perſons being lords, and they were tied down to a fixed proportion; and by a ſubſequent ſtatute, the ſame rate was extended even to the king.

By the Stat. 34 Edw. I. it is ordained that the king ſhall levy no *aid* or tax, without his parliament.

Aids ſeem to have been firſt eſtabliſhed with a view to the clients and freedmen of ancient Rome, who made preſents to their patron towards his daughter's fortune, as alſo on his birth-day, and on other ſolemn occaſions.—Accordingly, Bouteiller relates, that in his time, theſe *aids* depended on the courteſy and good will of the vaſſals; for which reaſon they were called, *droits de complaiſance*.

The biſhops alſo received *aids* from their eccleſiaſtics, called *ſynodals*, and *pentecoſtals*. They were to be paid at the time of their conſecration; or when they had a king to entertain; or when called by the pope to his court, or to a council; as alſo when they went to receive the *pallium*.

Add, that the archdeacons alſo exacted *aids* from the clergy of their juriſdiction. See PROCURATION.

A kind of feudal *aids* are ſtill levied in Germany, &c. under the title of *collectæ*.

AIDS are alſo uſed in matters of polity, for any extraordinary taxes, or impoſitions, occaſionally levied by the king and parliament, upon the ſubjects; to ſupport the charges of the government, when the ordinary revenue is deficient.

AID, *royal*, is a name frequently given to the land-tax.

AID, in *Theology*, the *aids* or aſſiſtances of divine favour, which are offered to man, have been the ſubject of much diſpute betwixt Janſeniſts and Jeſuits; for the compoſing whereof, a celebrated congregation was erected at Rome under the title of congregation of *aids*, *congregatio de auxiliis*.

Some divines, after St. Auguſtin, diſtinguiſh two kinds of *aids*, viz. *ſine quo*, and *quo*.

Auxilium ſine quo, that which the mind is at liberty either to uſe or refuſe; ſuch is ſuppoſed to have been the *aid* miniſtred to man in the ſtate of innocency, while his mind and will were ſound and upright.

Auxilium quo amounts to what is otherwiſe called efficacious grace, which ſurmounts and ſubdues the will; ſuch, according to the Calviniſts and Janſeniſts, is ſuppoſed to be the *aid* miniſtred by grace, in the preſent fallen ſtate of human nature.

AIDS, in the *Manege*, are helps, or aſſiſtances, which ſome call cheriſhings, by which the horſeman contributes towards the motion, or action, required of the horſe; by a diſcrete uſe of the bridle, caveſon, ſpur, poinſon, rod, calf of the leg, and voice; and alſo by a juſt and well-timed motion of the body.

Such a horſe knows his *aids*, anſwers his *aids*, takes his *aids* with vigour, &c.—The *aids* are made uſe of, to avoid the neceſſity of corrections.—The ſame *aids*, given in a different manner, become corrections.

The *aids* uſed to make a horſe go in airs, are very different from thoſe required in going upon the ground. Newcaſtle.

The inner heel, inner leg, and inner rein, are called *inner aids*.

aids.—The outer heel, outer leg, &c. are *outer aids.* See Berenger's Art of Horſemanſhip, vol. ii. p. 92, &c.

Aids, in the French *Law*, denote a duty paid on all goods ſold and tranſported either out of, or into the kingdom. In this ſenſe, *aids* anſwer to what the Latins call *vectigalia*, a *vehendis mercibus*, and are paid by all kinds of perſons, privileged, or non-privileged; by which they differ from *tailles*, *taxes*, which are only paid by the peaſants, being a ſort of capitation, anſwering to what the Latins call *tributum*. The farm of the *aids* was formerly diſtinct from, but now united to, that of the *gabelles*, and other impoſts.

Aids, *court of*, in France, is a ſovereign court, erected for the cognizance of matters relating to the taxes.—Appeals come to this from the court of elections, where matters relating to the *taille* are firſt heard.—The *court of aids* of a province is ſometimes ſeparated from the parliament of the province, and fixed in another city, as at Montpelier, Montauban, &c.—There are thirteen courts of *aids*, of which the principal is that at Paris.

AIEREBA, in *Zoology*, the name of a fiſh of the *paſtinacha marina* kind, but differing from all the others, in that the form of its body is regularly round, or oval, and its head placed far within the verge of its thin part. It is common in the weſtern ocean; but it is not much eſteemed for the table, being more looſe and flabby in its fleſh than the other kinds.

AIGEIROS, a name ſometimes given to *black* POPLAR.

AIGHENDALE, a liquid meaſure in Lancaſhire, containing ſeven quarts.

AIGITHALUS, αιγιθαλος, in *Zoology*, a name by which ſome of the old authors called the PARUS, or *titmouſe*.

AIGLETTE, in *Heraldry*, ſee Eaglet.

AIGRETTA, in *Zoology*, a name uſed by ſome authors, as the name of a diſtinct ſpecies of heron, but ſeeming to be no other than a ſynonym of the GAZA *giovane*, or ARDEA *alba minor*, the ſmall white heron.

AIGUE *marine*, in *Natural Hiſtory*. See Aqua *Marina*.

AIGUISCE', Aiguisse', or Eguisce', in *Heraldry*, a term applied to a CROSS, when its four ends are ſharpened, but ſo as to terminate in obtuſe angles.

The croſs *aiguiſcé* differs from the *croſs* FITCHE'E, in that the latter goes tapering by degrees to a ſharp point; whereas only the ends of the former are tapered.

AILE, or Aiel, in *Law*, a writ which lies where the grand-father, or great-grand-father, called *beſaile*, was ſeiſed of lands or tenements in fee-ſimple, on the day he died; and a ſtranger abates or enters the ſame day, and diſpoſſeſſeth the heir or grand-child. See Abatement.

The word is formed of the French *aieul*, *avus*, *grandfather*.

AILERONS, in *Natural Hiſtory*, petty-wings, a French term, expreſſing two ſmall ſhelly ſubſtances, reſembling parts of wings, or young and juſt growing wings, and found in the two-winged flies, ſituated at the root of the larger wings.

The word is a diminutive of the French *aile*, *wing*.

AILES *vitrées*, in *Natural Hiſtory*, a French term, uſed to expreſs the wings of a ſeries of inſects, which ſeem of a middle nature, between the fly and the butterfly kind, and are therefore called PAPILION *mouches* by theſe writers. The wings of theſe inſects are in part covered with duſt, or ſcales, and in part free from it, and tranſparent. In theſe free parts they look glaſſy; whence their name, ſignifying *glaſſy wings*.

AIPIMIXIRA, in *Zoology*, the name of an American fiſh, more uſually known by the name of PUDIANO. It is a ſmall fiſh, of the ſhape of a pearch, with a purple back, and yellow ſides and belly.

AIR, Aer, in *Phyſics*, a thin, fluid, elaſtic, tranſparent, ponderous, compreſſible, and dilatable body; ſurrounding the terraqueous globe to a conſiderable height.

Air was conſidered by ſome of the ancients as an *element*; but then, by *element*, they underſtood a different thing from what we do. See Elements.

It is certain, that *air*, taken in the popular ſenſe, is far from the ſimplicity of an *elementary* ſubſtance; though ſome of its properties and uſes in a ſtate of combination with various ſubſtances, from which it has been extricated by modern analyſis, may entitle it to this appellation.—Hence, *air* may be diſtinguiſhed into *proper* or *elementary*, and *vulgar* or *heterogeneous*.

Air, *elementary*, or Air *properly ſo called*, is a certain ſubtile, homogeneous, elaſtic matter; the baſis, or fundamental ingredient of the atmoſpherical *air*, and that which gives it the denomination.

In this ſenſe, it likewiſe enters into the compoſition of moſt, or perhaps all bodies, exiſting in them under a ſolid form, deprived of its elaſticity, and moſt of its diſtinguiſhing properties, and ſerving as their cement, and the univerſal bond of nature; but capable, by certain proceſſes, of being diſengaged from them, recovering its elaſticity, and reſembling the *air* of our atmoſphere. See Hales's Vegetable Statics, ch. vi.

The peculiar nature of this *aerial* matter we know but little of; what authors have advanced concerning it being chiefly conjectural. We have no way of altogether ſeparating it from the other matters with which in its pureſt ſtate it is more or leſs combined, and conſequently no way of aſcertaining, with ſatisfactory evidence, its peculiar properties, abſtractedly from thoſe of other bodies.

Dr. Hook, and ſome others, maintain, that it is the ſame with the *æther*, or that fine, fluid, active matter, diffuſed through the whole expanſe of the celeſtial regions: which coincides with Sir I. Newton's *ſubtile medium*, or ſpirit. In this view it is ſuppoſed to be a body *ſui generis*, ingenerable, incorruptible, immutable, preſent in all places, in all bodies.

Others, conſidering only its property of elaſticity, which they account its eſſential and conſtituent character, ſuppoſe it to be mechanically producible; and to be no other than the matter of other bodies ſo modified and altered, as to become permanently elaſtic.—Sir Iſaac Newton obſerves, that the particles of denſe, compact, and fixed ſubſtances, cohering by a ſtrong attractive force, are not ſeparable without a vehement heat, or perhaps not without fermentation; and ſuch bodies, being at length rarefied by ſuch heat or fermentation, become true *permanent air*; and diſtinguiſhable from vapour, which is only *apparent* or *tranſient air*, as is evident from the experiment with the *æolipile*. Optics, Qu. 31. p. 371, 372, Ed. 3. See Air, *atmoſpherical* and *fixed*.

Air, *vulgar*, or *heterogeneous*, is a coalition of corpuſcles of various kinds, which together conſtitute one fluid maſs, wherein we live and move, and which we are continually receiving and expelling by reſpiration.—The whole aſſemblage of this makes what we call the *atmoſphere*; where this *air*, or *atmoſphere*, terminates, there *æther* is ſuppoſed to commence; which is diſtinguiſhed from *air*, by its not making any ſenſible refraction of the rays of light, as *air* does.

Air, in this popular and extenſive meaning of the term, is acknowledged by Mr. Boyle to be the moſt heterogeneous body in the univerſe; Boerhaave ſhews it to be an univerſal chaos, or *colluvies*, of all kinds of created bodies. Beſide the matter of light or fire, which continually flows into it from the heavenly bodies, and probably the magnetic effluvia of the earth, whatever fire can volatilize is found in the *air*.

Hence, for inſtance, 1. The whole foſſil kingdom muſt neceſſarily be found in it: for all of that tribe, as ſalts, ſulphurs, ſtones, metals, &c. are convertible into fume, and thus capable of being rendered part of the *air*.—Gold itſelf, the moſt fixed of all natural bodies, is found to adhere cloſe to the ſulphur in mines; and thus to be raiſed along with it. Mr. Boyle obſerves, that beſide the ſaline *effluvia* of the common ſort, ſuch as the nitrous, vitriolic, marine, &c. there may be many compounded kinds of ſalts in the *air*, which we have not on earth, ariſing from different ſaline ſpirits, fortuitouſly meeting and mixing together. Thus, the glaſs windows of ancient buildings are ſometimes obſerved to be corroded, as if they had been worm-eaten; though none of the ſimple ſalts abovementioned have the faculty of corroding glaſs.

Sulphurs too muſt make a conſiderable ingredient of the *air*, on account of thoſe many volcanos, grottos, caverns, and other ſpiracles chiefly affording that mineral, diſperſed through the globe.

2. All the parts of the animal kingdom muſt alſo be in the *air*: for, beſide the copious *effluvia* continually emitted from their bodies, by the vital heat, in the ordinary proceſs of perſpiration; by means of which an animal, in the courſe of its duration, impregnates the *air* with many times the quantity of its own body; we find that any animal when dead, being expoſed to the *air*, is in a certain time wholly incorporated with it.

3. As to vegetables, none of that claſs can be ſuppoſed wanting; ſince we know that all vegetables by putrefaction, become volatile.

The aſſociations, ſeparations, attritions, diſſolutions, and other operations of one ſort of matter upon another, may likewiſe be conſidered as ſources of numerous other neutral, or anonymous bodies, unknown to us.

Air, in this general ſenſe, is one of the moſt conſiderable and univerſal agents in all nature; being concerned in preſervation of life, and the production of moſt of the *phænomena* relating to our world.—Its properties and effects, including a great part of the reſearches and diſcoveries of the modern philoſophers, have in a conſiderable degree been reduced to preciſe laws and demonſtrations; in which form they make a very extenſive and important branch of the mixed mathematics, called PNEUMATICS.

AIR, *mechanical properties and effects of.* The moſt conſiderable of theſe are its *fluidity*, *weight*, and *elaſticity*.

I. *Fluidity.*—That the *air* is a *fluid*, is evident from the eaſy paſſage it affords to bodies through it; as in the propagation of ſmells, and other *effluvia*, and the eaſy conveyance it affords to ſounds: for theſe, and ſimilar effects, prove it to be a body, whoſe parts give way to any force impreſſed, and, in yielding, are eaſily moved among themſelves; which is the definition of a *fluid*. Beſides, it is certain, that no degree of cold has ever yet been produced, natural or artificial, ſtrong enough to deprive it of its *fluidity*.

They who, with the Carteſians, make *fluidity* to conſiſt in a perpetual inteſtine motion of the parts, find that *air* anſwers alſo to that character: thus, in a darkened room, where the ſpecies of external objects are brought in by a ſingle ray, they appear in a continual fluctuation; and thus even the more accurate *thermometers* are obſerved never to remain a moment at reſt.

The cauſe of this *fluidity* of *air* is attributed by ſome late philoſophers to the fire intermixed with it; without which, they imagine, the atmoſphere would harden into a ſolid, impenetrable maſs.—And hence, the greater the degree of fire, the more fluid, moveable, and pervious, is the *air*: and thus, as the degree of fire is continually varying, according to the circumſtances and poſition of the heavenly bodies, the *air* is kept in a continual reciprocation. See Buffon's Hiſt. Nat. Supp. vol. i. Hence, in a great meaſure, it is, that on the tops of the higher mountains, the ſenſes of ſmelling, hearing, &c. are found very feeble. The increaſed rarity of the *air* at a conſiderable height may account for this effect; but the above hypotheſis is contradicted by the more ſenſible experience of cold: the *air* near the ſurface of the earth deriving greater heat from the reflected, than from the direct rays of the ſun. See MOUNTAINS.

II. *Weight* or *gravity*.—Galileo firſt diſcovered that *air* had weight, Dial. I. but the preſſure of the atmoſphere was obſerved by his diſciple Torricelli; and the variations of it depending on different heights, by M. Paſcal.—That the *air* is heavy, follows from its being a body; weight being an eſſential property of matter. But we have many arguments to the ſame purpoſe from ſenſe, and experiment: thus, the hand, applied on the orifice of a veſſel empty of *air*, ſoon feels the load of the incumbent atmoſphere.—Thus, glaſs veſſels, exhauſted of their *air*, are eaſily cruſhed to pieces by the weight of the *air* without. So, two ſmall hollow ſegments of a ſphere, four inches in diameter, exactly fitting each other, being emptied of *air*, are preſſed together with a force equal to 188 pounds, by the weight of the ambient *air*; and that they are kept together by the preſſure of the *air* is evident, by ſuſpending them in an exhauſted receiver, where they will ſeparate of themſelves. Farther, if a tube, cloſe at one end, be filled with mercury, and the other end immerged in a baſon of the ſame fluid, and thus erected, the mercury in the tube will be ſuſpended at the height of about thirty inches above the ſurface of that in the baſon. The reaſon of which ſuſpenſion is, that the mercury in the tube cannot fall lower, without raiſing that in the baſon; which being preſſed down by the weight of the incumbent atmoſphere, cannot give way, unleſs the weight of the mercury in the tube exceeds that of the *air* out of it.—That this is the caſe, is evident; becauſe, if the whole *apparatus* be included in the receiver of an *air*-pump, the mercury will fall in proportion as the *air* is exhauſted; and on gradually letting in the *air* again, the mercury reaſcends to its former height.—This makes what is uſually called the *Torricellian experiment*.

To ſay no more, we can actually weigh *air*; for a veſſel, full even of common *air* is found, by a very nice balance, to weigh more than when the *air* is exhauſted; a quart of *air* weighing about 17 grains; and the effect is proportionably more ſenſible, if the ſame veſſel be weighed full of condenſed *air* in a receiver void of *air*.

The weight of *air* is continually varying, according to the different degree of heat and cold, and the concurrence of other cauſes. Ricciolus eſtimates its weight to that of water, to be as 1 to 1000; Merſennus as 1 to 1300, or 1 to 1356; Lana, as 1 to 640; Galileo only makes it as 1 to 400. Mr. Boyle, by a more accurate experiment, found it about London, as 1 to 938; and thinks, all things conſidered, the proportion of 1 to 1000 may be taken as a *medium*; for there is no fixing any preciſe *ratio*, ſince not only the *air*, but the water itſelf, is continually varying. Add, that experiments made in different places neceſſarily vary, on account of the different heights of the places, the ſeaſons of making the experiment, and the different denſities of *air* correſponding to theſe circumſtances. It muſt be added, however, that by experiments made ſince, before the Royal Society, the proportion of *air* to water was, firſt, found as 1 to 840; then, as 1 to 852; and a third time, as 1 to 860. Phil. Tranſ. N° 181.—And laſtly, by a very ſimple and accurate experiment of Mr. Hauksbee, the proportion was ſettled as 1 to 885. Phyſ. Mechan. Exper.—But theſe experiments being all made in the ſummer months, when the barometer was $29\frac{3}{4}$ inches high, Dr. Jurin thinks, that at a *medium* between heat and cold, when the barometer is 30 inches high, the proportion between the two fluids may be taken as 1 to 800; which agrees with the obſervation of the honourable Mr. Cavendiſh, the thermometer being at 50°, and the barometer at $29\frac{3}{4}$ inches Phil. Tranſ. vol. lvi. p. 152.

Air, then, being heavy and fluid, the laws of its gravitation, or preſſure, may be inferred to be the ſame as in other fluids; and conſequently its preſſure muſt be as its perpendicular altitude. This is alſo confirmed by experiment.—For removing the *Torricellian tube* to a more elevated place, where the incumbent column of *air* is ſhorter, a proportionably ſhorter column of mercury is ſuſtained. On this principle depend the ſtructure and office of the BAROMETER.

From hence, alſo, it follows, that the *air*, like all other fluids, muſt preſs equally every way.—This is confirmed by obſerving, that ſoft bodies ſuſtain this preſſure without any change of figure, and brittle bodies, without breaking; though the preſſure upon them be equal to that of a column of mercury thirty inches high, or a column of water of thirty-two feet. It is obvious, that no other cauſe can preſerve ſuch bodies unchanged, but the equable preſſure on all ſides, which reſiſts as much as it is reſiſted. And hence, upon removing or diminiſhing the preſſure on one ſide only, the effect of the preſſure is ſoon perceived on the other. For the quantity and effect of this preſſure of the atmoſphere on the human body, and on the ſurface of the earth, ſee ATMOSPHERE.

From the *gravity* of the *air*, conſidered in connection with its *fluidity*, ſeveral of its uſes and effects are deducible.

1. By means of its *weight*, &c. it cloſely inveſts the earth, with all the bodies upon it; and conſtringes and binds them down with a force amounting, according to the computation of M. Paſchal, to 2232 pounds weight upon every ſquare foot, or upwards, of 15 pounds upon every inch ſquare. Hence it prevents, e. gr. the arterial veſſels of plants and animals from being too much diſtended by the impetus of the circulating juices, or by the elaſtic force of the *air* ſo plentifully contained in the blood.—Thus, we ſee, in the operation of cupping, that, upon a diminution of the preſſure of the *air*, the parts of the body grow tumid; which neceſſarily alters the manner of the circulation through the capillaries, &c.

The ſame cauſe hinders the juices from ouſing and eſcaping through the pores of their containing veſſels: this is experienced by ſuch as travel up high mountains, who, in proportion as they aſcend, find themſelves more and more relaxed; and at length become ſubject to a ſpitting of blood, and other hæmorrhages; becauſe the *air* doth not ſufficiently conſtringe the veſſels of the lungs. Similar effects are obſerved in animals that are incloſed under the receiver of the *air-pump*, who, as the *air* is taken from them, pant, ſwell, vomit, and diſcharge their urine and excrements. See VACUUM.

2. The *weight* of the *air* promotes the mixture of contiguous fluid bodies. Hence many liquids, as oils and ſalts, which readily and ſpontaneouſly mix in *air*, remain, on the removal of it, in a ſtate of ſeparation.

3. This *gravity* of *air* does in ſome caſes determine the action of one body upon another.

And, 4. to the ſame principle are chiefly owing our winds, which are only *air* put in motion by ſome alteration in its *equilibrium*.

III. *Elaſticity*—or a power of yielding to an impreſſion by contracting its dimenſions; and, upon removing or diminiſhing the impreſſive cauſe of returning to its former ſpace or figure. This *elaſtic* force has been long accounted the diſtinguiſhing property of *air*; the other properties hitherto enumerated being common to it with other fluids; though from late experiments it appears more than probable, that the capacity of being compreſſed and expanded is not peculiar to *air*. See WATER and COMPRESSION.

This property of *air* was firſt aſcertained by ſome experiments of lord Bacon, who, upon this principle, conſtructed his *vitrum calendare*, the firſt thermometer. Bacon. Nov. Organ. lib. ii. aph. 13.

Of this power we have numerous proofs.—Thus, a blown bladder being ſqueezed in the hand, we find the included *air* ſenſibly reſiſt; ſo that upon ceaſing to compreſs, the cavities or impreſſions, made in its ſurface, are readily expanded again, and filled up.

On this property of *elaſticity*, the ſtructure and office of the *air*-pump depend.

Every particle of *air* always exerts this *niſus*, or endeavour to expand, and thus ſtrives againſt an equal endeavour of the ambient particles; whoſe reſiſtance, happening by any means to be weakened, it immediately diffuſes into an immenſe extent.—Hence it is, that thin glaſs bubbles, or bladders, filled with *air*, and exactly cloſed, being included in the exhauſted receiver of an *air*-pump, burſt, by the force of the included *air*. So a bladder quite flaccid, containing only the ſmalleſt quantity of *air*, ſwells in the receiver, and appears quite full. The ſame effect is alſo found, by carrying the flaccid bladder to the top of an high mountain.

It has been queſtioned among philoſophers, whether this *elaſtic* power of the *air* is capable of being deſtroyed or diminiſhed. Mr. Boyle made ſeveral experiments, with a view to diſcover, how long *air*, brought to the greateſt degree of expanſion to which he could reduce it in his *air*-pump, would retain its ſpring; and could never obſerve any ſenſible diminution. Deſaguliers found that *air*, after having been incloſed for half a year in a wind-gun, had loſt none of its *elaſticity*; and Roberval, after preſerving it in the ſame manner for ſixteen years, obſerved, that its expanſive projectile force was the ſame, as if it had been recently condenſed. Nevertheleſs, Mr. Hauksbee concludes, from a later experiment, that the ſpring of the *air* may be ſo diſturbed by a violent preſſure, as to require ſome time to return to its natural tone. Dr. Hales inferred, from a number of experiments, that the *elaſticity* of the *air* is capable of being impaired and diminiſhed by a variety of cauſes. See Air, *fixed*.

The weight or preſſure of the *air*, it is obvious, has no dependence on its *elaſticity*; but would be the ſame, whether the *air* had ſuch a property or not.—But the *air*, being *elaſtic*, is neceſſarily affected by the preſſure, which reduces it into ſuch a ſpace, as that the *elaſticity* which re-acts againſt the compreſſing weight, is equal to that weight.

In effect, the *law* of this *elaſticity* is, that it increaſes as the denſity of the *air* increaſes; and the denſity increaſes, as the force increaſes by which it is preſſed. Now, there muſt neceſſarily be a balance between the action and re-action; i. e. the *gravity* of the *air*, which tends to compreſs it, and the *elaſticity* of the *air*, which endeavours to expand it, muſt be equal.

Hence, the *elaſticity* increaſing, or diminiſhing, univerſally, as the denſity increaſes, or diminiſhes, i. e. as the diſtance between the particles diminiſhes, or increaſes, it is no matter whether the *air* be compreſſed, and retained in ſuch ſpace, by the weight of the atmoſphere, or by any another means; it muſt endeavour, in either caſe, to expand with the ſame force.—And hence, if *air* near the earth be pent up in a veſſel, ſo as to cut off all communication with the external *air*, the preſſure of the incloſed *air* will be equal to the weight of the *atmoſphere*. Accordingly, we find *mercury* ſuſtained to the ſame height, by the *elaſtic* force of *air* incloſed in a glaſs veſſel, as by the whole *atmoſpherical* preſſure.

On the ſame principle *air* may be artificially condenſed; and hence the ſtructure of the WIND-*gun*.

The utmoſt limits to which *air*, of the denſity which it poſſeſſes at the ſurface of the earth, is capable of being compreſſed, have not been aſcertained. Mr. Boyle made it thirteen times more denſe; Dr. Halley ſays that he has ſeen it compreſſed ſo as to be 60 times denſer than in its natural ſtate, which is farther confirmed by M. Papin, and M. Huygens; Dr. Hales, by means of a preſs, condenſed it 38 times; and by forcing water in an iron ball or globe, into 1551 times leſs ſpace than it naturally occupies.

However Dr. Halley has aſſerted, in the Philoſophical Tranſactions, Abr. vol. ii. p. 17. that from the experiments made at London, and by the Academy del Cimento at Florence, it might be ſafely concluded, that no force whatever is able to reduce *air* into 800 times leſs ſpace than that which it naturally poſſeſſes on the ſurface of our earth. In anſwer to which, M. Amontons, in the Memoirs of the French Academy, maintains, that there is no fixing any bounds to its condenſation; that greater and greater weights will ſtill reduce it into leſs and leſs compaſs; that it is only *elaſtic* in virtue of the fire which it contains; and that as it is impoſſible ever abſolutely to drive all the fire out of it, it is impoſſible ever to make the utmoſt condenſation.

The dilatation of the *air*, by virtue of its *elaſtic* force, is found to be very ſurpriſing; and yet Dr. Wallis ſuggeſts, that we are far from knowing the utmoſt of which it is capable. In ſeveral experiments made by Mr. Boyle, it dilated firſt into 9 times its former ſpace; then into 31 times; then into 60; then into 150. Afterwards, it was brought to dilate into 8000 times its ſpace; then into 10000, and even at laſt into 13679 times its ſpace; and this altogether by its own expanſive force, without the help of fire.

On this depend the ſtructure and uſe of the MANOMETER.

Hence, it appears, that the *air* we breathe near the ſurface of the earth, is compreſſed by its own weight into at leaſt the 13679th part of the ſpace it would poſſeſs *in vacuo*.—But if the ſame *air* be condenſed by art, the ſpace it will take up when moſt dilated, to that it poſſeſſes when condenſed, will be, according to the ſame author's experiments, as 550000 to 1.

We hence ſee how wild and erroneous the obſervation of Ariſtotle was, that *air*, rendered ten times rarer than before, changes its nature, and becomes fire.

M. Amontons, and others, we have already obſerved, attribute the rarefaction of the *air* wholly to the fire contained in it; and therefore, by increaſing the degree of heat, the degree of rarefaction may be carried ſtill farther than its ſpontaneous dilatation. *Air* is expanded $\frac{1}{3}$ of its bulk by boiling water. Hiſt. Acad. Sc. 1699.

Dr. Hales found that the *air* in a retort, when the bottom of the veſſel was juſt beginning to be red-hot, was expanded through twice its former ſpace, and in a white, or almoſt melting heat, it occupied thrice its former ſpace; but Mr. Robins found, that *air* was expanded by the heat of iron, juſt beginning to be white, to four times its former bulk.

On this principle depend the ſtructure and office of the THERMOMETER.

M. Amontons firſt diſcovered that *air* will expand, in proportion to its denſity, with the ſame degree of heat. On this foundation, the ingenious author has a diſcourſe, to prove 'that the ſpring and weight of the *air*, 'with a moderate degree of warmth, may enable it to 'produce even earthquakes, and other of the moſt vehement commotions of nature.'

According to the experiments of this author, and M. de la Hire, a column of *air* on the ſurface of the earth, 36 fathoms high, is equal in weight to three lines depth of mercury; and it is found, that equal quantities of *air* poſſeſs ſpaces reciprocally proportional to the weights with which they are preſſed: the weight of the *air*, therefore, which would fill the whole ſpace poſſeſſed by the terreſtrial globe, would be equal to a cylinder of mercury, whoſe baſe is equal to the ſurface of the earth, and its height containing as many times three lines, as the atmoſpherical ſpace contains orbs equal in weight to 36 fathoms of that wherein the experiment was made.—Hence, taking the denſeſt of all bodies, e. gr. gold, whoſe gravity is about 14630 times greater than that of *air* in our orb, it is eaſy to compute, that this *air* would be reduced to the ſame denſity as gold, by the preſſure of a column of mercury 14630 times 28 inches high, i. e. 409640 inches: ſince the bulks of *air*, in that caſe, would be in the reciprocal ratio of the weights by which they are preſſed. Theſe 409640 inches, therefore, expreſs the height at which the barometer muſt ſtand, where the *air* would be as heavy as gold, and the number $2\frac{51632}{409640}$ lines, the thickneſs to which our column of 36 fathoms of *air* would be reduced in the ſame place. Now, we know, that 43528 fathoms, which is the depth, where the above preſſure, and conſequent reduction take place, are only the 74th part of the ſemidiameter of the earth; and therefore, beyond that depth, whatever matter exiſts, it muſt be heavier than gold. It is not improbable, therefore, that the remaining ſphere of 6451538 fathoms diameter may be full of denſe *air*, heavier, by many degrees, than the heavieſt bodies which we know. Hence, again, as it is proved, the more *air* is compreſſed, the more does the ſame degree of fire increaſe the force of its ſpring, and render it capable of a proportionably greater effect; we may infer, that a degree of heat, which in our orb can only produce a moderate effect, may have a very violent one in ſuch lower orb; and that, as there may be many degrees of heat in nature, beyond that of boiling water, it is probable there may be ſome, whoſe violence, thus aſſiſted by the weight of the *air*, may be ſufficient to tear aſunder the ſolid globe. Mem. de l'Acad. An. 1703. For the true cauſe of earthquakes, ſee EARTHQUAKES.

This *elaſtic* property of *air* is ſuppoſed by many philoſophers to depend on the figure of its corpuſcles, which they ſuppoſe to be ramous: ſome maintain that they are ſo many minute *flocculi*, reſembling fleeces of wool: others conceive them rolled up like hoops, and curled like wires, or ſhavings of wood, or coiled like the ſprings of watches, and endeavouring to reſtore themſelves in virtue of their texture: ſo that to produce *air*, muſt be to produce ſuch a figure and diſpoſition of parts; and thoſe bodies only are proper ſubjects, which are ſuſceptible of ſuch diſpoſition; which fluids, from the ſmoothneſs, roundneſs, and ſlipperineſs of their parts, are not.

But Sir Iſaac Newton (Optics, p. 371.) explains the matter otherwiſe; ſuch a texture he thinks by no means ſufficient to account for that vaſt power of *elaſticity* obſerved in *air*, which is capable of diffuſing into above a million of times more ſpace than it before poſſeſſed.—But, as all bodies are ſhewn to have an attractive and a repelling power; and as both theſe are ſtronger in bodies, the denſer, more compact, and ſolid they are; hence it follows, that when by heat, or any other powerful agent, the attractive force is ſurmounted, and the particles of the body ſeparated ſo far as to be out of the ſphere of attraction; the repelling power commencing thence, makes them recede from each other with a ſtrong force, proportionable to that wherewith they before cohered; and thus they become permanent *air*.—Hence, ſays the ſame author, it is, that as the particles of permanent *air* are groſſer, and riſe from denſer bodies, than thoſe of tranſient *air*, or vapour, true *air* is more ponderous than vapour; and a moiſt atmoſphere is lighter than a dry one.

The *elaſtic* power of the *air*, above illuſtrated and evinced, is the ſecond great ſource of the effects of this important fluid. By means of this, it inſinuates into the pores of bodies, poſſeſſing this prodigious faculty of expanding, which is ſo eaſily excited, that it muſt neceſſarily put the particles of bodies into which it inſinuates itſelf into perpetual oſcillations. Indeed, the degree of heat, and the *air's* gravity and denſity, and conſequently its elaſticity and expanſion, never remaining the ſame for the leaſt ſpace of time, there muſt be an inceſſant vibration, or dilatation and contraction in all bodies.

We obſerve this reciprocation in ſeveral inſtances, particularly in plants, the *tracheæ*, or *air*-veſſels, of which do the office of lungs; for the contained *air* alternately expanding and contracting, as the heat increaſes or diminiſhes, by turns preſſes the veſſels, and eaſes them again; and thus promotes a circulation of their juices. See Air-*veſſels*.

Hence, we find, that no vegetation or germination will proceed *in vacuo*. Indeed, beans have been obſerved to grow a little tumid therein; and this has led ſome to attribute that to vegetation, which was really owing to no other cauſe than the dilatation of the *air* within them. The *air* is very inſtrumental in the production and growth of vegetables, not only by invigorating their ſeveral juices, while in an *elaſtic* active ſtate, but, alſo, by greatly contributing in a fixed ſtate to the union and firm connection of their ſeveral conſtituent parts.

From the ſame cauſe it is, that the *air* contained in bubbles of ice, by its continual action, burſts the ice; and thus glaſſes and other veſſels frequently crack, when their contained liquors are frozen. Thus, alſo, entire columns of marble ſometimes cleave in the winter time, from ſome little bubble of included *air's* acquiring an increaſed elaſticity. From the ſame principle ariſe all PUTREFACTION and FERMENTATION; neither of which will proceed, even in the beſt diſpoſed ſubjects, *in vacuo*.

Since we find ſuch great quantities of *elaſtic air*, generated in the ſolution of animal and vegetable ſubſtances, a good deal muſt conſtantly ariſe from the diſſolution of theſe elements in the ſtomach and bowels, which is much promoted by it.

In reality, all natural corruption and alteration ſeem to depend on *air*; and metals, particularly gold, only ſeem to be durable and incorruptible, in virtue of their not being pervious to *air*.

Air, *effects of the different ingredients of it.*—*Air* not only acts by its common properties of *gravity* and *elaſticity*, but there are numerous other effects, ariſing from the peculiar ingredients of which it conſiſts.

Thus, 1. It not only diſſolves and attenuates bodies by its preſſure and attrition, but as a *chaos* containing all kinds of menſtrua, and conſequently poſſeſſing powers for diſſolving all bodies. It is known, that iron and copper readily diſſolve, and become ruſty in *air*, unleſs well defended with oil. Boerhaave aſſures us, that he has ſeen pillars of iron ſo reduced by *air*, that they might be crumbled to duſt between the fingers; and as for copper, it is converted by the *air* into a ſubſtance much like the verdigreaſe produced by vinegar.

Mr. Boyle relates, that in the ſouthern Engliſh colonies the great guns ruſt ſo faſt, that, after lying in the *air* for a few years, large cakes of *crocus martis* may be ſeparated from them.—Acoſta adds, that in Peru the *air* diſſolves lead, and conſiderably increaſes its weight.—Yet gold is generally eſteemed indiſſoluble by *air*; being never found to contract ruſt, though expoſed to it ever ſo long. The reaſon may be, that ſea-ſalt, which is the only menſtruum capable of acting on gold, being very difficult to volatilize, there is but a ſmall proportion of it in the atmoſphere. In the laboratories of chemiſts, where *aqua regia* is prepared, the *air* becoming impregnated with an unuſual quantity of this ſalt, gold contracts a ruſt like other bodies.

Stones alſo undergo the changes incident to metals.—Thus, Purbeck ſtone, of which Saliſbury cathedral conſiſts, is obſerved gradually to become ſofter, and to moulder away in the *air*; and Mr. Boyle gives the ſame account of Blackington ſtone. He adds, that *air* may have a conſiderable operation on vitriol, even when a ſtrong fire could act no farther upon it. And he has found, that the fumes of a corroſive liquor work more ſuddenly and manifeſtly on a certain metal, when ſuſtained in the *air*, than the menſtruum itſelf did, which emitted fumes, on thoſe parts of the metal, which it covered; referring to the effects of the *effluvia* of vinegar on COPPER.

The diſſolving power of *air* is increaſed by heat, and by other cauſes. It combines with water; and, by acceſs of cold, depoſits part of the matter which was kept diſſolved in it, by a greater degree of heat. Hence, the water, by being depoſited and condenſed upon any cold body, ſuch as glaſs, &c. in windows, forms fogs, and becomes viſible. *Air*, likewiſe, by means of its diſſolving power, accelerates EVAPORATION and DISTILLATION.

2. *Air* volatilizes fixed bodies. Thus, ſea-ſalt, being firſt calcined, then fuſed by the fire, and when fuſed expoſed to the *air* to liquify; when liquified ſet to dry, and then fuſed again, repeating the operation, will, by degrees, be almoſt wholly evaporated; nothing but a little earth remaining. Helmont mentions it as an arcanum in chemiſtry, to render fixed ſalt of tartar volatile; but this is eaſily effected by *air* alone: for, if ſome of this ſalt be expoſed to the *air*, in a place replete with acid vapours, the ſalt draws the acid to itſelf, and, when ſaturated with it, is volatile.

3. *Air* alſo fixes volatile bodies. Thus, though ſpirit of nitre, or aqua fortis, readily evaporate by the fire; yet if there be any putrefied urine near the place, the volatile ſpirit will be fixed, and fall down in form of aqua ſecunda.

4. *Air* brings many quieſcent bodies into action; i. e. excites their latent powers.—Thus, if an acid vapour be diffuſed through the *air*, all the bodies of which that is the proper menſtruum, being diſſolved by it, are brought into a ſtate proper for action.

In the various operations of chemiſtry, *air* is a very neceſſary and important agent; the reſult of particular proceſſes depending on its preſence or abſence, on its being open or incloſed. Thus, the parts of animals and vegetables can only be calcined in open *air*; in cloſe veſſels they never become any other than black coals. And theſe operations are affected by the changes to which the *air* is liable. Many inſtances might be adduced to this purpoſe. Let it ſuffice to obſerve, that it is very difficult to procure oil of ſulphur, *per campanam*, in a clear dry atmoſphere; but in a thick moiſt *air* it may be obtained with greater eaſe, and in larger quantities. So pure well-fermented wine, if it be carried to a place where the *air* is repleniſhed with the fumes of new wine, then fermenting, will begin to ferment afreſh.

The changes in the *air* ariſe from various cauſes, and are obſervable, not only in its mechanical properties, ſuch as gravity, denſity, &c. but in the ingredients that compoſe it. Thus, at Faſhlun in Sweden, noted for copper-mines, the mineral exhalations affect the *air* in ſuch a manner, as to diſcolour the ſilver coin in purſes; and the ſame effluvia change the colour of braſs. In Carniola, Campania, &c. where are mines of ſulphur, the *air* ſometimes becomes very unwholeſome, which occaſions frequent epidemic diſeaſes, &c.

The effluvia of animals alſo have their effect in varying the *air*; as is evident in contagious diſeaſes, plagues, murrains, and other mortalities, which are ſpread by an infected *air*.

The ſudden and fatal effects of noxious vapours has generally been ſuppoſed to be principally, if not wholly, owing to the loſs and waſte of the *vivifying ſpirit of air*. But Dr. Hales attributes this effect to the loſs of a conſiderable part of the *air's elaſticity*, and to the groſſneſs and denſity of the vapours with which the *air* is charged. He found, by an experiment made on himſelf, that the lungs will not riſe and dilate as uſual, when they draw in ſuch noxious *air*, the *elaſticity* of which has been conſiderably diminiſhed. For having made a bladder very ſupple by wetting it, and then cutting off ſo much of the neck, as would make a hole wide enough to admit the biggeſt end of a large foſſet, to which the bladder was bound; and then having blown the bladder, he put the ſmall end of the foſſet into his mouth, and, at the ſame time, pinched his noſtrils ſo cloſe, that no *air* might paſs that way, and he could only breathe to and fro the *air* contained in the bladder, which, with the foſſet, contained ſeventy-four cubic inches. In leſs than half a minute, he found a conſiderable difficulty in breathing; and, at the end of a minute, the bladder was become ſo flaccid, that he could not blow it above half full, with the greateſt expiration which he could make; and, at the ſame time, he could plainly perceive that his lungs were much fallen, in the ſame manner as when we breathe out of them all the *air* we can at once. Hence he concluded, that a conſiderable quantity of the *elaſticity* of the *air* was deſtroyed; and that when the ſuffocating quality of the *air* was the greateſt, it was with much difficulty that he could dilate his lungs in a very ſmall degree.

From this, and ſeveral other experiments, he inferred, that the life of animals is preſerved rather by the elaſtic force of the *air* acting on their lungs, than by its vivifying ſpirit; and that candles and matches ceaſe to burn, after having been confined in a ſmall quantity of *air*; not becauſe they have rendered the *air* effete, by conſuming its vivifying ſpirit, but becauſe they have diſcharged a great quantity of acid fuliginous vapours, which partly deſtroy its elaſticity, and retard the elaſtic motion of the remainder. He likewiſe found, that *air*, which paſſed through clothes dipped with vinegar, could be breathed to and fro as long again, as the like quantity of *air*, which was not thus purified; ſo that ſprinkling the decks of ſhips with vinegar may refreſh the *air*; and this is confirmed by experience. But where the corruption of the *air* is much greater, as in cloſe priſons, &c. nothing can be an adequate and effectual remedy but a VENTILATOR. He obſerved likewiſe, that *air* is not diſqualified for reſpiration, merely by the additional moiſture which it receives, but by ſome bad quality in that moiſture. See his Statical Eſſays, vol. ii.

Dr. Prieſtley obſerves, that, when animals die upon being put into *air*, in which other animals have died, after breathing in it as long as they could, it is plain, that the cauſe of their death is not the want of any *pabulum vitæ*, which has been ſuppoſed to be contained in the *air*; but becauſe the *air* is impregnated with ſomething ſtimulating to their lungs; for they almoſt always die in convulſions, and are ſometimes affected ſo ſuddenly, that they are irrecoverable after a ſingle inſpiration. And he has found the ſame effect from any other kind of noxious *air*. He concludes, from ſubſequent experiments, that the *air* becomes phlogiſticated in its paſſage through the lungs, by means of the blood. Experiments and Obſervations on Air, vol. i. p. 71. vol. ii. vol. iii. p. 55. See AIR *phlogiſticated*, BLOOD, and RESPIRATION.

Vegetables likewiſe produce a change in the ſtate of the *air*. Thus, when a great part of the clove-trees, which grew ſo plentifully in the iſland of Ternate, was felled at the ſolicitation of the Dutch, in order to heighten the value of that fruit, ſuch a change enſued in the *air*, as ſhewed the ſalutary effect of the effluvia, or rather of the vegetation, of the clove-trees, and their bloſſoms; the whole iſland, ſoon after they were cut down, being exceeding ſickly. See AIR *phlogiſticated*.

The *air* is alſo liable to alterations from the ſeaſon of the year. Thus, few ſubterraneous effluvia are emitted in the winter; becauſe the pores are locked up by the froſt, or covered by ſnow; the ſubterraneous heat being at work, and preparing a fund to be diſcharged in the enſuing ſpring. Again, from the winter ſolſtice to the ſummer ſolſtice, the ſun's rays become more and more perpendicular, and conſequently their impulſe on the earth's ſurface more powerful; ſo that the glebe, or ſoil, is more and more relaxed, ſoftened and putrefied, till he arrives at the tropic: where, with the force of a chemical agent, he reſolves the ſuperficial parts of the earth into their conſtituent principles, water, oil, ſalt, &c. which are all ſwept away into the atmoſphere.

The height and depth of the *air* produce a farther alteration; the exhalations not riſing high enough, in any great quantity, to aſcend above the tops of high mountains. Nor muſt drought and moiſture be denied their ſhare, in varying the ſtate of the atmoſphere: in Guinea, the heat, with the moiſture, conduces ſo much to putrefaction, that the pureſt white ſugars are often full of maggots; and their drugs ſoon loſe their virtue, and many of them grow verminous: it is added, that in the iſland of St. Jago, they are obliged to expoſe their ſweetmeats daily to the ſun, in order to exhale the moiſture contracted in the night, which would otherwiſe occaſion them to putrefy.

On this principle depend the ſtructure and uſe of the HYGROMETER.

For the refracting power of *air*, ſee REFRACTION.

After all, ſome of our more curious and penetrating naturaliſts have obſerved certain effects of *air*, which do not appear to follow from any of the properties, or materials, above recited. In this view, Mr. Boyle has compoſed a treatiſe of Suſpicions about ſome unknown Properties of the Air. The phænomena of fire and flame *in vacuo*, ſeem, according to him, to argue ſome unknown vital ſubſtance diffuſed through the *air*, on account of which that fluid becomes ſo neceſſary to the ſubſiſtence of flame. Buffon ſuppoſes, that *air* is neceſſary to the ſubſiſtence of fire, becauſe it is moſt adapted to acquire that expanſive motion, which is the principal property of fire. On this account fire combines with *air*, in preference to every other ſubſtance, and in a more intimate manner, as being of a nature moſt nearly approaching to its own; and therefore *air* is the proper aliment and moſt powerful aſſiſtant of fire. Hiſt. Nat. Supp. vol. i.

But Dr. Prieſtley has deduced, from experiments, a much more rational explication of this matter. The *air* is a menſtruum for the phlogiſton emitted by burning bodies; which muſt ceaſe to burn, when that menſtruum is ſaturated with it. And he accounts in the ſame manner for the ſuffocation of animals in a confined ſpace. When the phlogiſton, emitted by burning bodies, and breathing animals, can no longer be abſorbed by the ambient *air*, both life and flame are extinguiſhed. Exp. and Obſ. &c. vol. i.

Dr. Prieſtley, improving upon the experiments and inveſtigations of Boyle, Hales, Brownrigg, Black, Macbride, Cavendiſh, and others, has diſcovered many ſpecies of *air*, extracted by various proceſſes from different kinds of ſubſtances; of which a ſummary account will be given in the following articles. See alſo his curious and invaluable Experiments and Obſervations on different Kinds of Air, in three volumes. And for a compendium of the hiſtory of diſcoveries on this ſubject, Lavoiſier's Eſſays, Phyſical and Chemical, vol. i. See alſo AIR *fixed*.

AIR, *acid*, is a ſpecies of factitious *air*, which was firſt diſcovered by Mr. Cavendiſh; but its nature and properties were afterwards more fully inveſtigated by Dr. Prieſtley. It was firſt produced from copper, by means of ſpirit of ſalt; but Dr. Prieſtley expelled it by heat from ſpirit of ſalt only, without any metallic ſolution; and he afterwards procured it by the ſame kind of proceſs, whereby ſpirit of ſalt is made. For this purpoſe he filled a ſmall phial with common ſalt, and poured upon it a ſmall quantity of concentrated oil of vitriol; the fumes diſcharged in this proceſs were received in a veſſel previouſly filled with quickſilver, and ſtanding in a baſon of quickſilver, and appeared in the form of a perfectly tranſparent *air*; of ſuch a nature, that it is a permanent elaſtic ſubſtance, not liable to be condenſed by cold, like other vapours. This acid vapour extinguiſhes flame, which appears, before the candle goes out, and when it is firſt lighted again, of a beautifully green, or rather light-blue colour; and it is heavier than common *air*, though in what proportion is not yet determined. Water imbibes this *air*, changes its aerial or elaſtic form, acquires, when thus impregnated, a very acid taſte, becomes a very active ſolvent of iron, and generates *inflammable air*. Two grains and a half of rain-water will abſorb no leſs than three ounce meaſures of this fluid, and thus ſaturated, will weigh twice as much as it did before. This *acid air* has a very ſtrong affinity with phlogiſton, and attracts it from other ſubſtances; ſuch as inflammable ſpirits, expreſſed oils, oil of turpentine, charcoal, phoſphorus, bees-wax, and even ſulphur; and it is hereby converted into *inflammable air*.

The ſpecies of *air* now deſcribed may be called *marine acid air*, in order to diſtinguiſh it from the *vitriolic acid air*, which is obtained, by putting a ſmall quantity of common oil to oil of vitriol, and gently heating the phial which contains them. When this kind of *air* is generated in great plenty, the top of the phial is filled with white vapours; it is equally tranſparent with the former, and has no greater affinity with quickſilver. It is as readily abſorbed by water as the other, and by its union forms the volatile or ſulphureous *acid* of vitriol. It has the ſame property of extinguiſhing flame, and is heavier than common *air*. Ice is inſtantly diſſolved in both of them. The *alkaline air* being mixed with this kind of *acid* vapour, produced a beautiful white cloud, and evidently appeared to be the lighter of the two: the ſubſtance formed by this combination was the vitriolic *ſal ammoniac*, which is fixed or volatile, upon being expoſed to the common *air*, according to the proportion of the two kinds of *air* in the compound. This ſpecies of *air* differs from the *marine acid air*, in not diſſolving or corroding iron, though it becomes, when combined with water, a very powerful menſtruum for this metal.

Another kind of *acid air* is the *vegetable*, which Dr. Prieſtley expelled by heat from exceedingly ſtrong concentrated *acid* of vinegar. A quantity of olive oil imbibed ten times its bulk of this *air*, and in conſequence of the union became colourleſs like water, and leſs viſcid than before. In this reſpect it differs from the other kinds of *acid air*, which deepen the colour of every ſpecies of oil, making them brown, and at the ſame time viſcid, almoſt to the conſiſtence of reſin. The *vitriolic* and *vegetable acid air* very much reſemble one another; and the only real difference, beſide the ſmell, which is very remarkable, is that juſt mentioned.

In nature and properties the *fluor air acid* very much reſembles the *vitriolic acid air*. It is ſo called from the name of the ſubſtance, from which it is extracted. See Acid *fluor*.

Dr. Prieſtley procured this *air*, by pouring oil of vitriol upon the *fluor*, contained in a ſmall phial, fitted with a ground ſtopple and tube; and firſt without heat, and then by applying a very ſmall degree of it, *air* was produced in great plenty, perfectly tranſparent, and confined by quickſilver, like the other kinds already deſcribed. It formed a white cloud by iſſuing from the tube, and attaching itſelf to the water that floats in the atmoſphere, and yielded a very pungent ſmell. The ſurface of water, as ſoon as it came into contact with this *air*, was rendered white and opake, by a ſtrong film or incruſtation, which made a ſeparation between the *air* above, and the water below it. When this cruſt is broken, and the water riſes ſo as to form a new ſurface, a freſh incruſtation takes place; and thus ſucceſſive layers will be produced, till every particle of *air* is united to the water. Theſe films, being collected and dried, yield a white powdery ſubſtance, uſually a little acid to the taſte, but when waſhed in much pure water, perfectly inſipid. Dr. Prieſtley mentions another method, no leſs amuſing in its effect of combining this *air* with water. The incruſtation is ſo quick, that in leſs than an hour, two or three ounce meaſures of water have been converted into this ſolid maſs; and in this way a very ſtrong acid liquor may be obtained. Theſe appearances are explained, by ſuppoſing that the *vitriolic acid*, in uniting with the ſpar, is in part volatilized, by means of ſome phlogiſton contained in it, ſo as to form a *vitriolic acid air*; and that there is alſo combined with this *air* a portion of the ſolid earthy part of the ſpar, which continues in a ſtate of ſolution, till, coming into contact with the water, the fluid unites with the acid, and the earth is precipitated.

The effects of this vapour on fluids and ſolids are much the ſame with thoſe of the *vitriolic acid air*. There are two peculiar properties in which theſe two vapours agree; they both contain phlogiſton, and in ſuch a manner as to communicate it to the common *air* with which they are mixed, and to render it noxious. The electric ſpark will alſo by a ſingle exploſion incruſt the inſide ſurface of a tube containing this kind of *air* with a deep-brown or black matter, and it will at every ſtroke make the glaſs more and more opake. Some reflection on the nature of the ſpar which yielded this vapour, led Dr. Prieſtley to try, whether the ſame kind might not be procured from Mr. Canton's PHOSPHORUS, by means of oil of vitriol; and the trial ſucceeded.

Air, *alkaline*, is a ſpecies of *factitious air* extracted by heat from volatile ſpirit of ſal ammoniac. This vapour, received into a veſſel of quickſilver, ſtanding in a baſon of the ſame fluid, became a tranſparent and permanent *air*, not at all condenſed by cold. But Dr. Prieſtley ſoon found, that the moſt expeditious method of procuring it was from a mixture of $\frac{1}{4}$ of powdered ſal ammoniac, and $\frac{3}{4}$ of ſlaked lime. Large quantities of this vapour are readily imbibed and condenſed by water; and convert it into a volatile ſpirit of ſal ammoniac, ſtronger, Dr. Prieſtley ſays, than he had ever ſeen, and than any, he apprehends, which can be made in the common way. The *alkaline air*, upon being mixed with nitrous *air*, occaſioned a whitiſh cloud, without producing any neutral ſalt; when water was admitted to this mixture, the *alkaline air* was abſorbed, and the *nitrous air* remained, poſſeſſed of its peculiar properties. Alum undergoes a remarkable change by the action of this *air*. Its outward ſize and ſhape remain the ſame, but the internal ſtructure is quite changed; being hereby rendered opake, beautifully white, and in all reſpects, to appearance, like alum which had been roaſted. The *alkaline air* is ſlightly inflammable; it diſſolves ice as faſt as a hot fire can do it.

Air, *artificial* or *factitious*, was uſed by Mr. Boyle to expreſs what the more ancient chemiſts denominated *gas*, or *ſpiritus ſilveſtris*, and which is now more generally known by the name of *fixed air*. It comprehends all thoſe kinds of *air*, which are originally parts of ſome ſolid ſubſtance, and exiſt in an unelaſtic ſtate; but which, by various analytical proceſſes, are capable of being diſengaged, and recovering their elaſticity.

Air, *atmoſpherical* or *common*, conſiſts, according to Dr. Prieſtley, of the nitrous acid and earth, combined with ſo much phlogiſton as is neceſſary to its elaſticity, and likewiſe ſo much more as is requiſite to bring it from a ſtate of perfect purity, to the mean condition in which we find it. See Air and Atmosphere.

Air, *dephlogiſticated*, is a very extraordinary ſpecies of *air* lately diſcovered by Dr. Prieſtley, to which he has given this name, becauſe it is much purer than any other kind of *air*, and of courſe contains leſs phlogiſton; which, on his hypotheſis, verified by a variety of experiments, renders *air* noxious. This *air* was firſt extracted from *mercurius calcinatus per ſe*, by means of a burning lens; and, in a ſeries of ſubſequent experiments, it was procured from a variety of other ſubſtances, ſuch as red precipitate, minium, and ſeveral other preparations of lead, and from all kinds of earths mixed with ſpirit of nitre; the advantage being on the ſide of the metallic and calcareous earths. This pure *air* was alſo extracted from other ſubſtances, beſide *mercurius calcinatus* and red lead, without the addition of the ſpirit of nitre; viz. from ſedative ſalt, and Roman vitriol, ſlightly calcined. But the pureſt which Dr. Prieſtley ever obtained was from flowers of zinc, moiſtened with ſpirit of nitre, and put into a glaſs phial with a ground ſtopple and tube. This *air* is not imbibed by water, and appears to be a little heavier than common *air*. But the moſt remarkable property belonging to it is its ſuperior purity, which Dr. Prieſtley has evinced by a variety of indubitable teſts. A candle let down into a jar filled with this *air* burns with a very vigorous flame, and the heat produced by it in theſe circumſtances is remarkably great. The experiment is moſt pleaſing, when the *air* is only a little more than twice as good as common *air*; for when it is more highly dephlogiſticated, the candle burns with a crackling noiſe, as if it was full of ſome combuſtible matter. A mouſe was put into a glaſs veſſel, containing two ounce meaſures of the *air*, extracted from *mercurius calcinatis*, and, though it would not have lived in common *air* longer than about a quarter of an hour, it lived in this *air* a full half hour; and when it was taken out ſeemingly dead, it was only chilled by the extreme cold; for upon being held up to the fire it revived, and ſeemed to have received no injury. Another mouſe, in a ſubſequent trial, lived three quarters of an hour in leſs than the former quantity. But the moſt elegant and accurate teſt of the purity of any kind of *air*, is the *nitrous air*. Dr. Prieſtley put one meaſure of *nitrous air* to two meaſures of the *dephlogiſticated air* laſt mentioned; and he obſerved a greater diminution than common *air* would have received by the ſame treatment. A ſecond meaſure of *nitrous air* reduced it to two thirds of its original quantity, and a third meaſure to one half; adding another half meaſure, it was ſtill more diminiſhed, but not much; and another half meaſure made it more than half of its original quantity: ſo that, in this caſe, two meaſures of this *air* took more than two meaſures of *nitrous air*, and yet remained leſs than half of what it was. Five meaſures brought it pretty exactly to its original dimenſions. Now as common *air* takes about one half of its bulk of *nitrous air*, before it begins to receive any addition to its dimenſions from more *nitrous air*, and this *air* took more than four half meaſures before it ceaſed to be diminiſhed by more *nitrous air*, and even five half-meaſures made no addition to its original dimenſions, Dr. Prieſtley concludes, that it was between four and five times as good as common *air*. This *air* then being capable of taking more phlogiſton from *nitrous air*, it muſt originally contain leſs of this principle.

Dr. Prieſtley, in ſome farther proceſſes, obtained *air* between five and ſix times as good as the beſt common *air* he ever met with. Many experiments were made upon various ſubſtances, and upon red lead in particular, in order to determine by what means this kind of *air* came to be ſo pure; and Dr. Prieſtley was convinced in the reſult, that it was the nitrous acid which the red lead acquired from the *air*, that enabled it to yield this *dephlogiſticated air*; and he obſerves, that the red colour of *mercurius calcinatus*, and red lead, favours the ſuppoſition of their having extracted ſpirit of nitre from the *air*. He farther remarks, that *dephlogiſticated air* is purified by ſtanding in water; owing, probably, to its depoſiting more *fixed air* in thoſe circumſtances. He adds, that ſome mechanical contrivance may perhaps hereafter be thought of for conveying this pure *air* into rooms, for the purpoſe of purifying the noxious *air* contained in them. A mixture of one third of highly *dephlogiſticated air*, and the reſt *inflammable air*, in a phial, containing about an ounce meaſure and a half, will cauſe a report as loud as that of a common piſtol; and judging by the ear, not leſs than forty or fifty times as loud as with common *air*, of which there muſt be about two thirds in quantity, to make *inflammable air* explode to the greateſt advantage. And it may be inferred, that, if it were poſſible to fire gun-powder in this kind of *air*, a tenth part of the charge would in all caſes ſuffice. The force of

fire

fire would be very conſiderably augmented, by blowing it with *dephlogiſticated air*, inſtead of common *air*; and the prodigious heat which this *air* affords, may be uſefully applied by chemiſts in a variety of ways. It would likewiſe be very ſalutary as a medicine, in certain morbid caſes, when the common *air* would not be ſufficient to carry off the phlogiſtic putrid effluvium faſt enough. But in a healthful ſtate of the body, it might not be ſo proper; for, as a candle burns out much faſter in this than in common *air*, ſo we might *live out too faſt*, ſays Dr. Prieſtley, and the animal powers be too ſoon exhauſted in this pure kind of *air*. 'Who can tell, he adds, but that in time this pure *air* may become a faſhionable article in luxury. Hitherto only two mice and myſelf have had the privilege of breathing it.'

Air, *fixable* or *fixed*, may, in the largeſt ſenſe of the term, include all the different kinds of *air*, which are the ſubject of theſe articles; ſince they are all capable of being imbibed by ſome ſubſtance or other, and conſequently of being *fixed* in them, after they have been in an elaſtic ſtate. This kind of *air*, by being ſpecifically heavier than common *air*, is found at the bottom of pits; it extinguiſhes candles, &c. and kills animals that breathe it; and on this account has been called the *choke-damp*. However, the above appellation was firſt uſed by Dr. Black, profeſſor of chemiſtry at Edinburgh, to expreſs that particular ſpecies of *factitious air*, which adheres to all calcareous earths, magneſia and alkaline ſalts, with different degrees of force; and which may be ſeparated from theſe ſubſtances, and again combined with them.

This elaſtic matter was but very imperfectly known to the ancient chemiſts before the time of Paracelſus. It was called by them *ſpiritus ſilveſtris*. Paracelſus, and his cotemporaries, imagined, that this fluid is the ſame with the *air* which we breathe. Van Helmont, the diſciple of Paracelſus, made it the ſubject of particular inquiry, and gave it the name of *gas*. This ſubſtance, according to him, is diſcharged from fermenting bodies, and may be diſengaged from ſal ammoniac, and from vegetables. It is this likewiſe which eſcapes from ignited gunpowder and charcoal. To the effluvia of this *gas*, he alſo aſcribes the fatal effects of the Grotto del Cani in Naples, the ſuffocation of workmen in the mines, the accidents occaſioned by the vapour of charcoal, and that noxious *air* which is found in cellars, where ſpirituous liquors are fermenting. Van Helmont likewiſe obſerved, that a great quantity of this vapour is diſengaged from earths and metallic ſubſtances, by their efferveſcence with acids; and he has applied his theory to the explication of ſeveral phænomena in the animal œconomy. He ſuppoſed, that the *gas* was different from the *air* which we breathe, and that it has a great affinity with water; and he appears to have been acquainted with ſeveral properties of this fluid, which are now more generally known and underſtood. Tractatus de Flatibus; and, Complexionum atque Mixtionum Elementalium Figmentum.

Mr. Boyle repeated Van Helmont's experiments *in vacuo*, in condenſed and in open *air*; and he gave the *gas* of the foreign chemiſts the new name of *artificial* or *factitious air*. Both Van Helmont and Mr. Boyle obſerved, that this ſpecies of *air* eſſentially differs from that of the atmoſphere; as the latter is neceſſary to the exiſtence of animals, whilſt the other is noxious and fatal. Mr. Boyle demonſtrated, that artificial *air*, ſeparated from vegetable ſubſtances, is not always the ſame; and that the *air* which is produced by the exploſion of gunpowder, exhibits phænomena peculiar to itſelf; and he farther obſerved, that ſome bodies, ſuch as ſulphur, amber, camphor, &c. diminiſh the bulk of *air*, in which they burn. Boyle's Works, vol. iv.

Dr. Hales purſued this inquiry with great induſtry, and with very conſiderable ſucceſs. He not only ſhewed, that *air* entered into the compoſition of moſt bodies, animal, vegetable, and mineral, but eſtimated the proportion which it bore to the reſt of the compound. He obſerved, that certain ſubſtances and operations generate *air*, and others abſorb it; imagining, however, that the diminution of *air* was ſimply a deduction from the common maſs, without inducing any alteration in the properties of the remainder. Dr. Hales likewiſe examined the mineral waters, and particularly thoſe of Pyrmont; and to the great quantity of *air* which they contain, he attributed the ſpirit and briſkneſs of thoſe waters. But, though he made many important diſcoveries, ſome of which are recited in the courſe of theſe articles, and for the reſt of which the reader muſt be referred to his works, and particularly to chap. vi. of his Vegetable Statics, he ſtill apprehended, that the *air* ſeparated from bodies, as well as that which had been burned or reſpired from animals, was not different from that of the atmoſphere; and that its particular effects were owing to ſome noxious vapours, whereby its elaſticity was impaired or deſtroyed, foreign to its own nature. He likewiſe attributes the abſorption of this kind of *air* by water, not to the affinity which it bears to water in itſelf conſidered, but to the warmth of the water.

It has already been obſerved, that Dr. Seip was the firſt who diſcovered the impregnation of the mineral waters by the *mephitis* or *fixed air*; and that Dr. Brownrigg farther inveſtigated the nature of this principle which enters into their compoſition, and whence they derive their peculiar taſte and effect. See Acidulæ.

Dr. Black farther inveſtigated the chemical nature and effects of this principle, and explained many phænomena in this part of ſcience, which had been hitherto deemed unaccountable. Such was the efferveſcence of abſorbent earths, and alkaline ſalts, with acids, and the change of the mild calcareous earths into quick-lime, by heat, whereby they become cauſtic, or acquire the property of corroding, and burning animal and vegetable ſubſtances, in conſequence of the expulſion of the *fixed air*, which neutralizes them. And he has alſo informed us, that the lime-ſtone loſes nearly the ſame weight by diſſolution in acids, as by calcination; and that it recovers its former weight, when it has been precipitated in the form of a calcareous earth, or with all its *air*. Eſſ. and Obſ. Phyſ. and Liter. vol. ii.

For an account of the oppoſition which Dr. Black's theory met with in Germany, ſee Acidum *pingue*.

In 1764, Dr. Macbride publiſhed his Experimental Eſſays, containing a variety of curious facts and obſervations relating to the nature and properties of *fixed air*. From him we learn, that a conſiderable quantity of this *air* is diſcharged, not only from efferveſcing ſubſtances, and fermenting vegetables, but likewiſe from all putrefying animal ſubſtances; and to the preſence of this fluid he aſcribes their coheſion and firmneſs. He advances a ſtep farther, and obſerves, that fleſh which has begun to putrefy, by having loſt a portion of the *fixed air*, which entered into its compoſition, may recover its former ſweetneſs, by reſtoring to it the *fixed air*, of which it had been deprived. In the courſe of his experiments he diſcovered, that putrid diſeaſes, and the ſea-ſcurvy, owe their origin to the privation of that certain quantity of *air*, which is neceſſary to a ſtate of ſalubrity; and that the beſt antidote againſt theſe diſeaſes muſt be derived from ſubſtances and preparations capable of furniſhing an abundance of *fixed air*. On theſe principles he recommends the uſe of wort in the ſcurvy. The antiſeptic quality of this fluid was a very important and uſeful diſcovery. Dr. Macbride was led to it by a previous obſervation of Sir John Pringle.

Mr. Cavendiſh made ſeveral valuable additions to the knowledge which had been already gained on this ſubject. An account of his experiments may be found in the Phil. Tranſ. for 1766 and 1767, vol. lvi. and vol. lvii. He has accurately aſcertained the quantity of *fixed air* contained both in fixed and volatile alkali, according to their reſpective weight. He has alſo determined the ſpecific gravity of this fluid, as well as of *inflammable air*; ſhewing that the former is 1½ heavier than common *air*, and the latter ten times lighter. He has likewiſe ſhewn, that *fixed air* may be mixed with water, and that it will abſorb a quantity more than equal to its own bulk; that the quantity imbibed by it is greater as the water is colder, and that it flies off again upon being heated and expoſed to the common *air*. To him we owe the diſcovery, that water acquires from this fluid the power of diſſolving calcareous earths; in conſequence of which Mr. Lane found, that it would diſſolve a conſiderable quantity of iron, and become a ſtrong chalybeat. Phil. Tranſ. for 1769, vol. lix.

The next ſtep in this department of ſcience was the invention of a convenient apparatus for generating *fixed air*, and for impregnating water with it; and this was effected by Dr. Prieſtley in the year 1772, though he had made and uſed artificial waters impregnated by the ſame kind of *air*, ariſing from fermenting wort, as early as 1768. See Pyrmont.

Having brought down the hiſtory of *fixed air* to this period, the curious reader muſt be referred to Dr. Prieſtley's Obſervations, &c. ſo often cited in theſe articles, for an account of his numerous and valuable experiments; obſerving, that he has happily availed himſelf of every fact that had been previouſly diſcovered, and extended our acquaintance with this principle in all its various forms, and in the phænomena that attend it, far more than any of his predeceſſors in theſe inquiries. One obſervation however ſhould be mentioned; viz. that *fixed air* is capable of forming an union with phlogiſton, and in this ſtate it is immiſcible with water; and that it wants only phlogiſton to make it common *air*.

Mr. Bewley has proved, by very ſatisfactory experiments, that *fixed air* is an acid *ſui generis*; and Dr. Prieſtley apprehends,

prehends, that it is a modification of the nitrous acid, containing phlogiſton and earth.

The preceding diſcoveries, and others, the recital of which the nature of this work will not admit, have been already ſucceſsfully applied to medical purpoſes, and promiſe to be of very conſiderable utility. Dr. Percival, Mr. Hey, and others, have made various trials of this new medicine, as *fixed air* may be called, in putrid, and other diſorders, and found it efficacious and uſeful. Notice ſhall be taken of the caſes to which it has been applied, under ſubſequent articles, where it may be properly introduced.

M. Baumé, in his Chemiſtry, condemns the general application of the term *fixed air*; and he thinks that the fluid ſo called ſhould retain the denomination given it by Dr. Hales, viz. *detached* or *elaſtic air*; and that *fixed air* is only common *air*, impregnated with foreign ſubſtances, which it holds in ſolution, and that it ſhould be examined, only with reſpect to the nature and qualities of ſuch ſubſtances.

Air, *inflammable*, is that ſpecies of *air*, which, by being lighter than common *air*, occupies the upper parts of ſubterraneous places, and has been commonly found in mines and coal-pits, where it is called the *fire-damp*; becauſe it is liable to take fire, and to explode like gunpowder. It was little known, otherwiſe than as an object of curioſity, and by the fatal effects which it had often produced, till Mr. Cavendiſh began to make experiments upon it. We learn from him how to produce it in great abundance, by diſſolving zinc, iron, and tin, in the diluted vitriolic acid, or ſpirit of ſea-ſalt. He has ſhewn, that it is eſſentially different from the *mephitic*, or *fixed air*, being only the tenth part of the weight of common *air*; and produced a variety of inflammable mixtures, by combining it with common *air*. Dr. Prieſtley has extracted it from other ſubſtances, animal, vegetable, and mineral; and obſerves, that it emits a very offenſive ſmell, according to the nature of the ſubſtance by which it is generated; and the more violent the efferveſcence producing it, ſo much the more *inflammable* will be the *air*, and the more offenſive the ſmell; and the quantity obtained depends on the degree of heat employed in the proceſs. He ſhews, how this kind of *air* may be mixed with water, and deprived of its inflammability. Diſtilled water imbibed about one fourteenth of its bulk of this *air*, but occaſioned no ſenſible difference of taſte. The electric ſpark, which in *fixed air* is exceedingly white, is of a purple or red colour in *inflammable air*; and Dr. Prieſtley infers from hence, that the *inflammable air* may contain particles which conduct electricity, though very imperfectly. This *air*, he obſerves, conſiſts chiefly, if not wholly, of the union of the vitriolic or marine acid vapour with phlogiſton. Water, in which it is agitated, imbibes as much of the phlogiſton as contributes to make it *inflammable*; and in conſequence of this proceſs it becomes fit for reſpiration; and by a continuance of it, at length extinguiſhes flame. See Damps.

Air, *mephitic*, is applied to *fixed air*, to that which is *inflammable*, and to many other kinds, ſince they are equally noxious when breathed by animals; but it is uſually appropriated to the former ſpecies of *air*. See Air *fixable*.

Air, *nitrous*, a name given by Dr. Prieſtley to that kind of *air* which was firſt produced by Dr. Hales from the Walton pyrites, by means of ſpirit of nitre. Dr. Hales obſerves, that a mixture of this with common *air* occaſioned an efferveſcence, and was attended with a turbid red colour, and an abſorption of part of the common *air*. Dr. Prieſtley procured the ſame kind of *air* from the ſolution of iron, copper, braſs, tin, ſilver, quickſilver, biſmuth, and nickel, in the nitrous acid, and of gold, and regulus of antimony, in aqua regia. He aſcertained the phænomena taken notice of by Dr. Hales; and found, by many accurate trials, that upon a mixture of this *air* with common *air*, the latter is conſiderably diminiſhed in quantity; and that the former is wholly decompoſed, when the quantity of it admitted to common *air* is ſuch as is merely ſufficient to diminiſh it to the utmoſt. He adds, that the diminution and decompoſition, to which *nitrous air* is ſubject, reſult from two different cauſes: one is by ſubſtances, which ſeize upon its acid, and the other, thoſe which lay hold of the phlogiſton which it contains. One meaſure of *nitrous air*, applied to two meaſures of common *air*, will diminiſh the mixture about one ninth of the quantity of common *air*; and if both be very pure, the diminution will be gradual, and in a day or two, there will remain only one fifth of the original quantity of common *air*; and yet this mixture retains very nearly the ſame ſpecific gravity with common *air*. But the diminution of common *air*, by a mixture of *nitrous air*, is not more extraordinary, than the diminution which *nitrous air* itſelf is ſubject to, from a mixture of iron filings and brimſtone made into a paſte with water. When this is put to a quantity of *nitrous air*, it diminiſhes it ſo much, that no more than one fourth of the original quantity will be left. The proportion of common *air*, and *nitrous air*, above ſtated, forms the point of ſaturation between theſe two fluids; and if more *nitrous air* be afterwards added to the mixture, no efferveſcence nor redneſs will be produced; but it will make an addition equal to its bulk. *Nitrous air* makes no change either with *fixed* or *inflammable air*, or with any other *air* that is noxious; but the efferveſcence and diminution are peculiar to common *air*, or ſuch as is fit for reſpiration, and very nearly, if not exactly, proportional to its ſalubrity. And hence Dr. Prieſtley was led to adopt this ſpecies of *air* as a teſt, by which to eſtimate the goodneſs of *air*, and the kind as well as degree of the injury which it ſuſtains. In order to explain the peculiar effect produced by *nitrous air* on common *air*, he made uſe of a green precipitate, procured by a ſolution of copper in nitrous acid, and extracted from it, by means of a burning lens, a quantity of *nitrous air*. When any volatile alkali was added to a mixture of *nitrous* and common *air*, in a ſtate of efferveſcence, the jar was filled with white clouds, which precipitating in the form of fine ſnow, made a beautiful appearance, and proved to be a nitrous ammoniac. This, he ſuppoſes, was formed by the acid of the *nitrous air*, let looſe in the decompoſition of it by common *air*, while the phlogiſton, which muſt be another conſtituent part of *nitrous air*, entering the common *air*, was the cauſe of its diminution; as it is alſo the cauſe of a ſimilar diminution in a variety of other proceſſes; ſo that, in reality, phlogiſton is the teſt; and *air* is wholeſome, in proportion to the quantity of phlogiſton which it is able to take.

Nitrous air is extremely noxious both to plants and animals. It is capable of being mixed with water; diſtilled water imbibing about one tenth of its bulk of this kind of *air*; and it communicates to the water a very acid and aſtringent taſte. It is alſo abſorbed in different degrees by æther, oils, ſpirit of wine and alkali, the ſeveral ſorts of acids, and, in general, by any ſubſtance that has a near affinity either with its phlogiſton, or with any other of its conſtituent parts. It is likewiſe one of the ſtrongeſt antiſeptics; and Dr. Prieſtley ſuggeſts, that future preparations of it may be uſed with ſucceſs for checking or correcting putrefaction in the inteſtinal canal, or other parts of the animal ſyſtem.

Air, *phlogiſticated*. Under this general denomination may be included all thoſe different kinds of *air*, which are diminiſhed and rendered noxious by the burning of candles, inſomuch that a common candle conſumes, as it is called, a gallon of *air* in a minute, the reſpiration of animals, the putrefaction of vegetable or animal ſubſtances, the efferveſcence of iron filings and brimſtone, the calcination of metals, the fumes of charcoal, the effluvia of paint made of white lead and oil, a mixture of *nitrous air*, or other ſimilar proceſſes. All theſe proceſſes, Dr. Prieſtley obſerves, agree in this one circumſtance, and, he apprehends, in no other, that the principle, which the chemiſts call phlogiſton, is ſet looſe; and therefore the diminution of the *air* is in ſome way or other the conſequence of the *air* becoming overcharged with it.

Thus, we find, that many cauſes combine to produce very conſiderable alterations in the ſtate of the *air*, whereby it becomes leſs fit for reſpiration, and other purpoſes of nature; and if there were no proviſion for reſtoring its ſalubrity, it muſt, in time, become univerſally injurious and fatal. Dr. Prieſtley, in the courſe of his inquiries on this ſubject, has diſcovered the great reſtoratives, which are provided for this purpoſe. One of theſe is vegetation. In order to aſcertain this fact, he put a ſprig of mint, in a vigorous ſtate, under a glaſs jar, inverted in water; and he found, contrary to his expectation, that this plant not only continued to live, though in a languiſhing way, for two months; but that the confined *air* was ſo little corrupted by the effluvia of the mint, that it would neither extinguiſh a candle, nor kill a ſmall animal, which he conveyed into it. He found, likewiſe, that *air*, vitiated by a candle left in it till it was burnt out, was perfectly reſtored to its quality of ſupporting flame, after another ſprig of mint had vegetated in it for ſome time. And in order to ſhew, that the aromatic vapour of the plant had no ſhare in producing this effect, he obſerved, in a variety of other experiments, that vegetables of an offenſive ſmell, and even ſuch as had ſcarce any ſmell at all, but were of a quick growth, proved the beſt for this purpoſe. Nay more, the virtue of growing vegetables was found to be an antidote to the baneful quality of *air*, corrupted by animal reſpiration and putrefaction; and he infers from a number of ſimilar facts, that the injury, which is continually done to the atmoſphere, by the reſpiration of ſo many animals, and the putrefaction of ſuch maſſes of both vegetable and animal matter, is, in part at leaſt, repaired by the vegetable creation; and, notwithſtanding the prodigious maſs of *air* that is corrupted daily by the abovementioned cauſes; yet, if we conſider the immenſe profuſion of vegetables upon the face of the earth, growing in places ſuited to their nature, and conſequently at full liberty to exert all their powers, both inhaling and exhaling, it can hardly be thought, that the remedy is not adequate to the evil. Dr. Franklin, in a reflection on this diſcovery, expreſſes his hope, that it will give ſome check to the rage of deſtroying trees that grow near houſes, which has accompanied our late improvements in gardening, from an opinion of their being unwholeſome; adding, from long obſervation, that there is nothing unhealthy in the *air* of woods, 'ſince the 'Americans have their country habitations in the midſt 'of woods, and no people on earth enjoy better health, 'or are more prolific.'

The ſea, and other large bodies of water, are the ſecond reſource, which nature has provided for reſtoring the ſalubrity of corrupted *air*. Dr. Prieſtley found, that all kinds of noxious *air* were reſtored by continued agitation in a trough of water; the noxious effluvia being firſt imbibed by the water, and thereby tranſmitted to the common atmoſphere. And he hence concludes, that the agitation of the ſea, and of large lakes and rivers, muſt be highly uſeful for the purification of the atmoſphere; the putrid matter being abſorbed by the water, and imbibed by marine, and other aquatic plants, or applied to purpoſes yet unknown. Exp. and Obſ. vol. i. ſect. 2 and 4.

This ingenious philoſopher apprehends, that the agitation of water, and the vegetation of plants, purify noxious *air*, by abſorbing part of the phlogiſton with which it is loaded; and that this phlogiſtic matter is the moſt eſſential part of the food and ſupport of both vegetable and animal bodies. Ib. vol. i. p. 138, 139.

For an account of Dr. Prieſtley's numerous experiments and obſervations on theſe ſeveral ſpecies of *air*, the reader is referred to the excellent work already cited, and which has furniſhed the greateſt part of the preceding articles.

AIR, *innate*, in *Anatomy*, is a fine aerial ſubſtance, ſuppoſed, by ſome anatomiſts, to be incloſed in the labyrinth of the inner EAR, and to miniſter to the due conveyance of ſounds to the ſenſory.

But the exiſtence of ſuch *innate air* has been called in queſtion, and rendered very improbable. See EAR.

AIR, in *Medicine*, &c. makes one of the ſix NON-NATURALS.

From obſervations on bleeding in rheumatiſms, and after taking cold, it is evident, the *air* can enter with all its qualities, and vitiate the whole texture of the blood, and other juices.

From the palſies, vertigoes, and other nervous affections cauſed by damps, mines, &c. it is evident, that *air* thus qualified can relax and obſtruct the whole nervous ſyſtem. And from the colics, fluxes, coughs, and conſumptions produced by damp, moiſt, and nitrous *air*, it is evident it can corrupt and ſpoil the noble organs, &c. See ATMOSPHERE, and preceding articles.

AIR, in *Muſic*, ſignifies the MELODY, or the inflexion of a muſical compoſition.

The word is alſo uſed for a tune, or ſong itſelf, that is, for a compoſition whoſe movements are juſt and equal; and the times, eſpecially the firſt of ſuch meaſure, well marked—being uſually to be played pretty quick and lively, unleſs there be ſomething to indicate the contrary: as, *larga*, or *affettuoſa*, &c.

Thus we ſee an *air* of Lully: Handel's *airs*, with their ſymphonies and accompaniments, are made into concertos for the violin, &c.

AIR, in *Mythology*, was adored by the heathens under the names of Jupiter and Juno; the former repreſenting the ſuperior and finer parts of the *atmoſphere*, and the latter the inferior and groſſer part. The augurs alſo drew preſages from the clouds, thunder, lightning, &c.

AIR, in *Painting*, &c. denotes the manner and very life of action; or it is that which expreſſes the diſpoſition of the agent.

It is ſometimes alſo uſed in a ſenſe ſomewhat ſynonymous with geſture or attitude.

AIR-*bladder*, a kind of *veſicula* found in the bodies of fiſh, by means whereof they are enabled to ſuſtain themſelves in any depth of water, and either to riſe or ſink at pleaſure. The *air-bladder* is the ſame with what is otherwiſe called the *ſwim*, or *ſwimming-bladder*.

Dr. Prieſtley conjectures that this is not the only uſe of theſe *bladders*; but that the *air* incloſed in them may anſwer ſome farther purpoſe in the animal œconomy of fiſhes.

The diſcovery of the uſe of the *air-bladder* took its riſe from obſerving, that a bubble of *air* in riſing from the bottom of a fluid, continually dilates till it reaches the top, by reaſon of the continual diminution of the weight, or preſſure, of the incumbent water. For the *air* in the bladder is like the bubble, more or leſs compreſſed, according to the depth the fiſh ſwims at, and takes up more or leſs ſpace; and conſequently the body of the fiſh, part of whoſe bulk this bladder is, is greater or leſs, according to the ſeveral depths, though it retains the ſame weight. The rule of hydroſtatics is, that a body heavier than ſo much water as is equal in quantity to the bulk of it, will ſink; a body lighter, will ſwim; a body of equal weight will reſt in any part of the water. By which rule if the fiſh in the middle region of the water, be of equal weight with an equal bulk of the water, the fiſh will reſt there, without any tendency either upwards or downwards; and if the fiſh be deeper in the water, its bulk becoming leſs by the compreſſion of the bladder, and yet retaining the ſame weight, it will ſink and reſt at the bottom: on the other ſide, if the fiſh be higher than the middle region, the *air* dilating itſelf, and the bulk of the fiſh conſequently increaſing, without any increaſe of the weight, the fiſh will riſe and reſt at the top of the water.

Perhaps the fiſh by ſome action can emit *air* out of the bladder, and afterwards out of its body; and alſo when there is not enough, take in more *air*, and convey it to this bladder; in which caſe it will be no wonder, that there ſhould be always a fit proportion of *air* in the bodies of all fiſhes, to ſerve their uſe, according to the depth of water they live in: perhaps alſo by ſome muſcle, the fiſh can contract this bladder beyond the preſſure of the weight of water; and perhaps it can by its ſides, or ſome other defence, keep off the preſſure of the water, and give the *air* leave to dilate itſelf. In theſe caſes, the fiſh will be helped in all intermediate diſtances, and may riſe or ſink from any region without moving a fin. Phil. Tranſ. N° 114.

If the *air-bladder* of a fiſh be pricked or broken, the fiſh preſently ſinks to the bottom, unable either to ſupport or raiſe itſelf up again. Flat fiſhes, as ſoles, plaiſe, &c. which always lie groveling at the bottom, have no *air-bladder*.

In moſt fiſhes there is a manifeſt channel, leading from the gullet, or upper orifice of the ſtomach, to the *air-bladder*, which doubtleſs ſerves for conveying *air* into it. In a ſturgeon Mr. Willughby obſerved, that upon preſſing the bladder, the ſtomach preſently ſwelled; ſo in that fiſh it ſeems the *air* paſſes freely both ways. Poſſibly the fiſh while alive may have a power to raiſe up this valve, and let out *air* on occaſion.

All the cartilaginous kind want *air-bladders*: by what means it is they aſcend and deſcend in water, is yet unknown. The cetaceous kind, or ſea-beaſts, are alſo without the *air-bladder*: indeed, as theſe differ in little from quadrupeds, but the want of feet, the *air* which they receive into their lungs in inſpiration, may ſerve to render their bodies equiponderant to water; and the conſtriction or dilatation of it, by the help of the diaphragm and muſcles of reſpiration, may poſſibly aſſiſt them to aſcend, or deſcend, in the water, by a light impulſe thereof with their fins. Moſt of the EEL-kind have bladders, yet they can hardly raiſe themſelves in the water, by reaſon of the length and weight of their tails; the *air-bladder* being near their heads, may help them to lift up their heads and fore-part. Phil. Tranſ. N° 115.

There is great diverſity in *air-bladders*, in reſpect of figure, ſubſtance, ſituation, and connection, in different fiſh.

In ſome, the *air-bladder* is divided into two, e. gr. in *carps*; and in others, into three. Needham maintains, that all fiſh which have teeth in their jaws have only a ſingle *air-bladder*; whereas thoſe without teeth have a double one, or which amounts to the ſame, the *air-bladder* of theſe laſt is divided into two cells. Sig. Redi refutes this diſtinction; giving inſtances of fiſh with teeth, whoſe *air-bladder* is double; and of others without teeth, who have only a ſingle *air-bladder*.

The water-ſnake, in lieu of a bladder has a large membranous *air-bag* on its back, which it empties and fills with *air* at pleaſure, by an aperture, which it can ſhut very cloſe, from without inwards, by means of a ſort of valve, ſo that the leaſt globule of water cannot enter without its conſent. By this artifice it can enlarge or leſſen the bulk of its body, and inhabit all depths of the water; though a conjecture has been advanced by Mr. Ray, that it is by the help of water which they take in, and let out, by two holes in the lower part of their abdomen, near to the ventricle. They ſink in the water, by letting in ſome of it at theſe holes; the orifices whereof are opened and ſhut at pleaſure, by means of proper muſcles. The water being thus received into the cavity of their abdomen, by which they preponderate the water, and deſcend; when they would aſcend again, a compreſſion is made by the muſcles of their abdomen, and the water forced out again, at leaſt ſo much as ſuffices to give the degree of levity wanted. Ray's Wiſd. of God, p. ii, p. 546.

In the Phil. Tranſ. vol. lxiv. part i. p. 205. art. 29. an. 1774, there is an account of certain receptacles of *air* in birds, which communicate with the lungs, and are lodged both among the fleſhy parts, and in the hollow bones of thoſe animals, by John Hunter, F. R. S. who does not minutely deſcribe all the particular communications of this kind in birds; but mentions, however, a number of general facts, ſufficient for the introduction of this ſubject into natural hiſtory, and for opening a more particular inquiry into the final cauſe of this peculiarity in the ſtructure of birds, hitherto unobſerved or uninveſtigated.

Air-*chamber*, is a name given by Dr. Henſhaw to a room contrived for obtaining the benefit of change of *air*, without going out of the houſe. According to his whimſical propoſal, it is to be twelve feet ſquare, and *air*-tight, furniſhed with a very large pair of organ-bellows, to or from which, *air* is to be conveyed through the wall by a copper pipe, with valves for opening inwardly and outwardly, as occaſion ſhall require. With theſe bellows, the *air* in the room is either to be condenſed and made heavier, by forcing *air* in, or lighter and rarer, by conveying *air* out of the room. See his Aero-Chalinos, or Phil. Tranſ. N° 133. See **Ventilator** and *Blowing*-**Wheel**.

Air-*gun*, ſee **Wind**-*gun*.

Air-*pump*, a machine, by means whereof the *air* may be exhauſted out of proper veſſels.

The uſe and effect of the *air-pump* is, to make, what we popularly call, a *vacuum*; but this, in reality, is only a degree of rarefaction ſufficient to ſuſpend the ordinary effects of the atmoſphere.

By this machine, therefore, we learn, in ſome meaſure, what our earth would be without an atmoſphere; and how much all vital, generative, nutritive, and alterative power, depend thereon.

The principle on which the *air-pump* is conſtructed, is the elaſticity of the *air*; as that on which the common, or water-pump is founded, is the gravity of the ſame *air*.

The ſtructure of the *air-pump* is, in itſelf, more ſimple even than that of the water-pump.—The latter ſuppoſes two principles, gravity and elaſticity likewiſe: ſo that the water-pump muſt be firſt be an *air-pump*, i. e. it muſt rarefy the *air* before it can raiſe the water.—In effect, water, being a dormant unelaſtic fluid, needs ſome external agent to make it aſcend: whereas *air* aſcends in virtue of its own elaſtic activity: its natural tendency is, to ſeparate, and leave a *vacuum*; and all that remains for art, is to prevent the ambient *air* from ſupplying the place of that which thus ſpontaneouſly flies away.

To make water aſcend, the force wherewith it is preſſed downwards, is either to be diminiſhed or increaſed in one part, more than another; like a balance *in æquilibrio*, one of whoſe ſcales may be made to riſe, either by diminiſhing its own weight, or increaſing that of the other: the water, therefore, recedes from the common center of gravity, by the very power wherewith it tends towards it, indirectly or ſecondarily applied; becauſe, two ſimilar centripetal forces being made to act contrary to each other, what in the one over-balances the other, muſt have the effect of a centrifugal force.—Whereas, the principle whereby *air* rarefies or diminiſhes, does not reſpect the centre of the earth, but the centres of its own particles; being no other than a certain implanted power, whereby they immediately tend to recede from each other.

The invention of this noble inſtrument, to which the preſent age is indebted for ſo many fine diſcoveries, is aſcribed to Otto de Guerick, the celebrated conſul of Magdeburg, who exhibited his firſt public experiments therewith, before the emperor and the ſtates of Germany, at the breaking up of the imperial diet at Ratiſbon, in the year 1654.

Dr. Hook, and M. du Hamel, indeed, aſcribe the invention of it to Mr. Boyle; but that ingenious author frankly confeſſes de Guerick to have been beforehand with him. In a letter which he wrote to his nephew, lord Dungarvan, at Paris, about two years after Schottus's book was publiſhed, he introduces the acknowledgment of his obligation, for the diſcovery of this uſeful machine, to what he had heard of it, though he had not then peruſed it, by that well-applied paſſage of Pliny, *benignum eſt et plenum ingenui pudoris fateri per quos profeceris*. Some attempts, he aſſures us, he had made upon the ſame foundation, before he knew any thing of what had been done abroad: but the information he afterwards received from Schottus's Mechanica Hydraulico Pneumatica, publiſhed in 1657, wherein was an account of de Guerick's experiments, firſt enabled him to bring his deſign to any thing of maturity.—From hence, with the aſſiſtance of Dr. Hook, after two or three unſucceſsful trials, aroſe a new *air-pump*, more eaſy and manageable than the German one; and hence, or rather from the great variety of experiments that illuſtrious author applied it to, the engine came to be denominated *machina Boyliana*, and the *vacuum* produced by it, *vacuum Boylianum*.

Air-*pump*, *ſtructure and uſe of the*.—The *baſis* or eſſential part in the *air-pump*, is a metalline tube, anſwering to the barrel of a common pump, or ſyringe; having a valve at the bottom, opening upwards; and a moveable piſton or *embolus*, anſwering to the ſucker of a pump, furniſhed likewiſe with a valve opening upwards.—The whole, duly fitted to a veſſel, as a recipient.

The reſt, being only circumſtances chiefly reſpecting conveniency, has been diverſified and improved from time to time, according to the ſeveral views and addreſs of the makers.—That of Otto de Guerick, being leſs artful, laboured under ſeveral defects, in reſpect of the force neceſſary to work it, which was very great, and the progreſs very ſlow: beſide that it was to be kept under water; and allowed of no change of ſubjects for experiments.

Mr. Boyle, by degrees, removed ſeveral of theſe inconveniences, and alleviated others: but ſtill the working of his pump was laborious, by reaſon of the preſſure of the atmoſphere, a great part of which was to be removed at every exſuction, after a *vacuum* was nearly arrived at.—But this inconvenience has ſince been removed by Mr. Hawkſbee, who by adding a ſecond barrel and piſton to the former, to riſe as the other fell, and fall as it roſe, made the preſſure of the atmoſphere on the deſcending one, of as much ſervice as it was of diſſervice in the aſcending one.

Some of the Germans have alſo brought the *air-pump* to do the oppoſite office of a condenſer: but this is not to make the inſtrument ſo much the better, as more complex.

The ſtructure of the air-pump, as now made among us, with all its advantages, is repreſented in *Tab. Pneumatics*, *fig.* 16.

It conſiſts of two brazen barrels or cylinders, repreſented by *a a a a*; which communicate with each other by a canal paſſing between them at *d d*; and with the receiver *o o o o*, by means of the hollow wire *b b*, one end whereof opens into the canal of communication, and the other into a like canal *n n*; which penetrating the plate *i i i i*, opens into the receiver.

Within the cylinders are two emboli, or ſuckers, made of braſs, and fitted with cork and leather to the cavities of the barrels, ſo as exactly to fill the ſame; each being furniſhed with its valve, and terminating at top in a rack *c c*, by which it is worked.

At the bottom of either barrel is another valve, by which the *air* may paſs out of the communicating canal *d d*, and conſequently out of the hollow wire and the receiver itſelf, into the cylinder, below the piſton; from whence by the valves of the piſton it may proceed into the upper ſpace of the cylinder, and thus into the open *air*.

For the application of this mechaniſm—The winch *b b* being turned upward and downward, its ſpindle *f*, catching by its teeth into the racks, will raiſe and depreſs the two piſtons, alternately.

Mr. Vream, a late pneumatic operator, made an improvement in Hawkſbee's *air-pump*, by reducing the alternate motion of the hand and winch to a circular one. In his method, the winch is turned quite round, yet the piſtons are raiſed and depreſſed alternately: by which the trouble of ſhifting the hand backward and forward, as well as the loſs of time, and the ſhaking of the pump, are prevented. See the contrivance for this purpoſe deſcribed in Clare's Motion of Fluids, p. 154.

Now the conſequence of depreſſing a piſton is, that the *air* before incloſed between it and the bottom of the cylinder, being thus crouded into a leſs compaſs, will, by its elaſtic force, which now exceeds the preſſure of the atmoſphere, puſh up the valve of the piſton, and thus eſcape; till that little which remains be of the ſame denſity with the external *air* incumbent on the valve.

This done, and the ſame piſton being again raiſed in its turn, from the bottom of the cylinder to the top, the little *air* before left, will of neceſſity expand itſelf, ſo as to poſſeſs the whole ſpace of the cylinder thus deſerted by the piſton: upon which, its force or preſſure upon the valve at the bottom of the cylinder being now inconſiderable, the other denſer *air* of the receiver, hollow wire, and canal of communication, by their ſuperior elaſtic force, will lift up the valve, and thus paſs into the cylinder of rarefied *air*, till both be of the ſame degree of denſity.

And thus is the *air* in the receiver diminiſhed at each elevation of the piſton, by the quantity of a cylinder-full; abating for what little remained between the depreſſed

preſſed piſton, and the bottom: ſo that by thus repeating the operation again and again, the *air* in the receiver is at length rarefied to ſuch degree, that its denſity does not exceed the thin *air* remaining in the cylinder when the piſton is raiſed; which done, the effect of the *air-pump* is at an end; the valve cannot now be opened, or, if it could, no *air* would paſs it; there being a juſt equilibrium between the *air* on each ſide.

To judge of the degree of exhauſtion, there is added a gage, *l l*; conſiſting of a tube, whoſe upper orifice communicates with the receiver; the lower being immerged in a baſon of mercury, *m m*.—Hence, the *air* in the tube rarefying as faſt as that in the receiver, in proportion as the exhauſtion advances, the mercury will be raiſed by the preſſure of the column of external *air*, prevailing over that of the column of *air* included; till the column of *air*, and mercury together, become a balance to that of the external *air*. When the mercury is thus riſen to the ſame height as it ſtands in the barometer, which is indicated by the ſcale of inches added to the gage, the inſtrument is a juſt Torricellian tube; and the vacuum may be concluded to be as perfect as that in the upper end of the barometer.

To let *air* again into the exhauſted receiver, the cock *n* is to be turned, which makes a communication with the external *air*; upon which the *air* ruſhing impetuouſly in, the mercury in the gage immediately ſubſides into the baſon.

To the *air-pump* belongs a large apparatus of other veſſels, accommodated to the divers kinds of experiments.

There are ſeveral inconveniencies attending *air-pumps*, of the common form, though much improved from what they uſed to be formerly. Theſe inconveniences are enumerated, and a method ſhewn to remedy them, by Mr. Smeaton.

The principal improvements ſuggeſted by Mr. Smeaton reſpect the diſpoſition of the valves, of the piſton, and of the gage. Inſtead of one hole for the valves, he makes uſe of ſeven, all of an hexagonal ſhape, and of equal ſize; one being in the center, and the other ſix round it; ſo that the valve is ſupported at proper diſtances by a kind of grating, made by the ſolid parts between theſe holes. In order to remedy the inconvenience attending the piſton's not exactly fitting the barrel, the top of the barrel is ſhut up by a plate, having in the middle a collar of leather, through which the cylindrical rod works, that carries the piſton. His gage conſiſts of a bulb of glaſs, in ſhape reſembling a pear, and ſufficient to hold about half a pound of quickſilver. It is open at one end, and the other is a tube hermetically ſealed at top. A ſcale divided into parts of about one tenth part of an inch, and anſwering to a 1000th part of the whole capacity, is annexed to it. The gage, during the exhauſtion of the receiver, is ſuſpended therein by a ſlip-wire. When the pump is worked as much as is thought neceſſary, the gage is puſhed down, till the open end is immerged in a ciſtern of quickſilver placed underneath. The *air* being then let in, the quickſilver will be driven into the gage, till the *air* remaining in it becomes of the ſame denſity with the external; and as the *air* always takes the higheſt place, the tube being uppermoſt, the expanſion will be determined by the number of diviſions occupied by the *air* at the top. See Phil. Tranſ. vol. xlvii.

Mr. Smeaton's *air-pump* has only one barrel.

This ingenious artiſt has ſucceeded ſo well in his conſtruction of the *air-pump*, as to be able to rariſy *air* a thouſand times; whereas the beſt of the common *air-pumps*, eſteemed good in their kind, and in complete order, never rarified it above one hundred and forty times. Mr. Smeaton's *air-pump* is worked with much more eaſe than any other, and acts alſo as a condenſing engine, by the very ſimple *apparatus* of turning a cock. So that this *air-pump* is an univerſal engine, for ſhewing any effect ariſing from an alteration in the denſity or ſpring of the air; and with a little addition may be made to ſhew the experiments of the AIR-*fountain*, WIND-*gun*, &c. Phil. Tranſ. vol. xlvii. p. 422.

AIR-*pump*, *portable*, differs principally in ſize, and in the ſtructure of the gage, from that above deſcribed. The gage conſiſts of a glaſs tube, bent in the form of a ſyphon, hermetically ſealed at one end, and open at the other. The longeſt leg is four inches, each of which is divided on an adjoined ſcale into twenty equal parts. After conſiderable exhauſtion, the gage begins to act; and whilſt the quickſilver falls in one leg, it riſes in the other; and the quantity of air remaining will be determined by the difference of the height at which it ſtands in both tubes. This gage is placed under a ſmall receiver on a plate, communicating by a pipe with the main pipe, that leads from the receiver, to be exhauſted to the bottom of the barrels. See PUMP.

AIR-PUMP, *laws of rarefaction in the receiver of it.*—1. For the proportion of *air* remaining at any time in the receiver, we have the following general theorem.—'In a 'veſſel exhauſted by the *air-pump*, the primitive or na'tural *air* contained therein, is to the *air* remaining, as 'the aggregate of the capacity of the veſſel and of the 'pump (i. e. the cylinder left vacant in an elevation of 'the piſton, with the wire and other parts between the 'cylinder and the receiver) raiſed to a power whoſe ex'ponent is equal to the number of ſtrokes of the piſton, 'to the capacity of the veſſel alone raiſed to the ſame 'power.'

M. Varignon gives an algebraical demonſtration of this theorem, in the Memoires de l'Acad. Roy. an. 1693, p. 233, ſeq. Id. an. 1705, p. 397, ſeq. but it may be alſo demonſtrated pneumatically, thus:—Calling the *air* remaining after the firſt ſtroke, the *firſt reſidual*; that after the ſecond, the *ſecond reſidual*, &c. and remembering that the *air* in the receiver is of the ſame denſity as that in the cylinder, when the piſton is raiſed; it is evident, that the quantity of *air* in the receiver, is to the quantity of *air* in the cylinder, wire, &c. as the capacity of the receiver to that of the cylinder, and conſequently, the aggregate of the *air* in the receiver and the cylinder, i. e. the whole primitive *air*, is to the *air* in the veſſel alone, i. e. to the firſt reſidual *air*, as the aggregate of the capacity of the receiver and the cylinder, to the capacity of the receiver alone.—After the ſame manner it may be proved, that the quantity of the firſt reſidual *air*, is to the ſecond reſidual, as the aggregate of the capacity of the receiver and cylinder to the capacity of the veſſel alone. And the ſame proportion does the ſecond reſidual bear to the third, and ſo of the reſt.—Hence, the product of the primitive *air* into the firſt, ſecond, third, fourth, &c. reſiduals, is to the product of the firſt reſidual into the ſecond, third, fourth, fifth, &c. as the product of the capacity of the receiver and cylinder together, multiplied as oft into itſelf as the number of ſtrokes of the piſton contains units, is to the factum ariſing from the capacity of the receiver alone, multiplied ſo often by itſelf; that is, as the power of the aggregate of the capacity of the receiver and cylinder together, whoſe exponent is the number of ſtrokes of the piſton, to the capacity of the veſſel alone, raiſed to the ſame power.—Conſequently, the primitive *air* is to the laſt reſidual, in the ratio of thoſe powers. *Q. E. D.*

2. The number of ſtrokes of the piſton, together with the capacity of the receiver and cylinder with the wire, &c. being given; to find the ratio of the primitive *air* to the *air* remaining:

Subtract the logarithm of the capacity of the receiver, from that of the ſum of the capacity of the receiver and the cylinder; then, the remainder being multiplied by the number of ſtrokes of the piſton, the product will be a logarithm, whoſe natural number ſhews how oft the primitive *air* contains the remainder required.

Thus, if the capacity of the receiver be 460, that of the cylinder 580, and the number of ſtrokes of the piſton 6; the primitive *air* will be found to the remaining *air*, as 133,5 to 1.

For, ſuppoſe the capacity of the veſſel $= v$, that of the cylinder and veſſel together, $= a$; the number of ſtrokes of the piſton $= n$, and the remaining *air* $= 1$. Since the primitive is to the remaining *air* as a^n to v_n, the primitive *air* will alſo be to the remaining *air*, as $a_n \div v^n$ to 1. Conſequently, if the remaining *air* be 1, the logarithm of the primitive *air* is $a - v \times n$.

3. The capacity of the receiver and the barrel being given; to find the number of ſtrokes of the piſton required to rariſy the *air* to a given degree.

Subtract the logarithm of the remaining *air* from the logarithm of the primitive *air*; and the logarithm of the capacity of the receiver, from that of the aggregate of the capacity of the receiver and cylinder; then, dividing the former difference by the latter, the quotient is the number of ſtrokes required.

Thus, if the capacity of the cylinder be ſuppoſed 580, that of the receiver 460, and the primitive *air* to the remaining *air*, as 133,5 to 10: the number of ſtrokes required will be found to be 6. See Cotes's Hyd. and Pneum. Lectures, Lect. 13.

Beſides the effects, and the *phænomena* of the *air-pump*, recounted under the articles VACUUM, AIR, &c. we may add ſome others; which, related at large, make the ſubſtance of Mr. Boyle's Phyſico-Mech. Exper.—As, that the flame of a candle *in vacuo* uſually goes out in a minute, though it ſometimes laſts two, but the wick thereof continues ignited after; and even emits a ſmoke, which aſcends upwards. That a kindled charcoal is totally extinguiſhed in about five minutes, though in open *air* it remain alive half an hour; that it goes out by degrees, beginning from the top and the outſides.—That red-hot iron is not affected by the abſence of the *air*; and yet that ſulphur or gunpowder will not be lighted thereby, but only fuſed.—That a match, after lying ſeemingly extinct *in vacuo* a long time, revives again upon the re-admiſſion of the *air*.—That a flint and ſteel ſtrike ſparks of fire as copiouſly *in vacuo* as out of it; and that the ſparks move in all directions, upwards, downwards, &c. here as in the *air*.—That magnets and magnetic needles, are the ſame *in vacuo* as in *air*.—That ſmoke in an exhauſted receiver, the luminary being extinct, gradually ſettles to the bottom in a darkiſh body, leaving the upper part clear and tranſparent; and that inclining the veſſel ſometimes on one ſide, and ſometimes another, the fume keeps its ſurface horizontal, after the nature of other fluids.—That the ſiphon does not run *in vacuo*.—That water freezes *in vacuo*.—That heat may be produced by attrition in the exhauſted receiver.—That camphire will not take fire *in vacuo*; and that gun-powder, though ſome grains of a heap be kindled by a burning-glaſs *in vacuo*, will not give fire to the contiguous grains.—That glow-worms loſe their light in proportion as the *air* is exhauſted, and at length become totally obſcure; but upon the re-admiſſion of *air*, preſently recover it all.—That vipers and frogs ſwell much *in vacuo*, but will live an hour and half, or two hours; and though ſeemingly quite dead in that time, came to life again in ſome hours in the *air*.—That ſnails ſurvive ten hours; and efts, or ſlow-worms, two or three days; leeches five or ſix.—That oyſters will remain alive *in vacuo* twenty-four hours without harm.—That the heart of an eel taken out of the body, continues to beat *in vacuo*, more nimbly than in *air*; and this for a good part of an hour.—That warm blood, milk, gall, &c. undergo a conſiderable intumeſcence and ebullition *in vacuo*.—That a mouſe, or other animal, may be brought, by degrees, to ſurvive longer in a rarefied *air*, than naturally it does.—That *air* may retain its uſual preſſure, after it is become unfit for reſpiration.—And that ſilk-worms eggs will hatch *in vacuo*.

AIR-SHAFTS, among *Miners*, denote holes or ſhafts let down from the open *air* to meet the adits, and furniſh freſh *air*.

The damps, want, and impurity of *air*, which occur, when adits are wrought 30 or 40 fathoms long, make it neceſſary to let down *air-ſhafts*, in order to give the *air* liberty to play through the whole work, and thus diſcharge bad vapours, and furniſh good *air* for reſpiration: the expence of which *ſhafts*, in regard of their vaſt depths, hardneſs of the rock, drawing of water, &c. ſometimes equals, nay exceeds, the ordinary charge of the whole ADIT.

Sir Robert Murray deſcribes a method, uſed in the coal-mines at Liege, of working mines without *air-ſhafts*. Phil. Tranſ. Nº 5.

When the miners at Mendip have ſunk a groove, they will not be at the charge of an *air-ſhaft*, till they come at ore; and for the ſupply of *air* have boxes of elm exactly cloſed, of about ſix inches in the clear, by which they carry it down about twenty fathoms. They cut a trench at a little diſtance from the top of the groove, covering it with turf and rods diſpoſed to receive the pipe, which they contrive to come in ſide-ways to their groove, four feet from the top; which carries down the *air* to a great depth. When they come at ore, and need an *air-ſhaft*, they ſink it four or five fathoms diſtant, according to the convenience of the breadth, and of the ſame faſhion with the groove, to draw as well ore as *air*. Phil. Tranſ. Nº 39.

AIR-THREADS *of ſpiders*. See THREADS.

AIR-VESSEL, in *Hydraulics*, is a name given to thoſe metalline cylinders, which are placed between the two forcing-pumps in the improved fire-engines. The water is injected by the action of the piſtons through two pipes, with valves, into this veſſel; the *air* previouſly contained in it will be compreſſed by the water, in proportion to the quantity admitted, and by its ſpring force the water into a pipe, which will diſcharge a conſtant and equal ſtream; whereas in the common ſquirting engine, the ſtream is diſcontinued between the ſeveral ſtrokes.

AIR-*veſſels*, in PLANTS, are certain canals, or ducts, whereby a kind of RESPIRATION is effected in vegetable bodies.

Air-veſſels ſtand diſtinguiſhed from SAP-*veſſels*; the former anſwering to the *trachea*, and lungs of animals; the latter to their lacteals, and blood-veſſels.

Dr. Grew, in an inquiry into the motion and cauſe of the *air* in vegetables, ſhews, that it enters them various ways, not only by the trunk, leaves, and other parts above ground, but at the root. For the reception, as well as expulſion of *air*, the pores are ſo very large in the trunks of ſome plants, as in the better ſort of thick walking canes, that they are viſible to a good eye without a glaſs; but with a glaſs, the cane ſeems as if it were ſtuck full of large pin-holes, reſembling the pores of the ſkin in the ends of the fingers, and ball of the hand. In the leaves of the pine, through a glaſs they make an elegant ſhow, ſtanding almoſt exactly in rank and file throughout the length of the leaves.

But though the *air* enters in part at the trunk and other parts, eſpecially in ſome plants, yet its chief admiſſion is at the root: much as in animals, ſome part of the *air* may continually paſs into the body and blood by the pores of the ſkin; but the chief draught is at the mouth. If the chief entrance of the *air* were at the trunk, before it could be mixed with the ſap in the root, it muſt deſcend; and ſo move not only contrary to its own nature, but in a contrary courſe to the ſap: whereas by its reception at the root, and its tranſition from thence, it has a more natural and eaſy motion of aſcent.

The ſame is farther argued, from the fineneſs and ſmallneſs of the diametral apertures in the trunk, in compariſon of thoſe in the root; which nature has plainly deſigned for the ſeparation of the *air* from the ſap, after they are both together received thereinto. Grew, Anat. of Root, cap. iii. p. 127.

Air-veſſels are found in the leaves of all plants, and are even diſcoverable in many without the help of glaſſes; for upon breaking the ſtalk or chief fibres of a leaf, the likeneſs of a fine wooly ſubſtance, or rather of curious ſmall cob-webs, may be ſeen to hang at both the broken ends. This is taken notice of only in ſome few plants, as in *ſcabious*, where it is more viſible: but may alſo be ſeen more or leſs in moſt others, if the leaves be very tenderly broken. This wool is really a ſkein of *air-veſſels*, or rather of the fibres of the *air-veſſels*, looſed from their ſpiral poſition, and ſo drawn out in length. Id. ibid. cap. iv. p. 155.

That *air* is inſpired by vegetables, has been fully proved by Dr. Hales in his Statical Eſſays; and he has in many inſtances ſhewn, that *air* freely enters the veſſels of trees, and that it is in great abundance wrought into their ſubſtance. But as to particular *air-veſſels* in plants, he ſeems to ſpeak doubtfully. He ſays, by way of queſtion, may not the uſe of thoſe ſpiral wreaths, that are coiled round the inſides of thoſe veſſels, which are ſuppoſed to be *air-veſſels*, and which are manifeſtly to be ſeen in ſeveral trees; as alſo in the leaves of the vine and ſcabious, may not theſe be deſigned by nature to promote the quicker aſcent of *air*, by being in ſome meaſure conformed to its elaſtic contortions? For ſuch ſpiral wreaths ſeem to be altogether uſeleſs, for promoting the aſcent of any liquor, as the ſap, which aſcends moſt freely through innumerable other capillary veſſels, having no ſuch ſpiral coils in them: not that we are to ſuppoſe the *air* in its elaſtic ſtate actually to touch, and thereby to be determined in the courſe of theſe ſpirals, as any liquor would be. But as the rays of light, when they are reflected from a ſolid body, are found to be reflected, without actually touching the reflecting body in the point of reflection; ſo it is not unreaſonable to ſuppoſe, that elaſtic *air* may, like light, be diverted from one courſe, and ſo be determined to another, by the ſolid bodies it approaches, without touching them, but rebounding like light from thoſe ſolid bodies near the point of contact.

Dr. Hales has obſerved, that theſe ſpirals are coiled in a courſe oppoſite to the courſe of the ſun, that is, from weſt to eaſt. Vid. Static. Eſſ. vol. ii. p. 265, 266.

AIRA, in *Botany*, a genus of the *triandria digynia*, *hair-graſs*. See DARNEL.

AIRANI, in *Church Hiſtory*, a ſect of Arians, in the fourth century, who denied the conſubſtantiality of the Holy Ghoſt with the Father and the Son.

They are otherwiſe called *Airaniſtæ*, and are ſaid to have taken their name from one *Airas*, who diſtinguiſhed himſelf at the head of this party, in the reigns of Valentinian and Gratian.

AIRING, in the general ſenſe of taking, or going into the freſh air, is too well known to need any explanation.

The word is particularly uſed for exerciſing horſes in the open air; which is of the greateſt advantage to theſe animals. It purifies the blood, purges the body from groſs humours, and enures the creature to fatigue, ſo as not to be hurt by it, when much greater than on theſe occaſions; and it teaches him, as the jockies expreſs it, how to make his wind rake equally, and keep time with the other motions of his body. It alſo ſharpens the ſtomach, and keeps the creature hungry; which is a thing of great conſequence, as hunters and racers are very apt to have their ſtomach fall off, either for want of exerciſe, or from the too violent exerciſe which they are often expoſed to.

If the horſe be over fat, it is beſt to air him before ſun-riſe, and after ſun-ſetting; and, in general, it is allowed by all, that nothing is more beneficial to theſe creatures, than early and late *airings*.

Some of our modern managers, however, diſpute this;

they ſay, that the cold of theſe times is too great for the creature, and that if, in particular, he is ſubject to catarrhs, rheums, or the like complaints, the dews and cold fogs, in theſe early and late *airings*, will be apt to increaſe all thoſe diſorders. Nature, we ſee, alſo points out the ſun beams as of great uſe to theſe animals; thoſe which are kept hardy, and lie out all night, always running to thoſe places where the ſun-ſhine comes, as ſoon as it appears in a morning.

This ſhould ſeem to recommend thoſe *airings* that are to be made before ſun-ſet, and a little time after ſun-riſe; and as to the caution, ſo earneſtly inculcated by Markham, of uſing theſe early and late *airings* for fat horſes, it is found unneceſſary by many; for they ſay, that the ſame effect may be produced by *airings* at warmer times, provided only that they are made longer; and that, in general, it is from long *airings* that we are to expect to bring a horſe to a perfect wind, and ſound courage.

AIRS, in *Horſemanſhip*, denote the artificial or practiſed motions of a managed horſe.

Such are the *demi-volt*, *curvet*, *capriole*, *croupade*, *balotade*, *ſtep*, and *leap*; alſo, *advancing*, *yerking*, and *bounding*.

Some authors take *airs* in a more extenſive ſenſe; and divide them into *low* and *high*.

The *low airs* include the natural paces, as *walking*, *trotting*, *galloping*, and *terra-a-terra*. To which may be added, *prancing*, *ſidling*, *ſtopping*, and *turning*.

The *high*, or *raiſed airs*, are all ſuch motions as riſe higher than the *terra-a-terra*; as the *demi-volt*, *curvet*, &c.

AIRY *triplicity*, among *Aſtrologers*, the ſigns of Gemini, Libra, and Aquarius. See Triplicity.

AISIAMENTA, in *Law*. See Easement.

AJUBATIPITA *Braſilienſium*, in *Botany*, a name given to a ſhrub that bears a black fruit like an almond, which yields a great deal of oil.

AJUGA, in *Botany*, the name of a genus of plants, of the *didynamia gymnoſpermia*, according to Linnæus, which are called by Tournefort, and other authors, bugula.

Ajuru-Catinga, in *Zoology*, the name of a Braſilian parrot. It is of the ſize of a pullet, and all over of a very fine bright green; its eyes are red, and the ſkinny circle about them is white; its beak and legs are alſo white.

Ajuru-Curau, in *Zoology*, the name of a Braſilian ſpecies of parrot, of the ſize and ſhape of the common green parrot, of which there are two kinds. The firſt an extremely beautiful one with a blue crown; the throat and ſides of the head are of a fine yellow, and all the reſt of the body of a chearful green; the long-winged feathers are half black, and half of a fine ſtrong yellow, and at their ends variegated with blue and green; and the tail edged with red, black, and blue. The other kind has the ſame colours differently diſpoſed; its head is yellow, with a whitiſh caſt; the throat and ſides of the head about the eyes are of a clearer yellow; and there is a ſea-green ſpot near the head.

Beſides theſe, there is alſo yet another variety, the ſpecies of which have all the colours of the firſt kind, but have an admixture of black about the head, a yellow ſpot on the crown, another of the ſame colour below the eyes, and a blue one under the throat.

Ajuru-Para, in *Zoology*, the name of a Braſilian ſpecies of parrot of a ſmall ſize, all over of a beautiful green, and with white legs, a white beak, and white ſkinny circles round its eyes.

AJUTAGE, or **Adjutage**, in *Hydraulics*, part of the apparatus of an artificial fountain, or *jet d'eau*; being a ſort of tube, fitted to the mouth, or aperture of the veſſel; through which the water is to be played, and by it determined into this, or that figure.

The word is formed of the verb *ajouter*, *to adapt*.

It is chiefly the diverſity in the *ajutages*, that makes the different kinds of fountains.—And hence, by having ſeveral *ajutages* to be applied occaſionally, one fountain comes to have the effect of many.

Mariotte inquires into the beſt kind of *ajutages*, or ſpouts, for *jets d'eau*, affirming from experiment, that an even poliſhed round hole, in the end of the pipe, gives a higher jet than either a cylindric, or a conical *ajutage*; of which yet the latter is the better. V. Trait. du Mouvem. des Eaux, part 4. Phil. Tranſ. N° 181.

The various ſorts of *ajutages*, their ſtructure, application, &c. ſee under Fountain.

AIX-LA-CHAPELLE waters, are volatile, ſulphureous, ſaponaceous, powerfully penetrating, reſolvent, and contain a portion of iron. The three moſt noted hot waters in Europe, are thoſe of Aix-la-Chapelle, Bourbon, and Bath. Of theſe the firſt are the hotteſt, the moſt nauſeous, purgative, and abundant in ſulphur; the laſt is leaſt ſo.

AIZOON, in *Botany*, a name given by ſome authors to houseleek. It is a diſtinct genus of the *icoſandria pentagynia* claſs, in the Linnæan ſyſtem; the calyx of which is divided into five ſegments, without petals, and the capſule has five cells, with five valves.

AKOND, an officer of juſtice in Perſia, who takes cognizance of the cauſes of orphans and widows; of contracts, and other civil concerns.—He is the head of the ſchool of *law*, and gives lectures to all the ſubaltern officers; he has his deputies in all the courts of the kingdom, who, with the ſecond *ſadra*, make all contracts.

AL, an Arabic particle, prefixed to words, to exalt, or give them a more emphatical ſignification.—As, in *Al*koran, *Al*gebra, &c.

Al, or **Ald**, in our *Ancient Writings*, ſignifies as much as *old*, *ancient*.—This, being prefixed to the names of places, expreſſes their antiquity; as Aldborough, Algate, &c.

ALA, a Latin term, literally ſignifying *wing*, uſed, in *Anatomy*, for ſeveral parts of the body, which bear ſome reſemblance to the figure of a wing.

Thus, the lobes of the liver are ſometimes called *alæ*.

The ſoft, ſpongious bodies in the *pudendum muliebre*, uſually called the *nymphæ*, are denominated *alæ*.

The two cartilages of the noſe, which form the noſtrils, are called *alæ*.

And the ſame denomination is given to the tip of the auricle. It is alſo applied to the proceſs of the *os ſphenoides*.

Ala, in *Botany*, a name given by the Latin writers of *medicine*, in the later ages, to the *helenium*, or elecampane.

Ala is alſo uſed in *Botany*, for the angle which the leaves, or the ſtalks or pedicles of the leaves, form with the ſtem, or branches of the plant from which they ariſe. This angle is uſually acute, and always is directed upwards.

Ala is ſometimes alſo applied to the angle formed by the branches themſelves, with the ſtem; which is alſo obſerved to be very regular and uniform.

Ala has ſeveral other different ſignifications. It moſt frequently is uſed to expreſs the hollow of the ſtalk of a plant, which either the leaf, or the pedicle of the leaf, make with it; or it is that hollow turning, or *ſinus*, placed between the ſtalk, or branch of a plant, and its leaf, from whence a new offspring is wont to put forth. Sometimes it is taken alſo for a little branch, as when we ſay, a ſtock, or ſtem of a plant, is armed with many *alæ*; becauſe theſe ſmall branches ſtand out from it, in form of ſo many wings.

Alæ is alſo uſed to ſignify thoſe petals, or leaves of the papilionaceous flowers, placed between thoſe others which are called the *vexillum* and the *carina*, which make the top and bottom of the flower. Inſtances of flowers of this ſtructure are ſeen in the flowers of peas and beans, in which, the top-leaf, or petal, is the *vexillum*, the bottom the *carina*, and the ſide-ones the *alæ*.

Alæ is alſo uſed for thoſe extremely ſlender and membranaceous parts of ſome ſeeds, which appear as wings placed on them, as in the *plumeria*, the fruit of the trumpet-flower, the fruit of the maple, and the like, which are called by botaniſts *alated* ſeeds.

Alæ, is, finally, uſed alſo for thoſe membranaceous expanſions, which run all the way along the ſtems of ſome plants, which are therefore called *alated* ſtalks.

Alæ, in *Anatomy*, is ſometimes applied to the arm-pits, otherwiſe called *axillæ*. Theſe parts abound with glands, and are great receptacles of humours; whence a rank ſmell ſometimes exhales, called *fœtor alarum*.

Alæ, in the *Military Art*, the two wings or extremes of an army, ranged in form of battle.

ALABARCHA, in *Antiquity*, a kind of magiſtrate among the Jews of Alexandria, whom the emperors allowed them to elect, to have the ſuperintendency of their policy, and decide differences and diſputes which aroſe among them.

ALABARDA, the name of a ſpear anciently uſed by the Helvetians and Germans.

ALABASTER, in *Natural Hiſtory*, a kind of ſtone, ſofter than marble, yet harder than plaiſter of Paris: uſed for the making of figures, and other ornaments of ſculpture.

Some derive the word from *albus*, becauſe of the whiteneſs of this ſtone.—Others, from αλαϐαϛρον, which they form from the privative α, and λαμϐανω, *capio*, *to take*; this ſtone being too ſmooth and ſlippery for the hand to faſten-hold of it.

It is found of all colours; ſome extremely white and ſhining, which is the moſt common; ſome reddiſh or tawny; and ſome is called *onyx* from its colour, which reſembles that of the *onyx*, though very different from it in its nature.

Alabaſter cuts very ſmooth and eaſy, and is much uſed among ſculptors, for little ſtatues, vaſes, and columns.

They ſometimes alſo employ it as plaiſter of Paris: in order to which, they burn and calcine it; after which, mixing it up with water to a thin conſiſtence, it is caſt into a mould, where it readily coagulates into a firm body.

Alabaſter, Mr. Boyle obſerves, being finely powdered, and thus ſet in a baſon over the fire, will, when hot, aſſume the appearance of a FLUID, by rolling in waves, yielding to the ſmalleſt touch, and emitting vapour; all which properties it loſes again, on the departure of the heat, and diſcovers itſelf a mere incoherent powder.

The fineneſs and clearneſs of this ſtone renders it, in ſome meaſure, tranſparent; whence it has been ſometimes alſo employed for windows. There is a church at Florence ſtill illuminated by *alabaſter*-windows; inſtead of panes of glaſs, there are ſlabs of *alabaſter* near fifteen feet high, each of which forms a ſingle window, through which the light is conveyed.

Naturaliſts alſo mention divers extraordinary kinds of *alabaſter*, *ſoft*, *yellow*, *variegated*, *Indian*, *Caramanian*, *German*, &c. Grew ſpeaks of a *baſtard*-ALABASTER, ſpotted, which he calls GYPSUM *variegatum*, whereof there are divers ſorts and colours in the repoſitory of the Royal Society. Theſe all make a ſtrong effervеſcence with ſpirit of nitre. They are found in Burgundy, Miſnia, &c. Of theſe lightly burnt, is made that which is popularly called PLAISTER of Paris.

Ancient authors ſpeak much of the medicinal virtues of *alabaſter*, as a diſcutient. Some recommend it as a ſpecific in a dyſentery. But modern phyſicians ſcarce allow it in either of thoſe characters. Yet ſome diſpenſatories ſtill retain a preparation of it under the title of *unguentum alabaſtrinum*, preſcribed for the head-ach.

The countries in Europe which abound moſt in *alabaſter*, are Germany, toward Coblentz; the province of Maconnois, in the neighbourhood of Cluni in France; Italy, toward Rome; where that of Montaiout is particularly remarkable not only for its whiteneſs, but alſo for the bigneſs of its blocks, ſome of which are ſo large, that ſtatues as big as the life, may eaſily be cut out of them. F. Labat, in his journey to Italy, obſerves, that there are quarries of *alabaſter*, in the neighbourhood of the village called de la Toffa, near Civita Vecchia: there is alſo *alabaſter* to be found in ſome places of Lorrain; but it is not much eſteemed.

Cornelius le Brun, in his Voyage to the Levant (tom. v. p. 284) relates, that he has ſeen mountains of *alabaſter*, which are diſtant about a hundred and fifty leagues weſt from Archangel.

A new manufacture of *baſſo relievos*, from a ſingular ſpecies of factitious *alabaſter*, has been lately eſtabliſhed by M. Letapie, at the baths of St. Philip in Tuſcany. The ſtream at theſe baths depoſits a peculiar kind of ſand, which, when collected and condenſed in the cavities of any body employed to oppoſe its current, acquires the nature, hardneſs, and colour of *alabaſter*, and aſſumes the forms of thoſe cavities in which it is thus lodged. See Abbé Rozier's Obſervations, &c. for June, 1776.

ALABASTER is alſo uſed for a vaſe, wherein odoriferous liquors were anciently put.

The reaſon of the denomination is, that veſſels for this purpoſe were frequently made of the *alabaſter*-ſtone, which Pliny and other ancients repreſent as peculiarly proper for this purpoſe.

Several critics will have the box mentioned in the Goſpels as made of *alabaſter*, to have been of glaſs. And though the texts ſay, that the woman broke it, yet the pieces ſeem miraculouſly to have been united, ſince we are told, the entire box was purchaſed by the emperor Conſtantine, and preſerved as a relic of great price.

Others will have it, that the name *alabaſter* denotes the form, rather than the matter of this box. In this view, they define *alábaſter*, by a box without a handle, deriving the word from the privative *α*, and λαϐη, *anſa*, *handle*.

ALABASTER is alſo ſaid to have been uſed for an ancient liquid meaſure, containing ten ounces of wine, or nine of oil.

In this ſenſe, the *alabaſter* was equal to half the *ſextary*.

ALABASTRA, in a plant, are thoſe little herbaceous leaves which encompaſs the bottoms of flowers, particularly the roſe. See CALIX, &c.

Some, with Jungius, explain *alabaſtra*, by the globe or roundiſh bud of the roſe juſt peeping out.

ALABASTRITÆ, *alabaſters*, in *Natural Hiſtory*, the name of a genus of foſſils allied to the marbles, and defined to be ſtones compoſed of large ſeparate concretions, of great brightneſs, and an elegant, but ſhattery ſtructure, not very hard, not giving fire with ſteel, fermenting with and ſoluble in acids, and calcining in a ſlight fire.

ALABASTRITES is often uſed as ſynonymous with *alabaſter*. But Anſelmus Boetius diſtinguiſhes between *alabaſter* and *alabaſtrites*, in making the criterion of the former to be ſo ſoft, that it may be cut with a knife; and of the latter, that it is ſo hard that it cannot be ſo cut.

Grew ſpeaks of a ſort of *alabaſtrites*, repreſenting the tranſverſe ſection of the trunk of a tree.

ALABASTRUM *dendroide*, in *Natural Hiſtory*, a name given by authors to a ſpecies of alabaſter, found in great abundance in the province of Hohenſtein, and famous for the elegant delineations of trees, and other figures deſcribed in it. See GYPSUM.

ALACUOTH, among Arabian *Phyſicians*, an infirmity of the nerves, whereby a perſon in the act of venery, lets go at the ſame time his *fæces*.

ALADINISTS, a ſect among the Arabs, anſwering to free-thinkers among us.

The *aladiniſts* multiplied greatly under the two learned kings Almanſor and Miramolinus.

ALAISSEE, in *Heraldry*, the ſame with HUMETTY.

ALALCOMENIUS, in *Ancient Chronology*, the Bœotian name for the Athenian month MÆMACTERION, which was the fourth of their year, and anſwered to the latter part of our September, and beginning of October.

ALAMAK, ſee ALMAACK.

ALAMANNICUM, in *Antiquity*, a tribute impoſed on the people by the emperor Alexias Angelus; for raiſing the ſum of ſixteen talents of gold, to be paid the *Alamanti*, as the conditions of a peace ſtipulated with them.

The eccleſiaſtics themſelves were not exempted from this tax.

ALAMIRE, or A-LA-MI-RE, among *Muſicians*, a note of the modern SCALE of muſic. See NOTE.

ALAMODALITY, *alamodalitas*, is defined, by a late writer, a ſtudy or endeavour to accommodate a man's ſelf in point of behaviour, dreſs, converſation, and other actions of life, to the reigning taſte of cuſtom, from a motive of complaiſance, and to avoid the imputation of ill-breeding.

ALAMODALITY *of writing*, *alamodalitas ſcribendi*, is defined, by the ſame perſon, a particular ſtudy or endeavour of learned men to adapt the productions of their minds, both as to the choice of ſubject, and the manner of treating it, to the genius or taſte of the times, in order to render them more acceptable to the readers.

A German writer, under the name of Geamoenus, has a diſſertation on *alamodality* in writing.

ALAMODE, in *Commerce*, a thin, light, gloſſy black ſilk, not quilted or croſſed; chiefly uſed for women's hoods, and men's mourning ſcarves.

The name is French, though not given in the country to this fabric, for which they have no other name but *tafetas noir luſtré*.

The importation of theſe ſilks is regulated by ſeveral acts of parliament. See 4 and 5 W. and M. cap. 5.—5 and 6 W. and M. cap. 20.—6 and 7 W. III. cap. 18.—8 and 9 W. III. cap. 36.—9 and 10 W. III. cap. 43.—5 Anne, cap. 10. 20.

ALANA-GIEBA, a name given to the yellowiſh-white TRIPOLI.

ALANA-TERRA, Engliſh *oker*; it is eſteemed drying and aſtringent; its principal uſe is to mix with ſalts in diſtillation, in order to keep them from melting. It is thought that this ſtone is what the ancients called the SAMIAN *ſtone*.

ALANFUTA, in the Arabian *Phyſic*, the name given to a vein between the chin and under lip, anciently uſed to be opened againſt a ſtinking breath.

ALANORARIUS, in our *Ancient Cuſtoms*, a keeper or manager of ſpaniels, or ſetting-dogs, for the ſport of hunting, hawking, &c.

The word is formed from the Gothic, *alan*, a *greyhound*.

ALAPOULI, in *Natural Hiſtory*, the name of an Eaſt-Indian tree, a ſpecies of the *bilimbi*, which is uſed in medicine as a purge and vomit, mixt with the ſeeds of muſtard.

ALAQUECA, a medicinal ſtone brought from the Indies, in ſmall gloſſy fragments; much praiſed by ſome for its efficacy in hæmorrhages, when applied externally.

ALARAF, in the Mahometan *Theology*, the partition wall that ſeparates heaven from hell.

Alaraf gives the denomination to the ſeventh chapter of the Alcoran, wherein mention is made of this wall. Some take it for a ſort of *limbus* for the patriarchs, prophets, &c. others place here ſuch whoſe good and evil works ſo exactly balance each other, that they neither deſerve reward nor puniſhment.

ALARES, in *Antiquity*, are ſuppoſed by ſome authors to have been a kind of *militia*, or ſoldiery, among the Romans; ſo called from *ala*, a *wing*, becauſe of their lightneſs and ſwiftneſs in the combat.

Others make them a people of Pannonia; but others, with more probability, take *alares* for an adjective, or epithet, and apply it to the Roman cavalry; becauſe placed in the two wings, or *alæ*, of the army; for which reaſon, a body of horſe was called *ala*.

ALARES *muſculi*, in *Anatomy*. See PTERYGOIDEUS.

ALARIS *vena*, the inmoſt of the three veins in the bend of the arm.

ALARM, properly denotes a ſudden apprehenſion, conceived from ſome noiſe, or report, which makes men run to their arms, and ſtand on their guard.

The word is French, formed from the Italian *all' arme*, *to arms*; whence *gridare all' arme*, q. d. *to call to arms*.

Alarms are either true, that is, founded on juſt notice, or falſe.

Alarms, *falſe*, are frequently given by an enemy, either to fatigue the other's army, or by way of diverſion; to keep themſelves ſafe and quiet from attacks. To remedy the inconveniences of formal *alarms*, and prevent the horror and confuſion of trumpets, and noiſe of warlike cries, the captains uſually give the *alarm*, by ſilent advice, without noiſe.

Alarm-*poſt*, is the ground appointed to each regiment, by the quarter-maſter-general, for them to march to, in caſe of an *alarm*.

In a garriſon, the *alarm-poſt* is the place where every regiment is ordered to draw up, on ordinary occaſions.

Alarm, in *Fencing*, denotes a ſtep, or ſtamp, made on the ground with the advancing foot.

This coincides with what is otherwiſe called an appel, or challenge.

Alarm, or rather **Alarum**, is alſo uſed for an inſtrument to awaken perſons at a certain hour: one very ſimple contrivance of this kind, is that uſed by weavers. See Weaver's *Alarm*.

Alarm-*bell*, that which is rung to call the people together on ſome ſuch occaſion as a fire, mutiny, or the appearance of an enemy. This is what the French call *toeſin*.

ALASCANI, in *Church Hiſtory*, a ſect of Antilutherans, whoſe diſtinguiſhing tenet, beſides their denying baptiſm, is ſaid to have been this, that the words, *This is my body*, in the inſtitution of the euchariſt, are not to be underſtood of the bread, but of the whole action, or celebration of the ſupper.

They are ſaid to have taken the name from one Joannes a Laſco, a Poliſh baron, ſuperintendant of the church of that country, in England.

ALASTROB, among *Alchemiſts*, denotes lead; though ſome will have it to ſignify CALX.

ALATED *quadrupeds*. See Quadruped.

Alated *leaves*, among *Botaniſts*, thoſe made up of ſeveral pinnated ones; as in the *orobus*. See Leaf.

ALATERNOIDES, a name given by botaniſts to the CASSINE.

ALATERNUS, in *Botany*, the *rhamnus* of Linnæus. See Buckthorn, and Privet.

ALAUDA, in *Ornithology*, a genus of the order of *paſſeres*, and claſs of *aves*, in the Linnæan ſyſtem. See Lark.

Alauda, in *Ichthyology*, ſee Blennius.

ALB, **Alba**, **Albe**, a robe, or veſtment, of white linen, hanging down to the feet, and tied round the waſte of the wearer with a girdle or ſaſh. It was anciently embroidered with various colours, ornamented with fringe, wherein the Romiſh prieſts performed divine ſervice.

The *alb* correſponds to the ſurplice among us.—The rubric of Edward VI. diſtinguiſhes between them. It takes its name from its colour, *albus*, *white*.

In the ancient church it was uſual with thoſe newly baptiſed to wear an *alb*, or white veſtment, for eight days; and the Sunday after Eaſter was called *Dominica in albis*, on account of the *albs* worn by the neophytes, who were baptiſed on Eaſter-day. The *albs* were alſo worn by laymen living in monaſteries.

Alb. See Asper.

ALBADARA, ſignifies in Arabic the *ſeſamoide* bone of the firſt joint of the great toe, which is about the ſize of a ſmall pea. Its uſe is to that joint much the ſame as the *patella* is to that of the knee.

Alba Firma, or **Album**, was a yearly rent, payable to the chief lord of a hundred; ſo called, becauſe paid wholly in white money, or ſilver, and not in corn, which was called *black-mail*.

Alba Terra, among *Alchemiſts*, denotes the philoſophers ſtone, compounded of mercury and ſulphur.

ALBANENSES, ſee Albigenses.

ALBANI, in *Middle-aged Writers*, denotes ſtrangers or foreigners: anſwering to what we call aliens.

Albani, in *Antiquity*, a college of SALII, or prieſts of Mars, inſtituted by Tarquin, and denominated from mount Albanus, the place of their reſidence.

ALBANUM, among *Chemiſts*, denotes ſalt of urine.

ALBARA, or **Albora**, among *Phyſicians*, a mixt ſpecies of malignant itch, compounded of the *morphew*, *ſerpigo*, and *lepra*.

The *albora* partakes moſt of the nature of the leproſy; ſome make it the ſame with the LEUCE, VITILIGO, or MORPHEW. It ſignifies likewiſe the white POPLAR.

ALBARAZIN, or **Albazarin**, a kind of Spaniſh wool.

ALBARDEOLA, in *Zoology*, a name given by many authors to the PLATEA, or ſpoon-bill; a bird approaching to the nature of the HERON.

ALBARII, in *Antiquity*, properly denoted thoſe who gave the whitening to earthen veſſels, &c. In which ſenſe they ſtood contradiſtinguiſhed from *dealbatores*, who whitened walls.

ALBARIUM *opus*, in the *Ancient Building*, the incruſtation or covering of the roofs of houſes with white plaſter, made of mere lime. The workmen were called *albini*, or *albarii*.

This is otherwiſe called *opus album*. It differs from *tectorium*, which is a common name given to all roofing or cieling, including even that formed of lime and ſand, or even lime and marble; whereas *albarium* was reſtrained to that made of lime alone.

ALBATI *equi*, in *Antiquity*, was a denomination given to thoſe horſes in the games of the *Circus*, which were diſtinguiſhed by white cloths or furniture.

In which ſenſe, *albati* ſtands contradiſtinguiſhed from *ruſſati*, *praſini*, and *veneti*.

ALBATROSSE, the name of a large ſea-bird, common about the Cape of Good Hope, Cape Horn, and in many other places. This is a thieviſh creature, and principally feeds on the prey which another ſea-bird, called the *booby*, provides for itſelf.

It is ſaid that the head of the *albatroſſe* changes from brown to a fine ſcarlet, while it ſits on its eggs, and afterwards becomes brown again.

ALBELEN, in *Zoology*, the name of a fiſh of the truttaceous kind, called alſo *albula*, and much reſembling the *ferra*. It is caught in the German and other lakes, and is found from five or ſix to twelve pounds weight, but that more rarely. Its colour is a fine ſilvery white.

ALBELLUS, a ſpecies of *anſeres*, in the Linnæan ſyſtem, belonging to the order of MERGUS.

ALBEOLA, a ſpecies of *anas*.

ALBERNUO, a kind of camblet, or barracan, that comes from the Levant by the way of Marſeilles.

ALBERTISTS, a ſect of ſcholaſtics, denominated from their leader Albertus Magnus.

ALBESIA, a kind of ſhield uſed by the ancient Albenſes, a nation of the Marſi.

ALBICILLA, in *Natural Hiſtory*, a name given by ſome authors to that ſpecies of eagle commonly called PYGARGUS, from the whiteneſs of part of its tail.

ALBIGENSES, a ſect about Tholouſe and Alb, in Languedoc, whence they derived their name; who, in the twelfth century, became remarkable for their oppoſition to the diſcipline and ceremonies of the church of Rome. See Reformation.

They were alſo known by various other names; as, Petrobruſſians, Arnoldiſts, Cathari, Patarins, Publicans, Tiſſerans, Bons-hommes, Paſſagers, &c. Some will have them to be the ſame with the Albanenſes; and they who think them different, attribute the ſame opinions to both. They were a party of the Paulicians, who migrated from Bulgaria and Thrace into other countries. Their firſt ſettlement was in Italy, whence they ſent out colonies into almoſt all the other provinces of Europe. It is ſaid that Peter Bruys was the firſt that brought them into Languedoc, about the year 1126. See Petrobrussian.

The Romaniſts tax the *Albigenſes* with abundance of heterodox opinions; as, for inſtance, that there are two Gods, the one infinitely good, and the other infinitely evil: that the good God made the inviſible world, and the evil one that which we live in; with the reſt of the Manichean tenets.

But this ſeems to be one of thoſe pious frauds allowed particularly in that church, which eſteems it a kind of merit to blacken heretics, and thoſe whom they chuſe to call ſo.

However this be, the *Albigenſes* grew ſo formidable in a little time, that a holy league, or croizade, was agreed upon among the catholics; and war denounced againſt them, the pope himſelf raiſing the firſt ſtandard.—In 1229, a peace was ſtruck up, and an inquiſition eſtabliſhed at Tholouſe, from which time the *Albigenſes* dwindled by little and little, till the times of the reformation; when ſuch of them as were left, fell in with the Vaudois, and became conformable to the doctrine of Zuinglius, and the diſcipline of Geneva. See Waldenses.

ALBINI, in *Antiquity*, ſee Albarium *opus*.

ALBIREO, a ſtar of the third or fourth magnitude, in the conſtellation CYGNUS.

ALBOGALERUS, in Roman *Antiquity*, a ſacerdotal cap, or ornament, worn by the *flamen dialis*, which is otherwiſe called *galerus*.

ALBORAK, in the Mahometan *Theology*, the beaſt on which the prophet is ſaid to have rode in his extraordinary aerial journies. It is repreſented as of an intermediate ſhape and ſize between an aſs and a mule; and many fabulous accounts are given of it by the Arabian commentators.

ALBORO, in *Zoology*, a name by which the ERYTHRINUS, a ſmall red fiſh, caught in the Mediterranean, is commonly known in the markets of Rome and Venice.

ALBUCA, in *Botany*, a diſtinct genus in the Linnæan ſyſtem, belonging to the claſs of *hexandria monogynia*.

ALBUCUS, a name uſed by ſome for the white *aſphodel*.

ALBUGINEA, in *Anatomy*, the outermoſt coat, or tegument, of the eye; otherwiſe called *adnata*, and *conjunctiva*. It takes its name *albuginea* from its whiteneſs; it being this that forms what we call the *album*, or white of the EYE.

ALBUGINEA is alſo applied to the third coat of the teſticles; ſo called from its colour, which is white.

It is a ſtrong thick membrane, very ſmooth on the outer ſurface; the inner, which adheres to the ſubſtance of the teſticle, being rough and uneven. Into its upper part are inſerted blood-veſſels, nerves, and lymphatics, which from thence ſend divers branches into the ſubſtance of the teſticles. See TUNICA.

ALBUGINEUS is applied, by ſome, to denote the aqueous humour of the eye.

ALBUGO, or ALBUM *oculi*, the ſame with *albuginea*, or the *white of the eye*.

ALBUGO is a whitiſh, denſe, opaque ſpot, or film, growing on the horny tunic, by which it loſes its native colour, and becomes white and opaque.

The *albugo* is the ſame with what is otherwiſe called LEUCOMA.

It is moſt commonly the conſequence of inflammations, by the extravaſation of humours, between the membranes of this tunicle; and particularly in the ſmall-pox, by the ſuppuration of puſtules upon this part; but they ſometimes ariſe from ſcars left after punctures in the *cornea*, from ſwords, knives, glaſs, &c. from burns, or from cauſtic ſubſtances falling into the eye, or by a peculiar tunic growing to the eye itſelf.

The cure is various, according to circumſtances. If the diſorder ariſes from inſpiſſated humours, an attenuating diet and medicines, eſpecially ſudorific decoctions and infuſions, together with phlebotomy, ſcarifications, bliſters, and *pediluvia*, are uſeful. Cold and aſtringent *collyria*, eſpecially thoſe of white vitriol, are here pernicious; whereas warm applications are of the greateſt ſervice. But if theſe diſorders be of long ſtanding, there is little or no hope of a cure.

If the diſorder proceeds from abſceſſes, or a ſuppuration of matter, after an inflammation, betwixt the *laminæ* of the *cornea*, which they elevate like a pea, or pearl, whence they are ſometimes called *pearls*, an inciſion ought to be made into the *cornea*, to diſcharge the included matter. But neither this nor any other method will ſucceed, ſo as to preſerve the eye-ſight clear, if the matter be lodged deep.

If the puſtules take their riſe from burns, or the ſmall-pox, the contained matter muſt be diſcharged, and the pellicle muſt be removed with *alum. uſt. cum ſacchar. cand. & ovor. teſt. pp.* applied every day to the *cornea*.

Spots in the *cornea* ariſing from wounds, ſcars, or the abuſe of vitriolic *collyria*, are ſeldom curable.

Dr. Mead tells us of ſeveral cures of the *albugo*, performed by means of an eye-powder, which he recommends. The receipt is thus: take of common glaſs any quantity, pound it in a mortar to a very fine powder; then add an equal quantity of white ſugar-candy, and levigate the mixture till it becomes impalpable.

A little of this powder put into the eye with a quill, every day, gradually wears off the ſpot.

Another method of removing the ſpeck, is to have it pared by a ſurgeon every day with a knife: but this ſeems a doubtful remedy.

ALBULA, in *Ichthyology*, a genus of fiſhes of the truttaceous kind, having no teeth.

ALBULA *Indica*, the name of a ſmall fiſh, reſembling a herring, caught about the ſhores of the Eaſt-Indies, and called by the Dutch the WIT-fiſh.

ALBULA *nobilis*, the name of one of the truttaceous fiſhes, caught in great plenty in the lakes of Germany, and other places.

ALBULA is alſo a name given, by ſome naturaliſts, to mineral waters of the aluminous kind; hence endued with an aſtringent quality, and of uſe in wounds.

The word is Greek, in which language it ſignifies the ſame.

ALBUM, in *Literary Hiſtory*, is uſed to denote a kind of table, or pocket-book, wherein the men of letters with whom a perſon has converſed, inſcribe their names, with ſome ſentence, or motto.

This is called by divers names and titles, as *album amicorum*, *repoſitorium amicorum*, &c.

The famous Algernon Sydney being in Denmark, was by the univerſity of Copenhagen preſented with their *album*, whereupon he wrote theſe words:

———— *Manus haec inimica tyrannis*
Enſe petit placidam ſub libertate quietem.

ALBUM, in *Antiquity*, denotes a white table, or the like, whereon names, or other matters, were to be inſcribed, or entered.

Hence we meet with *album prætoris*, *album decurionum*, *album judicum*, &c.

The high-prieſt entered the chief tranſactions of each year into an *album*, or table, which was hung up in his houſe for the public uſe.

ALBUM, in *Natural Hiſtory*, is uſed for the white of an egg; more properly called *albumen*.

ALBUM, among *Chemiſts*, is uſed for white lead, popularly called *ceruſs*.

ALBUM is alſo uſed, among *Alchemiſts*, for a tincture pretended to tranſmute metals.

ALBUM is alſo applied, in *Pharmacy*, as a title, or epithet, of divers compound medicines. Thus we meet with *unguentum album cum camphora*, &c.

ALBUM *Græcum*, dogs white dung, is a medicinal drug, in the preſent practice, uſed with honey, to cleanſe and deterge, chiefly in inflammations in the throat; and for the moſt part outwardly, as a plaſter; but, as Dr. Quincy obſerves, ſeldom to any great purpoſe. See Neumann's Works, p. 585.

Some ſpeak of its uſe internally, in the *angina*, and other inflammations; as alſo in the dyſentery, colic, &c. and to prevent burns from riſing into bliſters.

ALBUM *nigrum* is uſed, among *Medical Writers*, for mice-dung, by ſome alſo called *muſcerda*.

ALBUM *oculi*, among *Anatomiſts*, denotes the *tunica adnata*; ſometimes alſo called *albugo*; popularly the white of the EYE.

ALBUMEN *ovi*, in *Natural Hiſtory*, and in *Medicine*, the white of an EGG.

ALBURN, or AUBURN *colour*, a whitiſh brown, or mixt colour, partaking of red and white.

ALBURNUM, in *Phytology*, the exterior part of the wood of a tree, next the BARK.

ALBURNUS, in *Zoology*, the name of a freſh water fiſh, commonly known in Engliſh by the name of the BLEAK. It is common in our rivers, and in thoſe of Germany and elſewhere, and is eſteemed a well taſted fiſh. It is moſt in ſeaſon in September. It is a ſpecies of the *cyprinus* of Linnæus.

ALBURNUS *lacuſtris*, in *Ichthyology*, a name given by the writers who have copied Geſner's errors, to the *ballerus* of the ancients, or the *pallerus*, or *pleyſta*, of the moderns.

ALBUS *piſcis*, the white fiſh, in *Ichthyology*, a name by which Salvian has called the fiſh more uſually called the *capito lacuſtris*, and ſeeming the ſame with the blue chub, or, as it is more frequently called, the JENTLING.

This fiſh is a ſpecies of the CYPRINUS, called by the Italians *albo*.

ALCA, in *Ornithology*, ſee ALKA.

ALCAHEST, ſee ALKAHEST.

ALCAICS, in the *Ancient Poetry*, a name common to ſeveral kinds of verſes; ſo called from the poet Alcæus, the inventor of them.

The firſt ſpecies of *Alcaics* conſiſts of five feet; of which the firſt may be either ſpondee, or iambic; the ſecond, is an iambic; the third, a long ſyllable; the fourth, a dactyl; and the fifth, a dactyl, or amphimacer: as theſe of Horace,

Omnes eodem cogimur, omnium
Verſatur urna, ſerius, ocyus,
Sors exitura.

The ſecond ſpecies of *Alcaics* conſiſts of two dactyls, and two trochees; as,

Exilium impoſitura cymbæ.

Beſides theſe two kinds of verſes, which are properly called *Dactylic Alcaics*, there is a third ſort, called ſimply *Alcaic*; whereof the firſt is an *Epitrite*, the ſecond and third are *Choriambuſes*, and the fourth a *Bacchius*; as,

Cur timet fla|vum Tiberim | tangere? cur | olivum?

ALCAIC *Ode* conſiſts of four ſtrophes, each of which contains four verſes: the two firſt are *Alcaic* verſes of the firſt kind; the third an iambic dimeter hypercatalectic, i.e. of four feet, and a long ſyllable: as,

Sors exitura, & nos in æternum.

The fourth is an *Alcaic* of the ſecond kind.—The entire *Alcaic* ſtrophe is as follows:

Omnes eodem cogimur, omnium
Verſatur urna, ſerius, ocyus,
Sors exitura, & nos in æternum
Exilium impoſitura cymbæ.

ALCAID, in matters of *Policy*, an officer of juſtice among the Moors, Spaniards, and Portugueſe.

The word is alſo written *alcade*, *alcalde*, and *alcayd*. Sometimes alſo *alvacide*.

It is originally Arabic, compounded of the particle *al*, and the verb *kad*, or *akad*, *to rule*, *govern*, *adminiſter*.

The emperor of Morocco's court conſiſts chiefly of ſeven or eight *alcaids*, his devoted ſlaves.

The *alcaid*, or governor of a city or caſtle in Barbary, hath ſovereign juriſdiction in civil and criminal concerns; and all fines and puniſhments are inflicted at his pleaſure.

In ſome places the *alcaids* are little elſe than the emperor's tax-gatherers.

Alcaid, among the Spaniards, &c. is a kind of inferior judge, or miniſter of juſtice, who takes cognizance of cauſes in the firſt inſtance, and anſwers in good meaſure to the French *prevoſt*, and an Engliſh juſtice of peace.

They had alſo their *alcaid* of the whores, who took cognizance of caſes of whoredom, and adultery. This officer was otherwiſe called *alcaid* of honour.

ALCALI, ſee Alkali.

ALCALIZATION, or Alkalization, which ſee.

ALCANNA, a coſmetic powder, much uſed in the Levant, made of the leaf of a ſpecies of ſhrub frequent in Barbary.

Alcanna, or Alcana, by the Turks called *knab*, a dying drug, brought from Egypt and the Levant, being the leaves of a plant called by botaniſts *liguſtrum Ægyptiacum*, or the Egyptian *privet*. The Egyptians call it *elle hanne*. The colour drawn from theſe leaves is either red or yellow, according to the manner of the preparation; yellow when ſteeped in common water, and red when infuſed in vinegar, or alum-water.

The people of Cairo make a conſiderable traffic of theſe leaves; which they reduce to a powder called *archenda*, much uſed by the women to dye their nails and hair of a golden-yellow hue.—From the berries of *alcana* an oil is extracted, of a very agreeable ſmell, and ſome uſe in phyſic, as a calmer, called oil of Cyprus, a name which is ſometimes alſo given to the plant. Phil. Tranſ. abr. vol. x. ii. 741.

Alcanna is alſo a denomination given by ſome to iſinglaſs, or ICHTHYOCOLLA, and the ANCHUSA.

ALCANTARA.—*Order of* Alcantara, an ancient military order. The preciſe year of its inſtitution is not ſettled among antiquarians.

The knights of *Alcantara* make the ſame vows as thoſe of Calatrava, and are only diſtinguiſhed from them by this, that the croſs fleur de lys, which they bear over a large white cloak, is of a green colour: they poſſeſs thirty-ſeven commandaries.

By the terms of the ſurrender of *Alcantara* to this order, it was ſtipulated, that there ſhould be a confraternity between the two orders, with the ſame practices and obſervances in both; and that the order of *Alcantara* ſhould be ſubject to be viſited by the grand-maſter of Calatrava. But the former ſoon releaſed themſelves from this engagement, on pretence that their grand-maſter had not been called to the election of that of Calatrava, as had been likewiſe ſtipulated in the articles.

After the expulſion of the Moors, and the taking of Granada, the ſovereignty of the order of *Alcantara*, and that of Calatrava, was ſettled in the crown of Caſtile, by Ferdinand and Iſabella.

In 1540, the knights of *Alcantara* ſued for leave to marry; which was granted them.

The hiſtory of this order is chiefly taken up in expeditions againſt the Moors, and broils with their neighbours.

ALCE, in *Zoology*, the ELK.

ALCEA, in *Botany*, VERVAIN-MALLOW.

Mr. Tournefort enumerates twenty ſpecies of this *alcea*, which is a medicinal herb, whoſe virtues are much the ſame with the mallow, but in leſs degree. It is uſed as an emollient, and is an ingredient in plaſters. Dioſcorides mentions the root, drank with wine or water, as a remedy againſt dyſenteries and ruptures.

There is a ſpecies of this plant called *alcea indica*, the ſeeds of which the Egyptians dry, and of which they mix the powder in their coffee, to make it more effectual in ſtrengthening their head, ſtomach, &c.

Alcea *veſicaria*, the *bladder alcea*, in *Botany*, the name of a ſpecies of KETMIA.

ALCEDO *vocalis*, in *Zoology*, a name by which Bellonius, Aldrovandus, and ſome others, have called the red ſparrow.

Alcedo, a genus of birds belonging to the order of *picæ*, and comprehending fifteen ſpecies. The characters are, that the beak is three cornered, thick, ſtrait, and long; the tongue is ſhort, fleſhy, ſmooth, and acute, and the feet are formed for walking.

ALCHATA, in *Zoology*, a ſpecies of the TETRAO.

ALCHEMIST, a perſon who profeſſes ALCHEMY.

ALCHIMELECH, the Egyptian *melilot*. Ray's Hiſt. Plant.

ALCHIMELLA, ſee Ladies-*mantle*.

ALCHITRAM, among the *Alchemiſts*, denotes ſometimes the oil of juniper, ſometimes liquid pitch, and ſometimes *arſenic*, prepared by ablution.

This is otherwiſe written *alchieram*, and *alchitran*; ſometimes *alchytran*, and *alkytran*.

ALCHOLLEA, a kind of food in uſe among the weſtern Moors, being fleſhy meat, pickled, dried, boiled, and potted.

ALCHYMY, or Alchemy, a higher, or more refined kind of CHYMISTRY, employed in the more myſterious reſearches of the art.

The word ſeems compounded of the Arabic augmentative particle *al*, and the Latin *chymia*, Egyptian *kemia*, or Greek χημια, *chymiſtry*. Though ſome object to this origin, and deny the Arabic any ſhare in the compoſition of the word; urging, that *alchemia* occurs in an author who wrote before the Europeans had any commerce with the Arabians, or the Arabians any learning, i. e. before the time of Mahomet.

The name *alchymy*, however, is really of no ancient ſtanding: the firſt time it occurs, is in Julius Firmicus Maternus, an author who lived under Conſtantine the Great, and who, in his Matheſis 3. 55. ſpeaking of the influences of the heavenly bodies, affirms, 'that if the 'moon be in the houſe of Saturn, at the time a child is 'born, he ſhall be ſkilled in *alchymy*.'

The great objects or ends purſued by *alchymy*, are, 1. The making of gold, which is attempted three different ways; by ſeparation, by maturation, and by tranſmutation; which laſt is to be effected by means of what they call the *philoſophers ſtone*.

With a view to this end, *alchymy*, in ſome ancient writers, is alſo called ποιητικη, *poetice*, and χρυσοποιητικη, *chryſo-poetice*, q. d. the art of making gold.—And hence, alſo, the artiſts themſelves are called ποιηται, *makers*; and χρυσοποιηται, *gold-makers*.

2. An univerſal medicine, adequate to all diſeaſes. See Elixir.

3. An univerſal diſſolvent, or ALKAHEST.

4. An univerſal ferment; or a matter, which, being applied to any ſeed, ſhall increaſe its fecundity to infinity: if, e. gr. it be applied to gold, it ſhall change the gold into the philoſophers ſtone of gold; if to ſilver, into the philoſophers ſtone of ſilver i. e. into a matter which tranſmutes every thing into ſilver; and if to a tree, the reſult is, the philoſophers ſtone of the tree, which tranſmutes every thing, to which it is applied, into trees. See a Hiſtory of *Alchymy*, and its Principles, &c. Dr. Lewis's Commerc. Philoſoph. Techn. p. 199, & ſeq.

The origin and antiquity of *alchymy* are much controverted.—If regard may be had to legend and tradition, it muſt be as old as the flood. But in effect, not one of the ancient poets, philoſophers, or phyſicians, from Homer, till four hundred years after Chriſt, mention any ſuch thing.—The firſt author who ſpeaks of making gold, is Zoſimus the Panopolite, who lived towards the beginning of the fifth century, and who has an expreſs treatiſe, Περι της ἱερας τεχνης της τȣ χρυσȣ και τȣ αργυρȣ ποιησεως, *Of the divine art of making gold and ſilver*, ſtill extant, in manuſcript, in the French king's library.

Kircher aſſerts, that the theory of the philoſophers ſtone is delivered at large in the table of Hermes; and that the ancient Egyptians were not ignorant of the art, but declined to proſecute it. They did not need to tranſmute gold; they had ways of ſeparating it from all kinds of bodies, from the very mud of the Nile, and ſtones of all kinds: however, he adds, theſe ſecrets were never written, or publiſhed, but confined to the royal family, and handed down traditionally from father to ſon.

Kircher, inſtructed in all the ſecrets of chemiſtry, has fully expoſed the artifices and impoſtures of *alchemiſts*.

An *alchemiſt* puts into a crucible the matter which is to be converted into gold; this he ſets on the fire, blows it, ſtirs it with rods; and, after divers operations, gold is found at the bottom of the crucible, inſtead of the matter firſt put in: this there are a thouſand ways of effecting, without any tranſmutation. Sometimes it is done, by dextrouſly dropping in a piece of gold concealed between the fingers, ſometimes by caſting in a little of the duſt of gold, or ſilver, diſguiſed under the appearance of ſome elixir, or other indifferent matter; ſometimes a crucible is uſed which has a double bottom, and gold put between the two; ſometimes the rod uſed to ſtir the matter is hollow, and filled with the duſt of the metal deſired; at other times there is metal mixed with the charcoal, the aſhes of the furnace, or the like.

Mr. Harris very properly diſtinguiſhes *alchemy* from *chemiſtry*; and defines the former to be *ars ſine arte, cujus principium eſt mentiri, medium laborare, et finis mendicare*; and the Italians have a proverb, *non ti fidiare al alchemiſta povero o medico amalato*. The ruin which has attended this deluſion has occaſioned ſeveral ſtates to make ſevere laws againſt pretences to *alchymy*. The Romans formerly baniſhed all ſuch as profeſſed it; and the ſacred canons likewiſe directed the thunder of their cenſure againſt them. Diocleſian and Cæſar directed all books which treated of this ſubject to be burnt. Rymer furniſhes us with a licence for practiſing *alchymy*, with all kinds of metals and minerals, granted to one Richard Carter in the year 1476. Rym. Fœd. tom. xii. Neverthleleſs, we have had ſevere laws againſt *alchymy*, and multiplying of metals, as much ſo as againſt coining itſelf.

The beſt writers in *alchymy*, according to the judgment of Boerhaave, are Geber, Morienus, Roger Bacon, Ripley, Raim. Lully, Bern. count Treviſanus, John and Iſaac Holandus, Sendivogius, Baſil Valentine, Artephius, Paracelſus, Irenæus Philalethes, and Van Helmont. See Petri Borelli, Bibliotheca Chymica, ſive Catalogus Librorum Philoſophicorum Hermeticorum, Par. 1654. 12mo. It contains an account of about four thouſand writers.

ALCHYMY is alſo uſed, in a leſs proper ſenſe, for the art of common *chemiſtry*.

In which ſenſe, Libavius has publiſhed a Practice of Alchymy, deſcribing the preparations of the chief chemical medicines. And. Libavii Praxis Alchemiæ, h. e. de Artificioſa Præparatione Præcipuorum Medicamentorum, Francof. 1604. 8vo.

ALCIBIADUM. See ALCIBIUM.

ALCIBIUM, in *Botany*, a word uſed ſometimes by the ancients, as an epithet, for a kind of *echium*, or viper's bugloſs, and ſometimes as the name of a peculiar plant.

ALCMANIAN, in the *Ancient Poetry*, a kind of lyric verſe, or metre, conſiſting of two dactyls, and two trochees. Such e. gr. is

Virginibus puerique canto.

The word is formed from *Alcman*, the name of an ancient Greek poet, in great eſteem for his Erotics, or amorous compoſitions.

Some authors aſſign other *Alcmanian* verſes, compoſed of three *dactyls*, and a long ſyllable:

E. gr. *Munera lætitiamque Dei.*

Others give an *Alcmanian*, compoſed of a *dactyl, ſpondee*, and another *dactyl*, and a long ſyllable:

E. gr. *Ne dubita, nam vera fides.*

ALCOHOL, or ALKOOL, in *Chemiſtry*, an Arabic term, chiefly underſtood of the pureſt ſpirit of wine, raiſed, or rectified, by repeated diſtillations, to its utmoſt ſubtilty and perfection.

The word is formed from the Arabic or Hebrew קאל, *kaal, to attenuate, ſubtilize.*

Alcohol is the moſt complete production of vegetable fermentation; and when brought to its higheſt degree of perfection, is the lighteſt *fluid* next to *air*; perfectly tranſparent, very thin, moſt ſimple, totally inflammable, without producing any ſmoke, or diffuſing any diſagreeable ſcent while it is burning; is exceeding volatile, without leaving any *fæces*; abſolutely immutable in diſtillation, extremely expanſible by heat, very eaſily diſpoſed to ebullition by fire, of a very pleaſant ſmell, and of a particular grateful taſte. All the humours of the human body that we are acquainted with, it coagulates in an inſtant, excepting the pure water and urine; whilſt it hardens all the ſolid parts, and thus preſerves both from putrefaction, or ſpontaneous colliquation. It preſerves the bodies of inſects, fiſh, birds, and other animals that are put into it, from corruption, or alteration, for ages, if cloſely ſtopped. With water, vinegar, any acid liquors, oils, and pure volatile alkaline ſalts, it ſuffers itſelf to be mixed, and that nearly of an equable mixture; gummy and reſinous ſubſtances it diſſolves. So that we are acquainted with no liquid, produced either by nature, or by the art of *chemiſtry*, that is capable of being united with more bodies than *alcohol*; but in a particular manner it proves an excellent vehicle for the *ſpiritus rector* of vegetables, which, by uniting with it, may be extracted from its proper body, retained, and applied to medicinal and other uſes.

In the human body, by its ſmell, taſte, and vapour, it wonderfully quickens, gratefully affects, and invigorates the animal, natural, and vital ſpirits, nerves, and brain. Flames fed by *alcohol* of wine, though of the ſame bigneſs with other flames, cauſe different degrees of dilatation in metals. See Collect. Acad. tom. i. p. 113.

Since there are various, and ſometimes very inviting occaſions, in which chemiſts, and other artificers, ſtand in need of the true and pureſt *alcohol*, the leaſt remainder of water rendering the operation unſucceſsful, it is abſolutely neceſſary we ſhould have ſome marks by which we may be able to diſtinguiſh whether our *alcohol* be pure or not. The principal of theſe are,

1. If the ſuppoſed *alcohol* contains any oil diſſolved in it, and ſo equally diſtributed through it, that it is no ways perceptible, than upon the pouring of water into it, the mixture will grow white, and the oil will ſeparate from the *alcohol*.

2. If any thing of an acid lies concealed in *alcohol*, a little of it mixed with the alcaline ſpirit of ſal ammoniac, will diſcover the acid by an effervеſcence; for otherwiſe there would be only a ſimple coagulation.

3. If there be any thing of an alcali intermixed, it will appear by the effervеſcence excited by the affuſion of an acid. As for other ſalts, they are ſeldom found in it.

4. But it is a matter of greater difficulty to diſcover whether there be any water intermixed with it; and therefore chemiſts have contrived certain methods by which this may alſo be determined, of which the beſt is this. Take a chemical vial with a long narrow neck, the bulb of which will hold four or ſix ounces of *alcohol*. Fill this two-thirds full with the *alcohol* you intend to examine, into which throw a dram of the pureſt and drieſt ſalt of tartar, coming very hot out of the fire; then mix them by ſhaking them together, and ſet them over the fire till the *alcohol* be juſt ready to boil. Being thus ſhaken and heated, if the ſalt of tartar remain perfectly dry, without the leaſt ſign of moiſture, we are ſure that there is no water in this *alcohol*.

The internal uſe of *alcohol* is highly deſtructive to the animal frame, as, among other inconveniencies, it dries and contracts the nerves, and coagulates the juices. *Alcohol*, however, and fermented ſpirits in general, are of good ſervice externally applied, in many caſes. Thus ſpirit of wine, eſpecially camphorated, is a very good addition to fomentations deſigned to reſolve inflammations, whether external or internal.

Pure *alcohol* likewiſe, according to Boerhaave, is the beſt of ſtyptics. According to Juncker, it is a combination of the acetous acid, phlogiſton, and water; but the ableſt chemiſts are not yet agreed as to the conſtituent principles of this fluid.

ALCOHOL is ſometimes alſo uſed for a very fine, impalpable powder, which women in the Eaſt make uſe of as a kind of *fucus*. Dr. Shaw in his Travels, ſpeaking of the women in Barbary, ſays, that none of theſe ladies think themſelves completely dreſſed, until they have tinged their hair, and edges of their eye-lids with *al-ka-hol*, the powder of lead ore. From this impalpable powder the name was transferred to other ſubtile powders, and afterwards to ſpirits of wine, exalted to its higheſt purity and perfection. See PORPHYRISATION.

ALCOHOL, in the Arabian *Aſtrology*, is when a heavy ſlow-paced planet receives another lighter one within its orb, ſo as to come in conjunction therewith.

ALCOHOL *Martis*, filings of ſteel reduced to an impalpable powder, by turning it into ruſt with urine, then levigating it, and mixing it with a large quantity of water; that is, about a gallon to two pounds and a half of filings. After it has ſtood a quarter of an hour, the upper part to the water is to be poured off, and evaporated to a dryneſs. The powder at the bottom is to be put into a paper, in the form of a ſugar-loaf, and waſhed, by gradually pouring in hot-water, till it is freed from the urinous ſalts. With regard to the remaining groſs powder, the ſame proceſs is to be repeated.

Muſgrave has a great opinion of this preparation, as a remedy to bring back the gout from the nobler parts to the joints. He preſcribes it thus: take of *alcohol martis* from five to ten grains, *theriaci andromachi* from half a ſcruple to one dram, mix theſe with as much ſyrup of clove july-flower, as is ſufficient to make a bolus.

ALCOHOLIZATION, in *Chemiſtry*, the rectification of a vinous ſpirit.

This is otherwiſe called *alcooliſation*.

Alcooliſation, according to Starkey, denotes the circulation of a volatile ſpirit on a fixed alkali, till ſuch time as out of the two ariſes only one neutral body, different from both the former. *Alcoholization* is one way of volatilizing alkalis.

ALCOHOLIZATION is alſo uſed for PULVERIZATION.

ALCOLA is uſed by alchemiſts, for the tartar of urine.

Alcola is found in three different forms, viz. 1. Reſolved, or reduced into an impalpable ſubſtance. 2. Sandy, or voided under the appearance of ſmall grains of whitiſh or reddiſh ſand. 3. Mucilaginous, or viſcous.

ALCOR, in *Aſtronomy*, a ſmall ſtar adjoining to the large bright one in the middle of the tail of URSA *major*.

The word is Arabic.—It is a proverb among the Arabians, applied to one who pretends to ſee ſmall things, but overlooks much greater, *Thou canſt ſee Alcor, and yet not ſee the full moon.*

ALCORAN, or AL KORAN, the Mahometan goſpel; or revelations, doctrine, and prophecies, of the pretended prophet Mahomet.

It is vulgarly called *Alcoran*; but the firſt ſyllable of the word is nothing more than an article ſignifying *the*; and therefore the true orthography of the word is *Al Coran*, or *Al Koran*, that is, the *Koran*. It is derived from the Arabic word *karoa, to read*, and ſignifies *the reading*, or what ought to be read. Thus Mahomet gave it this title by way of eminence, in imitation of the Jews and Chriſtians, who call the Old and New Teſtament *ſcripture*; and the *Bible*, i. e. the Book.

It is the common opinion among us, that Mahomet, aſſiſted by one Sergius, a monk, compoſed this book; but the Muſſulmen believe it as an article of their faith, that the prophet, who, they ſay, was an illiterate man, had no concern in inditing it; but that it was given him by God, who, to that end, made uſe of the miniſtry of the angel Gabriel; that, however, it was communicated to him by little and little, a verſe at a time, and in different places, during the courſe of twenty-three years.—'And hence, 'ſay they, proceeds that diſorder and confuſion viſible 'in the work;' which, in truth, is ſo great, that all their doctors have never been able to adjuſt it. For Mahomet, or rather his copyiſt, having put all theſe looſe verſes promiſcuouſly in a book together, it was impoſſible ever to retrieve the order wherein they were delivered.

Thoſe twenty-three years which the angel employed in conveying the *Alcoran* to Mahomet, are of wonderful ſervice to his followers: inaſmuch as they furniſh them with an anſwer to ſuch as tax them with thoſe glaring contradictions wherewith the book is full: thoſe contradictions they piouſly father upon God himſelf; alleging, that in the courſe of ſo long a time, he repealed and altered ſeveral doctrines and precepts which the prophet had before received of him.

M. D'Herbelot thinks it probable, that when the hereſies of the Neſtorians, Eutychians, &c. had been condemned by œcumenical councils; many biſhops, prieſts, monks, &c. being driven into the deſarts of Arabia and Egypt, furniſhed the impoſtor with paſſages, and crude ill-conceived doctrines, out of the Scriptures; and that it was hence that the *Alcoran* became ſo full of the wild and erroneous opinions of thoſe heretics.

The Jews alſo, who were very numerous in Arabia, furniſhed materials for the *Alcoran*; nor is it without ſome reaſon that they boaſt twelve of their chief doctors to have been the authors of this work.

The *Alcoran*, it is to be obſerved, while Mahomet lived, was only kept in looſe ſheets: his ſucceſſor, Abubeker, firſt collected them into a volume, and committed the keeping of it to Haphſa, the widow of Mahomet, in order to be conſulted as an original; and there being a good deal of diverſity between the ſeveral copies already diſperſed throughout the provinces, Ottoman, ſucceſſor of Abubeker, procured a great number of copies to be taken from that of Haphſa; at the ſame time ſuppreſſing all the others not conformable to the original.

The chief differences, in the preſent copies of this book, conſiſt in the points, which were not in uſe in the time of Mahomet, and his immediate ſucceſſors; but were added ſince, to aſcertain the reading; after the example of the Maſſoretes, who added the like points to the Hebrew text of Scripture.

The work is divided into *ſuras*, or chapters; and the *ſuras* are ſubdivided into little verſes, in Arabic called *ayat*, *ſigns* or *wonders*, which are all compoſed in a broken interrupted ſtyle, reſembling proſe rather than verſe.——The diviſion into *ſuras* is but of a late ſtanding; the uſual number of them is one hundred and fourteen.

Beſide theſe unequal diviſions of chapter and verſe, the *Koran* is divided into ſixty equal portions, called *ahzab*, each of which is again ſubdivided into four equal parts. The chapters bear different titles, which are uſually taken from the firſt word of note that occurs in them. Under the title, at the head of every chapter, except the ninth, is prefixed the following ſolemn form, called by the Mahometans the *biſmillah*, *in the name of the moſt merciful God*; which form, as well as the titles, are conſidered by ſome commentators of divine original, though others believe them to be human additions.

There are ſeven principal editions of the *Alcoran*; two at Medina, one at Mecca, one at Cufa, one at Baſſora, one in Syria, and the common, or vulgate edition. The firſt contains 6000 verſes, the others ſurpaſſing this number by 200 or 236 verſes; but the number of words and letters is the ſame in all; viz. 77639 words, and 323015 letters.

The *Alcoran* is held not only of divine original, but eternal and uncreated, remaining, as ſome expreſs it, in the very eſſence of God. The firſt tranſcript has been from everlaſting by God's throne, written on a table of vaſt bigneſs, in which are alſo recorded the divine decrees, paſt and future. A copy from this table, in one volume, on paper, was ſent down to the loweſt heaven, in the month of Ramadan, on the night of power. From whence it was delivered out to Mahomet by parcels, ſome at Mecca, and ſome at Medina; though he had the conſolation of ſeeing the whole once a year, and in the laſt part of his life twice. Ten new chapters were delivered entire, the greater part only in ſeparate periods, which were written down from time to time by the prophet's amanuenſis, in ſuch a part of any particular chapter, as he directed. The firſt parcel that was revealed, was the firſt five verſes of the ninety-ſixth chapter, which the prophet received in a cave of mount Harah, near Mecca.

The general aim of the *Alcoran* was, to unite the profeſſors of the three different religions, then followed in Arabia, idolaters, Jews, and Chriſtians, in the knowledge and worſhip of one God, under the ſanction of certain laws, and the outward ſigns of ceremonies, partly of ancient, and partly of novel inſtitution, enforced by the conſideration of rewards and puniſhments, both temporal and eternal, and to bring all to the obedience of Mahomet, as the prophet and embaſſador of God, who was to eſtabliſh the true religion on earth, and be acknowledged chief pontiff in ſpiritual matters. The chief point therefore inculcated in the *Alcoran*, is the unity of God, to reſtore which, the prophet pretended was the chief end of his miſſion. The reſt is taken up in preſcribing neceſſary laws and directions, frequent admonitions to moral and divine virtues, the worſhip and reverence of the Supreme Being, and reſignation to his will. One of their moſt learned commentators diſtinguiſhes the contents of the *Alcoran* into allegorical and literal; under the former are comprehended all the obſcure, parabolical, and ænigmatical paſſages, with ſuch as are repealed, or abrogated; the latter, ſuch as are clear, and in full force.

The Muſſulmen dare not ſo much as touch the *Alcoran*, without being firſt waſhed, or legally purified; to prevent which, an inſcription is put on the cover or label: *Let none touch but they who are clean.* It is read with great care and reſpect, being never held below the girdle. They ſwear by it, take omens from it on all weighty occaſions; carry it with them to war, write ſentences of it in their banners, adorn it with gold and precious ſtones, and knowingly ſuffer it not to be in the poſſeſſion of any of a different religion. Some ſay that it is puniſhable even with death in a Chriſtian to touch it; others, that the veneration of the Muſſulmen leads them to condemn the tranſlating it into any other language as a prophanation; but theſe ſeem to be aggravations. The Mahometans have taken care to have their Scripture tranſlated into the Perſian, the Javan, the Malayan, and other languages; though out of reſpect to the original, theſe verſions are generally, if not always, interlineated.

The ſtyle of the *Alcoran* is generally allowed to be beautiful and fluent; eſpecially where it affects to imitate the prophetic manner, and ſcripture phraſeology; adorned with bold figures after the eaſtern manner, enlivened with flowery and ſententious expreſſions, and in many places, particularly where the majeſty and attributes of God are deſcribed, truly ſublime. On this miraculous circumſtance, Mahomet reſts the credit of his divine miſſion. To this pomp and harmony of expreſſion, ſome aſcribe all the force and effect of the *Alcoran*; but others ſuppoſe that the ſenſual pleaſures of paradiſe, which are ſo frequently diſplayed to the imagination of the reader, are the chief allurements to which it owes its effect.

The number of commentaries on the *Alcoran* is ſo large, that the bare titles would make a huge volume.—Ben Oſchair has written the hiſtory of them, intituled, *Tarikh Ben Oſchair*. The principal among them are, Reidhaori Thaalebi, Zamalchſchari, and Bacai.

Beſide the *Alcoran*, which is the *baſis* of the Mahometan faith, they have alſo a book containing their traditions, which they call *Sonna*.

The Mahometans have a *poſitive* theology, built on the *Alcoran* and tradition; as well as a *ſcholaſtical* one, built on reaſon.—They have likewiſe their caſuiſts, and a kind of canon law; wherein they diſtinguiſh between what is of divine, and what of poſitive right.

They have their beneficiaries too, chaplains, almoners, and canons, who read a chapter every day out of the *Alcoran*, in the moſques; and have prebends annexed to their office.—The *hatib* of the moſque is what we call the parſon of the pariſh; and the *ſcheics* are the preachers, who take their text out of the *Alcoran*. See Sale's Tranſlation of the Koran, and Preliminary Diſcourſe.

ALCORAN is alſo uſed in a more limited ſenſe, for a portion or chapter of the Koran.

In which ſenſe, the word is ſynonymous with *ſura*.

ALCORAN is alſo figuratively applied to certain other books full of impieties and impoſtures.

In this ſenſe we meet with the *Alcoran* of the Cordeliers, which has made a great noiſe; wherein St. Francis is extravagantly magnified, and put on a level with Jeſus Chriſt.

ALCORAN, among the Perſians, likewiſe ſignifies a kind of tower, or ſteeple, very high, and narrow; ſurrounded without by two or three galleries, one over another; whence the moravites, a ſort of prieſts, repeat their prayers thrice a day, with a very loud voice; making the tour of the gallery all the while, that they may be the better heard all around.

ALCORANISTS, among Mahometans, thoſe who adhere ſtrictly to the letter or text of the *Alcoran*, from an opinion of its ultimate ſufficiency and perfection. The Perſians are generally *Alcoraniſts*, as admitting the *Alcoran* alone for their rule of faith. The Turks, Tartars, Arabs, &c. beſides the *Alcoran*, admit a multitude of traditions.

The *Alcoraniſts*, among Mahometans, amount to much the ſame with the *textuaries* among the Jews. The *Alcoraniſts* can find nothing excellent out of the *Alcoran*; are enemies of philoſophers, metaphyſicians, and ſcholaſtic writers. With them the *Alcoran* is every thing.

ALCOVE, in *Building*, a part of a chamber, ſeparated from the reſt by an eſtrade, or partition of columns, and other correſponding ornaments; in which is placed a bed of ſtate, and ſometimes ſeats, to entertain company.

The word is derived from the Spaniſh *alcoba*, and that from the Arabic *elcauf*, a *cabinet*, or *ſleeping-place*; or from *elcobat*, a *tent*.

The word is popularly uſed to denote an incloſed garden-ſeat.

ALCYON. See HALCYON.

ALCYON, a name given by the ancients to the ISPIDA, or king-fiſher.

ALCYONIUM, in *Botany*. See BYSSUS, BALLS *vegetable*, and SPUNGE.

ALCYONIUM, in *Ichthyology*, a ſpecies of ALCEDO.

ALCYONIUM is alſo a name given by Lloyd, to a peculiar kind of foſſile CORAL, of the ASTROITES kind, found in Wales. It is very plentiful in that country, and puts on the appearance of a ſort of marble, being bedded in a marbly matter for its matrix. Phil. Tranſ. N° 252.

ALDABARAM, in *Oſteology*, a name given by ſome to the *ſeſamoide* bones in the great toe.

ALDARU, in *Botany*, a name given by Avicenna, Serapion, and other writers of the Arabian nation, to the LENTISK tree.

ALDEBAC, in the *Materia Medica* of the ancient Arabian phyſicians, the name by which they have called BIRD-*lime*. They place this among the vegetable poiſons.

ALDEBARAN, an Arabian name for a fixed ſtar, of the firſt magnitude, in the eye of the ſign, or conſtellation, Taurus, or the Bull; and hence popularly called the *Bull's Eye*. Its longitude, latitude, &c. ſee among the reſt of the conſtellation TAURUS.

ALDER, *alnus*, in *Botany*, claſſed by Linnæus under the genus BETULA. Its characters are theſe: it hath male and female flowers, which are produced at remote diſtances on the ſame plant; the male flowers are digeſted into a long katkin, which is looſe, imbricated, and cylindrical. The female flowers are collected into a conical, ſcaly head, and are ſucceeded by ſcaly cones. The young fruit is of a ſquamoſe ſtructure, and loaded with *embrio* ſeeds; this finally increaſes in ſize, and becomes a regular fruit, containing a number of compreſſed ſeeds. There are two ſpecies, the wood of which is much eſteemed by turners, and is of great uſe for pipes to convey water, as it will laſt a long time under ground. See BORING.

The bark of the *alder*-tree is uſed by dyers in the preparation of ſome colours. It is a ſtrong ſtyptic, though rarely or never uſed medicinally, unleſs in fomentations and epithems, by the common people.

ALDER, *berry-bearing*, or *black*, *frangula*, in *Botany*. Tourn. Inſt. R. H. 612. Tab. 383. This is ranged under the genus of *rhamnus*, in the claſs of *pentandria monogynia*, by Linnæus. Its characters are theſe: the flower has one petal, cut into five ſegments; and it has five ſtamina, the length of the petal. In the center is ſituated a globular germen, which becomes a round berry, incloſing two plain roundiſh ſeeds. There are two ſpecies.

ALDERAIMIN, in *Aſtronomy*, a ſtar of the third magnitude on the right ſhoulder of the conſtellation of CEPHEUS.

ALDERMAN, among our ancient Saxon anceſtors, was the ſecond of the three orders, or degrees, of nobility.

The word, in its original, is *ealdorman*; compounded of *æld*, *old*; or *ældor*, *elder*; and *man*, q. d. *Elderman*.

Atheling was the firſt rank of nobility, *alderman* the ſecond, and *thane* the loweſt.

It muſt be obſerved, however, that among our Saxon anceſtors, there were ſeveral magiſtrates who bore the title of *alderman*. Among them there were *aldermannus totius Angliae*, *aldermannus regis*, *comitatus*, *civitatis*, *burgi*, *caſtelli*, *hundredi*, *ſive wapentachii*, & *novemdecimorum*.

According to Spelman, the *aldermannus totius Angliae*, ſeems to have been the ſame officer who was afterwards ſtiled *capitalis juſticiarius Angliae*, or chief-juſtice of England; the *aldermannus regis* ſeems to have been an occaſional magiſtrate, anſwering to our juſtice of aſſize; and the *aldermannus comitatus*, a magiſtrate who held a middle rank between what was afterward called the earl, and the ſheriff; he ſat at the trial of cauſes with the biſhop; the latter proceeding according to eccleſiaſtical law, and the former declaring and expounding the common law of the land.

ALDERMAN, in the Engliſh *Polity*, an aſſociate to the mayor, or civil magiſtrate, of a city or town, for the better adminiſtration of his office.

The *aldermen* are an order of magiſtrates, in our cities, and moſt of the municipal, or incorporate towns; who form a kind of council, and regulate things relating to the policy of the place.—They ſometimes alſo take cognizance of civil and criminal matters; but that very rarely, and only in certain caſes.

Their number is not limited; but in ſome places is more, in ſome leſs, from ſix to twenty-ſix.

Out of theſe are annually elected the mayors, or chief magiſtrates, of places; who, at the expiration of their mayoralty, return again into the body of the *aldermen*, whoſe delegates they were before.

The twenty-ſix *aldermen* of London preſide over the twenty-ſix wards of the city.

When one of them dies, or reſigns, the wardmote chuſe a ſucceſſor, who is admitted, and ſworn into office, by the lord-mayor and court of *aldermen*.

All the *aldermen* are juſtices of the peace, by a charter of 15 Geo. II.

The *aldermen* of London, &c. are exempted from ſerving inferior offices; nor ſhall they be put upon aſſizes, or ſerve on juries, ſo long as they continue to be *aldermen*. 2 Cro. 585. See COURT.

Formerly, there were alſo *aldermen* of the merchants, of hoſpitals, of hundreds, &c. See SENATOR.

ALDHAFERA, in the Arabian *Aſtronomy*, denotes a fixed ſtar of the third magnitude, in the Lion's mane.

ALDII, in *Antiquity*, ſervants who attended their maſters in expeditions to the wars.

Theſe were otherwiſe called *aldiones*, *aldionii*, and *aldinarii*.

ALDROVANDIA, in *Botany*, a genus of the *pentandria pentagynia* claſs of plants; the calyx of which is divided into five ſegments, with five petals; the capſule has five valves, one cell, and ten ſeeds.

ALE, a popular drink, made from malt.

For the method of brewing *ale*, ſee BREWING.

This liquor is of ſuch antiquity in England, that we find mention of it in the laws of Ina, king of Weſſex. But the firſt aſſize of *ale* was fixed by the famous Stat. 51 Hen. III.

Ale is chiefly diſtinguiſhed from beer, another potable liquor made from the ſame ingredients, by the quantity of hops uſed therein; which is greater in beer, and therefore renders the liquor bitterer, and fitter to keep.

The brewers alſo diſtinguiſh pale, or fine *ale*, brown *ale*, &c. Their ſeveral properties, effects, &c. ſee under MALT-*Liquor*.

The *zythum*, and *curmi*, mentioned by Tacitus, as the beverage of the ancient Germans, are ſuppoſed by Matthiolus to correſpond to our *ale* and beer.

The duties on *ale* and beer, make a principal branch of the revenue in England. They were firſt impoſed by the twelfth of Car. II. and have been continued by ſeveral ſubſequent acts of parliament to 1 Geo. III. which lays an additional duty of three-pence per barrel. In the whole, the brewer of *ale* and beer for ſale, ſhall pay eight ſhillings for every barrel of either, above ſix ſhillings a barrel; and for every barrel of ſix ſhillings, or under, the ſum of ſixteen pence.

ALE, *cereviſia*, is alſo a denomination given to divers medicated liquors, or diet-drinks, whereof *ale* is the baſis or vehicle. The medicated *ales* make a large article in our old diſpenſatories. Such are the *cereviſia oxydorica*, for the eyes; *ceriviſia anti-arthritica*, againſt the gout; *cereviſia cephalica*, for the head; *cereviſia epileptica*, &c.

ALE, *gill*, is prepared by infuſing the dry leaves of *hedera terreſtris*, i. e. ground-ivy, in malt-liquor; which hereby becomes impregnated with the virtues of that ſimple; and is therefore reputed abſterſive, and vulnerary; good in diſorders of the breaſt, and againſt obſtructions of the viſcera.

Gill is an Engliſh name of ground-ivy.

ALE, *Dr. Butler's purging*, is prepared of polypody, ſena, ſarſaparilla, aniſeeds, ſcurvygraſs, agrimony, and maidenhair, put up in a bag, and hung in a veſſel of *ale*.

We alſo meet in ſome diſpenſatories with ſyrup of *ale*, made by boiling that liquor to a conſiſtence: this is uſed againſt obſtructions in the kidneys, and the fluor albus.

ALE-*beer*. See BEER.

ALE-BERRY, is *ale* boiled with bread, and mace; ſweetened, ſtrained, and drunk hot.

ALE-CONNER, an officer in the city of London, whoſe buſineſs is to inſpect the meaſures of the public houſes.—There are four of them; and they are choſen by the common-hall of the city.

ALE-*houſes* muſt be licenſed by juſtices of the peace, who take recognizances of the perſons licenſed, and of their ſureties, viz. 10*l*. each, that they will not ſuffer unlawful gaming, nor other diſorderly practices in their houſes. Every perſon, excepting thoſe who ſell *ale* in fairs, neglecting to procure a licence, is liable to a penalty of 40*s*. for the firſt offence, 4*l*. for the ſecond, and 6*l*. for the third, with all coſts. The licence is granted on the firſt of September, or within twenty days after, at a general meeting of the juſtices for the diviſion to which he belongs, upon his producing a certificate to his character, unleſs, by living in a city or town-corporate, this laſt circumſtance is diſpenſed with, and continues in force for one year only. *Ale-houſe* keepers, ſelling *ale* in ſhort meaſure, are liable to a penalty not exceeding 40*s*. and not leſs than 10*s*. and likewiſe to a fine of 10*s*. for permitting tipling, &c.

ALE-*meaſure*. See MEASURE.

ALE-*ſilver*, a rent, or tribute, yearly paid to the lord-mayor of London, by thoſe who ſell *ale* within the city.

ALE-*taſter*, is an officer appointed, and ſworn, in every court-leet, to take heed that there be a due ſize, and goodneſs of bread, *ale*, and beer, ſold within the juriſdiction of the leet.

ALEA, in Roman *Antiquity*, ſignifies, in general, games of chance.

ALEA, in a more limited ſenſe, is applied by Roman writers to a particular game played with dice, in a pair of tables, ſomewhat after the manner of our back-gammon, or tric-trac. Inſtead of our men, they played with white and black ſtones, which were moved this way or that, as the dice directed.

Alea in this ſenſe appears to have been the ſame game with what the Greeks called *pettia* and *chivia*; the Romans ſometimes *tabula*, *teſſara*, and XII. *ſcripta*.

ALEATORIUM, in Roman *Antiquity*, was the place where they played at *alea*.

The *aleatorium* was near the *ſphæriſterium*; that the ſportſmen, when tired with the pila, or more robuſt exerciſes, might refreſh themſelves in the *aleatorium*.

ALEC, in *Ichthyology*, a name given by Gaza, in his commentaries on Ariſtotle, to the fiſh called by that author *mainis*, and by Ovid *menerela*. It is of the SPARUS kind.

ALECOST, ſee TANZY.

A-LEE, the ſituation of the helm, when it is puſhed down to the lee-ſide of the ſhip, in order to put the ſhip about, or lay her head to the windward.

ALECTO, in *Mythology*, one of the three Furies; ſhe is repreſented with vipers about her head and her wings, and armed with vipers, ſcourges, and torches. See a fine deſcription of this Fury in Virgil, Æn. vii.

ALECTORIA, in *Natural Hiſtory*, a ſtone ſaid to be found in the ſtomach, liver, or rather gall-bladder, of old cocks.

The word is derived from αλεκτωρ, *a cock*.

It is ordinarily of the figure of a lupine, and ſeldom exceeds the bigneſs of a bean.—It has abundance of virtues attributed to it; but moſt of them are fabulous.

This is otherwiſe called *alectorius lapis*, ſometimes *alectorolithos*, in Engliſh the cock-ſtone.

The more modern naturaliſts hold the *alectorius lapis* to be originally ſwallowed down, not generated in the ſtomach or gizzard of cocks and capons.

ALECTORICARDITES, in *Natural Hiſtory*, a name given by Plot, to a figured ſtone reſembling a pullet's heart, with the fat near the baſis of it, and the coronary veſſels deſcending from it.

The word is compounded of the Greek αλεκτωρ, *cock*, and καρδια, *heart*.

ALECTORIUS *lapis*, is uſed for a ſmall ſpecies of *bufonites*, or disjunct ſegment of a palate of a fiſh, approaching to the nature of the *cheledonius lapis*.

ALECTOROLOPHUS, ſee PEDICULARIS.

ALECTOROMANTIA, an ancient kind of divination, performed by means of a cock.

The word comes from αλεκτωρ, a *cock*, and μαντεια, *divination*.

This art was in uſe among the Greeks; and the uſual manner of it was this.—A circle was made on the ground, and divided into twenty-four equal portions, or ſpaces: in each of which ſpaces was written one of the letters of the alphabet, and upon each of theſe letters was laid a grain of wheat.—This done, a cock was turned looſe in the circle, and careful obſervation was made of the grains he pecked.—The letters correſponding to thoſe grains were afterwards formed into a word; which word was to be the anſwer deſired.

It was thus that Libanius and Jamblichus ſought who ſhould ſucceed the emperor Valens; and the cock anſwering to the ſpaces Θ Ο Δ, they concluded upon Theodore, but by a miſtake inſtead of Theodoſius.

There are alſo other ſpecies of *alectoromantia*; in ſome the augury was taken from the crowing of the cock, wherein regard was had to the time of day, whether before noon or after; to which ſome added the conſideration of the ſign the ſun was in, and the motion of the moon. Others ſpeak of a kind of *alectoromantia* performed by help of a ring. Phil. Tranſ. N° 162.

ALECTRUONURUS *gramen*, ſee FESTUCA.

ALEGER, a name given to an inferior ſort of vinegar, made of ale, or malt liquor, inſtead of wine. Power has given a deſcription of the *eels* in *aleger*. V. Power, Exper. Philoſ. Obſ. 3. p. 32.

ALEHOOF, in *Botany*, ſee GROUND-*ivy*.

ALEIPHA, in the *Materia Medica* of the ancients, a word uſed for all fatty bodies whatever. The oils of vegetables, and fat of animals, were all called by this general name. But theſe ſimple ſubſtances were not the only ones called by it, for it is very frequently uſed to expreſs any ſort of medicated oil impregnated with aromatic vegetables; but its general acceptation in this ſenſe, was for ſuch compoſitions as were intended to anoint the body; and therefore they were properly only vegetable or animal fats, impregnated with the lighter parts of plants, and not clogged with an addition of powders, nor with wax, or any thing of that kind, which might have given them the conſiſtence of ointments. The ancient phyſicians were very fond of theſe compoſitions, which they applied either to ſome diſeaſed part only, or to the whole body, and after they had made the patient uſe the warm bath to relax and open the pores.

ALEMBIC, or LIMBEC, a chemical veſſel, conſiſting of a matraſs or body, fitted with a roundiſh head, terminating in a ſloping tube, for the condenſed vapours to paſs through in diſtillation.

The word is formed of the Arabic particle *al*, and the Greek αμϐιξ, a ſort of earthen culinary veſſel, mentioned by Athenæus and Heſychius. Though Matthæus Sylvaticus, in his Pandecta Medicinæ, aſſerts the word *alembic* to be Arabic, and that it literally denotes the upper part of a diſtilling veſſel.

Alembic is popularly underſtood of the whole inſtrument of diſtillation, with all its apparatus; but in the proper ſenſe of the word, it is only a part of it; viz. a veſſel uſually of copper, whereto a concave, globular, metalline head is cloſely luted; ſo as to ſtop the riſing vapours, and direct them into its roſtrum, or beak.

The heat of the fire raiſing the volatile parts of the ſubject expoſed in the bottom of the veſſel, they are received into its head, where they are condenſed, either by the coldneſs of the ambient air, or by water externally applied, and become a liquor, which runs out at the beak into another veſſel called the RECIPIENT.

The head, or capital of the *alembic*, is ſometimes incompaſſed with a veſſel full of cold water, by way of refrigeratory; though this intention is now more commonly anſwered by a WORM-*tub*.

There are divers kinds of *alembics*; as an *open alembic*, which is alſo called *roſtratus*, where the head and cucurbit are two ſeparate parts; and a *blind alembic*, or blind head, where the capital is ſealed hermetically upon the cucurbit. But the invention of RETORTS ſeem to have ſuperſeded the uſe of *alembics*.

ALEMBROTH, in the writings of the *Alchemiſts*, a word uſed for a ſort of fixed alkaline ſalt, which had the power of the famous alcaheſt, in diſſolving bodies, opening the pores of moſt or all known ſubſtances, and thence, as well as by deſtroying ſulphurs, promoting the ſeparation of metals from their ores.

The word is ſaid to be of Chaldee origin, and its natural meaning to be *clavis artis*, the *key of art*.

Some uſe the term *alembroth dæſiccatum*, for ſalt of tartar.

ALEMDAR, an officer in the court of the Grand Signior, who bears the green ſtandard of Mahomet, when the ſultan appears in public on any ſolemn occaſion.

ALENON, a word uſed by ſome of the old medical writers, as a name for the oil of ſweet almonds.

ALEORE, a word uſed by the old medical writers, for an intermiſſion of eaſe, from the raging pains of any violent acute diſtemper.

ALES, a name given to a compound ſalt; it alſo ſignifies *contracted*, when uſed by phyſicians as an adjective.

ALETON, ſignifies meal, as Erotian and Heſychius explain it. It ſeems derived from αλεω, *to grind*, and to import the meal of any ſort of corn. The word is frequently uſed by Hippocrates.

ALETRIS, *baſtard* ALOE.

ALEUROMANCY, *aleuromantia*, is the ſame with what was otherwiſe called *alphitomantia*, and *crithomantia*, and means an ancient kind of divination performed by means of meal or flour.

ALEXANDERS, in *Botany*, a genus of umbelliferous flowers. See ALISANDERS.

ALEXANDRIAN, in a particular ſenſe, is applied to all thoſe who profeſſed or taught the ſciences in the ſchool of Alexandria.

ALEXANDRIAN is more particularly underſtood of a college of prieſts, conſecrated to the ſervice of Alexander Severus, after his deification.

ALEXANDRIAN *Copy*, is a manuſcript, conſiſting of four volumes, in a large quarto ſize; which contain the whole Bible in Greek, including the Old and New Teſtament, with the Apocrypha, and ſome ſmaller pieces, but not quite complete. This manuſcript is now preſerved in the Britiſh Muſeum. It was ſent as a preſent to king Charles I. from Cyrillus Lucaris, patriarch of Conſtantinople, by Sir Thomas Rowe, ambaſſador from England to the Grand Signior, about the year 1628. Cyrillus brought it with him from Alexandria, where, probably, it was written. In a ſchedule annexed to it, he gives this account; that it was written, as tradition informed them, by Thecla, a noble Egyptian lady, about thirteen hundred years ago, not long after the council of Nice. But this high antiquity, and the authority of the tradition to which the patriarch refers, have been diſputed; nor are the moſt accurate biblical writers agreed about its age. Grabe thinks that it might have been written before the end of the fourth century; others are of opinion, that it was not writ till near the end of the fifth century, or ſomewhat later. Thoſe who are deſirous of farther information concerning it, may conſult the Prolegomena of Mills, Wetſtein, and Grabe.

ALEXANDRIAN *Library* was firſt founded by Ptolemy Soter. Beſide the books which he procured, his ſon Ptolemy Philadelphus added many more, and left in this library at his death a hundred thouſand volumes; and the ſucceeding princes of this race enlarged it ſtill more, till at length the books lodged in it amounted to the number of ſeven hundred thouſand volumes. Part of this library, conſiſting of four hundred thouſand volumes, was deſtroyed in the war which Julius Cæſar waged with the inhabitants of Alexandria; but it was again ſupplied anew by Cleopatra and others, and continued, though frequently plundered, to be very conſiderable and famous, till it was burnt by the Saracens in the 642d year of the Chriſtian æra.

ALEXANDRIN, or ALEXANDRIAN, in *Poetry*, the name of a kind of verſe, which conſiſts of twelve, or of twelve and thirteen ſyllables, alternately; the reſt, or pauſe, being always on the ſixth ſyllable.

It is ſaid to have taken its name from a poem on the life of Alexander, intitled, the *Alexandriad*; written, or at leaſt tranſlated into this kind of verſe by ſome French poets; though others will have it ſo denominated from one of the tranſlators, Alexander Paris.

This verſe is thought by ſome very proper in the epopea, and the more ſublime kinds of poetry; for which reaſon it is alſo called *Heroic Verſe*.

It anſwers in our language to the hexameters in the Greek, and Latin; though, according to ſome, it rather anſwers to the *ſenarii* of the ancient tragic poets.—Chapman's tranſlation of Homer conſiſts wholly of *Alexandrians*.

The advantages of the *Alexandrin* verſe, are its keeping the rhimes from coming ſo near, and conſequently hindering them from being ſo much perceived. To this may be added, that coming nearer to the nature of proſe, it is fitter for theatrical dialogue, and ſupplies the office of the ancient iambics, better than any other verſe in rhime.

ALEXICACUS, ſomething that preſerves the body from harm or miſchief. The word is compounded of *αλεξω*, *I drive away*, and *κακον*, *malum*, *evil*.

Alexicacus amounts to much the ſame with alexiterial. Conſt. Rhodocanaces gives this name more peculiarly to the ſpirit of ſea-ſalt, and has publiſhed a work under that title.

ALEXICACUS, in *Antiquity*, was an attribute of Neptune, whom the tunny-fiſhers uſed to invoke under this appellation, that their nets might be preſerved from the *ξιφιας*, or SWORD-fiſh, which uſed to tear them, and prevent the aſſiſtance which it was pretended the dolphins uſed to give the tunnies on this occaſion.

ALEXIPHARMIC, in *Medicine*, expreſſes that property which a remedy, either ſimple or compound, hath to reſiſt or deſtroy every thing of a poiſonous or malignant nature.

The word is derived from *αλεξω*, *arceo*, *I expel*; and *φαρμακον*, *poiſon*.

The ancients had a notion, that there was a poiſon in all malignant diſeaſes, and in the generality of thoſe whoſe cauſe was unknown. Whence *alexipharmic* became a denomination for all remedies and antidotes againſt malignant diſeaſes, and for AMULETS.

Alexiterial, *cardiac*, *antidote*, *alexipharmic*, and *counterpoiſon*, are all terms nearly of the ſame ſignification.

Alexipharmics are ordinarily divided into ſuch as are general; and thoſe more particular, ſuppoſed only to combat ſome particular diſeaſe.—But this diviſion is founded more on ſpeculation, than experience.

Alexipharmic medicines in general contain a great number of volatile parts, and ſuch as render the maſs of blood fluid. The greateſt part of them are aromatic and pungent to the taſte.—Among the reſt, it is true, there are ſome acid plants and juices; but theſe are only reckoned in the number, on account of their uſe in malignant and colliquative fevers.

Alexipharmics chiefly act by exciting, or increaſing a diaphoreſis, or perſpiration; by which the noxious matter is thrown off. See SUDORIFIC.

Alexipharmics, whether ſimple or compound, are alſo eſteemed preſervatives againſt malignant and peſtilential fevers: but they are to be uſed with caution; ſome of them being only proper in condenſations, and others only in colliquations of the blood.

It is dangerous to adminiſter *alexipharmics* to young people of plethoric habits, without previous evacuations; and Celſus adviſes only to promote a ſweat, when the marks of one approaching are evident.

Alexipharmics are deemed proper correctors of OPIUM, when it produces ſickneſs, nauſeas, &c. They are alſo ſerviceable in thoſe diſeaſes which proceed from external cold, and obſtructed perſpiration; as catarrhs, rheumatiſms, fluxes, coughs, and glandular tumours. *Alexipharmics* make a large claſs of medicines; but the principal ones are theſe: 1. Of the animal kingdom, hartſhorn, bezoars, and the bones and teeth of different animals. 2. Of the vegetable kingdom, the leaves and flowers of all the aromatic plants, eſpecially ſuch as are umbelliferous. 3. Of the mineral kingdom, the different preparations of antimony, the dulcified ſpirit of vitriol with alcohol.

ALEXITERIAL, in *Medicine*, a term of the ſame import with *alexipharmic*; but chiefly applied to the milk-water of that name, and remedies againſt the poiſonous bites of animals.

But it is ſaid by ſome authors that *alexiterials* differ from alexipharmics: thus, alexipharmics ſignify medicines againſt poiſons taken internally; whereas *alexiterials* are remedies againſt the poiſons of venemous animals inflicted externally.

ALFANDIGA, the name of the cuſtom-houſe at Liſbon.

ALFAQUES, among the Spaniſh Moriſcos, were the clergy, or thoſe who inſtructed them in the Mahometan faith.

The *alfaques* differed from the *morabites*, who anſwered to monks, or religious, among Chriſtians.

ALFDOUCH, a name given by the Moors to a ſort of *vermicelli*, which they make of flour and water, and are very fond of in their entertainments.

ALFECCA, in *Aſtronomy*, a name given to the ſtar commonly called LUCIDA *coronæ*. It is alſo called *alfeta*.

ALFET, anciently ſignified a large caldron, in which boiling water was put, for the accuſed to plunge his hand in up to the elbow, by way of trial or purgation.

ALGA, in *Botany*, the name of a genus of plants of the ſame kind with the ſea FUCUS, or *zoſtera* of Linnæus, but they are compoſed of very long and narrow graſſy leaves, or of long capillaceous filaments. Tournefort enumerates three ſpecies. Tournef. Inſt. 569.

The *algas* are ſome *marine*, or growing in the ſea; others *fluviatile*, or produced in rivers; others *fontal*, growing in ſprings; and ſome again grow on ſtones at the bottom of the water; others on ſhells by the ſhore; others even float on the ſurface of the water.

One of the moſt conſiderable of the tribe of *algas*, is the common, called *alga marina*; ſometimes alſo *alga anguſtifolia vitriariorum*, as being uſed in the glaſs-works like kali.

Its aſhes afford great plenty of fixed ſalt.

Some ſpeak of its medicinal properties as aperient, vulnerary, and deſiccative.

It is ſaid that the *alga marina* put under the roots of colworts, and other plants, will forward their growth.

Alga is popularly known in Engliſh by the name of *wreck*, being generally conceived rather as excreſcences, than as regular plants; but this is unphiloſophical, and falſe.

ALGÆ, *flags*, form one of the ſeven families of plants in the Linnæan diſtribution.

ALGALI, a name given, by ſome of the old chemical writers, to nitre.

ALGAROT, or Algarel, in the Arabian *Chemiſtry*, a powder prepared of butter of antimony; being in reality no more than the *regulus* of that mineral, diſſolved in acids, and ſeparated again by means of ſeveral lotions with luke-warm water, which imbibes thoſe acids.

This is alſo called *mercurius vitæ*, or ſimply *emetic powder*. —It purges violently both upwards and downwards; and is more properly called *antimonium mortis*. See Butter *of* Antimony.

By collecting all the lotions, and evaporating two third parts, what remains is a very acid liquor, called *ſpirit of philoſophical vitriol*.

There are divers ways of preparing *algarot*, as by precipitating the butter, or by diſtilling antimony, together with the ſweet ſublimate, or white precipitate of mercury.

ALGATRANE, a ſort of pitch found in the bay formed by the point of the cape of St. Helena, on the ſouth of the iſle of Plata.

ALGAVAREIA, the language anciently ſpoken by the Moriſcos in Spain.

The *algavareia* was a ſort of Arabic, and ſtood contradiſtinguiſhed from the *aljameia*.

ALGEBRA, a method of reſolving problems, by means of equations.

Critics have given various etymologies of this word; but the moſt probable is from *geber*, a word whence, by prefixing the particle *al*, we have formed *algebra*, which is pure Arabic, and properly ſignifies the reduction of broken numbers to a whole number.—However, the Arabs, it is to be obſerved, never uſe the word *algebra* alone, to expreſs what we mean by it; but always add it to the word *macabelah*, which ſignifies *oppoſition* and *compariſon*.—Thus *algebra almocabelah*, is what we properly call *algebra*.

Some authors define *algebra* the art of ſolving all problems capable of being ſolved: but this is rather the idea of analyſis, or the analytic art.

The Arabs call it, the *art of reſtitution and compariſon*; or, the *art of reſolution and equation*.—Lucas de Burgo, the firſt European who wrote of *algebra*, calls it, the *rule of reſtoration, and oppoſition*.—The Italians call it, *regula rei & cenſus*, that is, the rule of the root and the ſquare; the root with them being called *res*, and the ſquare *cenſus*.—Others call it *ſpecious arithmetic*; others, *univerſal arithmetic*.

Algebra is a peculiar kind of Arithmetic, which takes the quantity ſought, whether it be a number, or a line, or any other quantity, as if it were granted; and by means of one or more quantities given, proceeds by conſequence, till the quantity at firſt only ſuppoſed to be known, or at leaſt ſome power thereof, is found to be equal to ſome quantity or quantities which are known, and conſequently itſelf is known.

Algebra is of two kinds, *numeral* and *literal*.

Algebra, *numeral*, or *vulgar*, is that of the ancients, which only had place in the reſolution of arithmetical queſtions.—In this, the quantity ſought is repreſented by ſome letter or character; but all the given quantities are expreſſed by numbers. This is thought by ſome to have proved an introduction to the art of keeping merchant's accounts by double entry.

Algebra, *ſpecious*, or *literal*, or the *new algebra*, is that wherein the given or known quantities, as well as the unknown, are all expreſſed or repreſented by their ſpecies, or letters of the alphabet.

This eaſes the memory and imagination of that vaſt ſtreſs or effort, required to keep ſeveral matters, neceſſary for the diſcovery of the truth in hand, preſent to the mind: for which reaſon this art may be properly denominated *metaphyſical geometry*.

Specious algebra is not, like the numeral, confined to certain kinds of problems; but ſerves univerſally for the inveſtigation or invention of theorems, as well as the ſolution and demonſtration of all kinds of problems, both arithmetical, and geometrical.

The letters uſed in *algebra* do each ſeparately repreſent either lines or numbers, as the problem is arithmetical or geometrical; and together, they repreſent planes, ſolids, and powers, more or leſs high, as the letters are in a greater or leſs number.—For inſtance, if there be two letters, *a*, *b*, they repreſent a rectangle, whoſe two ſides are expreſſed, one by the letter *a*, and the other by *b*; ſo that by their mutual multiplication they produce the plane *a b*. Where the ſame letter is repeated twice, as *a a*, they denote a ſquare. Three letters *a b c*, repreſent a ſolid, or a rectangled parallelopiped, whoſe three dimenſions are expreſſed by the three letters *a b c*; the length by *a*, the breadth by *b*, and the depth by *c*: ſo that by their mutual multiplication they produce the ſolid *a b c*.

As the multiplication of dimenſions is expreſſed by the multiplication of letters, and as the number of thoſe may be ſo great as to become incommodious; the method is, only to write down the root, and on the right hand to write the index of the power, that is, the number of letters whereof the power to be expreſſed does conſiſt; as a^2, a^3, a^4, a^5; the laſt of which ſignifies as much as *a* multiplied five times into itſelf; and ſo of the reſt.

For the ſymbols, characters, &c. uſed in *algebra*, with their application, &c. ſee Character, and Quantity, &c.

For the method of performing the ſeveral operations in *algebra*, ſee Addition, Subtraction, and Multiplication.

The origin of this art is very uncertain and obſcure.—The invention is uſually attributed to Diophantus, a Greek author, who wrote thirteen books, though only ſix of them are extant, firſt publiſhed by Xylander, in 1575, and ſince commented on and improved by Gaſper Bachet, of the French academy; and ſince by M. Fermat.

And yet *algebra* ſeems not to have been wholly unknown to the ancient mathematicians, long before the age of Diophantus: we ſee the traces, the effects of it, in many places, though it looks as if they had deſignedly concealed it.—Something of it there ſeems to be in Euclid, or at leaſt in Theon upon Euclid, who obſerves that Plato had begun to teach it.—And there are other inſtances of it in Pappius, and more in Archimedes and Apollonius.

But the truth is, the analyſis uſed by thoſe authors is rather geometrical than *algebraical*: as appears by the examples thereof which we find in their works: ſo that we make no ſcruple to ſay, that Diophantus is the firſt, and only author among the Greeks, who has treated of *algebra* profeſſedly. This art, however, was in uſe among the Arabs much earlier than among the Greeks. And it is ſaid, that the Arabs too borrowed it from the Perſians, and the Perſians from the Indians.—It is added, that the Arabs carried it into Spain; whence, ſome are of opinion, it paſſed into England, before Diophantus was known among us.

The firſt who wrote on the ſubject in this part of the world, was Lucas Pacciolus, or Lucas de Burgos, a Cordelier; whoſe book, in Italian, was printed at Venice in 1494.—This author makes mention of Leonardus Piſanus, and ſome others, of whom he had learned the art; but we have none of their writings.—He adds, that *algebra* came originally from the Arabs; and never mentions Diophantus; which makes it probable, that that author was not at that time known in Europe. His *algebra* goes no farther than ſimple and quadratic equations.

After Pacciolus appeared Stifelius, a good author; but neither did he advance any farther.

After him came Scipio Ferreus, Cardan, Tartaglia, and ſome others; who reached as far as the ſolution of ſome cubic equations. Bombelli followed theſe, and went a little farther.—At laſt came Nunnius, Ramus, Schoner, Salignac, Clavius, &c. who all of them took different courſes, but none of them went beyond quadratics.

About the ſame time, Diophantus was firſt made public; whoſe method is very different from that of the Arabs, which had been followed till then.

In 1590, Vieta entered on the ſtage, and introduced what he called his *ſpecious arithmetic*, which conſiſts in denoting the quantities, both known and unknown, by ſymbols or letters.—He alſo introduced an ingenious method of extracting the roots of equations, by approximations; ſince much facilitated by Raphſon, in his Analyſis Æquationum.

Vieta was followed by Oughtred, an Engliſhman, who, in his Clavis Mathematica, printed in 1631, improved Vieta's method; and has invented ſeveral compendious characters, to ſhew the ſums, differences, rectangles, ſquares, cubes, &c.

Mr. Harriot, another Engliſhman, cotemporary with Oughtred, left ſeveral treatiſes at his death; and among the reſt, an Analyſis, or Algebra, which was printed in 1631, where Vieta's method is brought into a ſtill more commodious form; and this is much eſteemed to this day.

In 1657, Des Cartes publiſhed his Geometry, wherein he made uſe of the literal calculus, and the *algebraic* rules of Harriot; and as Oughtred in his Clavis, and Marin Ghetaldus, in his books of Mathematical Compoſition and Reſolution, publiſhed in 1630, applied Vieta's arithmetic to elementary geometry, and gave the conſtruction of ſimple and quadratic equations; ſo Des Cartes applied Harriot's method to the higher geometry, explaining the nature of curves by equations, and adding the conſtructions of cubic, biquadratic, and other higher equations.

Des Cartes's rule for conſtructing cubic and biquadratic equations was farther improved by Tho. Baker, in his Clavis Geometrica Catholica, publiſhed in 1684, and the foundation of ſuch conſtructions, with the application of *algebra* to the quadratures of curves, queſtions de maximis & minimis, the centrobaryc method of Guldinus, &c. was given by R. Sluſius, in 1668, as alſo by Fermat, in his Opera Mathematica; Roberval, in the Mem. de Mathem. & de Phyſique; and Barrow, in his Lect. Geomet.—In 1708, *algebra* was applied to the laws of chance and gaming, by R. de Montmort; and ſince by de Moivre, and James Bernouilli, and others. Thus much for the progreſs of *algebra*.—The Elements of the Art were compiled and publiſhed by Kerſey in 1671, wherein the ſpecious arithmetic, and the nature of equations, are largely explained, and illuſtrated by variety of examples: the whole ſubſtance of Diophantus is here delivered; and many things added concerning mathematical compoſition and reſolution, from Ghetaldus. The like has been ſince done by Preſtet in 1694, and by Ozanam in 1703.—But theſe authors omit the application of *algebra* to geometry; which defect is ſupplied by Guiſnee in a French treatiſe expreſly on the ſubject, publiſhed in 1705, and L'Hopital in his Analytical Treatiſe of the Conic Sections, in 1707.—The rules of *algebra* are alſo compendiouſly delivered by Sir Iſaac Newton, in his Arithmetica Univerſalis, firſt publiſhed in 1707, which abounds in ſelect examples, and contains ſeveral rules and methods invented by the author.

This piece is rendered complete by Mr. Maclaurin's commentary on it, which is lately publiſhed, and intitled a Treatiſe of Algebra.

Other writers on *algebra*, are Dr. Pell, who reviſed and publiſhed a piece of *algebra*, firſt publiſhed in Dutch. In this the doctor has given us a peculiar method of his own for applying *algebra* to problems of various kinds; and introduced the way of regiſtering the whole proceſs in the margin. This method has been followed by Mr. Ward, and Mr. Hammond, in their treatiſes on this ſubject. Dr. Wallis publiſhed a treatiſe on *algebra*, both *hiſtorical* and *practical*, in the year 1664. There are many other treatiſes of *algebra*, of very various extent and value, that have been publiſhed ſince. See particularly Ward's Mathematicians Guide to *Algebra*; Jones's Synopſis; Wolfius's *Algebra*; Simpſon's *Algebra*; Dodſon's Mathematical Repoſitory; Clairaut's Elements of *Algebra*; and Dr. Saunderſon's Treatiſe of *Algebra*, in two volumes, quarto, which is the moſt comprehenſive of any.

Algebra has been alſo applied to the conſideration and calculus of infinities; from whence a new and extenſive branch of knowlege has ariſen, called the *doctrine of* FLUXIONS, or *analyſis of infinities*, or the *calculus differentialis*.—The authors on this ſubject ſee under ANALYSIS.

ALGEBRAICAL, ſomething that relates to *algebra*.

Thus we ſay, *algebraical* CHARACTERS, or ſymbols, curves, ſolutions, &c.

ALGEBRAICAL *curve*, is a curve, wherein the relation of the abſciſſes to the ſemiordinates may be defined by an *algebraical* equation.

Theſe are alſo called *geometrical lines*, or *curves*.

Algebraical curves ſtand contradiſtinguiſhed to MECHANICAL or TRANSCENDENTAL ones.

ALGEBRAICAL *ſolution*. See RESOLUTION.

ALGEBRAISM, or ALGEBRISM, is affectedly uſed, in ſome writers, for *algebra* itſelf. In which ſenſe, we read of the application of *algebraiſm*.

ALGEBRAIST, a perſon ſkilled in *algebra*.

ALGEDO, the name of an accident which ſometimes happens in a gonorrhœa, by the ſtoppage of the running ſoon after it appears. Calomel repeated ſo as to purge, brings back the running, and the difficulties and danger diſappear.

ALGENEB, or ALGENIB, in *Aſtronomy*, a fixed ſtar of the ſecond magnitude, on the right ſide of PERSEUS.

ALGIABARII, a Mahometan ſect of predeſtinarians, who attribute all the actions of men, good or evil, to the agency or influence of God.

The *algiabarii* ſtand oppoſed to the ALKADARII.

ALGOIDES, in *Botany*, a name given by Vaillant, to a genus of plants, called by Micheli and Linnæus, ZANNICHELLIA.

ALGOL, or *Meduſa's Head*, a fixed ſtar of the third magnitude, in the conſtellation PERSEUS.

ALGONQUIN, one of the chief American languages, ſpoken eſpecially in Canada, or New France. The *algonquin* is one of the two principal languages ſpoken in the Northern America, the other is the *huron*.

It takes its name from an ancient people of the ſame denomination, now almoſt extinct, the Iroquois being the only remains.

The *algonquin* tongue is ſpoken, with ſome diverſity of dialects, by moſt of the natives from the river St. Laurence to that of Miſſiſſippi.

The baron la Hontan has given a little dictionary of the *algonquin* language. Reland has alſo given a gloſs on ſeveral words of the ſame. The firſt is entitled Mem. de l'Americ. Septent. Hag. 1703; the laſt is in his Diſſ. Miſc. p. 3. Diſſ. 2.

ALGOR is uſed, by ſome *Medicinal Writers*, to denote a preternatural coldneſs or chilneſs in a part. Muys ſpeaks, in this ſenſe, of an *algor* of the arm, attended with an *atrophy*.

ALGORAB, a fixed ſtar, of the third magnitude, in the right wing of the conſtellation CORVUS.

ALGORITHM, an Arabic term, which ſome authors, and eſpecially the Spaniards, make uſe of to ſignify the practical operation of the ſeveral parts of *ſpecious* arithmetic, or *algebra*.

Sometimes it is alſo uſed for the practice of common arithmetic, by ten numeral figures.

Algorithm is properly the art of numbering truly, and readily; and comprehends the ſix common rules of arithmetic.—It is ſometimes called *logiſtica numeralis*.

We ſay, the *algorithm* of integers, the *algerithm* of fractions, the *algorithm* of ſurds, &c.

ALGOSAREL, in *Botany*, a name uſed by Avicenna, and ſome other authors, for the common wild carrot, or DAUCUS *ſylveſtris*.

ALGUAZIL, in the Spaniſh *Policy*, a ſerjeant or official of a judge, or magiſtrate, appointed to ſee his decrees executed.

ALHABOR, among the Arabian *Aſtronomers*, is that ſtar commonly called SIRIUS.

ALHAGI, the *pliant thorny* BROOM *of Syria*. The inhabitants of Aleppo gather from it a new kind of *manna*, the grains of which are ſomewhat larger than *coriander*. The leaves are of a hot drying nature, and the natives uſe the flowers as a purgative; one handful of which boiled in water ſuffices for a doſe.

ALHANDAL, a term in the Arabian *Pharmacy*, ſignifying *colocynth*.—The TROCHES of *alhandal*, *trochiſci alhandal*, are a kind of TROCHES, compoſed of *colocynthis*, *bdellium*, and *gum tragacanth*.

The word is formed of the Arabic *handal*, or *handhal*, a name for *colocynthis*.

They are eſteemed good purgatives, and are uſed on divers occaſions.

ALHEN, in *Natural Hiſtory*, a name by which Dr. Shaw, and others, have called a genus of plants, ſince named by Linnæus LAWSONIA.

ALHIDADE, or ALIDADE, the index or label of an aſtronomical, or geometrical inſtrument, for taking of heights or diſtances.

The word is Arabic, and it ſignifies the ſame thing.—In Greek and Latin, it is called *διοπτρα*, *dioptra*, and *linea fiduciæ*, *fiducial line*.

The *alhidade* is a kind of ruler, moveable on the centre of the inſtrument; and carrying two SIGHTS, which are erected perpendicularly at the two extremities of it.

ALHIRTO, in *Aſtronomy*, a fixed ſtar of the third magnitude, in the conſtellation CAPRICORN. This is otherwiſe called *roſtrum gallinæ*. Near this ſtar, in the year 1600, appeared a new ſtar, which laſted twenty-one years, and then diſappeared again.

ALI gives the denomination to a ſect, or diviſion, among the Mahometans, who adhere to the right of ſucceſſion of *Ali*, the fourth caliph, or ſucceſſor of Mahomet, and the reform of *Muſſulmaniſm* introduced by him.

The ſectaries of *Ali* are more particularly called *Schiites*, and ſtand oppoſed to the *Sunnites*, or ſect of Omar, who adhere to the law, as left by Mahomet, Abubeker, and Omar.

Ali was couſin of Mahomet, and ſon-in-law of that prophet, having married his daughter Fatimah. After Mahomet's death, great diſputes aroſe about the ſucceſſion; many ſtood for *Ali*, but Abubeker was preferred, and elected the firſt kaliph. *Ali* took his turn, after the death of Othman.

The Perſians are the chief adherents to the ſect of *Ali*, whom they hold to have been the legitimate ſucceſſor of Mahomet, and Abubeker an uſurper. On the contrary, the Turks are of the ſect of Omar, and hold *Ali* in execration, having raiſed a furious civil war among the *Muſſulmen*.

The Perſian emperors of the family of Sophi, pretend to be the direct deſcendants from *Ali*; but the deſcent is very darkly made out.

The diſtinguiſhing badge of the followers of *Ali*, is a red turban, which is worn by the Perſians, who are hence called in deriſion, by the Turks, *kiſilbachi*, q. d. *red heads*.

Ali is reputed the author of divers works, particularly a Centiloquium, in great repute among the Arabs and

Perſians; part of which has been publiſhed in Engliſh by Mr. Ockley.

ALJAMEIA is a name which the Moriſcoes in Spain give to the language of the Spaniards.

Among other articles agreed on by the junto, which was appointed by the emperor Charles V. in 1526, in favour of the Moriſcoes, this was one, that the Moriſcoes ſhould no longer ſpeak Algavareia, i. e. Mooriſh, or Arabic, but ſhould all ſpeak *Aljameia*, i. e. Spaniſh, as it was called by the Moors, and all their writings and contracts ſhould be in that language.

ALIARBUCHA, in *Natural Hiſtory*, the Arabian name for a large kind of rat, common in that country, and good to eat, according to Bochart, who thinks it the ſame as the *ſchaphan*, mentioned in Leviticus, and there declared unclean. Levit. xi. 5.

ALIAS, in *Law*, a ſecond or farther writ iſſued from the courts of Weſtminſter, after a *capias*, &c. ſued out without effect.

ALICA, in the *Ancient Phyſic* and *Diet*, a kind of food; but the various accounts given of it by authors, make it uncertain what it was; ſome repreſenting it as a ſort of grain, and others as an aliment made of grain.

The Greek word for *alica* was χονδρος, which term, and ϖτισσανη, ſeem to have been general names for all ſpelt or hulled grain, beaten or ground into a pulp.

Ray, in his hiſtory, ſays the *alica* differs from the χονδρος, as the *genus* from the *ſpecies*.

ALICARIÆ, in *Ancient Hiſtory*, a term ſynonymous with proſtitutes.

ALICATICA, an Arabian weight.

ALICES, in *Medicine*, ſpots preceding the ſmall-pox.

ALICULA, in *Antiquity*, a kind of puerile habit worn by the Roman children.

The *alicula* was a ſort of *chlamys*: ſome explained it by *tunica manicata*.

ALIDES, in the *Mahometan Hiſtory*, the deſcendants of *Ali*, otherwiſe called *Fatimites*.

The *Alides* had a long ſtruggle with the Ommiades, for the kaliphate, or ſucceſſion of Mahomet; which is the Mahometan papacy.

ALIE-Kruyk, a Dutch name given to a kind of ſea-ſnail, the hiſtory of which is given by Swammerdam. Bib. Nat. tom. i. p. 180.

ALJEMBUT, or, as ſome write it, *gembut*, a name given by the Arabians, Avicenna, and others, to a ſpecies of ACACIA, which they alſo called the Nabathæan pod, and ceration, or ſiliqua, and which ſome have ſuppoſed to be the ſame with the common carob; but they expreſly diſtinguiſh it, by ſaying that it is an aſtringent, whereas the other is gently purgative; and that the fruit of it was given in hæmorrhages. Nay, Iſidore goes ſo far as to ſay, that the acacia juice of the ſhops was made of its fruit, while unripe.

ALIEN, in *Law*, a ſtranger, or perſon born out of the king's allegiance; or under the juriſdiction of ſome other ſovereign; and not naturalized, or made a denizen.

Of theſe there are two kinds; viz. *alien friends*, who are of thoſe countries which are at peace and league with us; and *alien enemies*, who are of countries at war with us; to which ſome add a third, viz. *alien infidels*.

A man born out of the land, ſo it be within the limits of the king's obedience beyond the ſeas; or of Engliſh parents out of the king's obedience, ſo the parents at the time of the birth be of ſuch obedience, is no *alien*, but a ſubject of the king, ſtat. 2. 25 Edw. III. commonly called the ſtatute *De natis ultra mare*.

Add that if one born out of the king's allegiance come and dwell in England; his children begotten here are not *aliens*, but denizens.

By the ſtatute 11 and 12 W. III. cap. 6. all perſons being the king's natural born ſubjects, may inherit as heirs to their anceſtors, though their anceſtors were *aliens*. Children of an ambaſſador in a foreign country by a wife who is an Engliſh woman, are natural born ſubjects by the common law. 7 Rep. 11. And if an Engliſh merchant living beyond ſea, marries a wife there, and hath a child by her and dies, this child is born a denizen, and ſhall be heir to him, notwithſtanding the wife be an *alien*. Cro. Car. 605. Perſons born in Engliſh plantations are natural born ſubjects.

An *alien* can hold no land by deſcent or purchaſe, or be tenant by the courteſy, or in dower; and if he purchaſe, the king ſhall have it; but he may purchaſe a houſe for years for habitation, during his reſidence, as neceſſary for trade. If an *alien* merchant leaves the kingdom, the king ſhall have the leaſe; if he be no merchant, the king ſhall have his leaſe for years, though it were for his habitation; and by the ſtat. 32 H. VIII. there is a penalty for letting houſes to *aliens*. 5 Rep. 502.—7 Rep. 18.—1 Inſt. 2. 129.—2 Inſt. 741.

A deviſe of lands to an *alien* is void; and if a man be bound to an *alien* enemy in a bond, it is void to him, but the king ſhall have it.

Aliens, however, may obtain goods and perſonal eſtate by trade, &c. and may bring actions for the ſame; but an *alien* enemy cannot maintain any action whatever, nor obtain any thing lawfully within the realm. 1 Bulſt. 134. Terms des Ley, 36.

Aliens are not to be returned on any jury; but where an *alien* is party in a cauſe, the jury are to be half denizens, and half *aliens*, except in caſes of high treaſon. 2 Inſt. 17.

By the ſtat. 12 W. III. cap. 2. *aliens* are incapable of being members of parliament, or of enjoying offices; neither have they any vote for the election of members. Hob. 271. *Aliens* likewiſe are by ſeveral acts of parliament put under ſeveral other reſtrictions, with regard to exerciſing trades, taking apprentices, and are likewiſe diſabled from being factors in the plantations, &c.

Aliens *duty*, an impoſt laid on all goods imported into England by *aliens*, or denizens, and even on certain goods imported by natural ſubjects, if they be brought on foreign bottoms, over and above what is paid for the ſame goods imported by Britiſh, and in Britiſh ſhipping. 12 Stat. Car. II.

Aliens duty is otherwiſe called *petty cuſtoms*, and *navigation duty*.

Fiſh dried, or ſalted, and codfiſh, or herring, not caught in Britiſh veſſels, and cured by Britiſh, pay a double *aliens duty*.

Aliens duty outwards, is taken off by the following acts. 12 Car. II. cap. 4.—25 Car. II. cap. 6.—5 Ann, cap. 27.—6 Ann, cap. 10.—7 Ann, cap. 7.—9 Ann, cap. 6.—8 Geo. I. cap. 15.—11 Geo. I. cap. 29.

Scavage, *package*, and *balliage*, payable to the city of London, are properly *alien duties*. On what footing *aliens* are permitted to import foreign commodities into Great Britain, ſee Duty.

Alien is ſometimes uſed, in *Middle Age Writers*, for *exempt*.

Alien-*amy*, or *alien-friend*. See Alien.

Alien *priories*, a ſubordinate kind of monaſteries in England, belonging to, and dependent on, other monaſteries in foreign countries. Vid. Dugd. Monaſt. Abr. p. 44.

ALIENATION, Alienatio, in *Law*, the act of making a thing another man's; or the altering and transferring the property and poſſeſſion of lands, tenements, or other things, from one man to another.

To *alienate*, or alien, in MORTMAIN, is to make over lands or tenements to a religious community, or other body *politic*.

To *alienate* in FEE, is to ſell the fee-ſimple of any land, or other incorporeal right.

All perſons who have a right to lands, may generally *alien* them to others; but ſome *alienations* are prohibited: ſuch as *alienations* by tenant for life, &c. whereby they incur a forfeiture of their eſtate. 1 Inſt. 118.

By the ſtatute of Edward I. a bar was put to *alienations*, by what we call *entails*, which is an expedient for procuring *perpetuities* in families; but counter expedients were deviſed to defeat this intent, and a practice was introduced of cutting off entails by *fines*, and of barring remainders and reverſions by *recoveries*.

The ſtatute for *alienations* in Henry the ſeventh's time, had a great effect on the conſtitution of this kingdom; as among other regulations of that reign, it tended to throw the balance of power more into the hands of the people.

By the ſtat. 12 Car. II. cap. 24. fines for alienations are taken away.

Crown lands are only *alienable* under a faculty of perpetual redemption.

The council of Lateran, held in 1123, forbids any clerk to *alienate* his benefice, prebend, or the like.

By the laws of the ancient Jews, lands could only be *alienated* for the ſpace of fifty years. At each return of the jubilee, all returned again to the primitive owners, or their deſcendants, to whom the lands were originally allotted, at the firſt diſtribution of Canaan.

Alienatio *à familia*. See Abdication.

Alienation *office*, is an office to which all writs of covenants and entry, upon which fines are levied, and recoveries ſuffered, are carried, to have fines for *alienation* ſet and paid thereon.

ALIFORMES *muſculi*, a pair of muſcles, ariſing from the pterygoid bone, and ending in the neck of the lower-jaw, towards the internal ſeat of the head.

They are thus called from *ala*, *wing*, and *forma*, *ſhape*; as reſembling wings.

Aliformes *proceſſus*, in *Anatomy*, the prominences of the *os* CUNEIFORME.

ALII *multi*, or Alii *de regno*, are phraſes which often occur in our ancient records and hiſtorians. Their meaning has occaſioned much diſpute. Dr. Brady will have them to ſignify only tenants *in capite*; which Mr. Tyrhel endeavours to refute, and ſhew that they denote the whole commons of the kingdom.

ALIMA, among *Mineraliſts*, a kind of ſand found in gold mines, out of which lead is extracted.

ALIMENT, ALIMENTUM, in a phyſical ſenſe, is whatever may be diſſolved, and turned into chyle, ſo as to be afterwards converted into blood, for augmenting the body, or repairing its continual waſte.

The word is formed of *alere*, *to nouriſh*. See CHYLIFICATION, DIGESTION, FOOD, and NUTRITION.

ALIMENT *of plants*, ſee PLANTS.

ALIMENTARY, ALIMENTAL, ſomething that relates to aliment, or food.

The ancient phyſicians held, that every humour conſiſts of two parts; an *alimentary*, and an *excrementitious* one.

ALIMENTARY *duct*, *ductus alimentalis*, is a name given by Dr. Tyſon, and ſome others, to that part of the body through which the food paſſes, from its reception into the mouth, to its exit at the *anus*; including the *gula*, ſtomach, and inteſtines.

Dr. Morgan conſiders the whole *alimentary* tube (including the ſtomach, inteſtines, and lacteals), as conſtituting one gland; of the like nature, ſtructure, and uſe, with the other glands of the body.

Every gland has its *vaſa deferentia*, *ſecretoria*, and *expurgatoria*, together with its common ventricle, where the matter brought thither is firſt prepared by digeſtion, &c. —In this grand primary concoctive gland, the *gula*, from the mouth of the *œſophagus* to its *vas deferens* the ſtomach, is its common receptacle, the lacteals are its *vaſa ſecretoria*, or recipient ſtrainers, and the inteſtines from the *pylorus* to the *anus* conſtitute its *vas expurgatorium*, or common expurgatory duct. The actions therefore of this, as of every other gland, are principally four, viz. *ſolution*, *ſeparation*, glandular colature or *ſecretion*, and *evacuation* or expurgation.

The whole *ductus alimentalis*, from its uſes, may be ordinarily divided into four parts. 1. That which conveys the food, called the *œſophagus*. 2. That which digeſts, or corrodes it, called the *ſtomach*. 3. That which diſtributes the chyle, called the *inteſtines*. 4. That which empties the *fæces*, called the *rectum*. Phil. Tranſ. Nº 144, p. 32, and 33.

This duct is ſaid to be the true characteriſtic of an animal, or *proprium quarto modo*; there being no animal without it, and whatever has it, being properly enough ranged under the claſs of animals. Plants receive their nouriſhment by the numerous fibres of their roots, but have no common receptacle for digeſting the food received, or for carrying off the recrements. But in all, even the loweſt degree of animal life, we may obſerve a ſtomach, and inteſtines, even where we cannot perceive the leaſt formation of any organ of the ſenſes, unleſs that common one of feeling as in oyſters. Phil. Tranſ. Nº 269, p. 776, ſeq.

Dr. Wallis brings an argument from the ſtructure of the *alimentary* tube in man, to prove that he is not naturally carnivorous. To the cogency of which, Dr. Tyſon makes ſome objections. V. Phil. Tranſ. Nº 269, p. 777.

ALIMENTARY *duct* is ſometimes alſo underſtood of the thoracic duct.

ALIMENTARY *law*, *lex alimentaria*, was an old law among the Romans, whereby children were obliged to find ſuſtenance for their parents.

ALIMENTARII *pueri*, &c. were certain children, maintained and educated by the munificence of the emperors, in a ſort of public places, not unlike our hoſpitals.

Trajan was the firſt that brought up any of theſe *alimentary* boys. He was imitated by Adrian. Antoninus Pius did the ſame for a number of maids, at the ſolicitation of Fauſtina; and hence, in ſome medals of that empreſs, we read PVELLAE FAVSTINIANAE.— Alexander Severus did the like, at the requeſt of Mammæa; and the maids thus educated were called Mammæanæ.

ALIMENTATION is uſed by ſome naturaliſts, for what we more ordinarily call NUTRITION.

ALIMONY, ALIMONIA, properly ſignifies nouriſhment, or maintenance; but in a modern ſenſe, in *law*, it denotes that portion, or allowance, which a married woman ſues for, upon any occaſional ſeparation from her huſband, wherein ſhe is not charged with elopement or adultery.

This was anciently called *rationabile eſtoverium*, *reaſonable maintenance*, and was recoverable only in the ſpiritual court; but now it is recoverable alſo in chancery.

Where a woman is divorced *a menſa & thoro*, ſhe may ſue her huſband in her own name for *alimony*, or maintenance, out of her huſband's eſtate, during the ſeparation, either in the chancery, or in the ſpiritual court; and it will be allowed, except in the caſes of elopement and adultery, as aforeſaid. 1 Inſt. 235.

ALIMUS, in *Botany*, a name given, by ſome of the Greek writers, to the common liquorice. It has been thus called, from its quality of palling the appetite, and making it inſenſible either of hunger or thirſt.

ALINDESIS, in the *Ancient Gymnaſtic Medicine*, a kind of exerciſe, wherein perſons being beſmeared with oil, rolled themſelves naked in the duſt.

The word is ſometimes alſo written αλινδος.

ALIOS *baton*, in *Ichthyology*, a name given by Ariſtotle, to the ſtrange fiſh, called by Artedi, LOPHIUS, and by others RANA *piſcatrix*.

ALIPÆNOS, in the *Ancient Phyſic*, an appellation given to dry, topical medicines, or ſuch as have no fat mixed with them.

The word is ſometimes alſo written *alipantos*. It is purely Greek, αλιπαινος, compounded of the privative α, and λιπαινειν, *pingueſcere*, *to fatten*. In which ſenſe, *alipæna* ſtands oppoſed to *lipara*, or plaſters, which have fat in their compoſition; called alſo by Celſus, *lenia*.

Galen gives the name αλιπη, to the remedies applied to freſh wounds, to check the inflammation, and haſten their healing.

ALIPILARIUS, or ALIPILUS, in *Antiquity*, an officer belonging to the baths, who, by means of wax, and waxen plaſters, took off the hairs from the ALÆ, or arm-pits. The women who performed this office were called *picatrices*, and *partiltriæ*.

The *alipilus* anſwered to what the Greeks called δρωπακιστης.

The ancient Romans made it a point of cleanlineſs to keep the arm-pits clear and ſmooth. In after-times, they went further, and took off the hair from their arms, legs, and other parts, with pitch and roſin, and by the *volſella*, an inſtrument for that purpoſe.

ALIPOW-MONTIS-CETI, a kind of white *turbith*, which is a ſtrong purgative. It is to be found in ſeveral places of Languedoc, particularly near Cete, whence the modern botaniſts have given it its name. It is ſometimes uſed inſtead of *ſena*; which, however, may be dangerous, ſince it is a much ſtronger purgative.

ALIPTA, in the *Ancient Gymnaſtics*, an officer appointed to anoint the *athletæ*.

In which ſenſe, the *aliptæ* amount to the ſame with what are otherwiſe called *unctores*, and *jatraliptæ*.

ALIPTA is ſometimes alſo uſed, in a leſs proper ſenſe, for the director, or ſuperintendant of the exerciſes of the *athletæ*.

In which ſenſe, *alipta* is ſynonymous with *gymnaſtes*, and *pædotriba*.

ALIPTERIUM, αλειπτηριον, in *Antiquity*, a place in the ancient *paleſtræ*, where the *athletæ* were anointed before their exerciſes.

The *alipterium*, or *alipterion*, was otherwiſe called ELÆOTHESION, and *unctuarium*; ſometimes alſo *ceroma*.

ALIQUANT *part*, is that which will not meaſure or divide any number exactly.—Or an *aliquant part*, is that which, being taken any number of times, is always greater or leſs than the whole. See MEASURE.

Thus, 5 is an *aliquant part* of 12; for being taken twice, it falls ſhort; and when taken three times, it exceeds 12.

The *aliquant parts* of a pound, or 20*s.* are

3*s.* an *aliquant part* compoſed of a tenth and 20th,
6*s.* of a 5th and a 10th.
7*s.* of a 4th and a 10th.
8*s.* of two 5ths.
9*s.* of a 4th and a 5th.
11*s.* of a half and a 20th.
12*s.* of a half and a 10th.
13*s.* of a half, a 10th, and 20th.
14*s.* of a half and a 5th.
15*s.* of a half and a 4th.
16*s.* of a half, a 5th, and 10th.
17*s.* of a half, a 4th, and 10th.
18*s.* of a half, and two 5ths.
19*s.* of a half, a 4th, and 5th. See MULTIPLICATION.

ALIQUOT *part*, is ſuch part of any number, or quantity, as will exactly meaſure it, without any remainder. —Or, it is a part, which being taken a certain number of times, becomes equal to the whole, or integer.

The word is formed of *aliquoties*, any number of times.

Thus, 3 is an *aliquot part* of 12; becauſe, being taken four times, it will juſt meaſure it.

The *aliquot parts* of 20*s.* are

10*s.*	half of 20*s.*	2*s.* 6*d.*	an eighth.
5*s.*	a fourth.	1*s.* 8*d*	a twelfth.
4*s.*	a fifth,	1*s.* 4*d.*	a fifteenth.
2*s.*	a tenth.	1*s.* 3*d.*	a ſixteenth.
1*s.*	a twentieth.	10*d.*	a twenty-fourth.
6*s.* 8*d.*	a third.	5*d.*	a forty-eighth.
3*s.* 4*d.*	a ſixth.		

To multiply by the help of *aliquot parts*, ſee MULTIPLICATION.

We muſt not confound an *aliquot part* with that of a *commenſurable*; for every *aliquot part* is a *commenſurable*, but not *vice verſa*. Thus four is *commenſurable* with ſix, but is not an *aliquot part* of it. Phil. Tranſ. N° 41.

ALISANDERS, *ſmyrnium*, Tourn. Inſt. R. H. 315. Tab. 168. This genus belongs to the *pentandria digynia* of Linnæus. Its characters are theſe: it has an umbellated flower; the principal umbel is unequal, the ſmall ones are erect; they have no involucrum, and the empalement of the flowers are ſcarce diſcernible. The flowers have five ſpear-ſhaped petals, which are a little inflexed, and five ſtamina the length of the petals, terminated by ſingle ſummits. The germen is ſituated under the flower, ſupporting two ſtyles, crowned by headed ſtigmas. The germen afterward turns to an almoſt globular fruit, which is ſtreaked, and ſplits in two, each containing one moon-ſhaped ſeed, convex on one ſide, marked with three ſtreaks, and plain on the other. There are five ſpecies.

Aliſanders uſed to be ordered by the college for medicinal uſe, but is ſeldom now preſcribed; and at preſent is ſeldom cultivated in gardens, though formerly it was greatly uſed in the kitchen, before celery was ſo much cultivated, which hath taken place of *aliſanders*, and entirely ſuperſeded the uſe of it.

The ancient Greeks have plainly deſcribed two different plants under this name; the one the common *aliſanders*, the other the *petroſelinum Cilicium*, or Cicilian parſley. The former of theſe plants loves moiſt and rich ground, and the other grows no where but on rocky hills, and in the drieſt and moſt barren places. Pliny, not obſerving that the ancient writers knew two plants under this name, accuſes them of an error, in ſaying that the *ſmyrnium* loved dry and barren places, whereas the Romans, who cultivated the *ſmyrnium* at that time, found it delighted only in rich moiſt ſoils; but the ancients, whom he cenſures thus, had ſpoke what he records of the *petroſelinum*, not of the great water-SMYRNIUM.

ALISMA, in *Botany*, a name given by ſome to the *plantago aquatica*, or water-PLANTAIN. In the Linnæan ſyſtem, it is a genus of the *hexandria polygynia*.

ALITES, in *Antiquity*, a name given to thoſe birds which afforded auguries by their wings and flight.

In this ſenſe, *alites* ſtand oppoſed to OSCINES, or birds which gave auguries by their mouths, by ſinging, or croaking, &c.

To the claſs of *alites*, belong the buzzard, oſprey, &c.

To that of OSCINES, the crane, raven, owl, &c.

The word is Latin, formed from *ala*, a *wing*.

ALKA, in *Zoology*, the name of a water-bird, of the diver kind, belonging to the claſs of *anſeres* in the Linnæan ſyſtem, and called, in different parts of England, the *auk*, the *razor-bill*, and the *murre*. It approaches to the ſize of the common duck; and its head, neck, back, and tail, are all black; its belly and breaſt, and up half-way of the throat, is white. The *alk* in Norway very much reſembles this in ſize, ſhape, and colour; though Pontopiddan repreſents the latter as peculiar to that country. It is found in the rocks on the ſea-coaſts, and makes no neſt, laying its eggs in ſome hollow of the naked rock. The eggs are very large, and are white, with black ſpots.

ALKADARII, a ſect among the Mahometans, who deny any eternal, fixed, divine decrees; and are aſſerters of *free-will*.

The word is formed from the Arabic, *alkadar*, which ſignifies decree.

The *alkadarii* are a branch of MOATAZALITES.—They ſtand oppoſed to the ALGIABARII.

ALKAHEST, or ALCAHEST, in *Chemiſtry*, a word coined by Paracelſus to ſignify a moſt pure and univerſal *menſtruum*, or diſſolvent, wherewith ſome chemiſts have pretended adequately to reſolve all bodies into their firſt matter, and to perform other extraordinary and unaccountable operations.

The word *alcaheſt* is originally German, compounded of *al* and *geeſt*, i. e. *all ſpirit*.

The two eminent ADEPTS, Paracelſus and Helmont, expreſly declare, that there is a certain fluid in nature, capable of reducing all ſublunary bodies, as well homogeneous as mixed, into their *ens primum*, or original matter whereof they are compoſed; or into an uniform equable and potable liquor, that will unite with water, and the juices of our bodies; yet will retain its ſeminal virtues; and if mixed with itſelf again, will thereby be converted into pure elementary water.—Whence they alſo imagined it would at length reduce all things into water.

This declaration, ſeconded by the aſſeveration of Helmont, who religiouſly ſwears himſelf poſſeſſed of the ſecret, has excited the ſucceeding chemiſts and alchemiſts to the purſuit of ſo noble a *menſtruum*. Mr. Boyle was ſo fond of it, that he frankly acknowleges he had rather have been maſter thereof than of the philoſophers ſtone.

The different conjectures of chemiſts, with relation to the matter of the *alkaheſt*, are innumerable. Boerhaave ſeems to expect it from ſea-ſalt, and mercury together.—Few bodies but ſome alchemiſt or other has fixed on, as the object of his reſearches after the *alkaheſt*. Some have wrought on equinoctial dew; others on rain-water, others on talc, others on zinc, others on antimony itſelf.—Poterius and Glauber confined themſelves to nitre; Beguinus did the ſame, only concealing it under the name of hermaphrodite ſalt. Angel. Sala, Sir Kenelm Digby, and ſeveral others, preferred vitriol. The diſciples of Paracelſus, commonly chooſe ſea-ſalt; Sandivorgius, Tachenius, Beverovicius, Boyle, and ſome others, water. Pollemannus, Mullerus, &c. founded all their hopes on black lead; others preferred flint; ſome potters varniſh. Helmont pretends, that the *alkaheſt* is prepared from common ſalt and raddiſh juice, unleſs his words are to be taken figuratively. Becher will have it made of a moſt penetrating mercurial earth; others of a foliated earth of tartar, and an urinous ſalt, combined, digeſted, and circulated together; others of ſpirit of wine, and ſalt of urine, coupled in due form; others of ſublimate mercury, and vitriol; others of the ſame mercury, and highly rectified ſpirit of wine, frequently cohobated; others of the ſapa of urine, expoſed to the magnetiſm of the air, &c.

The generality of chemiſts take the *alkaheſts* of Paracelſus and Van Helmont for the ſame; ſome others conclude them to be entirely different things. It is certain theſe two authors ſpeak of their reſpective *alkaheſts*, in terms very different. Paracelſus only ſpeaks of his as a medicine for the liver, which would prevent diſorders of that viſcus, or even ſupply, and reſtore it, if entirely gone.—Van Helmont chiefly ſpeaks of his, as a menſtruum which would diſſolve all bodies.—Cnoeffelius, after an exact compariſon of the ſeveral paſſages of Van Helmont, wherein the *alkaheſt* is mentioned, concludes, that what he elſewhere calls *ignis gehennæ*, is not the ſame liquor with that which Paracelſus calls by the name of *alkaheſt*; but with that which Paracelſus calls his corroſive ſpecific, which appears to be a different thing from his *alkaheſt*; ſince Paracelſus never uſed his ſpecific internally, nor does Helmont, in all his writings, mention one word concerning the internal uſe of his *alkaheſt*, though he commends it externally for the leproſy. And it appears from Paracelſus himſelf, that it was only on account of its external application, that he ranked it among medicines.

Helmont is expreſs, that this *menſtruum* is entirely the product of art, and not of nature.—‘Though, ſays he, a homogeneal part of elementary earth may be artificially ‘ converted into water, yet I deny, that the ſame can be ‘ done by nature alone; for no natural agent is able to ‘ tranſmute one element into another.’ And this he offers as a reaſon why the elements always remain the ſame.—It may let ſome light into this affair, to obſerve that Helmont, as well as Paracelſus, took water for the univerſal inſtrument of chemiſtry, and natural philoſophy; and earth for the unchangeable baſis of all things; that fire was aſſigned as the efficient cauſe of all things; that ſeminal impreſſions were lodged in the mechaniſm of earth; and that water, by diſſolving and fermenting with this earth, as it does by means of fire, brings every thing forth; whence originally proceeded the animal, vegetable, and mineral kingdoms; even man himſelf being thus at firſt created, agreeably to the account of Moſes.

The great character or property of the *alkaheſt*, we have obſerved, is, to diſſolve and change all ſublunary bodies, water alone excepted.—The changes it induces proceed thus:

1. The ſubject expoſed to its operation, is converted into its three principles, ſalt, ſulphur, and mercury, and afterwards into ſalt alone, which then becomes volatile; and at length is wholly turned into inſipid water.—The manner of application is by touching the body propoſed to be diſſolved, e. gr. mercury, gold, ſand, or the like, once or twice with the pretended *alkaheſt*; and if the liquor be genuine, the body will on this be converted into its own quality of ſalt.

2. It does not deſtroy the ſeminal virtues of the bodies diſſolved thereby.—Thus, gold is, by its action, reduced to a ſalt of gold; antimony to a ſalt of antimony; ſaffron to a ſalt of ſaffron, &c. of the ſame ſeminal virtues or characters with the original concrete.—By ſeminal virtues, Helmont underſtands thoſe virtues which depend upon the ſtructure or mechaniſm of a body, and which make it what it is. Hence an actual and genuine *aurum potabile* might readily be gained by the *alkaheſt*, as converting the whole body of gold into ſalt, retaining its ſeminal virtues, and being withal ſoluble in water.

3. Whatever it diſſolves, may be rendered volatile by a

ſand-heat; and if, after volatilizing the ſolvend, it be diſtilled therefrom, the body is left pure inſipid water, equal in quantity to its original ſelf, but deprived of its ſeminal virtues.—Thus, if gold be diſſolved by the *alkaheſt*, the metal firſt becomes ſalt, which is potable gold; but when the *menſtruum* by a farther application of fire is diſtilled therefrom, it is left mere elementary water. Whence it appears, that pure water is the laſt production or effect of the *alkaheſt*.

4. It ſuffers no change or diminution of force by diſſolving the bodies it works on, and therefore ſuſtains no reaction from them; being the only immutable menſtruum in nature.

5. It is incapable of mixture, and therefore remains free from fermentation and putrefaction; coming off as pure from the body it has diſſolved, as when firſt put thereon; without leaving the leaſt foulneſs behind.

Van Helmont had another *menſtruum*, which he called *circulatum minus*, ſaid to be prepared by a circulation of nine weeks, from equal parts of ſpirit of urine rectified three times, alcohol, or highly rectified ſpirit of wine, and vinegar twice rectified. Thoſe who are acquainted with the great effects which may be produced by theſe ſeparately, will readily believe that theſe by an intimate union may be converted into a *menſtruum* capable of doing ſurpriſing things; eſpecially as we know that neutral *menſtrua*, as this muſt be, will act upon ſome very hard bodies, which are not otherwiſe diſſoluble by acid, alkaline, watry, or ſpirituous *menſtrua*.

There are various proceſſes deſcribed, whereby the *alkaheſt* may be procured, yet many, nevertheleſs, doubt of the poſſibility of ſuch a *menſtruum*. Though we have the expreſs teſtimonies of Paracelſus, Helmont, Philalethes, Starkey, Faber, and others, that they were actually poſſeſſed of the ſecret, yet many among the later writers, as Boyle, Wedelius, Major, Martini, and others, perſiſt in holding it impoſſible, and even to involve contradictions.

Either ſuch a *menſtruum* does not exiſt, or elſe there is not any body in nature which may not become an *alkaheſt*. For although certain ſubſtances have not hitherto been combined with others, the daily diſcoveries in *chemiſtry* of combinations formerly believed impoſſible, ſeem to prove, that by certain management, and certain circumſtances, any ſubſtance may be combined with all others; or, in other words, that all bodies may be diſſolved by any ſingle ſubſtance.

Kunckel very well ſhews the abſurdity of ſearching for an univerſal ſolvent, by aſking, 'If it diſſolves all ſub-'ſtances, in what veſſel can it be contained?'

The illuſtrious Boerhaave, after collecting every thing which has been ſaid by Helmont, and other chemiſts, with regard to this wonderful liquor, concludes in the following manner. 'Perhaps, ſays he, you may now 'be willing to know my opinion of this matter, and 'whether I believe that any of the chemiſts were ever 'maſters of this grand *arcanum*. To this I freely an-'ſwer: Van Helmont complains, that the bottle was 'once given him, but that it was taken away again; 'and therefore he could not make many experiments 'with that liquor. And Paracelſus does not ſay ſo 'many, and ſo great things of his ſolvent, and there-'fore I really do not know what to ſay to it. This, 'however, I will venture to ſay, that if you examine 'ſea-ſalt and mercury, by every chemical method poſ-'ſible, you will never repent of your trouble.'

ALKAHEST is alſo uſed in a more extenſive ſenſe, ſo as to comprehend all fixed ſalts volatilized, and reduced into a quinteſſence.

ALKAHESTIC is uſed by ſome to denote the quality of bodies which are powerfully ſolvent.

In which ſenſe, *alkaheſtic* amounts to much the ſame with menſtruous; except that the former imports a greater degree of the ſolutive power, than the latter. See MENSTRUUM.

ALKALESCENT, denotes a matter ſlightly *alkaline*, or which begins to turn to the *alkaline* and putrid fermentation.

ALKALI. See ALKALY.

ALKALI, in *Botany*. See SALICORNIA.

ALKALINE, in a general ſenſe, ſomething that has the properties of an ALKALY.

In this ſenſe we ſay, *alkaline* ſalts, *alkaline* ſpirits, *alkaline* ſubſtances, &c.

ALKALINE, in *Chemiſtry*, is more peculiarly applied to SALTS which will perſiſt in, and bear a ſtrong fire, without flying away and vaniſhing in the air. In which ſenſe theſe *alkaline* ſalts are ſaid to be *fixed*.

ALKALINE *acrimony*, in *Medicine*, ſignifies a morbid quality in the blood, which is indicated by a deſire of, and thirſt after four things, loſs of appetite, and averſion to alkaleſcent food, nidorous eructations, putrid ulcers on the lips, tongue, and other parts in the mouth, ſickneſs in the ſtomach, a frequent *diarrhœa*, a ſenſe of heat, laſſitude, and general uneaſineſs, a diſſolution of the texture of the blood, the urine high coloured, and red. It produces a putreſcency in the blood, &c. and is to be remedied by the ſame means as the ſea-ſcurvy, and other putrid diſorders.

ALKALINE, or ALKALIZATE *bodies*, among *Chemiſts*, are ſuch as have their pores naturally ſo formed, that they are fit to be pierced, and put into motion, by the points of an acid poured upon them.

ALKALIZATION, ALKALIZATIO, in *Chemiſtry*, the act of impregnating a liquor with an *alkaline* ſalt.

This is done either to make it a better diſſolvent, for ſome particular purpoſes; or to load the phlegm, ſo as it may not riſe in diſtillation, whereby the ſpirituous parts may go over more pure.

ALKALIZATION, is a name applied to operations, by which *alkaline* properties are communicated to bodies; or to thoſe by which *alkali* is extracted from bodies which contain it, or in which it may be formed; e. g. *ſpirit of wine* is ſaid to be *alkalized*, when it has been digeſted upon *alkali*; a part of which it diſſolves, and thence acquires *alkaline* properties. On the other hand, when a neutral ſalt is decompoſed, in order to obtain its *alkaline* baſis, this ſalt is ſaid to be *alkalized*. Vegetable ſubſtances, when reduced to aſhes, may alſo be ſaid to be *alkalized*; becauſe theſe aſhes contained fixed ALKALI.

ALKALY, ALKALI, or ALCALY, in *Chemiſtry*, a name originally given by the Arabians to a ſalt extracted from the aſhes of a plant called *kali*; and by us GLASS-*wort*; becauſe uſed in the making of glaſs.

Afterwards, the term *alkaly* became a common name for the lixivious ſalts of all plants; that is, for ſuch ſalts as are drawn by lotion from their aſhes.

And hence, again, becauſe the original *alkaly* was found to ferment with acids; the name has ſince become common to all volatile ſalts, and all terreſtrial ſubſtances, which have that property.

ALKALY, then, in its modern extenſive ſenſe, is any ſubſtance, which being mixed with an acid, occaſions an ebullition and effervescence.

And hence ariſes the grand diviſion of natural bodies into the two oppoſite claſſes of *acids* and *alkalies*.

Boerhaave ſcarce takes this circumſtance to be enough to conſtitute any determinate claſs of bodies.—In effect, *alkalies* are not of one ſimilar homogeneous nature; but there are two ſeveral ſorts of them.

The firſt are obtained from vegetable and animal ſubſtances, by calcination, diſtillation, putrefaction, &c. Such are ſpirit of urine, ſpirit of hartſhorn, ſalt of tartar, &c.—The ſecond are of the terreſtrial kind; as ſhells, chalk, &c.

Theſe two ſpecies of *alkalies*, Boerhaave obſerves, differ widely from each other; having ſcarce any thing in common, but their being effervеſcible with acids.—The one is a claſs of native, fixed, ſcentleſs, inſipid, mild, aſtringent bodies: the other a ſet of ſuch as are volatile, odorous, ſapid, cauſtic, aperitive, and are procured by art. Hence, adds the ſame author, mere effervеſcence with acids muſt be allowed to be of itſelf inſufficient to determine the nature of an *alkaly*; and that ſuch a name, which properly denotes a cauſtic, fiery ſubſtance, ſhould not be affixed to any mild and gentle body, as chalk, &c. but other properties and conſiderations are to be taken in, and particularly their taſte, which is pungent, the manner of procuring, and the change of colour they produce in bodies.

With regard to this laſt circumſtance, thoſe liquors which, being poured on ſyrup of violets, change it to a green colour, are *alkalies*; as thoſe which turn it red, are acids.—Thus oil of tartar turns it of a kindly green; and oil of vitriol of a carmine red; and if to the ſyrup thus made red by oil of vitriol, oil of tartar be poured, it turns that part, wherewith it comes in contact, green; leaving the reſt red; and the like holds of oil of vitriol, poured on ſyrup made green by oil of tartar. But this change of colour is not peculiar to *alkalies*; ſince a ſolution of quick-lime in the marine acid changes the colour of ſyrup of violets to a green.

To the like effect, M. Homberg obſerves, that 'a mere 'heat and bubbling ariſing upon the admixture of a body 'with an acid does not ſeem an adequate criterion of 'the *alkaline* nature; ſince diſtilled oils of all kinds are 'found to do thus much; and that many of them with 'more vehemence than *alkalies* themſelves; ſo as ſome-'times even to take fire, which *alkalies* never do.'

The opinion that *alkalies* ferment only with acids, ſeems too haſtily taken up; for the different *alkalies* will ferment with one another; ſpirit of hartſhorn, ſpirit of wine, ſpirit of ſal armoniac, and other volatile ſpirits of the *alkaline* kind, when in the dry form of ſalts, all ferment with ſalt of tartar, or other fixed *alkalies* of the lixivial kind. Spirit of ſalt is an *alkali*, in regard to ſpirit of nitre, and ferments with it; and many of the acids ferment with ſulphur. A ſpirit of ſulphur may be prepared ſo concentrated, that it will ferment violently with water, which will become hot, and as it were boiling, on mixing the one with the other; yet water is certainly neither an acid nor an *alkali*.

To the definition and character of an *alkali*, therefore, M. Homberg adds this circumſtance; ‘ that after the ‘ action, the mixture coaleſces and ſhoots into a ſalt, or ‘ ſaline matter.’—This excludes the oils above mentioned; which do not, after efferveſcence, unite with the acids into a ſaline ſubſtance, but rather compoſe a reſinous one.

All lixivious ſalts have theſe characters of *alkali.*—And not only lixivious, but alſo all urinous ſalts, which are conſtantly found to imbibe acids with great eagerneſs, and, after ebullition, to unite and cryſtallize with them. Hence we have two kinds of *alkali* ſalts, viz. *fixed*, or *lixivious*; and thoſe that are *volatile*, or *urinous*.

But beſide *alkali* ſalts, there are an infinity of other bodies, not ſaline, which anſwer to the characters of *alkali*, i. e. which produce much the ſame effects with acids as the *alkali* ſalts abovementioned.—And theſe *alkaline* matters are, in other reſpects, of different natures. Some, e. gr. are merely EARTHY; as quick-lime, marble, chalk, &c.—Others are METALLINE; among which, ſome have their peculiar and appropriate acids to act on them, as gold, tin, and antimony, which only diſſolve with aqua regia; ſilver, lead, and mercury, with aqua fortis; and the others with other ſorts of acids, as iron, copper, zinc, biſmuth, &c.—There are others of the ANIMAL claſs; conſiſting, 1. Of ſtony matters found in the viſcera of certain ſpecies; as the *calculus humanus*, bezoards, crabs eyes, &c.—2. Teſtaceous matters and ſhells; as pearls, oyſter-ſhells, cuttle-fiſh bones, the ſhells or coats of lobſters, crabs, &c.—3. The parts of animals, which by length of time, or ſome other cauſe, are become ſtony, or even earthy; as the foſſil unicorn's horn, &c.—And laſtly, almoſt all ſtony marine plants, as coral, &c.

After all, the *alkaline* property in fixed ſalts does not appear to be native, but rather producible by art.—This opinion ſeems to have been firſt ſtarted by Helmont; before him, it was the ſtanding opinion, that fixed *alkalies* pre-exiſted in mixed bodies; and were only ſeparated or extricated from the parts of the compound. Helmont advanced, that they did not thus pre-exiſt in their *alkaline* form, but were productions of the fire, by whoſe violent action, part of the ſalt, which in the concrete is all volatile, lays hold of ſome part of the ſulphur of the ſame body; and both melting together, are fixed into an *alkali*; which fixation he exemplifies, by this circumſtance, that, when ſalt-petre and arſenic, though both volatile, are expoſed to the fire, they are fluxed by the operation thereof, and made to fix each other.

Some late chemiſts, and particularly M. Geoffroy, carry the point ſomething farther; and aſſert, that all *alkali* ſalts whatever, both fixed and volatile, are wholly the effect of fire; becauſe, before any action of the fire, they did not pre-exiſt in the mixt, wherein they afterwards appeared.

Notwithſtanding all the ſeeming oppoſition and hoſtility between *acids* and *alkalies*, they may be converted into one another; at leaſt, *acids* are convertible into *alkalies*; as is ſhewn at large by M. Geoffroy, the elder, in the Mem. de l'Acad. an. 1717. where the nature and origin of *alkalies* are ingeniouſly explained, p. 226. Hiſt. 34.

Alkali ſalts, according to this author, are only acids concentrated in little molecules of earth, and united with certain particles of oil, by means of fire.

When an acid, which we conceive in the general as a ſmall, ſolid, pointed *ſpiculum*, happens to be abſorbed or concentrated in a proper portion of earth, the whole becomes denominated a *ſaline, compound*, *neutral*, or *intermediate ſalt*; by reaſon the acid, thus incloſed in a ſheath, cannot excite the ſame ſavour as when diſengaged therefrom; and yet excites a ſaline taſte; and for this reaſon is compound, &c.

Now, fire is the only agent capable of diſengaging the acid from the earth with which it is thus inveſted. Upon this, the acid, being lighter than the earth, riſes and evaporates, leaving the earth at the bottom of the veſſel; which for this reaſon is called FIXED, in contradiſtinction to the acid, which is VOLATILE. This earth, thus deprived of its acid, is left with its pores open and empty, which before were filled; and withal, in ſuſtaining the action of fire, it neceſſarily retains ſome of the particles thereof, which give it an acrimonious taſte, ſuch as mere earth could never have. From this taſte it is called *ſalt*; and from its pores being open, and thus diſpoſed to admit and imbibe new acids, it is called *alkali ſalt*.

Now, it is not to be imagined, that an earth, which has once been impregnated with acids, can ever be perfectly diveſted of it; there will ſtill remain ſome, though much leſs than before. So that an *alkali* may be conceived as only a too ſmall quantity of acid, incloſed in too large a quantity of earth.

The viſible and ſenſible fire is not the only agent capable of ſeparating acids from their earth; fermentation has the ſame effect, in virtue of that pure active fire produced or concerned therein. *Alkalies*, therefore, are the production either of the one, or of the other fire; and the ſame may be ſaid of the acids diſengaged from them; it being the diſunion of the parts of the ſame ſalt occaſioned by fire that produces both, the acids as well as the *alkalies*. All the difference is, that the *alkali* imbibes and retains certain corpuſcles of the fire, whereas nothing foreign is ſuperadded to the acid.

On this principle every acid is volatile, and every *alkali* ſhould be fixed, if the *alkali* were only earth; but in regard the little acid ſtill remaining in the *alkali*, may be united with a portion of oil, as well as a portion of earth, and oil is known to be volatile; the compound, that is, the *alkali*, muſt be volatile, in caſe the oil prevail in it.

In this caſe, the *alkali* is found to have a ſtrong, penetrating, urinous taſte and ſmell; and is what we call a *volatile urinous alkali ſalt*.

Theſe things well conſidered, it will be eaſy to aſſign what muſt enſue upon the ſeparations, or new unions, of the parts of a mixt.

An acid, it is evident, may become an *alkali*, becauſe, after having been ſeparated from its matrix, it may be reſtored in a ſmall quantity to another matrix, either wholly earthy, or earthy and oleaginous. In the firſt caſe, it will become a fixed *alkali*; in the ſecond, it may be a volatile *alkali*, if in the ſuppoſed matrix the proportion of oil prevail over that of earth; and in this caſe it will be urinous.

Again, what before was a fixed *alkali*, may become volatile and urinous, by depoſiting or diſcharging part of its earth, and taking oil in its ſtead.

Theſe tranſmutations are not found equally eaſy and practicable in the three different kinds of mixts, or the three kingdoms, by reaſon of the diverſity of circumſtances that muſt concur in the operation.—They are much the moſt rare and difficult in the mineral realm; becauſe, without doubt, the parts of minerals are more cloſely tied together, and have, as it were, leſs play. The only inſtance chemiſtry hath hitherto produced, of a mineral acid's being converted into a fixed *alkali*, is in the operation of fixing ſalt-petre.

The vegetable kingdom, it is obſerved, furniſhes a very large quantity of fixed *alkali* ſalt; and very little volatile *alkali*: the animal kingdom, on the contrary, affords much volatile *alkali* ſalt, and but little fixed. The foſſil kingdom affords a very little native fixed *alkali* ſalt, as the Egyptian *natrum*, and the ſalts procured by lotion from ſaline earths about Smyrna, and ſome other places of the Eaſt; and the chemiſts have alſo found a method of converting nitre into a fixed *alkali*; but nobody hath hitherto produced a volatile *alkali* from the acids of the mineral kingdom.—And yet, if acid ſalts of the vegetable kind be convertible either into FIXED or VOLATILE *alkalies*, why may not mineral acids be ſuſceptible of the ſame change, ſince vegetable acids are originally no other than mineral ones; for, from whence but the earth ſhould plants derive their acid juice?

In effect, M. Geoffroy has at length ſhewn the operation feaſible, by an actual transformation of the ſame acid nitre into a volatile urinous *alkali*. Mem. de l'Acad. an. 1717.

By the way, it is to be noted, that the inſtance of Egyptian *natrum*, or nitre, furniſhes an objection againſt the general aſſertion of all *alkalies* being artificial, or produced by fire. Mr. Boyle, who had ſome of this ſalt ſent him by the Engliſh embaſſador at the Porte, found that vinegar would work briſkly on it, even in the cold. ‘ Whence, ſays he, it appears, that the Egyptian nitre, ‘ acknowleged to be a native ſalt, and made only by the ‘ evaporation of the ſuperfluous water of the Nile, is ‘ yet of a lixivious nature, or at leaſt abounds with par‘ticles that are ſo, though produced without any prece‘dent incineration, and the matter of it expoſed to ‘ the violence of the fire, to make it afford an *alkali*.’ —He adds, ‘ however, he does not know any other ‘ body in nature, except this, wherein the *alkaline* pro‘perties are not produced.’ And proceeds to give inſtances of *alkalies* being made from ſea-ſalt, and other acids; and ſhews, ‘ how the ſame body, without the ‘ addition of any other ſalt, may, by varying the man‘ner of the fire's application, be made either to afford ‘ little elſe than acids, or a greater or leſs quantity of ‘ *alkali*.’ Producib. of Chym. Princip.

ALKALI *and acid, hypotheſis of.*—Tachenius and Sylvius de la Boe, followed by the tribe of vulgar chemiſts, ſtrenuouſly aſſert SAL *alkali* and *acid* to be the only univerſal principles of all bodies; and by means of theſe, they account for the qualities of bodies, and the reſt of the *phænomena* of nature; particularly thoſe in the animal œconomy. In a word, *alkali* and *acid* are ſubſtituted in the ſtead of matter and motion.

Mr. Boyle and Bohnius attack this hypotheſis with great force of argument. In effect, it is at beſt but precarious to affirm, that *acid* and *alkaline* parts are found in all bodies.

When the chemiſts ſee aqua fortis diſſolve filings of copper, they conclude, that the acid ſpirits of the menſtruum meet in the metal with an *alkali*, upon which they work; but how unſafe a way of arguing this is, appears hence, that ſpirit of urine, which is allowed a volatile *alkali*, and accordingly makes a great conflict with aqua fortis, readily diſſolves filings of copper, and that even more genuinely than the acid liquor.—So, when they ſee the magiſtery of pearl or coral, prepared by dropping oil of tartar into the ſolution of thoſe bodies made with ſpirit of vinegar, they aſcribe the precipitation to the fixed *alkali* of the tartar, which mortifies the acidity of the ſpirit of vinegar; whereas the precipitation would no leſs enſue, if, inſtead of the *alkalizate* oil of tartar, that ſtrong acid, oil of ſulphur *per campanam*, were uſed.

It may alſo be doubted, whether it be juſt to ſuppoſe, that when an acid is diſcovered in a body, the operation of that body on another, abounding with an *alkali*, muſt be the effect of a conflict between theſe two principles? For an acid body may do many things, not ſimply as an acid, but on account of a texture or modification, which endows it with other qualities as well as acidity. Thus, when the chemiſts ſee an acid menſtruum, as aqua fortis, ſpirit of ſalt, oil of vitriol, &c. diſſolve iron, they preſently aſcribe the effect to an acidity in the liquors; though well dephlegmated urinous ſpirits, which they hold to have a great antipathy to acids, will alſo readily diſſolve crude iron, even in the cold.

Farther, the patrons of this hypotheſis ſeem arbitrarily to have aſſigned offices to each of their two principles, as the chemiſts do to each of their *tria prima*, and the peripatetics to each of their four elements. But it is not enough to ſay, that an acid, for inſtance, performs theſe things, and an *alkali* thoſe; and that they divide the operations and phænomena of natural bodies between them: aſſertions of ſuch moment ought not to be received, without farther proof.

Indeed, the very diſtribution of ſalts into *acids* and *alkalies*, has ſomewhat arbitrary in it; there being not only ſeveral things wherein the acids agree with *alkalies*, but alſo ſeveral things wherein each differs from itſelf.—To ſay nothing of the diverſity of fixed and volatile *alkalies* above mentioned; ſome, as ſalt of tartar, will precipitate the ſolution of ſublimate into an orange-tawny; others, as ſpirit of blood and hartſhorn, precipitate the ſame ſolution into a milky ſubſtance; and oil of tartar very ſlowly operates upon filings of copper, which ſpirits of urine and hartſhorn will readily diſſolve on the fire. And among acids themſelves the difference is no leſs; for ſome of them will diſſolve bodies which others will not; and this even where the menſtruum that will not diſſolve the body, is reputed much ſtronger than that which does; as dephlegmated ſpirit of vinegar will diſſolve lead reduced to minute parts in the cold, which is an effect that chemiſts expect not from ſpirit of ſalt. Nay, one acid will often precipitate what another has diſſolved, and *è contra*; as, ſpirit of ſalt will precipitate ſilver out of ſpirit of nitre. Add, the properties peculiar to ſome particular acids; as, that ſpirit of nitre, or aqua fortis, diſſolves camphire into an oil, and coagulates common oil into a conſiſtent ſubſtance like tallow; and though it will both corrode ſilver, copper, lead, and mercury, and keep them diſſolved, it quickly lets fall almoſt the whole body of tin. It is no wonder that the definitions given of *acid* and *alkali* ſhould be inaccurate and ſuperficial, ſince the chemiſts themſelves do not ſeem to have any determinate notion, or ſure marks, whereby to know them diſtinctly. For to infer, that, becauſe a body diſſolves another, which is diſſoluble by this or that known acid, the ſolvent muſt alſo be acid; or to conclude, that, if a body precipitates a diſſolved metal out of a confeſſedly acid menſtruum, the precipitant muſt be an *alkali*, is precarious: ſince filings of ſpelter will be diſſolved by ſome *alkalies*, viz. ſpirit of ſal ammoniac, &c. as well as by acids; and bodies may be precipitated out of acid menſtrua, by other acids, and by other liquors wherein there appears not the leaſt *alkali*. Add, that a ſolution of biſmuth, made in aqua fortis, would be precipitated both by ſpirit of ſalt, and by common water.—Nor does that other criterion of *acids* and *alkalies*, viz. the heat, commotion, and bubbles, excited upon their being put together, appear more determinate; ſince almoſt any thing fitted variouſly and vehemently to agitate the minute parts of a body, will produce heat in it.—Thus, though water be neither an acid, nor an *alkali*, it will quickly grow very hot, not only with the highly acid oil of vitriol, but with the *alkalizate* ſalt of tartar.

Neither is the production of bubbles on the mixture, though accompanied with a hiſſing noiſe, a certain ſign; ſuch production not being a neceſſary effect of heat, excited by conflict, but depending on the peculiar diſpoſition of the bodies put together, to extricate, produce, or intercept, particles of air.—Hence, as oil of vitriol, mixed in a due proportion with fair water, may be brought to make the water very hot, without exciting bubbles; ſo Mr. Boyle has found, that *alkalizate* ſpirit of urine, drawn with ſome kinds of quick-lime, being mixed with oil of vitriol moderately ſtrong, would afford an intenſe heat, while it produced either no manifeſt bubbles at all, or ſcarce any; though the urinous ſpirit was ſtrong, and in other trials operated like an *alkali*; and though, with the ſpirit of urine made *per ſe*, in the common way, oil of vitriol will produce a great hiſſing, and a multitude of conſpicuous bubbles. On the other ſide, ſome acid ſpirits, as that of verdegris, made pure, poured on ſalt of tartar, will frequently make a conflict, and produce a large froth, though not accompanied with any manifeſt heat.

Many make the taſte the touchſtone whereby to try *acids* and *alkalies*; but there are a multitude of bodies, wherein we can ſo little diſcern by the taſte which of the principles is predominant, that one would not ſuſpect there was a grain of either of them therein: ſuch are diamonds, moſt gems, and many ignobler ſtones; gold, ſilver, mercury, &c. There are alſo bodies abounding with *acid* or *alkalizate* ſalts, which either have no taſte at all, or a quite different one from that of theſe chemical principles.—Thus, though glaſs be in great part compoſed of a fixed *alkali*, it is inſipid on the palate; and cryſtals of ſilver and lead, made with aqua fortis, and containing numerous acid particles of the menſtruum, manifeſt nothing of acidity in the mouth; the latter having a ſaccharine ſweetneſs, and the former an extreme bitterneſs. And even in vegetable ſubſtances of a manifeſt taſte, it is not eaſy to know by that, whether it be the *acid* or the *alkaline* principle which predominates in them: as, in the eſſential oil of ſpices, and the groſs empyreumatical oils of wood; and even in *alcohol* of wine, which ſome contend to be an ACID, and others an *alkali*.

The peculiar properties of *alkalies* and *acids*, and the effects of their combination with each other, have been conſiderably explained by the modern diſcoveries of Dr. Black, and others. *Alkaline* ſubſtances yield a quantity of fixable air, by combining them with acids, and by other proceſſes. As their combination with this fluid is weaker than with acids, *alkalies* may be deprived of it by acids. Fire likewiſe will diſcharge it; and it may be extricated by means of other *alkaline* ſubſtances, with which it has a ſtronger affinity. Thus mild volatile *alkali* may be deprived of its air, or rendered cauſtic, by applying to it uncombined magneſia, fixed *alkali*, or calcareous earth, while theſe ſubſtances unite with the air, and are thereby rendered mild. When by any of theſe means, *alkalies* have been deprived of their fixable air, and are expoſed to an atmoſphere in which particles of it float, they readily abſorb it; unleſs they have been previouſly combined with ſome other ſubſtance as an acid, with which they preferably unite, and reſume their former ſtate. Calcareous earth, combined with fixable air, forms the ſeveral maſſes of lime-ſtone, marble, chalk, &c. When any of theſe ſubſtances are deprived of the air combined with them, they become pure calcareous earth, or quick-lime. *Alkaline* ſubſtances combined with fixable air, become capable of cryſtallization; ſo that the extrication of this air deſtroys the uniform texture of marbles, calcareous ſpars, cryſtals of vegetable or of mineral *alkali*. The combination of *alkalies* with fixable air diminiſhes their power of combining with other ſubſtances, which are incapable of expelling this air from them. Hence the power of *alkaline* ſalts to diſſolve oil is leſſened, ſo that ſoap-boilers find it neceſſary, in the preparation of ſoap, to deprive theſe ſalts by quick-lime of all the fixable air united with them. *Alkaline* ſubſtances combined with fixable air are called mild, and when uncombined with it, cauſtic. In the former caſe they efferveſce with acids, which they do not when rendered perfectly cauſtic; the efferveſcence being occaſioned by the diſcharge of the fixable air. See Neumann's Chemical Works, by Dr. Lewis, and Macquer's Chem. Dict. See AIR, *fixable*.

Phyſicians have various methods of adminiſtring *fixed alkaline ſalts*. When ſuch medicines are required, ſmall doſes are given warm every three or four hours, interpoſing a purge now and then. When intermitting fevers return, this method, for a few days, is thought an excellent preparation for the bark. The *volatile alkaline ſalt* is either in a dry or liquid form; when dry it is called *ſalt*, when liquid, *ſpirit*; the firſt is obtained by *ſublimation*, the ſecond by *diſtillation*.

ALKANET, ſee Anchusa, and Lithospermum.

ALKEBLA, or Alkiblia. See Kebla.

ALKEKENGI, in *Botany*. See Winter-Cherry.

Alkekengi, a medicinal fruit or berry, produced by the beforementioned plant, popularly alſo called the *winter-cherry*; of ſome uſe as an abſtergent, diſſolvent, and diuretic.

The fruit is celebrated for its lithontriptic quality; and preſcribed to cleanſe the urinary paſſages of gravel, and other obſtructions. Its deterſive quality alſo recommends it againſt the jaundice, and other diſorders of the *viſcera*.

ALKERMES, in *Medicine*, &c. a term borrowed from the Arabs, denoting a celebrated remedy, of the form and conſiſtence of a confection; whereof the *kermes* are the baſis.

The other ingredients are roſe-water, ſugar, ambergris, muſk, cinnamon, aloes wood, pearls, and leaf-gold, &c. But the ſweets are uſually omitted.

The *confectio alkermes* is chiefly made at Montpelier, which place ſupplies moſt parts of Europe with it. It is ſaid to be better made there, than it can be elſewhere; the reaſon of which doubtleſs is, that the drug, which gives it the denomination, is no where found ſo plentifully as there. The manner of preparing the grain for making the confection is deſcribed in the Phil. Tranſ. N° 20.

It is much uſed as a cordial; eſpecially, ſays Dr. Quincy, among female preſcribers, and in complaiſance to them; but that author decries its value in that intention, and thinks it ought only to be regarded as a ſweetener.

Count Marſigli, in an enquiry into the compoſition of this medicine, ſhews, that many of the ingredients, wherewith the ancients ſo plenteouſly loaded it, and which are ſtill retained in it by the moderns, are not only uſeleſs, but hurtful; more particularly the *lapis lazuli*, by many miſtakenly held cordial, on account of the appearance of veins of gold in it; whereas, in reality, it is only a marcaſite of ſulphur and vitriol, and contains a great quantity of acid, directly repugnant to the alkaline nature of the kermes, and highly prejudicial in diſeaſes, where the blood tends to coagulation.

ALKES, a ſtar in the conſtellation crater.

ALKOOL. See Alcohol.

ALKORAN. See Alcoran.

ALKUSSA, in *Ichthyology*, a name given by the Swedes to a fiſh, which they alſo call *lake*. It is a ſpecies of the silurus, and is diſtinguiſhed by Artedi by the name of the *ſilurus* with only one *cirrus*, or beard, under the chin. The common *ſilurus*, which is the *glanus* of the ancients, has four *cirri*.

ALKY *of lead*, among *Alchemiſts*, denotes a ſweet ſubſtance procured from lead.

ALL *Saints*, in the *Calendar*, denotes a feſtival celebrated on the firſt of November, in commemoration of all the ſaints in general; which is otherwiſe called *All-hallows*.

The number of ſaints being ſo exceſſively multiplied, it was found too burdenſome to dedicate a feaſt-day to each. In reality there were not days enough, ſcarce hours enough, in the year for this purpoſe. Hence an expedient was had recourſe to, by commemorating ſuch in combination, who had no peculiar days of their own. Boniface IV. in the ninth century, introduced the feaſt of *All Saints* into Italy, which was ſoon after adopted into the other churches.

ALL *Souls*, in the *Calendar*, denotes a feaſt-day, held on the ſecond of November, in commemoration of all the faithful deceaſed.

The feaſt of *All Souls* was firſt introduced in the eleventh century, by Odilon abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches.

ALLAH, or Alla, an Arabic word, and the name which all who profeſs Mahometaniſm give to God, and make frequent repetitions of in their prayers.

ALLANTOIS, Allantoides, otherwiſe called *farciminalis*, in *Anatomy*, a thin, ſmooth, membranous ſubſtance, or veſicle, inveſting the *fœtus* of divers animals, and replete with urinous liquor conveyed to it from the *urachus*.

The word is derived from αλλας, *farcimen*, a *gut*; and ειδος, *forma*, *ſhape*; becauſe in many brutes it is in this form, though in ſome others it is round.

The *allantois* makes a part of the secundine.—It is conceived as an urinary tunic, placed between the *amnion* and *chorion*; which, by the navel and *urachus*, receives the urine that comes out of the bladder.

The *allantois* appears differently in different animals. Fabricius ab Aquapendente will have dogs, cats, and the like animals, which have teeth both in the upper and nether jaw, to be without it. It is moſt conſpicuous in the cow and ſheep kind. Its length in the former extends to about twelve feet. It is very dilatable, and may be blown up to above a foot diameter. The inhabitants of Iceland make uſe of it, inſtead of glaſs for windows.

It is a point controverted among anatomiſts, whether the *allantois* be found in the human ſpecies?—M. Dreſincourt, profeſſor of anatomy at Leyden, in an expreſs diſſertation on this membrane, maintains it peculiar to the ruminating kind.

Several anatomiſts who diſpute the exiſtence of the human *allantois*, allow of an intermediate membrane in the human ſpecies, between the *chorion* and *amnios*, but deny it the appellation of an *allantois*, as holding it to differ from the *allantoides* of brutes, in ſtructure, as well as office. Neither artery nor vein can be diſcovered in this membrane. See Mem. Acad. des Scienc. 1701.

Dr. Hale, on the contrary, has given an accurate deſcription of the human *allantois*; and aſſigned the reaſon why even thoſe, who believed its exiſtence, had not before fully found it out; and alſo an anſwer to thoſe who yet deny its reality. See Phil. Tranſ. N° 271.

ALLAT, derived from the Arabic *Allah*, *God*, is the name of an idol among the Arabians, and idolatrous Jews.

ALLAY. See Alloy.

ALLAZÆZIS, in the language of the *Chemiſts*, denotes a philoſophical braſs, or copper, called alſo *æs album*, *aqua mercurii*, and by divers other names.

ALLE, a ſpecies of the *alea*. It is met with among fragments of ice in the northern ſeas of Europe and America.

ALLECTOR, a ſpecies of the crax.

ALLEGATA, a word anciently ſubſcribed at the bottom of reſcripts and conſtitutions of the emperors, as *ſignata*, or *teſtata*, was under other inſtruments.

In this ſenſe, *allegata* imports as much as verified, *verificata*.

Allegata was a kind of ſubſcription, ſomewhat leſs uſual than *data*, *propoſitum*, *accepta*, *ſubdita*, *ſuppoſita*, or *ſubſcripta*.

ALLEGATION, is uſed for the producing of acts, or inſtruments, to authorize a thing.

Allegation, in a literary ſenſe, denotes the act of citing or quoting an author, or paſſage of ſome book.

ALLEGEAS, or Allegias, a ſtuff manufactured in the Eaſt Indies. There are two ſorts of them; ſome are of cotton, and others of ſeveral kinds of herbs, which are ſpun like flax and hemp. Their length and breadth are of eight ells, by five, ſix, or ſeven eighths; and of twelve ells, by three fourths, or five eighths.

ALLEGIANCE, the legal faith and obedience, which every ſubject owes to his prince.

This was anciently called *ligeantia*, or *ligence*; from the Latin *ligare*, and *alligare*, *to bind*; q. d. *ligamen fidei*.

The oath of *allegiance*, taken by the people to the king, is only the counter-part to the coronation oath, taken by the king to the people, and as ſuch, partakes of the nature of a covenant; that is, is conditional, and ceaſes on a violation of the contract by the prince; at leaſt this is the doctrine of ſome of the chief advocates for the revolution. The anti-revolutioners, on the contrary, hold the oath of *allegiance* to be abſolute and unconditional.

The convention of eſtates having offered the crown to the prince and princeſs of Orange, who accepted of it, the old oaths of *allegiance* impoſed by the ſtat. 1 Q. Eliz. and 3 James I. were abrogated; and a new oath was drawn up, to be taken by all the ſubjects of England, on penalty of being deprived of all employments, civil, military, and eccleſiaſtical. Seſſ. 1. cap. 8. Stat. Abridg. tom. iii. p. 8. ſeq. 8vo.

The form of the oath of *allegiance* by 1 G. ſtat. 2. cap. 13. is: 'I A. B. do ſincerely promiſe and ſwear, that 'I will be faithful, and bear true *allegiance* to his majeſty 'king George. So help me God.'

This oath is given to the king, in quality of a temporal prince, or ſovereign; to diſtinguiſh it from the oath given to him as primate, or ſupreme head of the church, which is called the *Oath of Supremacy*.

Allegiance is either perpetual, where one is a ſubject born, or where one hath the right of a ſubject by naturalization, &c. Or it is temporary, by reaſon of reſidence in the king's dominions. To ſubjects born it is an incident inſeparable; and as ſoon as born, they owe by birth-right obedience to their ſovereign; and it cannot be confined to any kingdom, but follows the ſubject wheresoever he goes. All perſons above the age of twelve years are to be required to take the oath of *allegiance* in courts-leet.

The Quakers are excuſed from taking the oath of *allegiance*;

allegiance; and, in lieu thereof, are only enjoined a declaration of fidelity. 8 G. cap. 6.

ALLEGORICAL, ſomething containing an *allegory*.

The divines find divers ſenſes in Scripture; as a *literal*, a *myſtical*, and an *allegorical* ſenſe. See PROPHECY, TYPE.

ALLEGORY, ALLEGORIA, a figure in rhetoric, whereby we make uſe of terms which, in their proper ſignification, mean ſomething elſe than what they are brought to denote; or it is a figure whereby we ſay one thing, expecting it ſhall be underſtood of another, to which it alludes.

An *allegory* is, properly, a ſeries or ſtring of metaphors. Such is that beautiful *allegory* in Horace, lib. i. Od. 14.

O navis, referunt in mare te novi
Fluctus, &c.

Where the *ſhip* is uſually held to ſtand for the *republic*; *waves*, for *civil war*; *port*, for *peace* and *concord*; *oars*, for *ſoldiers*; and *mariners*, for *magiſtrates*.

Allegory includes parable, apologue, μυθος, or *fable*, and *parœmia*, or *proverbs*; at leaſt, under *allegories* are comprehended ſuch proverbs as are applicable to ſubjects of different kinds.

Scaliger conſiders *allegory* as one part, or ſide, of a compariſon. It differs from *irony*, in that *allegory* imports a ſimilitude between the thing ſpoken and intended; *irony* a contrariety between them.

The Old Teſtament is ſuppoſed, by many, to be a perpetual *allegory*, or typical repreſentation of the myſteries of the New.

In effect, *allegories* have entered into moſt religions.—The Jews, we know, abound with them. Philo Judæus has three books, of the *allegories* in the hiſtory of the ſix days.

Nor are the heathens without *allegories* in their religion: it may be even ſaid, that the uſe hereof is of a much earlier ſtanding in the Gentile, than in the Jewiſh world.—Some of their philoſophers, undertaking to give a *rationale* of their faith, and to ſhew the reaſon and ſcope of their fables, and the ancient hiſtories of their gods, found it neceſſary to put another conſtruction on them, and maintain, that they ſignified ſomething very different from what they ſeemed to expreſs.—And hence came the word *allegory*, or a diſcourſe that, in its natural ſenſe, αλλο αγορευει, ſignifies ſomething other than what ſeems intended by it.

This ſhift they had recourſe to, in order to prevent people from being ſhocked with thoſe abſurdities which the poets had introduced into their religion; and to convince the world, that the gods of Greece had not been thoſe vile perſons which their hiſtories repreſented them to be. By this means, the hiſtory, as well as religion, of Greece, was at once converted into *allegory*; and the world left to ſeek for them both in a heap of fables, few of which have been ſatisfactorily ſolved, either by ancient or modern writers.

The Jews, finding the advantages of this way of explaining religion, made uſe of it to interpret the ſacred writings, ſo as to render them more palatable to the pagans.

The ſame method was adopted by the primitive writers of Chriſtianity.

Allegories are diſtinguiſhed into divers kinds: as, *verbal*, *real*, *ſimple*, *alluſive*, *phyſical*, *moral*, *political*, *theological*, &c.

ALLEGORY, *ſimple*, according to ſome writers, is that which is taken from any kind of natural things.

ALLEGORY, *alluſive*, is that which relates to other words, or things.

ALLEGORY, *verbal*, is a thread, or ſeries of metaphors; or a continuation of the ſame trope, chiefly metaphor, through many words.—Such is that in Virgil:

Claudite jam rivos pueri, ſat prata biberunt.

Where the metaphor of watering the ground is carried on to the ſhutting of the ſluices, &c.

ALLEGORY, *perpetual*, or *continued*, is that where the allegorical thread is purſued through all the parts of a conſiderable diſcourſe.—Such are the books of Jonah, of Canticles, of Job, not to ſay the whole Old Teſtament, according to the hypotheſis of ſome divines.

ALLEGORIES, *phyſical*, thoſe wherein ſome point of natural philoſophy is repreſented: ſuch in Homer, are Juno, who repreſents the air; Jupiter, the æther, &c.

ALLEGORIES, *medical*, thoſe wherein ſome ſecret of phyſic is revealed: ſuch is Solomon's deſcription of old age, Eccleſ. xii. 1, &c, wherein, according to certain authors, the circulation of the blood is indicated: ſuch alſo, according to a modern writer, is the ſtory of the labours of Hercules.

ALLEGORIES, *chemical*, thoſe relating to chemiſtry: ſuch, according to Suidas, and many moderns, is the ſtory of the Argonautic expedition, wherein the proceſs of making gold is exactly deſcribed: ſuch alſo, according to Tollius, is the name and title of Baſil, Valentine, Benedictine, Monk; under which are concealed the ſecret of the philoſophical mercury.

ALLEGORIES, *moral*, thoſe whereby ſome uſeful moral inſtruction is held forth: ſuch, in Homer, is the victory of Diomede over Venus, or fleſhly luſt: ſuch alſo are the Pythagorean metempſychoſis, and the ſtory of the judgment of Hercules, related by Prodicus. To which may be added, the fables of avarice and luxury; of the grotto of grief, and others in the Spectators and Tatlers. Spectat. N° 55. Tatl. N° 97.

ALLEGORIES, *political*, thoſe wherein ſome maxim of good government is artfully wrapped up: ſuch is that celebrated one of Menenius Agrippa, whereby he prevailed on the Roman people, who had withdrawn in diſcontent at the magiſtrates, to return into the city; to which purpoſe, he related to them the parable of a war raiſed by the ſeveral parts of the human body againſt the ſtomach.

ALLEGORIES, *theological*, thoſe wherein ſome truth relating to the nature or attributes of God is couched.

ALLEGORY is alſo uſed for the drawing ſome words, plainly and literally intended at firſt, from their natural and proper meaning, to a foreign ſenſe; for the better inſtructing of our minds in ſome point of faith, or manners. This coincides with what is otherwiſe called ACCOMMODATION.

ALLEGRO, in *Muſic*, a word uſed by the Italians to denote one of the ſix diſtinctions of TIME.

Allegro expreſſes a ſprightly, quick motion, the quickeſt of all excepting *preſto*.

The uſual diſtinctions ſucceed each other in the following order: *grave*, *adagio*, *largo*, *vivace*, *allegro*, and *preſto*.

It is to be obſerved, that the movements of the ſame name, as *adagio*, or *allegro*, are ſwifter in triple than in common time.—The triple $\frac{3}{8}$ is uſually *allegro*, or *vivace*; the triples $\frac{6}{4}$, $\frac{6}{8}$, $\frac{9}{8}$, $\frac{12}{8}$, are moſt commonly *allegro*.

ALLEGRO, *piu*, in the Italian *Muſic*, intimates to play, or ſing, a little quicker.

ALLEGRO, *poco piu*, ſignifies, that the part it is joined to muſt be played, or ſung, a little more briſk and lively, than *allegro* alone requires.

ALLELENGYON, in *Antiquity*, a kind of tax, or tribute, which the rich paid for the poor, when abſent in the armies.

ALLELOPHAGI, in *Natural Hiſtory*, a term uſed by Mouffet, and other writers on inſects, to expreſs a peculiar genus of flies, which feed on one another. They are thus called in diſtinction from another claſs, called the *heterophagi*, from their feeding on different ſubſtances, not on one another.

ALLELUJA, in *Botany*, a name uſed by many for the common *wood*-SORREL.

ALLELUJAH. See HALLELUJAH.

ALLEMAND, ALMAIN, a kind of grave, ſolemn muſic, originally invented by the Germans, where the meaſure is good, and the movement ſlow.

ALLEMANNIC, in a general ſenſe, ſomething relating to the ancient Germans. The word is alſo written *Alamannic*, *Alemannic*, and *Alemanic*. It is formed from *Alemanni*, *Allemanni*, or *Alamanni*; the name whereby the German nation was anciently known.

In this ſenſe we meet with *Allemannic* hiſtory, *Allemannic* language, *Allemannic* laws, &c. Goldaſtus, and others, have publiſhed collections of writers on *Allemannic* affairs: *Allemannicarum rerum ſcriptores*.

Allemannic language was ſpoken throughout the ſouthern parts of Germany. It is divided into ſeveral dialects; the principal of which are the Suevic, and Helvetic.

The *Allemannic* differed from the Francic, which was the language in uſe through the northern parts of Germany; the chief dialects of this, are the Palatine, Franconian, and Saxon.

ALLEMANNIC *law*, *jus Allemannicum*, is the ſame with what is otherwiſe called the Suevic law, being that which obtained in the more ſouthern parts of the country, as the Saxon law did throughout the northern.

Schilter has publiſhed the provincial *Allemannic law*, and alſo the code of the feudal *Allemannic law*.

ALLER, *good*, in our *Ancient Writers*.—The word *aller* ſerves to make the expreſſion of ſuperlative ſignification. So, *aller good*, is the greateſt good. Sometimes it is written *alder*.

ALLERION, or ALERION, in *Heraldry*, a ſort of eaglet, repreſented without either beak, or feet.

The name is French; and is ſaid to have been introduced for the word *eaglet*; it is added, that the practice of calling eaglets, *allerions*, and of repreſenting them ſpread, without feet and beaks, is not above an hundred years old, and is of French invention; introduced to repreſent the Imperialiſts as ſubdued. Hence, Menage derives the word from *aquilario*, a diminutive of *aquila*.

The *allerion*, repreſented *Tab. Heraldry, fig.* 1. appears much the ſame with the *martlet*, except that the wings of the latter are cloſe, and it is repreſented, as it were, *paſſant*; whereas the *allerion* is ſpread, and is repreſented in *pale*. Add, that among our heralds, the *martlet* has a beak, which the *allerion* wants.

ALLEU, or ALLODE, in our *Ancient Cuſtoms*. See ALLODIUM.

ALLEVEURE, the ſmalleſt copper coin that is ſtruck in Sweden; it is not worth quite two *deniers Tournois* of France.

ALLEVIARE, in *Old Records*, to LEVY or pay an accuſtomed fine or compoſition.

ALLEVIATION, denotes the art of making a thing lighter, and eaſier to bear or endure.

The word is originally Latin, compounded of *ad*, *to*; and *levis*, *light*.

In which ſenſe, *alleviation* is ſynonymous with *lightening*, and ſtands oppoſed to *aggravation*.

ALLEY, in *Gardening*, a ſtrait parallel walk, bordered or bounded on each hand with trees, ſhrubs, or the like.

The word *alley* is derived from *aller*, *to go*; the ordinary uſe of an *alley* being for a walk, paſſage, or thoroughfare, from one place to another.

Alleys are uſually laid either with graſs or gravel.

According to lord Bacon, ‘ where *alleys* are cloſe gra‘ velled, the earth putteth forth the firſt year knot-graſs, ‘ and after ſpire-graſs. The cauſe is, that the hard ‘ gravel, or pebble, at the firſt laying, will not ſuffer the ‘ graſs to come forth upright, but turneth it to find way ‘ where it can; but after that the earth is ſomewhat ‘ looſened at the top, the ordinary graſs cometh up.’

An *alley* is diſtinguiſhed from a *path*, in this; that in an *alley* there muſt be always room enough for two perſons, at leaſt, to walk a-breaſt; ſo that it muſt never be leſs than five feet in breadth; and there are ſome who hold, that it ought never to have more than fifteen.

ALLEYS, *counter*, are the little *alleys* by the ſides of the great ones.

ALLEY, *front*, is that which runs ſtraight in the face of a building.

ALLEY, *tranſverſe*, that which cuts the former at right angles.

ALLEY, *diagonal*, is that which cuts a ſquare, thicket, parterre, &c. from angle to angle.

ALLEY, *ſloping*, is that which, either by reaſon of the lowneſs of the point of ſight, or of the ground, is neither parallel to the front, nor to the tranſverſe *alleys*.

ALLEY, in the *New Huſbandry*, implies the vacant ſpace between the outermoſt row of corn on one bed, and the neareſt row to it on the next parallel bed; and it is uſually about four feet in breadth, excluſive of the partitions between the rows of corn in the beds. The firſt hoeing of wheat is performed in the beginning of winter, and the earth is ploughed away from the rows into the intervals, which forms ſmall ridges in the middle between the double rows. The ſecond hoeing is in the ſpring, which turns it back to the rows, leaving a furrow in the middle of the *alley*. The third hoeing is from the rows, after the wheat has bloſſomed; this turns the earth into the intervals, forming ſmall ridges there, as at the firſt hoeing. The fourth hoeing returns the earth to the ridges, which is performed a month or more after the third hoeing. This commonly finiſhes the horſe-hoeings, if the land is in good heart; otherwiſe one or two more hoeings are neceſſary.

ALLEY *in ziczac*, is that which has too great a deſcent, and which, on that account, is liable to be damaged by floods; to prevent the ill effects whereof, it has platbands of turf run acroſs it from ſpace to ſpace, which help to keep up the gravel.

This laſt name is likewiſe given to an *alley* in a labyrinth, or wilderneſs, formed by ſeveral returns of angles, in order to render it the more ſolitary and obſcure, and to hide its exit.

ALLEY, in *Perſpective*, is that which is larger at the entrance than at the exit; to give it the greater appearance of length.

ALLEY *of compartiment* is that which ſeparates the ſquares of a *parterre*.

ALL-GOOD, in *Botany*, *chenopodium*. See GOOSE-*foot*.

ALL-HEAL, *Hercules's*, in *Botany*, a name given to WOUNDWORT.

ALL-HEAL, *clowns*, ſtachys. See HOREHOUND.

ALLIANCE, the union or connection of two perſons, or two families, by means of marriage; otherwiſe called AFFINITY.

The word ſeems formed of the Latin *adligatio*, q. d. a *tying together*.

The law of the *Twelve Tables* forbids all *alliance* between perſons of unequal rank and condition.—And, in Portugal, we are told, the daughters of the nobility are prohibited to *ally* with ſuch as have never been in the wars.

ALLIANCE is alſo extended to the leagues or treaties concluded between ſovereign princes, and ſtates, for their mutual ſafety and defence; in which ſenſe they are the ſame with what we otherwiſe call *confederacy*, *league*, &c.

Alliances make a ſpecies of treaties; which are uſually divided into treaties of peace, of commerce, and of *alliance*, properly ſo called. Theſe are ſometimes particularly denominated foreign *alliances*.

Alliances are variouſly diſtinguiſhed, according to their object, the parties in them, &c. Hence we read of equal, unequal, triple, quadruple, grand, offenſive, defenſive, &c. *alliances*.

ALLIANCES, *unequal*, *fœdera inequalia*, are thoſe wherein one of the contracting powers promiſes patronage, or protection, and the other fidelity and obſervance; by which they ſtand contradiſtinguiſhed from equal *alliances*, wherein the ſeveral powers treat on a par.

ALLIANCE, *offenſive*, that whereby the parties oblige themſelves jointly to attack ſome other power. This ſtands contradiſtinguiſhed from defenſive *alliances*.

The *triple alliance*, between England, Holland, and Sweden, is famous.—So is the *quadruple alliance*, between England, Holland, the emperor, and the king of France.

Though the title of *allies*, *ſocii*, of the Romans, was a ſort of ſervitude, it was much coveted. Ariarathes, we are told by Polybius, offered a ſacrifice to the gods by way of thankſgiving for having obtained this *alliance*. The reaſon was, that thenceforwards people were ſure not to receive any injuries except from them.

There were divers ſorts of *allies*: ſome only united to them, by a participation of the privileges of Romans, as the Latini and Hernici; others by their very foundation, as the colonies; others by the benefactions they received from them, as Maſſiniſſa, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which laſt by a long *alliance* became ſubjects, as the kings of Bithynia, Cappadocia, Egypt, and moſt of the cities of Greece: laſtly, others by compulſive treaties, and the law of ſubjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an *alliance* with him; that is, they never ſubdued any people without uſing it as a means of ſubduing others.

The forms or ceremonies of *alliances* have been various in different ages and countries. Among us, ſigning and ſwearing, ſometimes at the altar, are the chief; anciently eating and drinking together, chiefly offering ſacrifices together, were the cuſtomary rite of ratifying an *alliance*. Among the Jews and Chaldeans, heifers or calves; among the Greeks, bulls or goats; and among the Romans, hogs were ſacrificed on this occaſion. Among the ancient Arabs, *alliances* were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a ſharp ſtone, dipping herein a piece of their garments, and therewith ſmearing ſeven ſtones, at the ſame time invoking the gods Vrotalt and Alilat, i. e. according to Herodotus, Bacchus, and Urania. Among the people of Cholchis, the confirmation of *alliances* is ſaid to be effected by one of the princes offering his wife's breaſts to the other to ſuck, which he was obliged to do till there iſſued blood.

It has been diſputed, whether the ſtates of the empire have a right of making *alliances*, without the emperor's participation. And whether the king of England be veſted with abſolute power of making *alliances* at diſcretion, without conſent of parliament. Dr. Davenant aſſerts the negative. According to him, the contrary opinion owes its riſe to the mere flattery of modern courtiers, having no foundation in the ancient laws and conſtitution of the kingdom. King John and Richard II. were, according to this author, the firſt that attempted any thing like it. It is certain there occur numerous inſtances in hiſtory, where the king has aſked, or the parliament have offered, their advice, concerning *alliances* to be made; but there are many others, at leaſt of later times, wherein no footſteps of any ſuch conſultation appear.

There are inſtances likewiſe where the parliament have declined giving any advice concerning ſuch arduous matters.

ALLIARIA, in *Botany*. See *Dame's* VIOLET.

ALLIGATION, in *Arithmetic*, a rule or operation, whereby queſtions are reſolved, relating to the mixture of divers commodities or ingredients together, with the value, effect, &c. thereof in compoſition.

The word is formed of *alligare*, *to tie together*, by reaſon, perhaps, of a ſort of *vincula*, or circular ligatures, ordinarily uſed to connect the ſeveral numbers together.

Alligation is of two kinds, *medial* and *alternate*.

Alligation *medial* is, when, from the ſeveral quantities and rates of divers ſimples given, we diſcover the mean rate of a mixture compounded out of them.

The ſeveral caſes will come under the following rules.

1. The quantity of the ingredients, and the prices of each, being given; to find the price or value of ſome part of the mixture.

Rule. As the ſum of the quantities given,
Is to the ſum of the ſaid products;
So is one ounce of the mixture,
To its value.

Example. A refiner, or goldſmith, hath 12℥ of gold at 4*l*. per ℥, 8℥ at 4*l*. 5*s*. 3℥ at 4*l*. 6*s*. 8*d*. and 9℥ at 4*l*. 13*s*. 4*d*. per ℥; what is an ounce worth of all theſe melted together.

℥ of gold		*l.*	*s.*	*d.*		*l.*
12 ×	by	4	0	0	the product is	48
8	by	4	5	0		34
3	by	4	6	8		13
9	by	4	13	4		42
32 total.						137 ſum.

Then as 32 ℥ : 137*l*. :: 1 ℥ : 4*l*. $\frac{9}{32}$, or to 4*l*. 5*s*. 7*d*. $\frac{1}{2}$. By the ſame rule the value of any other quantity of that compoſition is to be found: as ſuppoſing 7 ℥.

For as 32 : 137 :: 7 : $29\frac{31}{32}$.

2. The prices of the ſeveral ingredients, and the ſum paid or received for the mixture, being given; to find what quantity of each was bought or ſold.—Divide the ſum paid or received, by the ſum of the particular prices; the quotient is the anſwer.

3. The ingredients of a mixture being given, to augment or diminiſh the mixture proportionally.

Rule. As the ſum of the particular quantities of the compound given,
Is to the whole quantity propoſed to be augmented or leſſened;
So is each particular quantity in the given compound,
To the due proportion required of that ſpecies, fineneſs, &c.

Example. The compound in the foregoing inſtance is required to be augmented to 48 ℥: that is, 16 is to be added to 32, how much of each ingredient muſt be taken?

$$\begin{array}{r} 12\\ 8\\ 3\\ \underline{9}\\ 32\ \text{ſum.}\end{array}\quad \text{Then, as } 32 : 16 :: \left\{\begin{array}{rcl} 12 & : & 6\ \text{℥}\\ 8 & : & 4\\ 3 & : & 1\frac{1}{2}\\ 9 & : & \underline{4\frac{1}{2}}\\ & & 16\ \text{ſum.}\end{array}\right.$$

		l.	*s.*	*d.*	
So that there muſt be	18 ℥ of gold at	4	0	0	per ℥.
	12	4	5	0	
	4½	4	6	8	
	13½	4	13	4	
Sum =	48 for proof of the operation.				

4. The nature, quality, &c. of the ſeveral ingredients of a mixture being given, to find the temperament or degree of fineneſs reſulting from the whole.—Place the ſeveral quantities of the mixtures in rows; againſt which place orderly their ſeveral qualities or fineneſs; and multiply each quantity by its own quality or degree of fineneſs: then, as the ſum of the quantities is to their products, ſo is unity to the quality or fineneſs of the mixture.

5. The quantities of a mixture being given; to find the particular quantities of any ingredient in any part of the mixture.

Rule. As the total of the compoſition,
Is to the quantity of any ſimple in that compoſition;
So is the total quantity propoſed, to be proportionably compounded
To the quantity of each ſimple to be in that propoſed quantity.

Example. How much of each ingredient (or price of gold mentioned in the firſt caſe) is in a pound, or 12 ℥ of the 32, being the compound given?

$$\text{As } 32 : 12 :: \left\{\begin{array}{rclcccc} & & & & l. & s. & d.\\ 12\,\text{℥} & : & 4\frac{1}{2} & \text{at} & 4 & 0 & 0\ \text{per ℥.}\\ 8 & : & 3 & \text{at} & 4 & 5 & 0\\ 3 & : & 1\frac{1}{8} & \text{at} & 4 & 6 & 8\\ 9 & : & \underline{3\frac{3}{8}} & \text{at} & 4 & 13 & 4\\ & & 12\ \text{proof.} & & & & \end{array}\right.$$

6. Given the total of a mixture, with the whole value, and the values of the ſeveral ingredients; to find the ſeveral quantities mixed, though unequally.

This caſe admits of two varieties; firſt, where the mixture is of two ſimples; and ſecondly, when it conſiſts of more than of two. For the firſt, the rule is—Multiply the total of the mixture by the leaſt value, ſubtract the product from the total value; and the remainder is the firſt dividend: then take the ſaid leaſt value from the greateſt valued ingredient, and the remainder is the firſt diviſor. The quotient of this diviſion ſhews the quantity of the higheſt-priced ingredient, and the other is the complement to the whole.

Thus, ſtill referring to the firſt example, and aſſuming the two firſt terms of it:

Gold at 4*l*. per ℥
Ditto at 4*l*. 5*s*.

$$\text{Total of the compoſition} = \begin{array}{r} 20\ \text{℥}\\ \times\ \underline{4}\\ 80 \end{array}\qquad \text{Total value } \begin{array}{r} 82l.\\ \underline{-\ 80}\\ \div \text{ by } \tfrac{1}{4}l.\,)\,2\,(8 \end{array}$$

the quantity of the higheſt priced ingredient.

Secondly, when the quantities are more than two in number.

Theſe kinds of queſtions, as in thoſe of *alligation* alternate, admit of various anſwers, all of them true, and are called INDETERMINATE *problems*. They are beſt done by parcel, two at a time, as in the preceding operation.

Alligation *alternate* is, when the rates or qualities of divers ſimples are given; and the quantity of each is required, neceſſary to make a mixture of the given rate or quality.

Alligation alternate ſhews the due proportion of ſeveral ingredients; and counterchanges the places of ſuch exceſſes or differences as ariſe between the mean price and the extremes; aſcribing that to the greater extreme, which proceeds from the leſſer; and contrarily.

The rules which obtain in *alligation* alternate are as follow:

Every greater extreme is to be linked with one leſſer.

If either of the extremes be ſingle, and the other extremes plural, the ſingle extreme is to be linked to all the reſt.

If both greater and leſſer extremes be not plural, they may be linked ſo diverſly, that ſeveral differences may be taken, and a variety of anſwers may be made to the queſtion, yet all true; but if one of the extremes be ſingle, there can be but one anſwer.

The numbers being linked, take the difference of each from the mean or common price; and place this difference againſt the number it is linked to, alternately.

Every number, linked with more than one, muſt have all the differences of the numbers it is linked to, ſet againſt it.

Theſe differences reſolve the queſtion, when the price of every one of the ingredients is given without their quantities; and the demand is, to mix them ſo as to ſell a certain quantity at a mean rate.

But when the quantity of one, with the price of all the ingredients, is given, and the demand is to know the quantities of the other ingredients; then, the rule of three is to be uſed.

And when the price of every ingredient is given, without any of their quantities, and the demand is to make up a certain quantity to be ſold at a mean rate; then all the differences added together will be the firſt number in the rule of three; the whole quantity to be mixed, the ſecond number; and each difference apart, the ſeveral third numbers; and ſo many ſorts mixed, ſo many operations of the rule of three.

We ſhall add an example, wherein both the kinds of *alligation* have place.—Suppoſe a mixture of wine of 119 quarts, required to be made of wines of the following prices, 7*d*. 8*d*. 14*d*. and 15*d*. per quart; and ſo, as that the whole may be afforded at 12*d*. per quart.

Having linked 8 to 14, and 7 to 15, and counterchanged their differences from the common price, 12*d*. the ſum of their difference is found to be 14; by which dividing 119, the quotient is $8\frac{7}{14}$, or $8\frac{1}{2}$, or for convenience in operation $\frac{17}{2}$.

$$\begin{array}{rr} 8 & 2\\ 14 & 4\\ 7 & 3\\ \underline{15} & \underline{5}\\ & 14 \end{array}\qquad \begin{array}{r} \text{Quarts.}\\ \frac{17}{2}\times 2=\frac{34}{2}=17\\ \frac{17}{2}\times 4=\frac{68}{2}=34\\ \frac{17}{2}\times 3=\frac{51}{2}=25\frac{1}{2}\\ \frac{17}{2}\times 5=\frac{85}{2}=\underline{42\frac{1}{2}}\\ 119 \end{array}$$

Thoſe who are curious to have a fuller explanation of this rule, may conſult Ward, Wallis, Jaquet, Malcolm, and other books of *arithmetic*.

ALLIGATI, in *Antiquity*, the baſeſt and worſt kind of ſlaves, whom they kept locked up, or with fetters on.

The Romans had three degrees, or orders of ſlaves, or ſervants, the firſt employed in the management of their eſtates, the ſecond in menial or lower functions of the family, the third called *alligati* above mentioned.

ALLIGATOR, in *Zoology*, a name given to the ſmaller kind of CROCODILE in the Weſt Indies.

An *alligator* ſmells ſo ſtrong of muſk, as to affect the water and air at a conſiderable diſtance.

Alligator *Pear*, a *ſpecies* of PEAR.

ALLIONIA, in *Botany*, a genus of the *tetrandria monogynia* claſs.

ALLIOTH, in *Aſtronomy*, a ſtar in the tail of the great bear, whoſe obſervation is much uſed at ſea.

It is alſo written *alliot*, and *aliot*, and literally denotes a *horſe*. The Arabs give this name to each of the three ſtars, in the tail of the *great* BEAR, on account of their appearing like three horſes, ranged for the drawing a waggon. See URSA *major*.

To find the latitude, or elevation of the pole, by this ſtar, ſee LATITUDE, and POLE.

ALLIOTICUM, (from αλλιοω, *to vary*) a *galenical medicine*, which alters and purifies the blood, conſiſting chiefly of the roots of dandelion, ſuccory, fennel, and raiſins; with the herbs endive, common ox-eye, lettuce, ſorrel, fumitory, &c.

ALLIUM, *garlick*, a genus of the *hexandria monogynia*. See GARLICK.

ALLOCATION, ALLOCATIO, the admitting or allowing of an article in an ACCOUNT; and paſſing it as ſuch.

ALLOCATION is alſo an allowance made upon an account; uſed in the *exchequer*.

ALLOCATIONE *facienda*, a writ directed to the lord-treaſurer, and barons of the exchequer, upon the complaint of ſome accountant; commanding him to allow him ſuch ſums as he hath in execution of his office lawfully expended. Reg. Orig. p. 206.

ALLOCATO *comitatu*, is a new writ of exigent allowed, before any other county-court holden, when the former has not been fully ſerved, or complied with, &c. Fitz. Exig. 14.

ALLODIAL, in *Ancient Cuſtoms*. See ALLODIUM.

ALLODIARIUS, the owner or proprietor of an *allodium*, or *allodial* lands: alſo uſed to denote a lord paramount of a manor.

This is otherwiſe written *alodiarius*, *alodarius*, *aloarius*, *aloer*, *aloerius*, and *aleutier*.

ALLODIUM, or ALLEUD, land held of a man's own right, without acknowlegement of ſervice, or payment of any new rent to another; and this is a property in the higheſt degree; but *feudum* is ſuch land as is held of another, for which ſervice is done, or rent is paid, as an acknowlegement thereof. All the lands in England, except the crown-lands in the king's own hands, in right of his crown, are of the nature of FEUDUM, or FEE; for although many have lands by deſcent from their anceſtors, and others have bought land, it cannot come to any either by deſcent or purchaſe, but with the burden that was laid upon him who had *novel-fee*, or firſt of all received it from his lord; ſo that there is no perſon hath *directum dominium*, i. e. the very property or demeſne in any land, but the king, in right of his crown.

The origin of the word is controverted. Caſſeneuve ſays, it is almoſt as obſcure as the head of the Nile. There are few of the European languages, from which one etymologiſt or other has not derived it; yet ſome, not improbably, take it for a primitive French word without etymon.

Bollandus explains *allodium*, to be *prædium, ſeu quævis poſſeſſio libera, juriſque proprii, & non in feudam clientelari onere accepta.*

After the conqueſt of the Gauls, the lands were divided in two manners; viz. into benefices, *beneficia*; and *allodia*. Benefices conſiſted in lands given by the king to his officers and ſoldiers; either for life, or for a time fixed.

Allodia, or *alleuds*, were ſuch lands as were left in property to the ancient poſſeſſors.—The ſixty-ſecond title of the Salic law, is *de allodiis*; where the word ſignifies hereditary lands, or thoſe derived from a man's anceſtors. Whence, *allodium* and *patrimonium* are frequently uſed indiſcriminately.

In the ancient capitulars of Charlemaign, and his ſucceſſors, we find *allodium* conſtantly oppoſed to *fee*; but, toward the period of the ſecond race of kings, it loſt the prerogative; the feudal lords obliging the proprietors of *allodial* lands to hold of them for the future. The ſame change alſo happened in Germany, &c.

The uſurpation of the feudal lords over the *allodial* lands went ſo far, that they were almoſt all either ſubjected to them, or converted into fees: whence the maxim, *nulla terra ſine domino*, *no land without a lord*.

In the cuſtomary laws of France, we find mention made of two kinds of *allodiums*, viz.

ALLODIUM *nobile*, *aleu noble*, that to which *juſtitia* or juriſdiction was annexed; and which was alſo free from all homage, or ſervice.

ALLODIUM *villanum*, *aleu raturier*, that to which no juriſdiction was annexed.

ALLOGIA, in *Antiquity*, denote winter-quarters appointed for the ſoldiery.

Some will have the word of French origin from *logement*; others with more probability from the Italian *alloggio*, formed of *locus*, *place*.

ALLOM. See ALLUM.

ALLONGE, in *Fencing*, a thruſt, or PASS at the enemy.

The word is French, formed of the verb *allonger*, *to lengthen out a thing*.

ALLOPHYLLUS, in *Botany*, a genus of the *octandria monogynia* claſs, the calyx of which is a perianthium compoſed of four leaves of an orbicular figure, and two oppoſite ones, ſmaller than the others; the corolla conſiſts of four petals leſs than the cup; the germen is didymous, and the ſtigma divided into four parts.

ALL-SEED. See FLAX.

ALL-SPICE. See PIMENTO.

ALLOTTING, or ALLOTMENT *of goods*, in matters of *Commerce*, is when a ſhip's cargo is divided into ſeveral parts, bought by divers perſons, whoſe names are written on as many pieces of paper, which are applied by an indifferent perſon to the ſeveral lots or parcels; by which means the goods are divided without partiality; every man having the parcel which the lot with his name on is appropriated to. See INCH *of Candle*.

ALLOY, or ALLAY, in matters of *Coinage*, &c. a proportion of a baſer metal, mingled with a finer, or purer.

The word ſeems derived from the French *loy*, *law*; in regard the *alloy* is fixed by law.

Minters never ſtrike any gold or ſilver coin without *alloy*, always mixing ſome copper with thoſe two metals, according to a certain proportion, ſettled by the rules of the MINT; which in France cannot be altered but by the king's edicts, proclamations. or ordinances.

Braſs coin is made of an *alloy* of copper, mixed with a few parts of fine ſilver, regulated alſo by the prince. The jewellers, gold-wire-drawers, gold-beaters, and gold and ſilverſmiths, are obliged to uſe *alloy* in the gold and ſilver they work; but it ought to be leſs than that of coin, to prevent their melting it in order to uſe it in their works; called by the French *billonage*, which is an unlawful melting of gold or ſilver coin. The braſs-founders alſo have their *alloy* of copper, pewter, and tin. This *alloy* differs according to what they deſign to caſt, whether ſtatues, guns, or bells. The pewterers, in making their ſeveral veſſels, diſhes, plates, &c. alſo make uſe of an *alloy* of red copper, *regulus* of antimony, and ſome other minerals.

There are ſeveral kinds of *alloy*; ſuch as BRONZE, TOMBAC, BRASS, WHITE COPPER, &c.

Metallic ſubſtances cannot unite directly with earthy matters, not even with their own earths when deprived of their inflammable principle, and conſequently of their metallic properties. But in general it may be ſaid, that all metals may be *alloyed* with each other, although more or leſs eaſily, and although ſome of them have not yet been made to unite. As *metals* are bodies naturally ſolid, the firſt condition for their union is that they be fuſed; they then unite like all bodies that reciprocally diſſolve each other; and from theſe combinations new compounds reſult, which have the mixed properties of the component ſubſtances.

In *metallic alloys*, as in almoſt all other *metallic* combinations, phænomena appear which depart from the general rules of combination; and ſome of the properties of metals forming an *alloy* are altered, increaſed, or diminiſhed by their union. The ductility, for inſtance, of a *metallic* compoſition is generally leſs than the ductility of the component metals alone and pure. The denſity or ſpecific gravity of metals and ſemi-metals, is alſo changed by *alloying* them with each other. Sometimes the ſpecific gravity of the compound is intermediate betwixt the ſpecific gravity of the component metals; ſometimes it is leſs, and frequently greater; this depends upon the nature of the metal.

ALLOYS, *metallic*, are either *natural* or *artificial*.

ALLOYS, *natural*, are thoſe made by *nature*, ſuch as moſt minerals containing ſeveral metals *alloyed* with each other.

Native gold is always more or leſs *alloyed* with ſilver; and native ſilver with gold.

ALLOYS, *artificial*, are thoſe made expreſsly for different uſes, or for the ſake of examining their properties.

There are two ſorts of *alloys* practiſed in the coinage of money: the one when gold and ſilver are uſed which have not yet been coined; the other when ſeveral ſpecies of coin, or ingots of different fineneſs are melted together to coin new money. The proportion of the *alloy* with the finer metal is eaſy in the firſt caſe; ſince when once the fineneſs of the gold or ſilver is known by refining, it is only adding to it the *alloy* of copper required by law, to bring it to the legal ſtandard.

In England the ſtandard of gold coin is 22 *carats* of fine gold and 2 *carats* of *alloy*, in the pound troy: the French, Spaniſh, and Flemiſh gold are nearly of the ſame fineneſs.

neſs. The pound weight is cut into 44 pieces and $\frac{1}{2}$, each current for 21 ſhillings.

The ſtandard of ſilver is 11 oz. 2 pennyweights troy of ſilver, and 18 pennyweights of *alloy* of copper. The *alloy* in gold coin is ſilver and copper, and in ſilver coin copper alone. Whether gold or ſilver be above or below ſtandard, is to be found by ASSAY.

The chief reaſons alleged for the alloying of coin are, 1. The mixture of the metals, which when ſmelted from the mine are not perfectly pure. 2. The ſaving the expence it muſt otherwiſe coſt if they were to be refined. 3. The neceſſity of rendering them harder, by mixing ſome parts of other metals with them, to prevent the diminution of weight by wearing, in paſſing from hand to hand. 4. The melting of foreign gold or coin which is *alloyed*. 5. The charges of coinage, which muſt be made good by the profit ariſing from the money coined. 6. and laſtly, the duty belonging to the ſovereign, on account of the power he has to cauſe money to be coined in his dominions. See GOLD, SILVER, REFINING, and ASSAY. See a particular account of the *alloy* of gold, its uſefulneſs, and its proportion in different coins, in Dr. Lewis's Commerc. D. Techn. p. 114. & ſeq.

According to the different proportions of *alloy*, money is of different degrees of fineneſs or baſeneſs; and is valued accordingly in foreign exchanges.

The ſilver coin among the Romans, was long kept to a great degree of purity; which was firſt broke in upon by the tribune Livius Druſus; who mixed with them an eighth part of copper. But the acts of his tribunate were afterwarns annulled, and the money reſtored to its ancient fineneſs. Thus things remained till the time of the emperor Severus, who increaſed the *alloy* ſtill more; yet on his medals, he took the title of *reſtitutor monetæ*.

ALLUM, ALLOM, or ALUM, a kind of mineral ſalt, of an auſtere taſte, leaving in the mouth a ſenſe of ſweetneſs, accompanied with a conſiderable degree of aſtringency.

The word *allum* comes from ἅλς, *ſalt*; or perhaps from the Latin *lumen*, *light*; becauſe it gives luſtre to colours.

ALLUM is a cryſtallizable ſalt, compoſed of vitriolic acid, united with an argillaceous earth. It diſſolves ſufficiently well in cold, but in much larger quantity in boiling water. Neuman ſays that *allum* requires ten times, and other authors ſay that it requires fourteen times its weight of water to diſſolve it. It retains half its weight of water in cryſtallizing; of which cryſtallization it is ſuſceptible by the evaporation and cooling of the water in which it is diſſolved. The figure of its cryſtals, like that of the cryſtals of other ſalts, vary according to the circumſtances concurring during the cryſtallization.

In Italy this ſalt is obtained from a ſoft reddiſh ſtone, about Putcoli, from ſeveral kinds of earth; and in England from a whitiſh or bluiſh ſtone, called Iriſh ſlate.

ALLUM, *its generation and nature.*

As *vitriol* is produced from a ſulphureous mineral, either ſimple or compound, that is, of iron and copper, ſo *allum*, which is, as it were, a kind of white vitriol, is alſo generated of a kind of ſulphureous mineral, partly bituminous, partly luteous. Therefore the acid which is extracted from *allum*, called *ſpirit* of *allum*, ſeems to be of the ſame nature and properties, with what is afforded by *vitriol*, whatever difference there is in the earths or receptacles in which both theſe kinds of ſalts are coagulated. For the *caput mortuum* of *vitriol* is of a metalline, that is to ſay, of an irony or copper like quality; but the earth of *allum* ſeems to be a peculiar kind of BOLE, very ſpungy and ſubtle.

Chemiſts are generally agreed in opinion, that the acid of *allum* is the pure vitriolic; but the preciſe nature of its earthy baſe has been a ſubject of diſpute. For a long time it was conſidered as a calcareous earth; but the late experiments of Pott, Margraaf and Baron, have ſhewn that calcareous earths, united with vitriolic acid, form ſelenites, and not *allum*; and that theſe and the earth of *allum* have no common diſtinguiſhing properties. M. Baron therefore conjectures, that the earth of *allum* is of a metallic nature. Others, on the contrary, as M. Geoffroy, Hellot, and Macquer have urged experiments to prove, that the earth of *alum* is contained in clays. M. Macquer, in particular, in a Memoir read to the Academy of Sciences at Paris in 1762, expreſſes his full conviction that the earth of *allum* has an entire and perfect reſemblance to the pureſt clay; and he recites a variety of experiments and obſervations in ſupport of this opinion.

Though *vitriol* and *allum* be produced, as it were, from the ſame matter, and from one ſulphureous matrix; yet each of them is endued with peculiar properties and virtues. For *allum* and *vitriol* are very different in taſte, and the common *vitriol* leaves no ſuch aſtringency on the palate as is obſerved in *allum*. Again, a ſolution of *allum* makes no commotion nor precipitation in a ſolution of gold or ſilver, which a ſolution of *vitriol* is known to effect. Nor will a decoction of galls, or pomgranate flowers grow black, and be converted to ink, by the mixture and ſolution of *allum*, as with a ſolution of *vitriol*. Laſtly, in *allum* the acid may be readily ſeparated by the help of fire, from its earthy principle, in which it is inherent; but the caſe is otherwiſe with *vitriol*.

Allum and *ſulphur* are both formed from the ſame ſaline ſpirit, which, if it meets with a ſtony ſubſtance, forms *allum*; if with a bituminous one, *ſulphur*.

Allum may eaſily be decompoſed by various intermediate ſubſtances, ſaline alkalies, calcareous earths, iron, and any matter containing *phlogiſton*, treated properly, &c. It is formed on the univerſal acid, or fluid ſalt combining with a chalky earth.—The ſame acid with a mercurial earth forms common *ſea* SALT, and with a moiſt rocky, or clay earth, SAL *gemmæ*.

This ſyſtem is confirmed, by what naturaliſts have obſerved concerning the origin of the native *alum* in the iſle of Chio. That iſland is a hollow ſpungy rock, penetrated on all parts by the ſea-water. M. Tournefort conſiders the whole as a natural laboratory, wherein the ſea-water undergoes much the ſame action in it as in our retorts. By this means, an acid ſpirit is ſeparated from it, which penetrating the ſubſtance of the rocks, diſſolves and incorporates with them, and forms mines of *allum*. This ſeems hardly to be doubted, inaſmuch as by pouring ſpirit of ſalt on common ſtones, or chalk, aluminous concretions are readily formed. The ſame ſpirit mixing with a BITUMEN under-ground, forms SULPHUR.

Some attribute the origin of *allum* chiefly to a ſulphureous principle acting on, corroding of, and coagulating with a mineral ſubſtance, uſually of a terrene and ſtony, rather than metallic nature, though that metal be often contained in the *allum* ſtone. That the ſulphur is the chief efficient and material cauſe of this production, ſeems to appear hence, that many *allum* ſtones diſtilled *per deſcenſum*, yield good brimſtone, and all *allum* ſtones during calcination, emit a ſulphureous ſteam. An inquiſitive naturaliſt gathered from the very ſame rock, and that within a few inches of each other, both *vitriol*, *allum*, and *ſulphur*, all of them excellent in their kind. Indeed thoſe three minerals are ſo nearly allied, that an ingenious chemiſt aſſures us, he can by ſome artifices convert *allum* into *vitriol*, or *vitriol* into *allum*, the ſame to all intents and purpoſes, with the natural. Phil Tranſ. N° 104.

Allum is ranked by Homberg, and others, as an urinous neutral ſalt, on account of the urinous ſmell it exhales by burning, and its uſe in the volatilization of fixed ſalts. Yet ſome deny *allum* to belong to the claſs of ſalts, and rank it rather among ſtony ſubſtances; by reaſon that after diſſolving *allum*, and precipitating the ſolution with oil of tartar *per deliquinm*, the coagulation at the bottom reſembles a ſtony *calx*, and being expoſed to the fire will neither melt nor ſublime. The *ore* of *allum*, if mature, yields its ſalt immediately, and without trouble; but if leſs mature, it requires a previous calcination, as is the caſe in many of our Engliſh *allum* ſtones; and if very crude or immature, it muſt not only be burnt, but a long time expoſed to the air before it will yield its ſalt. From this it appears, that the *allum* is not a genuine and native ſalt, but is compoſed by the acid of ſulphur corroding ſome peculiar earth or ſtone, as vitriol is by its corroding ſome metal; and that, in both theſe operations, this corroding acid can ſometimes perform its buſineſs, while it lies in the bowels of the earth; and ſometimes while it lies in the open air, though it failed of it while buried. Phil. Tranſ. N° 104.

Allum diſtilled into an acid ſpirit, with copper, or iron, becomes good *vitriol*; and *vitriol* freed from its metallic parts becomes aluminous; and, being diſtilled, yields a ſpirit not to be diſtinguiſhed by the taſte from that of *allum*, and even ſcarce by the moſt accurate ſcrutiny.

Rectified oil of *vitriol*, or ſpirit of *ſulphur*, of the ſame degree of ſtrength, will ſometimes concrete into a ſolid and tranſparent ſubſtance, reſembling cryſtallized *allum*; and this ſubſtance is no way different whether prepared by one or the other of theſe ways, and in both reſembles the pureſt *allum*, ſo as not to be diſtinguiſhable from it unleſs by taſting it. *Aqua fortis* is as well made with *allum* as with *vitriol* and *nitre*.

Alum ores generally contain *vitriol* as well as *alum*, and are capable of great fermentation, when expoſed to the air, though they would never have been ſubject to it while buried in the earth. They will become ſo hot in the heap, that it is ſcarce poſſible to endure the hand upon them; and ſometimes will break out into abſolute flame. The acid and the ſulphur they contain are the occaſion of this, as, according to Sympſon and ſome others, they are the cauſe of all ſubterranean fermentations and heats; and the whole is not badly explained by the familiar inſtance of adding water to rectified oil of *vitriol*. The acid and the ſulphur of that fluid are, as in theſe ores, ſo combined as not to exert their forces naturally againſt one another, but all is quiet as in theſe ſtones while under ground, but the water does to the one what the air does to the other; ſends in a third, which not agreeing with either of the other, diſturbs and ſets their particles in motion, and the veſſel containing the liquid becomes as hot to the touch in the one caſe, as the ſolids themſelves are in the other.

Allum diſſolves in water; what remains undiſſolved at bottom is a ſort of *calx*, which ſoon diſſolves in oil, or in ſpirit of vitriol; and hence ariſes ſome doubt whether *allum*, as it does not leave an earth behind, does properly belong to the claſs of ſalts. Mr. Boyle aſſures us that *allum-ore*, robbed of its ſalt, does, in tract of time, recover it again from the air.

Allum, *the proceſs of making it.*

The proceſs of making *allum* at Whitby in Yorkſhire is thus deſcribed by Mr. Ray, at the end of his collection of Engliſh words not generally uſed. They take the mine or ore picked from the deſſe or rock, and laying it in great heaps, burn it with whins or wood, till it be white. When it is ſufficiently burnt, they barrow it into a pit, ten feet long, ſix broad, and ſeven fourths of a yard deep, where it is ſteeped in water the ſpace of eight or ten hours; then they draw out the liquor, which is only a lixivium impregnated with the *allum* mine, into troughs, by which it is conveyed to the *allum* houſe, into a deep ciſtern, about twenty yards in circumference, and three yards and a half deep. After this firſt water is drawn off the mine into the pits, they do not preſently caſt away the mine, but pour freſh water on it a ſecond time; and after the ſecond water is drawn off, which is much weaker than the firſt, they caſt out the mine, and put in new, and pour on freſh water as before. Out of the ciſtern they convey the lixivium by troughs into the pans, where it is boiled the ſpace of twenty-four hours ordinarily. Then they take the liquor out of the pans, and examine it by weight, to know how much lye made of kelp, it will require, which for the moſt part is ſix inches of the pan's depth. This being put in, as ſoon as the liquor boils or flows up, by the putting in of an iron coal-rake, or other iron inſtrument, they draw it off into a ſettler, and let it ſtand about an hour, that the ſulphur and other dregs may ſettle to the bottom; which being done, it is drawn off into coolers, where it continues about four days and nights. The cooler being drawn about half full, they pour into it a quantity of urine, viz. about eight gallons into a cooler that contains about two half tuns. Having thus ſtood about four days and nights, it is quite cool, and the *allum* cryſtallized to the ſides of the cooler. Then they ſcoop out the liquor, which they call the mother, into a ciſtern, and put it into the pans again with new lixivium, to be evaporated by boiling, &c. The *allum* that is ſhotten and cryſtallized on the ſides of the cooler they ſcrape off, and waſh with fair ſpring water, then throw it into a bing, where the water drains from it. Thence it is caſt into a pan, called the *roching* pan, and there melted; after which it is ſcooped out, and conveyed by troughs into tuns, in which it ſtands about ten days, till it be perfectly cool and condenſed. Then they unhoop and ſtave the tuns, and taking out the *allum*, chip it and carry it into the ſtore-houſe. The exact proportion of kelp does not appear in this proceſs; for though the workmen told Mr. Ray, that the lye was ſix inches of the pans depth, yet they did not tell him how deep the pans were. Phil. Tranſ. N° 142. See **Doggers**.

At Solfatara, near Puzzuoli, there is a conſiderable oval plain, the ſoil whereof is wholly ſaline; and ſo hot, that the hand cannot long endure it.—From the ſurface hereof, in ſummer time, there ariſes a ſort of flour, or ſaltiſh duſt; which being ſwept up, and caſt into pits of water at the bottom of the plain, the heat of the ground, i. e. of certain ſubterraneous ſpiracles, over which the coppers are placed, without any other fire, evaporates the water, and leaves an *allum* behind.

Allum is made at Cypſella in Thrace, by gently calcining the ſtone, and letting it diſſolve afterwards in the air by the dews and rains; then boiling and cryſtallizing the impregnated waters.

Allum, *its properties and uſes.*

Allum is of ſome uſe in medicine, in quality of an aſtringent; but, being apt to excite vomiting, is not much uſed inwardly, and rarely without ſome ſmooth aromatic, as a corrector. It is proper for diſeaſes where the principal indications are to fortify and conſtringe. It is ſaid to be good in hæmorrhages of all kinds, eſpecially uterine hæmorrhages; whether to correct the frequent return of the *menſes*, or their too great abundance; to ſtop the flooding to which women with child are ſubject, or to moderate the flow of the too plentiful *lochia*. It is alſo ſaid to be efficacious in the caſe of a *fluor albus*. *Allum* mixed with honey cures the *aphthæ*, and with the juice of *knot*-GRASS is good for *exanthemata* and rheums in the ears; with cabbage-leaves and boiled honey it is effectual in the leproſy; and very good in warm water to make a fomentation for the itch, *paronychia pterygia*, and kibes; to ſcour away all nits and lice, and to anoint ſcalds or burns. It is uſed outwardly alſo in aſtringent lotions, and is an ingredient in ſeveral dentifrices and coſmetics.

It is a principal ingredient in dying and colouring; neither of which can be well performed without it.—It ſerves to bind the colour upon the ſtuffs, and has the ſame uſes there, that gum water and glutinous oils have in painting. It likewiſe diſpoſes ſtuffs to take the colour, and adds a degree of briſkneſs and delicacy to it; as we ſee viſibly in cochineal, and the ſcarlet-grain. Without *allum* theſe dyes would be only confuſed ſtains, which might be waſhed out by water.

This effect of *allum* ſeems alſo owing to its ſtyptic, or aſtringent quality, by which it binds the finer parts of colours together, and prevents their exhaling. Hence alſo it preſerves paper that has been dipped in its water, from ſinking when wrote upon.

Vintners fine down their wines, &c. with *allum*; fiſhers uſe it to try codfiſh with; and bakers have mixed it with the flour to make their bread compact and white; to this laſt uſe of it, great objections have been made, but unjuſtly, for it is entirely innocent, and now ſeldom uſed. It is recommended from ten to twenty grains, mixed with an equal proportion of ſugar, gum arabic, or ſpermaceti, as a cure for colics. Dr. Percival adds, that in about fifteen caſes he has employed it with ſucceſs. Percival's Eſſays, vol. ii. p. 194.

Naturaliſts ſpeak of divers kinds of *allum*, which may be reduced to two, *native* and *artificial*.

Allums, *native*, are thoſe prepared and perfected under ground, by the ſpontaneous operations of nature, mixing the proper ingredients, water, earth, and ſalt, or ſulphur. It is found in the coal-mines near Whitehaven. Theſe are either *liquid*, or *ſolid*, and *concrete*.

Allum, *liquid*, appears to be the primitive kind, as being that out of which the reſt is formed.

It is not uncommon to find *liquid allum* in the places where ſubterraneous fires have raged. It is a milky thick liquor, and is found lodged in cavities of the ſtrata of ſtone, when the ſulphur and ſal armoniac have been ſublimed away. The acid aluminous part of the matter will alſo eſcape with a great degree of heat, leaving in the place of the liquor only a dry ſtyptic, and hard ſtony matter. The liquor itſelf is of a very ſtyptic taſte, and will yield one half its weight of pure cryſtalline *allum* on evaporation. Phil. Tranſ. N° 130.

Allum, *ſolid*, or *concrete*, is divided into ſciſſile *allum*, called by the Greeks σχιϛη, as being ſoft and eaſily ſeparable. This is ſaid to bear a near reſemblance to our *plumoſe alum*, only differing in this, that the former inſtead of whitiſh, is of a greeniſh hue. Some pretend to have done wonders with it againſt hæmorrhages, looſeneſs of the teeth, the itch, *pterygium*, *pernios*, &c. In ſome of which its aluminous or aſtringent quality might be expected to do more harm than good.

Allum, *round*, *alumen rotundum*, called alſo ϛρογγυλη, as being found ordinarily in roundiſh maſſes, though ſometimes angular.

Allum, *ſciſſile*, or *foſſile*, is either compoſed of thin flakes, very friable to the fingers, or of *ſtriæ*, or whitiſh hairs, hence called *capillary*, uſually *plume* ALLUM.

Allum, *rock*, or *roche*, is prepared from pyritous ſtones cut from the rocks of the quarry; and ſtands contradiſtinguiſhed from the common *allum*, or that prepared from earths. It is ſometimes called *ice-allum*. The method of making *allum* in Italy, is ſomewhat different from that deſcribed above.

It appears, that the names *ice allum*, and *rock allum*, are ſynonymous, and confounded in *commerce*, becauſe there is no difference in the price. There is this remarkable circumſtance attends the cryſtallization of *allum*, that good cryſtals of this ſalt cannot be formed, unleſs an *alkaline lixivium* be added to the *lixivium* of *allum*, when ſet to cryſtallize.

Mr. Geoffroy had an exact information in Italy of the method of making *roche allum*, at Civita Vecchia. Near that city are quarries of a greyiſh or reddiſh ſtone, pretty hard, like the *travertin*. They calcine theſe ſtones in kilns, and then boil the *calx* in water over a ſtrong fire. The water diſſolves all the ſalt contained in the *calx*, and there remains an inſipid earth. The water thus impregnated is left to cool, and the ſalt ſhoots into cryſtals like tartar, about the ſides and bottoms of the caſk, which is a ſpecies of the *roche allum*, called ROMAN *allum*, the price of which is greater than that of common *rock allum*.

Allum, *ſaccharine*, bears a near reſemblance to ſugar.—It is a compoſition of common *allum* with roſe-water, and whites of eggs, boiled together to the conſiſtence of a paſte, and thus moulded at pleaſure. As it cools, it grows hard as ſtone. It is uſed as a coſmetic.

Allum, *burnt*, *alumen uſtum*, is prepared by melting the ſalt in a fire-ſhovel, or crucible, and letting it bubble till it comes to a white hard ſubſtance. This is uſed as an eſcharotic; it gently eats proud fleſh, but leaves ſuch a hardneſs on the part, as makes it little eſteemed in that intention.

Allum, *plume*, *alumen plumoſum*, is a ſort of ſaline mineral, of various colours, moſt commonly white bordering on green, reſembling Venetian TALC, except that inſtead of ſcales, it riſes in threads or fibres, reſembling thoſe of a feather; whence its name, from *pluma*, *feather*.

Some will have this to be the *lapis amianthus* of the ancients. It is chiefly found in the iſlands of Rhodes and Crete, where there are whole mountains of it. See Phil. Tranſ. vol. lxiv. art. 48. an. 1774, p. 489.

Allumen *plumoſum*, is alſo a name given, by ſome chemiſts, to a peculiar kind of ſublimate of mercury, invented by Baſil Valentine, whoſe name it alſo bears. It is a compound formed of arſenic, united with vitriolic acid.

Allumen *ſcagliolæ*, or *ſcalolæ*, a ſquamoſe or flaky ſtone, the ſame with what is otherwiſe called *lapis* SPECULARIS.

Some take this for the ſame with what the ancients called SCHISTON.

Allumen *catini* is a name which ſome have given to the aſhes, or rather ſalt of the herb *kali*, uſed chiefly in the making of glaſs.

In this ſenſe, *allumen catini* amounts to the ſame with what is more frequently called ALKALI.

Allumen *fæcis* is made of the lees of wine, formed into round maſſes, dried by the ſun, and then burnt or torrified ſo long by the fire, as to turn white. Its chief uſe is among the women of Italy, to dye the hair of a yellow colour, much affected in that country.

Allum, *purified*, is that prepared by diſſolving it in hot rain water, and evaporating it again, till it ſhoot into cryſtals.

By repeating this operation divers times, the ſourneſs of the *allum* is much abated.

Allum, *crude*, is the ſalt, ſuch as produced at the *allum*-works, without further preparation. This ſtands contradiſtinguiſhed from prepared *allum*.

It is, by ſome, uſed as a *noſtrum* againſt the itch and ſwellings of the feet; but rather palliates than works a thorough cure.

Allum, *prepared*, is of divers kinds.—Under this claſs come *purified allum*, *ſaccharine allum*, *burnt allum*, *allum majeſteries*, *tinctures* of *allum*, water, ſpirit, *dulcedo* of *allum*.

Allum, *Roman*, properly denotes a *rock allum*, of a red colour, prepared in the country near Rome.

In the genuine Roman *allum*, the red colour is not ſuperficial, but diffuſed through the whole ſubſtance of it; by which it may be diſtinguiſhed from the ſpurious, or counterfeit kind, which is only the common Engliſh *allum* dyed red.

Allum mines are ſaid to have been firſt found in Italy in the year 1460; and in 1506 king Henry VII. made a monopolizing grant of this commodity to Auguſtine Chigi, a merchant of Sienna. In the year 1608 the manufacture of *allum* was firſt invented, and ſucceſsfully practiſed in England, meeting with great encouragement in Yorkſhire, where it was firſt made, from lord Sheffield, and other gentlemen of that county. King James I. by advice of his miniſtry, aſſumed the monopoly of it to himſelf, and therefore prohibited the importation of foreign *allum*; and in 1625 the importation of it was farther prohibited by the proclamation of Charles I.

All the *allum* which is in *commerce*, is extracted by different operations from ſeveral *pyritous*, earthy, or ſtony matters, containing the vitriolic acid, and the earth, proper for forming this ſalt. See PYRITES.

Allum Water, ſee ALLUMINOUS *waters*.

Allum Works, places where *allum* is prepared, and manufactured in quantities for ſale. They differ from *allum* mines, as in the former an *artificial* ALLUM, and in the latter *natural* ALLUM is produced.

ALLUMINOR, from the French *allumer*, *to lighten*, is uſed for one who coloureth or painteth upon paper, or parchment; and the reaſon is, becauſe he gives light and ornament by his colours to the letters, or other figures. Such ornaments are ſtyled illuminations. The word is uſed in ſtat. 1. R. III. cap. 9. But now ſuch a perſon is called a *limner*.

ALLUMINOUS, any thing that contains *allum*, or partakes of the nature and qualities of that SALT.

Grew deſcribes ſome extraordinary kinds of *alluminous* earths in the repoſitory of the Royal Society.

Alluminous *waters* are thoſe impregnated with the particles of that ſalt.

Alluminous waters make a ſpecies of thoſe called mineral or medicinal waters.

Such is the Spa at Scarborough obſerved to be by Witty, Simpſon, &c.

According to the laſt author, that which gives the eſſence to this water is an acid *alluminous* mineral ſalt, preying on, and diſſolving a ſlight mixture of iron. Dr. Highmore objects, that ſuppoſing *allum* the principal ingredient in theſe waters, the properties of *allum* being to dry, to aſtringe, and to incraſſate, how comes it to paſs that they are pretended to be ſo highly deoppilative, and ſo beneficial to hypochondriac and cachectical perſons, where their aſtringency ſhould rather be noxious? Dr. Witty anſwers, that they do not derive theſe virtues from the *allum*, but from the other ingredients in them.—It is diſputed whether or no the bath at Lucca be *alluminous*. Phil. Tranſ. N° 42, N° 56, and N° 160.

We have alſo factitious waters, under the denomination of *alluminous*; ſuch is that called in the ſhops *aqua aluminoſa magiſterialis*.

Its preparation is thus: take of *rock allum*, and white ſublimate, *ana* ℥ii, boil them in roſe and plantain water, *ana* ℔ i, till half is conſumed; filter the remainder, and keep it for uſe.

This is preſcribed againſt deformities of the ſkin, and often for the itch; but it is an uncertain remedy, and not to be uſed without caution.

ALLUSION, ALLUSIO, in *Rhetoric*, a figure whereby ſomething is applied to, or underſtood of another, by reaſon of ſome ſimilitude of name, or ſound.

The word is formed of *ad*, and *ludere*, *to play*.

Camden defines *alluſion* a dalliance, or playing with words alike in ſound, but unlike in ſenſe; by changing, adding, or ſubtracting a letter, or two; whence words reſembling one another become applicable to different ſubjects.

Thus the Almighty, if we may uſe ſacred authority, changed Abram, i. e. high father, into Abraham, i. e. father of many.—Thus the Romans played on their tippling emperor Tiberius Nero, by calling him Biberius Mero; and thus in Quintilian the four fellow Placidus is called Acidus.

Alluſions come very near to what we popularly call *puns*.

ALLUVION, ALLUVIO, in the *Civil Law*, a gradual addition or accretion made along the ſea-ſhore, or the banks of large rivers.

The word is formed of *adluo*, *I waſh to*, compounded of *ad*, and *lavo*.

The civil law places *alluvion* among the lawful means of acquiſition; and defines it to be a latent, imperceptible accretion.—Hence, where any conſiderable portion of ground is torn away at once, by an inundation, and joined to ſome neighbouring eſtate, this is not acquired by right of *alluvion*, but may be claimed again by the former owner.

Great alterations are made in the face and limits of countries, by *alluvions* of the ſea, rivers, &c. Whole plains are ſometimes formed by *alluvions*. It is controverted whether *alluvions* ſhould be conſidered as fruits, and as ſuch accruing to *uſufructuaries*.

ALLY. See ALLIANCE.

ALMACANTARS, ALMACANTARAS, or ALMICANCHARATH, in *Aſtronomy*. See ALMUCANTARS.

Almacantars *ſtaff*. See ALMUCANTARS *ſtaff*.

ALMADE, in SHIP-*Building*, a ſmall veſſel uſed by the negroes of Africa, about four fathom long; and made uſually of the bark of a tree.

The ſame name is alſo given to the veſſels of Calicut in India, which are eighty feet long, and ſix or ſeven broad, and ſquare ſterned.

Theſe are otherwiſe denominated *cathuri*. They go with great ſwiftneſs. Witſen ſays, that they are twelve or thirteen paces long, ſharp at head and ſtern, and that they are moved both by ſails and oars. In time of war, the king of Calicut fits out two or three hundred of theſe veſſels.

ALMAGEST, the name of a celebrated book, compoſed by Ptolemy; being a collection of many of the obſervations and problems of the ancients, relating both to geometry and aſtronomy.

In the original Greek it was called *συνταξις μεγιστη*, q. d. *greateſt conſtruction*, or *collection*; which laſt word *megiſte*, Joined to the particle *al*, gave occaſion to its being called *almageſt* by the Arabians, who tranſlated it into their tongue about the year 800, by order of the caliph Al Maimon.—The Arabic word is *almagheſti*.

Ricciolus has alſo publiſhed a body of *aſtronomy*, which he intitles, after Ptolemy, the New Algameſt; being a collection of ancient and modern obſervations and diſcoveries in that ſcience.

We have alſo a botanical *almageſt*, compoſed by Plukenet, being a kind of *pinax*, or general index of plants, containing the proper, and deſcriptive names, of upwards of ſix thouſand. To which in a ſupplement, ſince publiſhed by the ſame author, have been added above one thouſand others. Almageſtum Botanicum, ſive Phytographiæ Plucnetianæ Onomaſticon, &c. Lond. 1696. fol.

ALMAGRA, in *Natural Hiſtory*, a name given in later ages to an earth of the OCHRE kind, called *ſil atticum* by the ancients. It is an ochre of a fine and deep red, with ſome admixture of purple, very heavy, and of a denſe yet friable ſtructure, and rough duſty ſurface. It adheres very firmly to the tongue, and melts freely and eaſily in the mouth, and is of an auſtere and ſtrongly aſtringent taſte, it ſtains the ſkin in touching it, and ferments very violently with acid menſtruums; by which ſingle quality, it is ſufficiently diſtinguiſhed from the *ſil ſyricum*, to which it has in many reſpects a great affinity. It is found in immenſe quantities, in many parts of Spain; and in Andaluſia there are in a manner whole mountains of it. It is uſed in *painting*, and in *medicine*, being a very valuable aſtringent.

ALMAGRA, in the cant of chemiſts, denotes red *bole*, or RUDDLE, ſometimes a lotion, or waſh.

ALMALECI, in *Medical Hiſtory*, a celebrated work, containing a ſyſtem of the ancient Arabian phyſic.

The word imports as much as the *royal work*.

Concerning the hiſtory, contents, &c. of the *almaleci*, ſee Friend's Hiſt. of Phyſ. p. ii. p. 36.

ALMANAC, a *calendar* or *table*, wherein are ſet down the days and feaſts of the year, the courſe of the moon, &c. for each month of the year.

The original of the word is much controverted among grammarians.—Some derive it from the Arabic particle *al*, and *manah*, *to count*.—Others, and among them Scaliger, rather derive it from *al*, and μανακος, the courſe of the months; which is contradicted by Golius, who advances another opinion. He ſays, that, throughout the Eaſt, it is the cuſtom for ſubjects, at the beginning of the year, to make preſents to their princes; and, among the reſt, the aſtrologers preſent them with their ephemerides for the year enſuing; whence thoſe ephemerides came to be called *almanha*, i. e. handſels, or new-year's gifts.—To ſay no more, Verſtegan writes the name *almon-at*; and makes it of Saxon original. Our anceſtors, he obſerves, uſed to carve the courſes of the moon, of the whole year, upon a ſquare ſtick, or block of wood, which they called *al-monaght*, q. d. *all-moonheed*.

The modern *almanac* anſwers to the *faſti* of the ancient Romans.

The neceſſaries for making an *almanac*, the reader will find under the article CALENDAR.

Henry III. of France very prudently decreed, by an ordonnance of 1579, that 'no *almanac*-maker ſhould pre-
'ſume to give predictions relating to civil affairs, either
'of ſtates, or private perſons, in terms either expreſs or
'covert.'

In the Philoſoph. Collect. we have a perpetual *almanac*, deſcribed by Mr. R. Wood.

Many forms of a head-*almanac* have been propoſed in ſome of our periodical publications; but the following diſtich will very well anſwer the purpoſe:

At Dover dwells George Brown, Eſquire;
Good Chriſtopher Fimb, and David Frier.

The twelve words anſwer to the twelve months; the firſt letter of each word ſtands in the Calendar againſt the firſt day of the correſponding month; and if the Dominical letter is known, it is eaſy to find on what day of the week any day of the month will fall throughout the year. In 1776, F being the Dominical letter, Dec. 25, is Wedneſday, becauſe the firſt day denoted by F is Sunday.

ALMANAC, *nautical*, is publiſhed annually, by anticipation, under direction of the commiſſioners of longitude. Beſide every thing eſſential to general uſe that is to be found in any *almanac* hitherto publiſhed, it contains many new and intereſting particulars; more eſpecially, the diſtances of the moon from the ſun and fixed ſtars for every three hours of apparent time, adapted to the meridian of Greenwich, by comparing which with the diſtances carefully obſerved at ſea, the mariner may readily, and with little danger of miſtake, infer his longitude to a degree of exactneſs, that may be thought ſufficient for moſt nautical purpoſes. And the publication of it is chiefly deſigned to facilitate the uſe of Mayer's lunar tables, by ſuperſeding the neceſſity of intricate calculations, in determining the longitude at ſea. It began with the year 1767, and has been continued ever ſince.

ALMANAR, in the Arabian *Aſtrology*, denotes the preeminence, or prevalency of one planet over another.

ALMANDIN, or ALABANDIN, a precious ſtone, of the RUBY kind, ſomething ſofter than the oriental ruby; and, as to colour, partaking more of that of the granate than the ruby.

It is ranked among the richeſt of ſtones, and takes its name from Alabanda, a city of Caria, whence Pliny ſays it was brought.

ALMARIA, in our *Ancient Records*, the archives of a church, or the like.

ALMEHRAB, among *Mahometans*, denotes a niche in their moſques, which directs to the *kebla*, that is, to the temple of Mecca, to which they are obliged to bow their faces in praying.

The word is Arabic, where it is properly written *al mehrab*.

ALMEISAR, a celebrated game among the ancient Arabs, performed by a kind of caſting of lots, with arrows, ſtrictly forbid by the law of Mahomet, on account of the frequent quarrels occaſioned by it.

The manner of the game was thus: a young camel being brought and killed, was divided into a number of parts. The adventurers, to the number of ſeven, being met, eleven arrows were provided without heads or feathers; ſeven of whcih were marked, the firſt with one notch, the ſecond with two, the third with three, &c. the other four had no marks. Theſe arrows were put promiſcuouſly into a bag, and thus drawn by an indifferent perſon. Thoſe to whom the marked arrows fell, won ſhares in proportion to their lot; the reſt to whom the blanks fell, were intitled to no part of the camel, but obliged to pay the whole price of it.

Even the winners taſted not of the fleſh themſelves, more than the loſers; but the whole was diſtributed to the poor.

ALMELILETU is uſed, by Avicenna, for a preternatural kind of heat, a degree more remiſs than that of a fever, and which ſometimes remains after a fever is gone.

ALMENE, a name given, by ſome of the Arabian writers, to the prickly *lotus* of Africa, called by ſome of the ancients *lotus acanthos*, and by Virgil *acanthus* only.

ALMERICANS, were the followers of Almeric, or Amauri, in the thirteenth century. They maintained that the power of the Father continued no longer than the Moſaic diſpenſation; that the empire of the Son extended only to the thirteenth century; and that then the reign of the Holy Ghoſt commenced, when all ſacraments and external worſhip were to be aboliſhed, and the ſalvation of Chriſtians was to be accompliſhed merely by internal acts of illuminating grace. Their morals were as infamous as their doctrine was abſurd. Their tenets were condemned by a public decree of the council of Sens, in the year 1209.

ALMERY. See AMBRY.

ALMIGGIM *wood*, a word uſed in the Scriptures, to ſignify a beautiful and light ſort of wood. It has been conjectured to be ſeveral different ſorts of woods now in uſe; others think it has been loſt long ſince. But Meibomius proves, from the accounts of Joſephus, that it was the wood of the Indian pine, or fir-tree. This was excellent for its whiteneſs, as well as remarkably light, and therefore was uſed in muſical inſtruments.

ALMIZADIR, among *Alchemiſts*, is ſometimes uſed for verdegris; ſometimes for the proceſs of the philoſophers ſtone; and ſometimes for the *aqua mercurialis*, or *aqua philoſophorum*. See ALKAHEST.

ALMOGIZA, among Arabian *Writers*, denotes the limb, or circumference of the ASTROLABE.

ALMOHARRAM, one of the ſacred months of the ancient Arabs.

The word is Arabic, *al moharram*. It was the firſt month of the Arab year.—On ſome occaſions they put off the obſervance of this month, to the following month Safar.

ALMOIN, in *Law*. See FRANK-*almoin*.

ALMOND, *amygdala*, a kind of medicinal fruit, the produce of the ALMOND-*tree*.

ALMOND-*tree*, *amygdalus*, in *Botany*, the name of a genus of trees, of the *icoſandria monogynia*, the characters of which are theſe: it hath a tubulous empalement of one leaf, which is cut at the brim into five obtuſe ſegments; the flower hath five oval, obtuſe, concave petals, which are inſerted in the empalement. After the flower is paſt, the germen becomes an oval compreſſed large fruit, with a thin, tough, hairy covering, having a longitudinal furrow; this opens and falls away, leaving an oval compreſſed nut.

Mr. Miller enumerates four ſpecies of this tree; which is propagated by inoculating a bud of any of the ſpecies into the ſtock of a plum, peach, or *almond*, of another ſpecies, in the month of July.

The ſecond year after their budding, they are to be removed to the places where they are to remain.

The beſt ſeaſon for tranſplanting them, if for dry ground, is in October; but for a wet ſoil, February is always found the propereſt ſeaſon.

The fruit of this tree is of two kinds, the ſweet *almonds*, and the bitter *almonds*.

ALMONDS, *ſweet*, are of a ſoft, grateful taſte; and are reputed cooling, healing, emollient, and nutritive: they are much preſcribed in emulſions, and found of good effect in all diſorders from choleric and acrimonious humours. Neumann ſays, that when roaſted they are a *ſuccedaneum* to coffee.—The oil of ſweet *almonds*, drawn without fire, is a ſafe and uſeful remedy in nephritic pains: it is alſo of good repute for coſtiveneſs, and for gripes in children.

For the manner of procuring it, ſee OIL.

Half an ounce of it may be taken for a doſe, with thirty drops of the mineral anodyne liquor. Neuman, p. 389.

Some reckon two kinds of ſweet *almonds*. 1. Jordan, which are the larger, longer, and dearer kind, chiefly ſold to be eat with raiſins. 2. Valentian and Barbary *almonds*, which are thoſe from whence the oil is procured. Hought. Collect. N° 434. tom. ii. p. 76.

The tree that bears them is called *amygdalus ſativa*. Their chief medical uſes are to ſoften and obtund acrimony, and to render reſinous ſubſtances ſoluble in water, and in the animal fluids. Neumann's Works, p. 389.

ALMONDS, *bitter*, are held aperient, deterſive, and diuretic; and, on thoſe accounts, they are commended in obſtructions of the liver, ſpleen, uterus, &c.—Some eſteem them good to take off the effects of drunkenneſs. Accordingly, Plutarch relates, that Druſius's phyſician, a ſtout drinker, took down at every cup five bitter *almonds*, to allay the heat and fumes of the wine.

The expreſſed oil of bitter *almonds* is as taſteleſs as that of the ſweet: it is much uſed to ſoften and deterge the wax out of the ear.—Some affirm, that *bitter almonds* are poiſonous to birds, particularly; and Neuman adds, to all animals that come into the world blind. It is ſaid that bruiſed, they ſtupify fowl, ſo that they may be eaſily taken with the hand; that this is a ſecret practiſed among the Bohemians; and that the huſks, remaining after the oil is expreſſed, have the ſame effect.

The kernels of bitter *almonds* give much the ſame reliſh in diſtillation, as the kernel of the cherry; on which account, ſome practiſe the making a counterfeit cherry brandy with them. They are alſo frequently uſed inſtead of apricot kernels, in RATAFIA. See the Chemical Hiſtory of *almonds*, in Neumann, ut ſupra.

ALMONDS, *ſweet*, and *bitter*, contain an expreſſible oil, and farinaceous earth; the bitter part of *bitter almonds* is not expreſſed with the oil, but may be diſſolved by digeſtion in aqueous, and in ſpirituous liquors, and with theſe may be diſtilled. Waters diſtilled from *bitter almonds*, or from moſt other bitter vegetables, fruits, and flowers, which have a ſimilar flavour to them, are poiſonous to birds, to ſome animals, and have ſometimes been ſo to men. It is chiefly, if not ſolely, in the matter which ariſes in diſtillation, that the noxious qualities of the *bitter almonds* reſide. Dr. Lewis. See more in Neumann's Works, p. 389, & n.

Almonds give the denomination to a great number of preparations in confectionary, cookery, &c. whereof they are the baſis; as *almond* cakes, *almond* cream, criſped *almonds*, *almond* milk, *almond* paſte, *almond* ſnow, &c.—With ſweet *almonds* blanched (that is, put into warm water a while, which makes them ſlip their ſkins) and water, is made *almond* milk, frequently uſed as a cooler in emulſions, &c. V. Hought. Collect. N° 434.

There is a preparation alſo called ALMOND-*butter*, made of cream and whites of eggs boiled; to which is afterwards added, blanched *almonds*; the whole ſet over a ſlow fire, till it become thick.

ALMONDS are alſo a fruit which ſerves inſtead of ſmall money, in ſeveral parts of the Eaſt Indies; particularly where the *cowries*, thoſe ſmall ſhells which come from the Maldivies, are not current.

ALMOND-*dwarf*. See PERSICA.

ALMOND, *African*. See BRABEJUM.

ALMONDS, *amygdalæ*, in *Anatomy*, denote two glands of the *fauces*, more properly called the *tonſils*.

Theſe are commonly called *almonds of the ears*; but ought rather to be denominated *almonds of the throat*.

They are two rough glands placed on the ſides of the *baſis* of the tongue, under the common membrane of the *fauces*, with which they are covered.

Each of them has a large oval *ſinus*, which opens into the *fauces*; wherein are contained a great number of leſſer ones, which diſcharge through the great *ſinus* a mucous and ſlippery matter into the *fauces*, *larynx*, and *æſophagus*, for the moiſtening and lubricating of thoſe parts.

When the *æſophagus* muſcle acts, it compreſſes the *almonds*; and as they are ſubject to inflammation, they frequently are the occaſion of what the common people call a *ſore throat*.

ALMOND, or **ALMAN**-*furnace*, is a peculiar kind of furnace, uſed in refining; to ſeparate all kinds of metals from cinders, parts of melting-pots, teſts, bricks, &c.

The *almond-furnace*, called alſo the *ſweep*, is uſually ſix feet high, four wide, and two thick: it is built of brick, and having a hole in the middle of the top, eight inches over, which grows narrower towards the bottom, where, on the fore-part, it ends in a point, encompaſſed with a ſemicircle of iron, to keep in the melted metal.—About the middle of the back, there is another hole, to receive the noſe of a pair of bellows, which require the continual ſtrength of two men to work.

The matter, then, on which the operation is to be performed, being beat ſmall, they kindle charcoal in the furnace, to anneal it; and, when hot, they throw in two or three ſhovels of coals to one of the forementioned ſtuff; and ſo proceed during the whole work, putting lay upon lay, of one and the other. After eight or ten hours, the metal begins to run; and when the receiver below is pretty full, they lade it out with an iron ladle, and caſt it in ſows, in cavities or forms made with aſhes.

In this furnace the refiners of ſilver out of lead melt the ſlags of the LITHARGE left in this operation, and reduce them into lead again.

ALMOND, a meaſure in Portugal for OIL. The Portugueſe ſell their oil by *almonds*, twenty-ſix of which make a butt, or pipe.

ALMONDS, *amandes*. Thus the French lapidaries, and looking-glaſs makers, call thoſe pieces of rock cryſtal, or caſt cryſtal, which they cut with a wheel, giving them a figure ſomething like that fruit. They are uſed to adorn branch candleſticks, and other furniture made of glaſs or cryſtal.

ALMONER, anciently alſo written AMNER, an officer in a king's, prince's, or prelate's houſhold, whoſe buſineſs is to diſtribute alms to the poor.

The *lord almoner*, or *lord high almoner*, of England, is an eccleſiaſtical officer, uſually a biſhop; who is to viſit and relieve the ſick, poor widows, priſoners, and others in neceſſity: for which purpoſe, he has the forfeiture of all deodands, and the goods of *felos de ſe*, which he is to diſpoſe of to the poor.

He has likewiſe, by an ancient cuſtom, a privilege to give the firſt diſh, from the royal table, to whatſoever poor perſon he pleaſes; or, inſtead thereof, an alms in money.

He alſo diſtributes to twenty-four poor men, nominated by the pariſhioners of the pariſh adjacent to the king's place of reſidence, to each, four-pence a day in money, and an alms of bread and ſmall beer; each perſon firſt repeating the Creed, and the Lord's prayer, in preſence of one of the king's chaplains, deputed by the lord *almoner* to be his *ſub-almoner*; who is alſo to ſcatter new-coined two-pences in the towns and places through which the king paſſes in his progreſs. See MAUNDY-*Thurſday*.

He has alſo the charge of ſeveral poor penſioners to the crown, below ſtairs; conſiſting of ſuch as have ſpent their youth, and become ſuperannuated, in the king's ſervice; or the widows of ſuch houſhold ſervants as died poor, and were not able to provide for their wives and children; whom he duly pays. Chamberlayne's State of Great Britain, p. 98.

Under the lord *almoner*, beſides the *ſub-almoner*, there is a yeoman, and two grooms of the *almonry*, choſen by his lordſhip.

The French kings have their great *almoners*, firſt *almoners*, ordinary or quarterly *almoners*, &c.

Great *almoner*, *grand aumonier*, is the higheſt eccleſiaſtical dignity in that kingdom. To him belongs the ſuperintendency of all hoſpitals, and houſes of lepers. The king receives the ſacrament from his hand. He ſays maſs before the king, in all grand ceremonies and ſolemnities.

ALMONER is alſo applied, in *Eccleſiaſtical Writers*, to the DEACONS of churches.

ALMONER is alſo uſed, in *Hiſtorians of the Middle Age*, for him appointed by a perſon to diſtribute his alms to the poor. In this ſenſe, *almoner* amounts to much the ſame with what has been ſince denominated executor.

ALMONER is alſo ſometimes uſed for a perſon who left alms to the poor, by his laſt will.

ALMONER is ſometimes alſo uſed for a legatee.

In this ſenſe, it is the rule, that the ſame perſon could not both be *almoner* and heir.

ALMONER is alſo a more faſhionable title given, by ſome writers, to chaplains.

In this ſenſe, we meet with *almoner* of a ſhip, *almoner* of a regiment.

ALMONRY, or AUMBRY, the office or lodgings of the almoner; alſo the place where the alms are given. See AMBRY.

ALMS, *eleemoſyna*, ſomething given out of charity or pity to the poor.

The eccleſiaſtics anciently ſubſiſted wholly on *alms*.—The *alms* of the primitive Chriſtians were divided into three parts; one whereof belonged to the biſhops, another to the prieſts, and a third to the deacons and ſubdeacons.—Sometimes they divided them into four; the laſt of which went to the poor, and to the repairing of churches.

The Romaniſts extend the term *alms*, to that which is given to the church, or to other pious uſes.—Hence, what the church holds on this footing, is called *tenure in alms*. See AUMONE.

Alms are of divers kinds.

ALMS, *paſchal*, *eleemoſynæ paſchales*, were thoſe diſtributed at the ſolemnity of Eaſter, attended, in ſome places, with other acts of humility, as waſhing of feet, &c.

ALMS, *reaſonable*, *eleemoſyna rationalis*, a certain portion of the effects of perſons dying inteſtate, ſet apart for the uſe of the church and the poor.

ALMS *of plough-lands*, *eleemoſyna carucarum*, or *eleemoſyna pro aratris*, was a tax anciently paid for the benefit of the poor, at the rate of a penny for each plough-land.

ALMS *of the king*, denote what was otherwiſe called *Peter-pence*.

Theſe were ſometimes alſo called *alms* of St. Peter.

ALMS are divided by Mahometans, into *voluntary* and *legal*.

ALMS, *voluntary*, are thoſe left to every man's diſcretion, to give more or leſs, as he ſees fit.

The *voluntary alms* are properly denominated, by the Arabs, *ſerdeckad*.

No religious ſyſtem is more frequent or warm in its exhortations to *alms*-giving, than the Mahometan. The Alcoran repreſents *alms* as a neceſſary means to make prayer be heard.

ALMS, *legal*, thoſe of indiſpenſible obligation, as being commanded by the law, which directs and determines both the portion to be given, and the kind of things it is to be given of.

The *legal alms* are properly called, by the Mahometans, *zacat*, either on account of their increaſing a man's ſtore, or of their purifying the remaining part of his ſubſtance.

Some writers have given theſe the denomination of tithes, but improperly; ſince, in ſome caſes, they fall ſhort, and in others, exceed the proportion of a tenth.

ALMS, *charter of*, *charta eleemoſynaria*, that whereby a thing is given to the church.

ALMS, *aumone*, among the French, is alſo uſed for a compulſory payment, impoſed by way of puniſhment, to be converted to pious or charitable uſes.

In all adjudications to the king's right, there is an *alms* reſerved. This amounts to what among us is uſually called *forfeiture to the poor*.

ALMS-*box*, or *cheſt*, a ſmall cheſt, or coffer, wherein anciently the *alms* were collected, both at church and at private houſes. This is alſo in common uſe in ſeveral places.

The *alms-cheſt*, in churches, is a ſtrong box, with a hole in the upper part, having three keys, one to be kept by the parſon, or curate, the other two by the church-wardens.

The erecting of ſuch *alms-cheſt* in every church, was introduced by an act in 27 H. VIII. and it is enjoined by the book of Canons, as alſo the manner of diſtributing what is thus collected among the poor of the pariſh.

ALMSFEOH, or ALMESFEOH, among our Saxon anceſtors, *alms-money*; that is, PETER-PENCE, anciently paid in England on the firſt of Auguſt; called alſo *romeſeoh*, *romeſcot*, and *hearthpening*.

ALMS-HOUSE, a petty hoſpital; or an edifice built by a perſon in a private capacity, and endowed with a revenue, for the maintenance of a certain number of poor, aged, or diſabled people.

ALMUCANTARS, in *Aſtronomy*, are circles parallel to the HORIZON, imagined to paſs through all the degrees of the MERIDIAN.

The word is formed of the Arabic *almocantharat*.

As the meridians paſs through the ſeveral degrees of the equator, the *almucantars* paſs through thoſe of the meridian of any place.

The *almucantars* are the ſame thing with regard to the azimuths and horizon, that the parallels are with regard to the meridians and horizon.

They ſerve to ſhew the height of the ſun and ſtars; and are deſcribed on many quadrants, &c. being alſo called PARALLELS *of altitude*.

ALMUCANTARS-*ſtaff*, is an inſtrument uſually made of pear-tree or box, having an arch of fifteen degrees; uſed to take obſervations of the ſun, about the time of its riſing and ſetting; in order to find the amplitude, and conſequently the variation of the compaſs.

ALMUCIUM, or ALMUTIUM, in *Middle Age Writers*, denotes a kind of cover of the head, part of it pendant over the neck and ſhoulders, worn chiefly by the ancient canons and monks.

The word is alſo written, *almucia*, *aumucia*, *almucella*, *armutia*, and *amicia*.

The *almucium* appears to have been much the ſame with what is otherwiſe denominated *caputium*.

The *almucium*, though proper only to religious, was ſometimes alſo aſſumed by laymen, princes, and even women of quality.

The part which covered the head was of a ſquare form, making, as it were, four horns, as may be ſeen from the ancient pictures of canons. Hence appears the origin of the ſquare caps, bonnets, &c. ſtill retained in cathedrals and univerſities, which are no other than the upper part of the *almucium*, without the lower.

ALMUCIA is alſo uſed, in ſome *Ancient Writers*, for the furs, or ſkins, worn by the canons, on their left arms, in the manner of muffs.

ALMUDHEBIS, in the Arabian *Aſtrology*, a kind of dignity, or pre-eminence accruing to a planet in ſome place, either from its diſpoſition, or benign aſpect.

ALMUG-*tree*, a kind of wood mentioned in Scripture, imported by Solomon from Ophir, and uſed in the making of rails, or pillars of the temple. 1 Kings, ch. x. ver. 11, 12. 2 Chron. ch. ii. ver. 8.

ALMUGEA, in *Aſtrology*, denotes a certain configuration of the five planets, in reſpect of the ſun and moon, correſpondent to that which is between the hours of thoſe planets, and the ſun's and moon's hours.

Thus Saturn will be in the *almugea* of the ſun, when diſtant from him the ſpace of five ſigns in ſucceſſion, or in the *almugea* of the moon, when he is at the ſame diſtance, only contrary to the ſucceſſion of the ſign.

ALMUTAZAPHUS, a magiſtrate of Arragon, whoſe office is to ſearch houſes for ſtolen goods, weigh the bread, meaſure the wine, &c.

ALMUTHEN, in the Arabian *Aſtrology*, the planet which has the diſpoſal of a place, that is, ſurpaſſes the reſt in the number and efficacy of dignities, regard being had to the eſſential points, viz. *exaltation*, *terms*, *trigon*, and *phaſes*. This is otherwiſe called ALMUSTEULI.

ALNABATI, in the *Materia Medica*, a name given, by Avicenna and Serapion, to the SILIQUA *dulcis*, or carob-tree. They called both this and the ACACIA, by the common name *charnub*, or *charub*; but they ſufficiently diſtinguiſh this, not only by this appellation, but by telling us it was a gentle purge, whereas the other was aſtringent.

ALNAGE, or AULNAGE, q. d. ell-meaſure; the meaſuring of woollen manufactures with an ell, and the other functions of the ALNAGER.

The word is French, formed of *aune*, or *alne*, an *ell*.

All the attempts which our forefathers made for regulating manufactures, when left to the execution of any particular officer, in a ſhort time reſolved into a tax on the commodity, without reſpect to the goodneſs thereof.—As is moſt notorious in the caſe of *aulnage*, which was intended for a proof of the goodneſs of the commodity; and to that purpoſe a ſeal was invented, as a ſignal that the commodity was made according to their ſtatute; which ſeals, it is ſaid, may now be bought by thouſands, and put on what the buyers pleaſe. Sir Joſ. Child's Diſc. on Trade.

It is probable that the abuſes here mentioned by Sir Joſiah Child did, among other reaſons, give occaſion to the clauſe 11 and 12 W. III. cap. 20. by which *aulnage* duties are wholly taken away.

ALNAGER, ALNEGER, or AULNEGER, q. d. *meaſurer by the ell*; ſignifies a ſworn public officer, who by himſelf, or deputy, is to look to the aſſize of woollen cloth made throughout the land, i. e. the length, width, and work thereof; and to the ſeals for that purpoſe ordained. The office of king's *aulnager* ſeems to have been derived from the ſtatute of Richard I. A. D. 1197, which ordained, that there ſhould be only one weight, and one meaſure, throughout the kingdom; and that the cuſtody of the aſſiſe, or ſtandard of weights and meaſures, ſhould be committed to certain perſons in every city and borough. His buſineſs was, for a certain fee, to meaſure all cloths made for ſale, till the office was aboliſhed by the ſtatute 11 and 12 W. III. cap. 20.

ALNAM, in *Botany*, a name uſed, by ſome, for PENNY-ROYAL.

ALNASI, in the Mahometan *Law*, the transferring the obſervation of a ſacred month to a profane month.

ALNUS, in *Botany*, the ALDER.

ALNUS *baccifera*, the berry-bearing *alder*, in *Botany*, a name given, by ſome writers, to the FRANGULA.

ALNUS alſo denotes a part in the ancient theatres at the greateſt diſtance from the ſtage.

ALOA, in *Antiquity*, a Grecian feaſt, celebrated by the Athenian huſbandmen, in honour of Ceres, as inventreſs and protrectreſs of corn and tillage.

The word is ſometimes alſo written *ἀλῶα*. It is formed of *αλως*, *grange*, or *barn*; it being in theſe places that much of the ſolemnity paſſed.

Authors are not agreed as to the time or occaſion of the celebration of the *aloa*. Some ſuppoſe it to have been before the beginning of harveſt; others will it have it to have been a rejoicing after harveſt, not unlike our *harveſt-home*.

ALOE, a name applied to three different things. 1. To a very precious and ſcarce tree. 2. To a plant, from the roots and leaves of which a drug, very uſeful in phyſic, is extracted. 3. To that drug itſelf.

Moſt authors miſtake the plant and tree for each other; becauſe, no doubt, we have but little knowledge of the tree; and the drug which the plant produces is much better known, and of much greater uſe.

The *aloe* tree grows in China, in the kingdom of Lao, and in Cochinchina, Champac, and Sumatra. It is about the ſame height and form as the olive tree; its trunk is of three colours, and contains three ſorts of wood: the heart is that of *tambac*, or *calombac*, which is dearer in the Indies than even gold itſelf; it ſerves to perfume cloaths and apartments, is a ſovereign cordial in fainting fits, and againſt the palſy. It deſtroys the *tineæ* and *aſcarides* in children. It is uſed at ſacrifices, as incenſe, by the Chineſe, and all the heathen Moors. It is alſo uſed to ſet the moſt precious jewels that are worked in the Indies.

The *aloes* wood is very highly valued; and divers ſtrange fables have been invented as to the origin of the tree that yields it; ſome feign that it grew in Paradiſe, and was only conveyed to us by means of the rivers overflowing their banks, and ſweeping off the trees in their way. Others ſuppoſe it to grow on inacceſſible mountains, where it is guarded by certain wild beaſts, &c.—The Siameſe ambaſſadors to the court of France, in 1686, who brought a preſent of this wood from their emperor, firſt gave the Europeans any conſiſtent account of it.

ALOE-*plant*. The characters of this plant are theſe: the flower is liliaceous, and conſiſts of one petal, which is of a tubular form, and is divided into ſix ſegments at the edge. In ſome ſpecies of this genus, the cup, and in others the piſtil, finally becomes a fruit, or ſeed-veſſel, of an oblong cylindric form, divided into three cells, and containing flat and ſemicular ſeeds. Tournefort ranges this plant in his ninth claſs, and Linnæus in his ſixth, called *hexandria monogynia*; becauſe the flowers have ſix ſtamina, and one ſtyle.

Mr. Miller enumerates twenty-five ſpecies of this plant, which grow in divers parts of the Eaſt and Weſt Indies; and is alſo found in ſome countries of Europe, as Spain, and particularly the mountains of Sierra Morena.—Its leaves are green, very thick, hard, and prickly, yielding a kind of ſtrong threads, whereof laces may be made.

The ſoil in which theſe plants thrive beſt, is one half freſh, light earth, from a common; and if the turf is taken with it, and rotted, it is much better; the reſt ſhould be white ſea-ſand, and ſifted lime rubbiſh, each of theſe two, a fourth part; mix theſe together ſix or eight months at leaſt before it is uſed, obſerving to turn it over often in this time. The middle of July is a very proper ſeaſon to ſhift the plants; at which time you may take them out of the pots, and with your fingers open the roots, and ſhake out as much of the earth as poſſible, taking off all dead or mouldy roots, without wounding the young freſh ones: then fill the pot about three parts full of the above mentioned earth, putting a few ſtones at the bottom of the pot to drain off the moiſture; and after diſpoſing the roots in ſuch a manner as to prevent their interfering too much with each other, put in as much of the ſame earth, as to fill the pot almoſt to the brim, ſhaking the plant ſo as to let the earth in between the roots, and ſettling it cloſe to the roots with your hand, to place it ſteady in the pot; then water them gently, and ſet them abroad in a ſhady place, where they may remain for three weeks, giving them gentle waterings, if the weather be hot and dry. Toward the latter end of September, in a dry day, remove them into the houſe again, obſerving to give them as much free open air as poſſible, while the weather holds warm; but if the nights are cool, you muſt ſhut up the glaſſes, and give them air only in the day; and as the cold increaſes, you muſt decreaſe opening the glaſſes, only giving them gentle waterings till the middle of October, when you muſt abate them according to the heat of the houſe in which they are kept. For thoſe plants which are placed in a ſtove, will require to be watered at leaſt once a week, moſt part of the winter, whereas thoſe which are kept in a green-houſe, without artificial heat, ſhould not be watered in the winter oftener than once in a month.

The tender ſorts ſhould conſtantly remain in the ſtove, or be removed in the ſummer to an airy glaſs-caſe, where they may have free air in warm weather, but be protected from the rain and cold. With this management the plants will thrive and increaſe; and ſuch of them as uſually flower, may be expected to produce them in beauty at their ſeaſons.

Some *aloes* are arboreſcent, inclining to make large trees, breaking forth into branches; others are ſo ſmall, that a whole plant does not exceed the bigneſs of a crown piece. Some grow cloſe to the ground, others are more aſpiring, and have their crown of leaves raiſed upon a ſtem, ſomewhat above the earth. The kind moſt common in our gardens, with ſome few other ſorts, are brought from America; but the greateſt varieties, and as ſome think, the beſt kinds, come from Africa, chiefly from the Cape of Good Hope.

The two kinds moſt conſiderable, the one for its curioſity, the other for its uſe, are the *aloe Americana*, or flowering *aloe*, and the *aloe Aſiatica*, or drug *aloe*.

The American *aloe* ſeldom flowers in cold climates. See AGAVE.

ALOE, *baſtard*, *aletris*, in *Botany*, a genus of the *hexandria monogynia* claſs; the corolla is funnel-ſhaped, and furrowed; the ſtamina are inſerted in the baſe of the ſegments, and the capſula has three cells.

ALOE, *water*, *ſtratiotes*, in *Botany*, of the *polyandria hexagynia*. Its characters are theſe: it has but one flower incloſed in a compreſſed obtuſe ſheath, compoſed of two leaves, which are keel-ſhaped, and permanent. The empalement of the flower is of one leaf, trifid, and erect. It has three almoſt heart-ſhaped petals, which are twice the ſize of the empalement, and about twenty ſtamina inſerted in the receptacle of the flower, terminated by ſingle ſummits. The germen is ſituated under the empalement, ſupporting ſix ſtyles, divided in two parts, crowned by ſingle ſtigmas. The germen becomes an oval capſule, narrowed on every ſide, having ſix angles, and as many cells, filled with oblong incurved ſeeds. We know but one ſpecies, which is ſhaped like the *aloe*, and grows plentifully in ſtanding waters in the iſle of Ely, and other places.

ALOES, in *Medicine* and *Pharmacy*, the inſpiſſated juice of a particular ſpecies of the foregoing plant, much uſed as a purgative remedy, but very improper for ſuch as are ſubject to the piles.

The juice, or extract, for Neumann thinks it is the true extract, of *aloes*, is uſually diſtinguiſhed into three kinds.—The firſt, which is called *Socotorine*, as being brought from Socotora, is the pureſt and moſt tranſparent; being friable, inodorous, black in the lump, but of a beautiful yellow colour when broken.—It is brought in ſkins from the Levant and Eaſt Indies.

The ſecond is called *hepatic*, becauſe of its liver-colour: it is reſinous, ſmells ſomewhat like myrrh, has a yellow colour when pounded, and is brought from China and Barbadoes.—Some confound this with the following ſort; as, in effect, there are but two ſorts commonly known in our ſhops.

The third is the moſt impure, the blackeſt, and the ſtrongeſt.—It was formerly uſed by the Indians to pitch their veſſels with; and is of little uſe among us, excepting for horſes and cattle; for which reaſon it is called *caballine*, i. e. *horſe-aloes*.—It is prepared in Jamaica and Barbadoes, and brought over in large gourds.

A late writer deſcribes the preparation of *aloes* thus: the leaves being pulled from the roots of the tree with the hand, or an inſtrument, and preſſed, diſtil a juice, of which the thick parts will ſubſide, and the thinner are poured off, and put in the ſun till it dries and hardens, in which time it gains a yellow colour. This is called *aloe Socotorina*. The thicker part remaining is put into another veſſel, and by being inſpiſſated in the ſun, gains a liver-colour, and is called *aloe hepatica*. The thickeſt part is called *caballina*, or horſe-*aloes*.

The general nature of theſe three kinds is the ſame; their particular differences conſiſt in the different proportions of gum to their reſin, and in their flavours, which render them more or leſs diſguſtful for internal uſe. Good *aloes*, Neumann ſays, muſt be gloſſy, not very black, but brown; when chewed, rubbed, or cut, of a yellow colour; compact, but eaſy to break; eaſily ſoluble, of an unpleaſant ſmell, and an extremely bitter taſte. Such as is black, firm, and hard to break, we may ſuſpect, he ſays, to be adulterated.

From M. Boulduc's analyſis by extraction, it appears, that the *Socotorine aloes* contains ſcarce half the quantity of reſin or ſulphureous matter, and about a third more, of ſaline ſubſtance, than the *hepatic*. As for the horſe-*aloes*, it is ſo impure, and contains ſo much earth in proportion to its ſulphur and ſalts, that it deſerves not to be regarded.

The different proportion of the principles of the *Socotorine* and *hepatic aloes*, might well be the cauſe of their different properties. As the reſinous part of *aloes*, contrary to other cathartics charged with reſin, is little or nothing purgative; the *Socotorine*, which has the leaſt of that reſin, has been always preferred to the *hepatic* for inward uſes; and on the contrary, the *hepatic*, which has more of it, excels as much the other in its external uſefulneſs, for cleaſing wounds, and cloſing the lips of recent cuts, &c. M. Boulduc equals it in that reſpect to the natural balſams. It is plain enough that theſe effects are the natural reſult of the reſinous and balſamic parts. The ſalts of *aloes* are very active, and corrode the extremities of the veins, where the fibres are fineſt; whence proceed hæmorrhages. Therefore it highly concerns us that the ſaline part, which wants to be reſtrained by the reſinous, be not ſeparated from it; and yet this is the caſe in ſeveral preparations of *aloes*, when they have not been made by ſkilful hands. They have rejected the reſinous part as too groſs and good for nothing, becauſe it kept at the bottom of the ſolution. Hiſt. de l'Acad. Roy. des Scienc. 1708.—It is very obſervable that the eſſence of *aloes* ſtains the glaſs wherein it has been kept for ſome time of a deep red colour, covering it as it were with a coat of fine tranſparent varniſh, which no other eſſence does. Neumann's Works, p. 307.

Aloes is extremely bitter, and purgative, whence ſome have called it *fel naturæ*; externally applied, either in ſubſtance or tincture, it prevents putrefaction and gangrene.—Its bitterneſs makes it ſo nauſeous, that it is rarely uſed in liquid forms, but it is generally made into pills, whereof half a dram is an ordinary doſe.—Scarce any of the officinal purging pills are without this in their compoſition.

Its cathartic virtue is beſt employed in watery, cold, and corpulent conſtitutions, as it heats and attenuates; being bad for thin and hectic conſtitutions. It is accounted efficacious in promoting the menſes; and is alſo good to deſtroy worms.—Guy Patin decries *aloes* as a ſorry and noxious drug, which heats and dries the liver, diſpoſes towards a dropſy, cauſes the piles, &c.

The *aloes*, as imported, is uſually too foul for medicinal purpoſes; as having a mixture of ſtraws, ſticks, or gritty matter. To purify it, they gently diſſolve it in water, enough to paſs it conveniently through a flannel cloth when warm, and afterwards evaporate it to a conſiſtence. Some for this purpoſe uſe ſpirit of wine, and others ſpirit of tartar, under the notion of better correcting the *aloes*; but that diſſolvent ſeems moſt ſuitable, which leaves the drug its native qualities, after refinement, referring it to the phyſician afterwards to correct it in preſcription as he pleaſes.

This drug applied to ſores will cauſe a purging. Thus we find in the Medical Eſſays, that a paſtil made of myrrh, *aloes*, and honey, having been put every day into a cavity formed by an ulcer in the bone, the patient had a conſtant purging, which ceaſed the day after the *aloes* was omitted. Med. Eſſ. Edinb. vol. v. art. 241.

Where it is alſo obſerved, that the tincture of *aloes*, applied to ulcers and carious bones, frequently brings on a purging.

Aloes is a prime ingredient in *elixir proprietatis*, and *ſpecies hiræ picræ*, with which the *tinctura ſacra* is made.

Aloes was uſed among the ancients, in embalming, to preſerve bodies from putrefaction. Of this *aloes*, interpreters underſtand that to have been which Nicodemus in the Goſpel brought to embalm the body of Chriſt. John, ch. xix. ver. 39.

Several authors have treated expreſly on *aloes*; as Bejer and Major; Duroſtantis on its ſubſtance; Marquis on its virtue; Martinez on its choices; Fuchſius and Puteanus on its opening the veins.—Many particulars alſo relating to *aloes* are given occaſionally by botanic and pharmaceutical writers.

Aloe *roſata*, is a preparation of the *Socotorine aloes*, made by diſſolving it in juice of damaſk roſes, and evaporating it to the conſiſtence of a paſte. Then, more juice is added, and the evaporation repeated, again and again.—This is held a gentler and ſafer cathartic than the *aloes* alone. If this be diſſolved in a good quantity of the freſh juices of roſes, violets, borage, and bugloſs, mixed in equal proportions, and afterwards reduced by evaporation to its former conſiſtence, the extract, thus prepared, is called ALOE *inſuccata*, and with the addition of one third its weight of cream of tartar, ALOE *inſuccata tartarizata*.

Aloe *violata*, is prepared by means of the expreſſed juice of violet flowers; and mixed with half its weight of cream of tartar, it is called *aloe violata tartarea*.

Aloe is applied by ſome writers, to a kind of mineral juice produced in Judea.

This is called foſſile, mineral, or metalline *aloe*.—Some diſpute the exiſtence of any ſuch *aloe*. Others ſuppoſe it to be no other than the ASPHALTUS.

Aloes, *lignum*. This wood, of which we have ſpoken before, by the Indians and Portugueſe is called *calamba*, or *calambac*, being the ſame with what is otherwiſe called by medical writers *xyloaloes*, and *agallochum*.

Grew deſcribes a piece of *lignum aloes*, with its own gum growing on it, in the repoſitory of the Royal Society. See Grew, Muſ. Reg. Soc. p. ii. c. 1. p. 179.

ALOEDARY, *aloedarium*, αλοηδαριον, denotes a purging medicine, wherein *aloes* is an ingredient.

This amounts to the ſame with what we otherwiſe call an ALOETIC.

Aloedary is alſo uſed for a hiſtory of the claſs of plants, under the denomination of ALOES.

ALOETICS, medicines wherein *aloes* is the chief, or fundamental ingredient.

Aloetics open the orifices of the veſſels, and are on this account found hurtful in caſes of hæmorrhages, particularly at the noſe; alſo in the *teneſmus*, *hemicranium*, &c. The immoderate uſe of *aloetics* tends to produce hæmorrhoids, hypocondriac pains, and inflations.

Joannius has a treatiſe expreſs on *aloetic* pills.

ALOEUS, a ſpecies of *ſcarabæus*, or *beetle*, found in America.

ALOGIANS, ALOGI, or ALOGIANI, a ſect who denied that Jeſus Chriſt was the *Logos*, or eternal word; and on this ground alſo rejected the Goſpel of St. John as ſpurious.

The word is compounded of the privative α, and λογος, q. d. *without Logos*, or *Word*.

Some aſcribe the origin of the name, as well as of the ſect of *Alogians*, to Theodore of Byzantium, by trade a currier, who, having apoſtatized under the perſecution of the emperor Severus, to defend himſelf againſt thoſe who reproached him therewith, ſaid, that it was not God he denied, but only man. Whence his followers were called in Greek αλογοι, becauſe they rejected the Word. But others, with more probability, ſuppoſe the name to have been firſt given them by Epiphanius in the way of reproach. They made their appearance toward the cloſe of the ſecond century.

ALOGOTROPHIA, in *Medicine*, an irregular nutrition of ſome part, attended with a vicious figure or conformation thereof, as in the rickets.

If the bones of the *vertebræ* of the back receive too much nutriment on one ſide, as ſometimes happens in children, an incurvation neceſſarily enſues, which, as Charleton expreſſes it, is produced by an *alogotrophia*.

ALOIDES, in *Botany*, a name uſed by ſome for the *aloe paluſtris*, or freſh water aloe, called in ſome parts of England *water*-SOLDUC; and by Linnæus, *ſtratiotes*.

ALOOF. See LUFF.

ALOPECIA, in *Medicine*, a total falling off of the hair from certain parts, occaſioned either by the defect of nutritious juice, or by its vicious quality corroding the roots of it, and leaving the ſkin rough and colourleſs.

The word is formed from αλωπηξ, *vulpes*, a *fox*; whoſe urine, it is ſaid, will occaſion baldneſs; or becauſe it is a diſeaſe which is common to that creature.

The *alopecia* properly differs from *defluvium capillorum*, as in the former, certain parts or patches are left entirely bald, whereas in the latter, the hair only grows immoderately thin. It alſo differs from the *ophiaſis*, as this latter creeps in ſpires about the head, like the windings of a ſerpent, whereas the former is not confined to any figure. See PLICA *Polonica*.

The cauſe as well as cure of the *alopecia* is the ſame as that of the *ophiaſis*; though ſome would make a difference; urging that the primary intention in the former, is to correct or carry off the vicious humour; in the latter, to ſupply the want of nutriment to the cutaneous parts. The remedies which remove the proximate cauſe of this malady, are called μετασυγκριτικα, *metaſyncritica*. Here, firſt, if any corrupt hairs ſtill remain, they are to be drawn out either with tweezers, or by *dropaciſm*; or the place muſt be ſhaved by a razor. Then the head is to be waſhed every night at going to bed, with a lye prepared

pared by boiling the aſhes of vine branches in red wine. A powder made by reducing hermodactyls to fine flour, is alſo recommended for the ſame purpoſe.

In caſes where the baldneſs is total, a quantity of the fineſt burdock roots are to be bruiſed in a marble mortar, and then boiled in white wine, until there remains only as much as will cover them. This liquor, carefully ſtrained off, is ſaid to cure baldneſs, by waſhing the head every night with ſome of it warm. A lye made by boiling aſhes of vine branches in common water, is alſo recommended with this intention. A freſh cut onion rubbed on the part, until it be red and itch, is likewiſe ſaid to cure baldneſs.

A multitude of ſuch remedies are every where to be found in the works of Valeſcus de Taranta, Rondeletius, Hollerius, Trincavellius, Celſus, Senertay, and other practical phyſicians.

ALOPECIA is alſo uſed, by Galen, for a change of the hair to another colour.

ALOPECIAS, in *Ichthyology*, a name of the *vulpes marina*, or *Sea*-FOX.

ALOPECOPITHECOS, in *Natural Hiſtory*, a name derived from the Greek, and given by Aldrovand and others to that ſtrange creature, the OPOSSUM.

ALOPECUROS, ſee Fox-*tail graſs*, a genus of the *triandria digynia*.

ALOPEX, in *Zoology*, a ſpecies of the CANIS, with a ſtrait tail, and black tip. It is commonly called the *field fox*.

ALOSE, a ſort of fiſh, ſomewhat like the *ſardine*, or *pilchard*, in ſhape, but much larger. Some will have it to be the ſhad, but it is quite another fiſh, and is very ſcarce in England. It is one of thoſe called paſſage-fiſh, or fiſh of a ſeaſon, becauſe it never ſwims out of the ſea into rivers, but in the ſpring.

The roes of *aloſes* are as much valued in the Eaſt Indies, as thoſe of the ſturgeon in Ruſſia, and form a very lucrative article of trade.

ALOUCHI, a kind of ſweet-ſcented gum, which runs from the tree that produces white cinnamon.

ALP, in *Zoology*, an Engliſh name uſed by ſome for the BULL-FINCH.

ALPAGE, *alpagium*, in *Ancient Writers*, denotes the privilege of feeding cattle on the ALPS or high mountains, or a ſum paid for the purchaſe of ſuch a right.

This is otherwiſe called *Alpaticum*.

ALPAGNA, an animal much like the *llamus* and *vigognas*, except that its legs are ſhorter, and its muzzle thicker and flatter, ſo that it ſomewhat reſembles a human face. The inhabitants of Peru reckon this animal among the beaſts of burden, and make it carry a hundred weight. Of its wool they make ſtuffs, ropes, and bags, and of its bones tools for weavers. They even make an advantage of its excrement, uſing it for fuel.

ALPAM, is the *ſiliquoſa indica flore tripetalo ſiliquis teretibus pulpa abſque ſeminibus repletis*.

The ſtem of this plant, which divides itſelf twice or thrice, is covered with a bark of an aſhy green colour, inodorous, and of an acid aſtringent taſte. The branches are of a whitiſh wood, have a green pith running through them, and are diſtinguiſhed into joints. The root is red, compoſed of a great number of capillary fibres. The leaves are of a narrow, oblong form, terminating in a point, of a deep green on the outſide, but pale within. They have a ſmell not ungrateful, and taſte ſomewhat acrid. The flowers, which are of a dark purple colour, and inodorous, grow on very ſlender round pedicles, ſometimes two or three together. To the flowers ſucceed the pod, which are ſharp, pointed, round, and full of a carnoſe pulp, without any diſcernible ſeeds. It bears flowers and fruit as well at the end of the year as at the beginning, and is always full of leaves.

Any part of this ſhrub made into an ointment with oil, is a powerful remedy in caſe of the ſcab, and old ulcers. The juice of the leaves, with *calamus aromaticus*, is good againſt the venom of ſerpents.

ALPHA, the name of the firſt letter of the Greek alphabet.

The word is originally Hebrew, formed from *aleph*, the name of the firſt letter in the Hebrew alphabet.

The Greek *alpha* anſwers to what in Engliſh we call ſimply A.

Alpha, according to Plutarch, was placed at the head of all the letters, becauſe in the Phœnician language, it denotes an ox; which, with regard to uſe and ſervice, is the firſt among beaſts.

ALPHA, in *Compoſition*, denotes, ſometimes, *privation*, in the ſame ſenſe with *ατερ*, *without*; ſometimes augmentation, as *αγαν*, *much*; and ſometimes union, as *αμα*, *together*. See A.

ALPHA is alſo uſed as a letter of order, to denote the *firſt*; and of number, to ſignify *one*; but when it was a numerical letter, a little ſtroke, or an acute accent, was drawn above it thus ʹA, to diſtinguiſh it from the mere A, which was a letter of order.

ALPHA and *Omega*, in the *Divine Writings*, ſignify the beginning and the end, or the firſt and the laſt, (viz. before and after all things); and therefore the hieroglyphic of God is formed of theſe two letters A and Ω.

Theſe two letters were made the ſymbol of Chriſtianity, and were accordingly engraved on the tombs of the ancient Chriſtians, to diſtinguiſh them from thoſe of idolaters.

ALPHA is particularly uſed among *Ancient Writers*, to denote the chief or firſt man of his claſs or rank.

In this ſenſe the word ſtands contradiſtinguiſhed from *beta*, which denotes the *ſecond* perſon.

Plato was called the *alpha* of the wits; Eratoſthenes, keeper of the Alexandrian Library, whom ſome called a ſecond Plato, is frequently named *beta*.

ALPHA is alſo a title given by ſome ancient writers to the Jewiſh legiſlator Moſes. The reaſon of the appellation is much controverted.

ALPHABET, the ſeveral letters of a language, diſpoſed in their natural, or accuſtomed order.

The word is formed from the names of the two firſt letters of the Greek *alphabet*, *alpha*, *beta*; which were borrowed from thoſe of the Hebrew, *aleph*, *beth*.

In the Engliſh *alphabet* we reckon 26 letters, viz. *a b c d e f g h i j k l m n o p q r ſ t u v w x y z*. See each under its proper article, A, B, C, &c.

But as there is a much greater number of different ſounds in our language, it is not without reaſon that ſome grammarians maintain, that there ought to be a greater number of letters: as alſo, that the double letters, *x*, *y*, and *w*, and the ſuperfluous ones, *k* and *g*, ſhould be retrenched.

The French *alphabet* contains only 23 letters.—Paſquier indeed maintains it to conſiſt of 25, becauſe he adds the two double letters. & for *et*, and ꝰ for *us*; but thoſe are only abbreviatures. The abbé d'Angeau, on better grounds, reckons 34 different ſounds in the French tongue; and urges, that the *alphabet* ought of conſequence to conſiſt of 34 different characters, ſetting aſide the double letters *x* and *y*, and the ſuperfluous one *q*.

The difference between languages, with reſpect to the number of letters, in their *alphabets*, is very conſiderable: the Hebrew, Chaldee, Syriac, and Samaritan *alphabets*, have each 22; the Arabic 28; the Perſian 31; the Turkiſh 33; the Georgian 36; the Cophtic 32; the Muſcovite 43; the Greek 24; the Latin 22; the Sclavonic 27; the Dutch 26; the Spaniſh 27; the Italian 20; the Indians of Bengal 21; the Bramas 19.

The Ethiopic has no leſs than 202 letters in its *alphabet*, there being 7 vowels, which they combine with each of their 26 conſonants; to which they add 20 other aſpirated ſyllables.—The like is ſaid of the Tartarian; each of their letters is a ſyllable, having one of the vowels joined to its conſonant; as *la*, *le*, *li*, &c.

The Chineſe have no *alphabet*, properly ſpeaking; except we call their whole language their *alphabet*; their letters are words, or rather hieroglyphics, and are in number about 80,000. See Phil. Tranſ. vol. lix. an. 1769, N° 66.

In effect, *alphabets* were not contrived with deſign, according to the juſt rules of reaſon and analogy; but have been ſucceſſively framed, altered, &c. as occaſion offered.—And hence many grievous complaints as to their deficiencies; and divers attempts to eſtabliſh new, and more adequate ones, in their places. Biſhop Wilkins charges all the *alphabets* extant with great irregularities, with reſpect both to the order, number, power, figure, &c.—As to the order, it appears inartificial, precarious, and confuſed; in that the vowels and conſonants are not reduced into claſſes, with ſuch order of precedence and ſubſequence as their natures will bear.—Even the Hebrew order is not free from this imperfection.

As to number, they are both redundant and deficient; redundant, either by allotting ſeveral letters to the ſame power and ſound; as in the Hebrew ס and ש, and the ordinary Latin *c* and *k*, *f* and *ph*; or by reckoning double letters among the ſimple elements of ſpeech; as in the Hebrew צ, the Greek ξ and ψ, the Latin *q*, *cu*, *x*, *cs*, and the *j* conſonant, or jod.—Deficient in divers reſpects, eſpecially in regard of vowels, of which there are ſeven or eight kinds commonly uſed, though the Latin *alphabet* only takes notice of five; whereof two, viz. *i* and *u*, according to our Engliſh pronunciation, are not properly vowels, but diphthongs.

Add, that the difference among vowels, in reſpect of long and ſhort, is not ſufficiently provided for: the ancients, we know, uſed to expreſs a long vowel by doubling its character; as *amaabam*, *naata*, *ree*, *ſeedes*, *ſanctiſſimiis*; though the vowel *i*, inſtead of being doubled, was frequently prolonged, as ÆDILIS, PISO, VIVUS.—The ways uſed in Engliſh for lengthening and abbreviating vowels, viz. by adding *e* quieſcent to the end of a word, for prolonging a ſyllable; and doubling the following conſonants, for the ſhortening of a vowel, as *wane wann*, *ware warr*, &c. or elſe by inſerting ſome other vowel, for the lengthening of it, as *meet met*, *read red*, &c. are all improper; becauſe the ſign ought ever to be where the ſound is.

As to their powers, again, thoſe are not always fixed to the ſame ſignification: the vowels, for inſtance, are generally acknowledged to have each of them ſeveral ſounds: *vocales omnes pluriſonæ*, ſays Lipſius; and Voſſius aſſures us, the ancients uſed their vowels in very different ways, *aliquando tenuius exiliuſque, nunc craſſius, nunc intermedio ſono*. Thus the power of the vowel *i* is expreſſed in writing no leſs than in ſix ſeveral ways, viz. by *e*; as in *be*, *me*, *ſhe*, *ye*; by *ee*, in *three*, *free*, *wee*; by *ie*, in *field*, *yield*, *ſhield*, *chief*; by *ea*, in *near*, *dear*, *hear*; by *eo*, in *people*; by *i*, in *privilege*. So is the power of the vowel *a*; as in *all*, *aul*, *aw*, *fault*, *caught*; which are only various ways of writing the ſame long vowel; beſides the other diſtinct ways of expreſſing the ſame vowel when uſed ſhort: again, the power of the vowel *o* is written five ways: *o*, as in *to*, *who*, *move*; *oe*, as in *doe*; *oo*, in *ſhoo*, *moon*, *noon*; *ou*, in *could*, *would*; *wo*, in *two*; and ſo of the reſt.—Nor are the conſonants of more determinate powers; witneſs the different pronounciation of the ſame letter *c* in the ſame word *circo*; and of *g* in *negligence*.—To ſay no more, the letters *c*, *ſ*, *t*, are uſed alike, to denote the ſame power; and the letter *ſ* is commonly uſed for *z*; and which is yet worſe, ſome letters of the ſame name and ſhape, are uſed at one time for vowels, and at another for conſonants; as *j*, *v*, *w*, *y*; which yet differ from one another, ſays biſhop Wilkins, *ſicut corpus & anima*.

From this confuſion in the power of letters, there ariſe divers irregularities; as, that ſome words are diſtinguiſhed in writing, which are the ſame in pronunciation, e. gr. *ceſſio* and *ſeſſio*, &c. and others are diſtinguiſhed in pronunciation, which are the ſame in writing; as *get*, *acquirire*, and *get*, *gagates*, &c. Hence alſo the Latin *malè* is a diſſyllable, and the Engliſh *male* is a monoſyllable.

The names alſo, in moſt *alphabets*, are very improperly expreſſed by words of divers ſyllables; *alpha*, *beta*, &c. in which reſpect, the Roman and our Engliſh *alphabets*, which only name the letters by their powers, have a great advantage over the reſt.

Laſtly, their figures are not well concerted; there being nothing in the characters of the vowels anſwerable to the different degrees of apertion; nor in the conſonants, analogous to the agreements or diſagreements thereof. Wilkins's Eſſ. towards a real Character, &c. b. i. c. 4.

All theſe imperfections are obviated in the *univerſal alphabets*, or characters, of Mr. Lodowic, biſhop Wilkins, &c. See *Univerſal* CHARACTER.

In the French king's library, is an Arabic work, intitled *Sephat Alacham*; containing divers ſorts of imaginary *alphabets*, which the author diſtributes into *prophetical*, *myſtical*, *philoſophical*, *magical*, *taliſmanical*, &c.

Monſieur Leibnitz had it in view to compoſe an *Alphabet of Human Thoughts*. Mem. de l'Acad. Roy. an. 1716.

It is no wonder that the number of letters in moſt languages ſhould be ſo ſmall, and that of the words ſo great; ſince from a calculation made by Mr. Preſtet, it appears, that, allowing only twenty-four letters to an *alphabet*, the different words or combinations that may be made out of thoſe twenty-four letters, taking them firſt one by one, then two by two, three by three, &c. would amount to the following number, 1391,724288,887252,999425. 128493,402200. See COMBINATION.

It may be here obſerved, that every combination may make a word, even though that combination have not any vowel in it; becauſe the *e* mute, or quieſcent, inſinuates itſelf imperceptibly between the conſonants, or after the conſonants, where they are but two, the latter of which would not be heard without it.—The uſe of this ſilent *e* is very remarkable in the Armenian, Welſh, and Dutch languages; wherein the generality of words have ſeveral conſonants together.

Nor muſt it be omitted, that every ſingle letter may make a word: which is very apparent, where the letter is a vowel; words of that kind being found in moſt languages. Thus, *α* and *ω* make words in the Greek; *a*, *o*, in the Latin; *a*, *i*, *o*, in Engliſh; *a*, *o*, *y*, in French; *a*, *e*, *i*, *o*, in Italian; *a*, *y*, in Spaniſh; *a*, *o*, in the Portugueſe; *o*, in moſt languages, and even in the Dutch and Swediſh. Any conſonant alſo becomes a word, by adding an *e* mute to it in pronunciation.

In fine, though a conſiderable number of the poſſible combinations of twenty-four letters were retrenched, yet the number remaining would ſtill be immenſe, and vaſtly ſuperior to that of the words in any language known.

Of all known languages, the Greek is looked upon as one of the moſt copious, the radices only of which are eſteemed about 3244; but then it abounds exceedingly in compounds, and derivatives. Biſhop Wilkins thinks theſe may be moderately computed at about ten thouſand. Hermannus Hugo, indeed, aſſerts, that no language has ſo few as 100000 words; and Varro is frequently quoted by learned men, as if he affirmed that there are in the Latin no leſs than 5000000; but upon enquiring into the ſcope of the paſſage, biſhop Wilkins obſerves, that this number is not intended by him to expreſs the juſt number of words in the Latin; but the great variety made thereof, by the inflexion and compoſition of verbs.—To this purpoſe he lays it down, that there are above one thouſand radical verbs in the Latin; and that each verb admits of five hundred ſeveral varieties. He further ſuppoſes, that each of theſe may be compounded with nine prepoſitions; as *ceſſit*, *receſſit*, *acceſſit*, *deceſſit*, *præceſſit*, *proceſſit*, *ſucceſſit*, &c. which amounts to five millions. See WORD.

Concerning the origin and progreſs of *alphabetical* writing, ſee LETTERS.

ALPHABET, in matter of *Polygraphy*, is a duplicate of the key or cypher, which each of the parties correſponding are to keep by them.

It is properly an *alphabet* of the uſual letters diſpoſed in their order; oppoſite, or underneath which, are the ſecret characters correſponding thereto, with the blank or uſeleſs letters, and the other ſigns or ſymbols ſerving to obſcure, and render it difficult to DECIPHER.

ALPHABET, among *Merchants* and *Traders*, is a kind of index, with the twenty-four letters in their natural order, in which are ſet down the names and ſurnames of thoſe with whom open accounts are kept; and which refers to the folios of the ledger where thoſe accounts are written, in the form of debtor and creditor; ſerving to find eaſily, and without any trouble, ſuch accounts as are neceſſary to be turned to.

ALPHABET, among the French, ſignifies alſo thoſe punches of iron tools, which engravers upon metal uſe to engrave the ſeveral letters, or characters, which belong to their works, either for legends, or for other inſcriptions. The book-binders have alſo ſmall braſs tools, which they call alphabets, and with which they put the titles, and the number of the volume, on the back of books.

ALPHÆNIX, white barley-ſugar, to which is given an extraordinary name, to render it more valuable. This ſugar, which is thought good for colds, is made of common ſugar, which is boiled until it becomes eaſy to crack, when they pour it upon a marble table, greaſed with oil of ſweet almonds, and mould it into various figures with a braſs crotchet. It is eaſily falſified with ſtarch.

ALPHARD. See COR *hydræ*.

ALPHERATZ, in *Aſtronomy*, a fixed ſtar of the third magnitude in AQUARIUS.

This is otherwiſe called *alpharatz*. Some alſo give the denomination *enif alpharatz*, and *marchab alpharatz*, to two other ſtars in the right ſhoulder of PEGASUS.

ALPHESERA, in *Botany*, a name by which the Arabian, and ſome other authors, expreſs the white BRYONY.

ALPHESTES, in *Ichthyology*, the name of a fiſh, called by others CINÆDUS, ſeeming to approach very much to the *turdus*, or *wraſſe* kind, but having the rays or nerves of its back-fin prickly all the way to the tail; whereas the *turdi* have only the anterior rays of that fin prickly, the reſt ſmooth. It is a ſmall fiſh, and is always caught about the ſhores, and among rocks: its back is purple, and its ſides and belly yellowiſh. Its mouth is ſmall, and has thick and fleſhy lips. Geſner.

ALPHETA, in *Aſtronomy*, a fixed ſtar in the northern crown; otherwiſe called *lucida coronæ*.

ALPHITIDON, in *Surgery*, a ſpecies of fracture, wherein the bone is broken into a great number of ſmall parts, or particles.

The word is formed of αλφιτον, *farina*, *flour*; q. d. a bone ground to flour or powder.

ALPHITOMANTIA, in *Antiquity*. See ALEUROMANCY.

ALPHONSIN, is the name of a ſurgeon's inſtrument, uſed in the extraction of bullets from the body.

The *Alphonſin*, ſo called from its inventor Alphonſus Ferrier, a phyſician of Naples, conſiſts of three branches, which are cloſed together by means of a ring. The inſtrument thus cloſed, being conveyed into the wound to the bullet, the operator draws back the ring towards the handle, upon which the branches opening themſelves, lay hold of the ball: after this he puſhes the ring again, from the haſt, whereby the branches graſp the bullet ſo firmly, that it muſt needs come out with them.

ALPHONSINE *Tables*. See TABLES.

ALPHOS, in *Medicine*, a diſtemper deſcribed by Celſus, under the name of *vitiligo*; wherein the ſkin is rough, and becomes ſprinkled as it were with drops of white; and are thence denominated *leuce*. Where the ſpots are black, it is called *nigra*; and is alſo called *melane*. It bears the ſame relation to the *leuce*, as the *ſcabies* to the *lepra*; the firſt is ſuperficial and cutaneous, the ſecond ſinks deeper into the fleſh. The *alphos melas*, and *leuce*, are but one and the ſame diſorder, only differing in its degree of inveteracy.

ALPIEU, ſee BASSET.

ALPINE, ſee CISALPINE.

ALPINIA, in *Botany*, ſo called from Proſper Alpinus, a celebrated botaniſt, who died in 1616, a genus of the *monandria monogynia* claſs. Its characters are theſe: the flower has one *ſtamen*, and one ſtyle; it is cut into ſix parts at the top, and has a ſwelling tube, with three ſpreading lobes.

We know but one ſpecies of this genus, viz. the white branching *alpinia*, with leaves like the flowering reed. This plant is a native of the Weſt Indies, from whence it has been brought into ſome of the curious gardens of Europe, where it muſt be preſerved in a warm ſtove, and the pots plunged into a hot-bed of tanner's bark, otherwiſe it will not thrive in this country. The leaves decay every winter, and are puſhed out from the roots every ſpring like the ginger and *maranta*, ſo ſhould be managed in the ſame manner as is directed for thoſe two plants; and may be propagated by parting the roots, when the leaves decay. It grows naturally in moiſt places in the Weſt Indies.

ALPISTE, or ALPIA, a ſort of ſeed uſed to feed birds with, eſpecially when they are to be nouriſhed for breeding. The *alpiſte* ſeed is of an oval figure, of a pale yellow, inclining to an iſabel colour, bright and gloſſy. It is an article of the corn-chandlers and ſeedſmen's trade.

ALPS, in *Geography*, beſides its proper ſignification, by which it denotes a certain chain of mountains, which ſeparate Italy from France and Germany, is ſometimes uſed as an appellative to denote any mountains of extraordinary height.

In this ſenſe, Auſonius, and others, call the Pyrenean mountains, *Alps*; and Gellius, the Spaniſh *Alps*, *Alpini Hiſpani*.

Sidonius gives the ſame appellation of *Alps*, to mount Athos. Other authors ſpeak of Norman *Alps*, *Alps Arvennæ*, *Alpes Aſtoricenſes*, *Alpes Dofrinæ*, *Alpes Romaniæ*, *Alpes Baſtarnicæ*.—The Appennines are alſo called by Johannes Villeneuf, *Alpi D'Appennini*.

ALPS is alſo uſed to denote paſtures on the mountains, wherein cattle are fed in the ſummer time; or rather in the vallies, and ſpaces between the mountain tops. Some will have this to be the primary ſignification of the word *Alps*, which is ſuppoſed by theſe authors literally to denote the ſtreights or apertures between hills.

ALQUIER, which is alſo called *cantar*, a liquid meaſure for oil, uſed in Portugal. It contains ſix *cavadas*, or *canadors*. Two *alquiers* make an *almeede*, or *almonde*.

ALQUIER is alſo a meaſure for grain, at Liſbon.

ALQUIFOU, or ARQUIFOU, as the merchants ſpell it, is a ſort of mineral *lead*, very heavy, eaſily reduced into powder, and hard to melt. When it is broken, it parts into ſhining ſcales, much like the colour of needles of antimony. The potters uſe it to give their works a green varniſh. In England it is commonly called *potter's* ORE. It is found in Cornwall; the potters mix manganeze with it, and then the varniſh, or glazing, on their wares, becomes of a blackiſh colour.

ALRAMECH, or ARAMECH, in *Aſtronomy*, the Arabic name of a ſtar of the firſt magnitude, otherwiſe called ARCTURUS.

ALRATICA, among the Arabian *Phyſicians*, is where the *vulva*, or *vagina*, of a woman is imperforate, or at leaſt the *foramen* ſmaller than ordinary, whether naturally, or by accident.

ALRAUPE, in *Ichthyology*, a name given by the Germans, to the *muſtela fluviatalis*, or eelpout, a ſpecies of the GADUS

ALRUKAK, in the *Materia Medica*, a word uſed by Avicenna, and others of his nation, for what was called by the Greeks *leptos libanotis*, and *manna thuris*. This was the fragments of frankincenſe, which were broken off from the larger pieces in the collecting or packing up, and were moſt eſteemed in medicine, as being the drieſt and pureſt kind.

ALRUM, in the *Botanical Writings of the Ancients*, a name given to the tree which produces the *bdellium*. This gum was originally known to be the exſudation of a tree growing in Arabia and the Eaſt Indies, and well known to Avicenna and others, and by all of them called by that name.

ALRUNES, a name given by the ancient Germans to ſmall figures of wood of which they made their LARES.

ALSADAF, in the *Materia Medica*, a name given by Avicenna and Serapio, to the *unguis odoratus*, and alſo to the *murex*, or purple fiſh, of the ſhell of which it was ſuppoſed to be a part

ALSAHARATICA, a name uſed in *Botany*, by ſome, to ſignify the *parthenium*, or FEVERFEW.

ALSCHARCUR, in the *Materia Medica*, a name given by Rhaſes, and ſome other of the old writers, to the SKINK, a ſmall animal of the lizard kind, uſed in medicine as a cordial, and as a provocative to venery.

ALSCNEFU, in *Botany*, a name uſed, by ſome authors, for WORMWOOD.

ALSEBON, a name given by ſome of the chemical writers, to ſea-ſalt.

ALSIMBEL, in the *Materia Medica*, a name given, by Avicenna and others, to the *ſpikenard* of India. It is thus called from its having the appearance of a ſpike, or ear, and alſo *ſimbalath*, a word which ſignifies its being a *congeries* of many ſpikes, or ears, and ſuch is much of the *nardus Indica*, or Indian *ſpikenard*, that we receive at this day.

ALSINASTRUM, in *Botany*, the *elatine* of Linnæus; a name given by Vaillant to a genus of plants, on account of their general reſemblance to the *alſines*, or *chickweeds*. The characters of the *alſinaſtra* are theſe: the flower and fruit are the ſame with thoſe of the *alſine*; but the flower-cup in theſe is compoſed only of one leaf, whereas in thoſe it is made up of ſeveral. Tournefort mentions two ſpecies. Inſt. 244.

ALSINE, CHICKWEED, in *Botany*, a genus of the *pentandria trigynia* claſs of plants, the calyx of which is a perianthium, conſiſting of five concave, oblong, and acuminated leaves; the corolla conſiſts of five equal petals, longer than the cup; the fruit is an oval covered capſule, containing only one cell, with three valves; the ſeeds are numerous and roundiſh.

ALSINELLA, in *Botany*, the name by which Dillenius calls the plant *ſagina*.

ALSINOIDES, the *buſonia* and *montia* of Linnæus.

ALSIRAT, in the Mahometan *Theology*, a bridge laid over the middle of hell, finer than a hair, and ſharper than the edge of a ſword, over which people are to paſs, after their trial, on the day of judgment.

To add to the difficulty of the paſſage, Mahomet aſſures, that the *alſirat*, narrow as it is, is beſet with briars and thorns; none of which, however, will be any impediment to the good, who ſhall fly over it like the wind; Mahomet and his muſſulmen lead the way; whereas the wicked by the narrowneſs of the path, the entangling of the thorns, and extinction of the light, which directed the former to paradiſe, will ſoon miſs their footing, and tumble headlong into hell, which is gaping beneath to receive them. Vid. Sale's Prelim. Diſc. to Koran, ſec. iv. p. 90.

ALSTROEMERIA, in *Botany*, a genus of the *hexandria monogynia* claſs; the corolla of which hath ſix petals, with two lower petals, tubulous at the baſe, and declining ſtamina.

ALT, in *Muſic*. See DIAGRAM and SCALE.

The word is formed of the Latin, *altus*, *high*,

ALTAR, ALTARE, ARA, a place or pile whereon to offer ſacrifice to ſome deity.

The Jews had their brazen *altar*, for burnt-offerings, and a golden *altar*, or *altar* of incenſe.

Among the Romans, the *altar* was a kind of pedeſtal, either ſquare, round, or triangular; adorned with ſculpture, with baſſo relievos, and inſcriptions, whereon were burnt the victims ſacrificed to idols.

According to Servius, thoſe *altars* ſet apart for the honour of the celeſtial gods, and gods of the higher claſs, were placed on ſome pretty tall pile of building; and for that reaſon were called *altaria*, from the words *alta* and *ara*, a high elevated *altar*.—Thoſe appointed for the terreſtrial gods, were laid on the ſurface of the earth, and called *aræ*.—And on the contrary, they dug into the earth, and opened a pit, for thoſe of the infernal gods, which they called βοϑροι λακκοι, *ſcrobiculi*. But this diſtinction is not every where obſerved: the beſt authors frequently uſe *ara* as a general word, under which are included the *altars* of the celeſtial and infernal, as well as thoſe of the terreſtrial gods. Witneſs Virgil, Ecl. 5.

——*En quatuor aras.*

Where *aræ* plainly includes *altaria*; for whatever we make of Daphnis, Phœbus was certainly a celeſtial god. So Cicero, pro Quint. *Aras delubraque Hecates in Græcia vidimus.*

The Greeks alſo diſtinguiſhed two ſorts of *altars*; that whereon they ſacrificed to the gods, was called βωμος, and was a real *altar*, different from the other, whereon they ſacrificed to the heroes, which was ſmaller, and called εσχαρα. Pollux makes this diſtinction of *altars* in his Onomaſticon; he adds, however, that ſome poets uſed the word εσχαρα, for the *altar* whereon ſacrifice was offered to the gods.—The Septuagint verſion does ſometimes alſo uſe the word εσχαρα, for a ſort of little low *altar*, which may be expreſſed in Latin by *craticula*; being a hearth, rather than an *altar*.

The Jews alſo gave the name *altars* to a kind of tables occaſionally raiſed in the country or field, whereon to ſacrifice to God.—In ſuch a place, *he built an* altar *to the Lord.*

Altars were of divers kinds, with regard to their qualities, uſe, matter, form, accidents, and the like, and were ſacred to gods, heroes, virtues, vices, diſeaſes, &c. Thus we read of inner and outer, ſtationary and portable, public and private *altars*, &c.

Altars are doubtleſs as ancient as ſacrifices themſelves; conſequently their origin is not much later than that of the world. Gen. ch. iv.

Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some carry them as far back as Adam, whoſe *altar* is much ſpoken of by Jewiſh, and even Chriſtian writers. —Others are contented to make the patriarch Enoch the firſt who conſecrated a public *altar*. Be this as it will, the earlieſt *altars* we find any expreſs teſtimony of, are thoſe erected by Abraham.

ALTAR *of Adam*, in *Antiquity*, is pretended, by ſome rabbins, and others, to have been erected by the firſt man, ſoon after the fall; when being overwhelmed with ſorrow, a promiſe was made him, by the miniſtry of the angel Haziel, that a redeemer ſhould be ſent. In gratitude for this news, and for a perpetual remembrance thereof, Adam is ſaid to have built an *altar*, and ſacrificed on it a heifer.

The reliques of this *altar* have been mentioned by ſeveral writers of late ages.

ALTAR is ſometimes alſo uſed, among Chriſtians, for a ſquare table, placed on the eaſtern ſide of a church, raiſed a little above the floor, and ſet apart for the celebration of the euchariſt.

Its form is not borrowed, either from that of the heathen *altars*, or even from that of the Jews in the temple; but, as the euchariſt was inſtituted by Jeſus Chriſt at ſupper, and upon a table, the modern *altar* is made in form of a table; whence it is more uſually, and even more ſignificantly, denominated *Communion Table.*

In effect, the denomination *altar* is founded on this ſuppoſition, that the euchariſt is a proper ſacrifice; which, though the ſtanding doctrine of the church of Rome, is utterly denied by moſt of the reformed.

In the primitive church, the *altars* were only of wood; as being frequently to be removed from place to place. But the council of Paris, in 509, decreed that no *altar* ſhould be built but of ſtone.

At firſt there was but one *altar* in each church; but the number ſoon increaſed; and from the writings of Gregory the Great, who lived in the ſixth century, we learn, that there were ſometimes in the ſame church twelve or thirteen.—In the cathedral of Magdeburg there are no leſs than forty-nine *altars.*

The *altar* is ſometimes ſuſtained on a ſingle column, as in the ſubteraneous chapels of St. Cæcilia, at Rome, &c. and ſometimes by four columns, as the *altar* of St. Sebaſtian of Crypta Arenaria; but the cuſtomary form is, to be a maſſive of ſtone-work, ſuſtaining the *altar-table.*

Theſe *altars* bear a reſemblance to tombs: to this purpoſe, we read in church-hiſtory, that the primitive Chriſtians chiefly held their meeting at the tombs of the martyrs, and celebrated the myſteries of religion upon them. For which reaſon, it is a ſtanding rule to this day in the church of Rome, never to build an *altar*, without incloſing the relics of ſome ſaint in it.

In lieu of proper *altars*, the Greeks in proceſs of time made uſe of ANTIMENSIA.

ALTAR *of Protheſis*, is a name given by the modern Greeks to a ſmaller, preparatory kind of *altar*, whereon they bleſs the bread, before it be carried to the large *altar*, where the ſolemn liturgy is performed.

F. Goar maintains, that the table of *protheſis* was anciently in the ſacriſty, or veſtry; which he makes appear from ſome Greek copies, where ſacriſty it made uſe of in lieu of *protheſis.*

ALTAR is alſo uſed, in *Church Hiſtory*, for the oblations, or contingent incomes of a church.

In ancient days they diſtinguiſhed between the church and the *altar.*—The tithes, and other ſettled revenues, were called the *church*, *eccleſia*; and the other incidental incomes, the *altar.*

ALTAR, in *Aſtronomy*. See ARA.

ALTAR-*thane*, in our *Ancient Law Books*, denotes a prieſt, or parſon of a pariſh.

In this ſenſe, the word is ſynonymous with *church-thane.*

ALTARAGE, includes not only the offerings made upon the altar, but alſo the profit that ariſes to the prieſt on account of the altar.

ALTARIST, *altariſta*, properly denotes the vicar of a church, who ſerves the altar, and to whom the altarage, or produce of the altar, is aſſigned for his maintenance. Du-Cange.

The *altariſt* is ſometimes alſo called *altararius*, ſometimes *altar-prieſt.*

ALTARIST is alſo uſed for *chaplain.*

ALTASRIF, in *Literary Hiſtory*, the title of a medicinal book, written in Arabic, deſcribing the method of practice in uſe among the Arabs.

It was written by Alſaharavius, an author in the fifteenth century, and tranſlated into Latin by P. Ricius, in 1519. Concerning the hiſtory and contents of the *Al-Taſrif*, ſee Freind, Hiſt. Phyſ. p. ii. p. 124, ſeq.

ALTAVELA, in *Ichthyology*, the name of a flat cartilaginous fiſh, of the *aquila marina* kind; but with its wings, as they are called, that is, its thin and flat ſides, broad and obtuſe toward their lower part. The fiſhermen, from the reſemblance theſe flat ſides have to wings, have an opinion that this fiſh can fly. The tail is very ſhort, ſcarce being of half the length of the body. Its fleſh is ſolid, and well taſted, and it always ſells well in the markets. It is caught in the Mediterranean, and is frequently brought to market at Rome. Fab. Columna.

ALTE' *& baſſe*, in *Middle Age Writers*, denotes ſovereignty, or a thing done with the ſupreme power. Du-Cange.

ALTERANT, or ALTERATIVE, in *Medicine*, a property, or power, in certain remedies, whereby they induce an *alteration* in the body, and diſpoſe it for health or recovery, by correcting ſome indiſpoſition, without occaſioning any ſenſible evacuation.

Alteratives, therefore, muſt generally be either ſuch remedies as deſtroy ſome prevailing acrimony in the *primæ viæ*, or in the juices; or elſe ſuch as reſolve concretions in the blood-veſſels, and diſpoſe them, when thus reſolved, to paſs out of the body by perſpiration, or ſome of the leaſt remarkable evacuations.

Alteratives are generally divided into four kinds, which are, *abſorbents* for imbibing and blunting the acid juices; *temperating medicines* for checking and mitigating the rage of the bilious intemperies; *penetrating medicines* for diſſolving and attenuating the thick and viſcid juices; and, in fine, *demulcents* for ſheathing and mitigating their burning and corroſive acrimony.

We meet with medicines of the purgative kind, repreſented by practical writers as *alterants*; the *colocynth* particularly by Helmont; for all medicines which operate in the fartheſt paſſages, they frequently include under that appellation. Phil. Tranſ. Nº 365.

Dr. Woodward inquires into the efficacy of ſeveral of the moſt celebrated *alterants*, and endeavours to ſhew on what little foundation their great uſe is eſtabliſhed. Of this number, according to him, are the abſorbents, *cortex Peruvianus*, bitters, ſalts, ſteel, and its preparations, mineral waters, &c.

The more efficacious and uſeful *alterants*, according to the ſame writer, are cordials, ſtomachics, attenuants, *mercurius dulcis*, vegetable oils, mucilages, certain abſorbents, and ſome preparations of opium.

According to this learned phyſician, all that is commonly alledged concerning the change of the principles, or ferments of diſeaſes, by *alterant* remedies, is merely chimerical and imaginary; that there is no change made to the advantage of the human body, without a ſucceſſive renovation, and diſcharge of what is hurtful, and a ſupply of its place by ſomething innocent.

The primitive or conſtituent elements of bodies never change their figure, magnitude, ſolidity, or gravity, but remain ſtill the ſame as at the creation. Hence ſome infer, 1. The vanity of all pretences to the tranſmutation of metals. And, 2. The folly of pretending to change the maſs of blood, by thoſe remedies called *alterants.*

The mixtures and combinations of the primitive elements are almoſt infinite, and their alterations as to ſenſe and external appearance is ſo too. It may be added, that among *alterant* medicines, there are ſeveral which change the ſcene of the ſymptoms; others ſuſpend the action of the morbific matter for a time; and others diminiſh the ſenſibility of the organs. But theſe remedies, which hold the morbific principles captive for a time, are only palliatives, and even, on ſome accounts, dangerous, ſince they may as well captivate other principles neceſſary to life. Woodward gives the preference to evacuants, as being the only medicines capable of freeing the machine from that which incommodes it.

Some take a contrary courſe, and aſcribe even the ſalutary effects of evacuants to their *alterative* nature. This has been alledged of mercury in the venereal diſeaſe; the like is urged concerning minoratives, which ſome maintain do not work a cure by evacuation, ſo much as by alteration. The like is alledged of *ipecacuanha* in the cure of dyſenteries, and of divers other emetics, in caſes of apoplexies. In effect, evacuating medicines, as they do not ſeparate the good from the bad, ſeem indifferently diſpoſed, either to do harm or good. See Woodward's State of Phyſic, *paſſim.*

ALTERATE. See SESQUIALTERATE.

ALTERATION, **Alteratio**, in *Phyſic*, the act of changing the circumſtances and manner of a thing; its general nature and appearance remaining the ſame.—Or, it is an accidental, and partial change in a body; without proceeding ſo far, as to make the ſubject quite unknown, or to take a new denomination thereupon.—Or, it may be defined, the acquiſition or loſs of ſuch qualities as are not eſſential to the form of the body.

Thus, a piece of iron, which before was cold, is ſaid to be *altered*, when it is made hot; ſince it may ſtill be perceived to be iron, is called by that name, and has all the properties thereof.

By this, *alteration* is diſtinguiſhed from *generation* and *corruption*; thoſe terms expreſſing an acquiſition or loſs of the eſſential qualities of a thing.

The modern philoſophers, after the ancient chemiſts and corpuſcularians, hold all *alteration* to be effected by means of local motion. According to them, it always conſiſts either in the emiſſion, acceſſion, union, ſeparation, or tranſpoſition, of the component particles.

Ariſtotle makes a peculiar kind of motion, which he calls the *motion of alteration*.

Alteration, is uſed, in *Medicine*, to denote a change in the ſtate and qualities of an animal body, in reſpect of temperature or conſtitution, health or ſickneſs.

In this ſenſe, *alteration* includes both *evacuation* and *accretion*.

Alteration is more ſtrictly taken for a change in the quality of the body, contradiſtinguiſhed from *evacuation* and *appoſition*.

In which ſenſe, *alteration* is the effect of medicines called ALTERANTS.

Alteration is chiefly applied in reſpect of the fluids, or humours of the body. When applied to the ſolids, it is chiefly in reſpect of the humours, or the motions of them.

Alteration is ſometimes alſo applied in reſpect of the vital motions of the body.

Thus ſpecifics are applied to alter and rectify convulſive and other diſorderly motions. The *alteration* of the humours is either extrinſic, or intrinſic.

Alteration, *extrinſic*, is a change produced in the ſenſible appearances, as colour, thickneſs, and the like.

Alteration, *intrinſic*, is a change in the primitive craſis, or conſtitution of a fluid.

Alteration, in a ſenſe ſtill more ſtrict, denotes that converſion which the food undergoes, to render it nouriſhment.

In this ſenſe *alteration* both includes the digeſtion performed in the ſtomach, and the aſſimilation in the habit of the body.

It is diſputed among phyſicians what the *alteration* is which the food undergoes.—Some reduce it to a mere comminution or trituration.—Others aſſert a total tranſubſtantiation. See DIGESTION.

Alteration, in *Alchemy*, denotes the converſion of one body into another by ſimilitude.

Alteration *of quantities*, among *Algebraiſts*, denote what we otherwiſe call variations, or permutations.

ALTERATIVE, in *Medicine*, the ſame with ALTERANT.

ALTERCATION, a debate or conteſt between two friends, or acquaintance.

The word comes from *altercari*; which anciently ſignified to converſe or hold diſcourſe together.

Thus, we ſay, they never come to an open quarrel; but there is continually ſome little *altercation* or other.

ALTERCUM, in *Botany*, a name by which ſome of the old authors expreſs the HYOSCYAMUS, or HENBANE.

ALTERITY is uſed by ſome philoſophers for DIVERSITY.

The word is formed of the Latin, *alter*, *another*.

Alterity amounts to the ſame with what others call *aliety*, *alietas*.

ALTERN *baſe*, a term in *Trigonometry*, contradiſtinguiſhed from *true baſe*, thus—In an oblique triangle, the true baſe is either the ſum of the ſides; in which caſe, the difference of the ſides is called the *altern baſe*; or, the true baſe is the difference of the ſides; in which caſe, the ſum of the ſides is called the *altern baſe*.

ALTERNATE, or ALTERNATIVE, is underſtood of ſeveral things which ſucceed, or are diſpoſed after each other by turns.

We ſay, an *alternate*, or *alternative* office, or truſt, which is that diſcharged by turns; ſo, two general officers, who command each his day, are ſaid to have the command *alternately*.

In *Botany*, the leaves of a plant are ſaid to be *alternate*, or placed *alternatively*, when there is a correſpondence between the two ſides of a branch; the leaves of the one ſtanding a little above thoſe of the other, not one oppoſite to the other.

Alternate, in *Arithmetic*. See ALLIGATION.

Alternate *angles*, in *Geometry*, are the internal angles made by a line cutting two parallels, and lying on the oppoſite ſide of the cutting line; the one below the firſt parallel, and the other above the ſecond.

Thus, x and u, and z and y (*Tab. Geometry*, *fig.* 46.) are *alternate* angles.

There are alſo two external angles, *alternately* oppoſite to the internal ones. See PARALLEL.

Alternate *ratio*, or *proportion*, is where the antecedent of one ratio is to its conſequent, as the antecedent of another to its conſequent; the very ſame ratio, in this caſe, holding *alternately* in reſpect of the antecedents to each other, and the conſequents to each other.

Thus, if $A : B :: C : D$; then, *alternately*, $A : C :: B : D$.

Alternate, in *Heraldry*, is uſed in reſpect of the ſituation of the QUARTERS.

Thus in quarterly *ecartelé*, the firſt and fourth quarters are *alternate*; and are uſually of the ſame nature. And the like holds of the ſecond and third.

ALTERNATION, in its primary ſenſe, denotes a ſucceſſion by turns.

Alternation is more particularly uſed, among *Civilians*, for disjunction, as in ſaying this or that.

ALTERNATIONS, a term ſometimes uſed to expreſs the divers changes, or alterations of orders, in any number of things propoſed.

This is alſo called *permutation*, &c. and is eaſily found by a continual multiplication of all the numbers, beginning at unity.

Thus, if it be required to know how many changes or *alternations* can be rung on ſix bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually one into another; and the laſt product gives the number of changes.

ALTERNATIVE, is particularly uſed for the choice of two things propoſed.—In this ſenſe we ſay, to take the *alternative* of two propoſitions.

ALTHÆA, in *Botany*, a genus of the *monodelphia polyandria* claſs. See MARSH-MALLOW.

ALTIMETRY, **Altimetria**, the art of taking or meaſuring ALTITUDES or heights, whether acceſſible or inacceſſible.

The word is compounded of *altus*, *high*, and *μετρεω*, *metior*, *to meaſure*.

Altimetria makes the firſt part of geometry; including the doctrine and practice of meaſuring both perpendicular and oblique lines; whether in reſpect of height, or depth.

ALTIN, a money of account in Muſcovy; worth three *copecs*, one hundred of which make a *ruble*, worth about four ſhillings and ſix pence ſterling.

ALTINCAR, among *Mineraliſts*, a ſpecies of factitious ſalt uſed in the fuſion and purification of metals.

The *altincar* is a ſort of flux powder. Divers ways of preparing it are given by Libavius.

ALTITH, in *Botany*, a name given by ſome authors to the plant of which the *aſſafœtida* of the ſhops is the gum.

ALTITUDE, **Altitudo**, in *Geometry*, the third dimenſion of body, conſidered with regard to its elevation above the ground—called alſo *height* or *depth*.

Altitude *of a figure*, is the diſtance of its vertex from its baſe, or the length of a perpendicular let fall from the vertex to the baſe.

Thus, K L (*Tab. Geometry*, *fig.* 19.) being taken for the baſe of the rectangle-triangle, K L M; the perpendicular K M will be the *altitude* of the triangle.

Triangles of equal baſes and *altitudes* are equal; and parallelograms, whoſe baſes and *altitudes* are equal to thoſe of triangles, are juſt the double thereof.

Altitude, in *Optics*, is uſually conſidered as the angle ſubtended between a line drawn through the eye, parallel to the horizon, and a viſual ray emitted from an object to the eye.

For the laws of the viſion of *altitude*, ſee VISION.

If through the two extremes of an object, S and T (*Tab. Optics*, *fig.* 13.) two parallels, T V and S Q be drawn; the angle TVS, intercepted between a ray paſſing through the vertex S, and terminating the ſhadow thereof in V, makes, with the right line TV, what is called, by ſome writers, the *Altitude of the Luminary*.

Altitude, in *Coſmography*, is the perpendicular height of an object, or its diſtance from the horizon, upwards.

Altitudes are diveſted into *acceſſible* and *inacceſſible*.

Altitude, *acceſſible*, of an object, is that whoſe baſe you can have acceſs to, i. e. meaſure the neareſt diſtance between your ſtation, and the foot of the object on the ground.

Altitude, *inacceſſible*, of an object, is that when the foot or bottom of it cannot be approached, by reaſon of ſome impediment; ſuch as water, or the like.

There are three ways of meaſuring *altitudes*, viz. *geometrically*, *trigonometrically*, and *optically*.—The firſt is ſomewhat indirect and unartful; the ſecond is performed by means of inſtruments for thv purpoſe: and the third by ſhadows

The inſtruments chiefly uſed in meaſuring of *altitudes*, are the quadrant, theodolite, geometric quadrat, or line of ſhadows, &c. the deſcriptions, applications, &c. whereof, ſee under their reſpective articles QUADRANT, THEODOLITE, and QUADRAT.

ALTITUDES, *to take acceſſible.* To meaſure an acceſſible *altitude, geometrically.*—Suppoſe it required to find the *altitude* AB (*Tab. Geometry, fig.* 88.) plant a ſtaff DE perpendicularly in the ground, of ſuch height as may equal the height of the eye. Then, lying proſtrate on the ground, with your feet to the ſtaff; if E and B prove in the ſame right line with the eye C; the length CA is equal to the *altitude* AB. If ſome other lower point, as F, prove in the line with E, and the eye, you muſt remove the ſtaff, &c. nearer to the object: on the contrary, if the line continued from the eye over E, mark out ſome point above the *altitude* required; the ſtaff, &c. are to be removed farther off, till the line CE raſe the very point required.—Thus, meaſuring the diſtance of the eye C from the foot of the object A, the *altitude* is had; ſince CA=AB.

Or thus: at the diſtance of thirty, forty, or more feet, plant a ſtaff DE (*fig.* 89.) and at a diſtance from this, in C, plant another ſhorter one, ſo as that the eye being in F, E and B may be in the ſame right line therewith. Meaſure the diſtance between the two ſtaves, GF; and between the ſhorteſt ſtaff, and the object, HF; as alſo, the difference of the heights of the ſtaves, GE.—To GF, GE, and HF, find a fourth proportional BH.—To this add the *altitude* of the ſhorter ſtaff, FC. The ſum is the *altitude* required, AB.

To meaſure an acceſſible *altitude*, trigonometrically—Suppoſe it required to find the *altitude* AB (*Tab. Trigonom. fig.* 23.) chooſe a ſtation in E; and with a quadrant, theodolite, or other graduated inſtrument duly placed, find the quantity of the angle of *altitude* ADC. Meaſure the ſhorteſt diſtance of the ſtation from the object, viz. DC; and this of conſequence is perpendicular to AC.

Now, C being a right angle, it is eaſy to find the line AC; ſince, in the triangle ACD, we have two angles, viz. D and A its complement, and a ſide oppoſite to one of them, CD, the ſide oppoſite to the other may be eaſily found by this canon.—As the ſine of the angle A is to the given ſide oppoſite thereto DC; ſo is the ſine of the other angle D to the ſide required CA. See TRIANGLE.

To the ſide thus found, adding BC, the ſum is the perpendicular *altitude* required.

The operation is beſt performed by logarithms. See LOGARITHM.

If there happen an error in taking the quantity of the angle A (*fig.* 24.) the true *altitude* BD will be to the falſe one BC, as the tangent of the true angle DAB, to the tangent of the erroneous angle CAB.

Hence, ſuch error will be greater in a greature *altitude* than in a leſs; and hence alſo, the error is greater, if the angle be leſſer, than if it be greater. To avoid the inconveniences of both which, the ſtation is to be pitched on at a moderate diſtance; ſo that the angle of *altitude*, DAB, may be nearly half right.

Again, if the inſtrument were not horizontally placed, but inclined, e. gr. to the horizon in any angle, the true *altitude* will be to the erroneous one, as the tangent of the true angle to that of the erroneous one.

To meaſure an acceſſible *altitude* optically, by the ſhadow of the body, ſee SHADOW.

To meaſure an acceſſible *altitude* by the geometrical quadrat.—Suppoſe it required to find the *altitude* AB (*Tab. Geom. fig.* 90.) chooſing a ſtation at pleaſure in D, and meaſuring the diſtance thereof from the object DB; turn the quadrat this and that way, till the top of the tower A appear through the ſights.

If, then, the thread cut the right ſhadows, ſay, as the part of the right ſhadow cut off, is to the ſide of the quadrant, ſo is the diſtance of the ſtation DB, to the part of the *altitude* AE.—If the thread cut the verſed ſhadows, ſay, as the ſide of the quadrant is to the part of the verſed ſhadow cut off, ſo is the diſtance of the ſtation DB, to the part of the *altitude* AE.

AE, therefore, being found in either caſe, by the rule of three, and the part of the *altitude* BE added thereto, the ſum is the *altitude* required. See QUADRAT.

ALTITUDE, *to meaſure an acceſſible, geometrically.*—Suppoſe AB (*fig.* 89.) an inacceſſible *altitude*, ſo that you cannot meaſure to the foot of it. Find the diſtance CA, or FH, as taught under the article DISTANCE; then proceed with the reſt as in the article for acceſſible diſtances.

To meaſure an inacceſſible *altitude*, *trigonometrically.*—Chooſe two ſtations, G and F (*Tab. Trigonom. fig.* 25.) in the ſame right line with the required *altitude* AB, and at ſuch diſtance from each other, DF, as that neither the angle FAD be too ſmall, nor the other ſtation G too near the object AB.—With a proper inſtrument take the quantity of the angles ADC, AFC, and CFB. See ANGLE.—And alſo meaſure the interval FD.

Then, in the triangle AFD, we have the angle D, given by obſervation; and the angle AFD, by ſubtracting the obſerved *altitude* AFC, from two right angles; and conſequently the third angle DAF, by ſubtracting the other two from two right ones; and alſo the ſide FD; from whence the ſide AF is found by the canon above laid down, in the problem of acceſſible *altitudes*. And again, in the triangle ACF, having a right angle C, an obſerved angle F, and a ſide AF, the ſide AC, and the other CF, are found by the ſame canon. Laſtly, in the triangle FCB, having a right angle C, obſerved angle CFB, and a ſide CF; the other ſide CB, is found by the ſame canon.

Adding, therefore, AC, and CB, the ſum is the *altitude* required, AB.

To find an inacceſſible *altitude* by the ſhadow, or the geometrical quadrat.—Chooſe two ſtations in D and H (*Tab. Geom. fig.* 90.) and find the diſtance DH, or CG: obſerve what part of either the right or verſed ſhadow is cut by the thread.

If the right ſhadows be cut in both ſtations, ſay, As the difference of the right ſhadows in the two ſtations, is to the ſide of the ſquare; ſo is the diſtance of ſtations GC to the *altitude* EA.—If the thread cut the verſed ſhadow at both ſtations, ſay, As the difference of the verſed ſhadows marked at the two ſtations, is to the leſſer verſed ſhadow; ſo is the diſtance of the ſtations GC, to the interval GE.—Which being had, the *altitude* EB is alſo found by means of the verſed ſhadow in G; as in the problem for acceſſible *altitudes*. Laſtly, if the thread in the firſt ſtation G, cut the right ſhadows, and in the latter, the verſed ſhadows; ſay, As the difference of the product of the right ſhadow into the verſed, ſubtracted from the ſquare of the ſide of the quadrat, is to the product of the ſide of the quadrat into the verſed ſhadow; ſo is the diſtance of the ſtations GC, to the *altitude* required AE.

The utmoſt diſtance at which an object may be ſeen, being given, to find its *altitude.*—Suppoſe the diſtance DB (*Tab. Geography, fig.* 9.) turn this into degrees; by which means, you will have the quantity of the angle C: from the ſecant of this angle ſubtract the whole ſide BC, the remainder will be AB, in ſuch parts, whereof BC, is 10000000—Then ſay, as 10000000 is to the value of AB in ſuch parts, ſo is the ſemidiameter of the earth BC 19695539, to the value of the *altitude* AB in Paris feet.

Suppoſe, e. gr. the *altitude* be required of a tower AB, whoſe top is viſible at the diſtance of five miles: then will DCB 20′, from whoſe ſecant 10000168, ſubtracting the whole ſine 10000000; the remainder AB is 168, which will be found 331 Paris feet.

The method of taking conſiderable terreſtrial *altitudes*, of which thoſe of mountains are the greateſt, by means of the BAROMETER, is very eaſy and expeditious. This is done by obſerving on the top of the mountain how many inches, &c. the mercury is fallen below what it was at the foot of the mountain. When this is done, you will have its *altitude* by the help of a table calculated for that purpoſe. A very accurate table of this kind may be found in the Hiſt. de l'Acad. Roy. des Scien. 1703, and 1705, calculated by M. Caſſini; and alſo in the Phil. Tranſ. Eame's and Martin's Abr. vol. vi. p. 34.

ALTITUDE, *determinative*, in *Mechanics*, is ſometimes uſed for the height, whence a falling body acquires, by acceleration, a certain velocity. Hermannus, Phoron. lib. i.

ALTITUDE *of the eye*, in *Perſpective*, is a right line let fall from the eye, perpendicular to the geometrical plane.

ALTITUDE, in *Aſtronomy*, is the diſtance of a ſtar, or other point, in the mundane ſphere, from the horizon.

This *altitude* may be either TRUE or APPARENT.—If it be taken from the rational, or real horrizon, the *altitude* is ſaid to be *true*, or *real*; if from the apparent or ſenſible horizon, the *altitude* is *apparent.*—Or rather, the apparent *altitude* is ſuch as it appears to our obſervation; and the *true* is that from which the refraction has been ſubtracted.

The true *altitudes* of the ſun, fixed ſtars, and planets, differ but very little from their apparent *altitudes*; becauſe of their great diſtance from the center of the earth, and the ſmallneſs of the earth's ſemidiameter, when compared thereto. But the difference between the true and apparent *altitude* of the moon is about 52′.

The *altitude* of a ſtar, or other point, is properly an arch of a VERTICAL circle, intercepted between the aſſigned point and the HORIZON. Hence

ALTITUDE, *meridian.*—The meridian being a vertical circle; a *meridian altitude*, that is, the *altitude* of a point in the meridian, is an arch of the meridian intercepted between it and the horizon.

To obſerve the *meridian altitude* of the ſun, of a ſtar, or other phænomenon, by means of the quadrant, ſee MERIDIAN *Altitude*.

To obſerve a *meridian altitude* by means of a gnomon, ſee GNOMON.

The ſun's *altitude* may alſo be found without a quadrant, or any the like inſtrument, by erecting a pin or wire perpendicularly, as in the point C (*Tab. Aſtronomy, fig.* 62.) from which point you have deſcribed the quadrantal arch AF. Make CE equal to the height of the pin or wire, and through E draw ED parallel to CA, and make it equal to CG, the length of the ſhadow; then will a ruler, laid from C to D, interſect the quadrant in B; and BA is the arch of the ſun's *altitude*, when meaſured on the line of chords.

An irregularity has been obſerved in the apparent *altitudes* of the ſtars near the MERIDIAN. On ſome occaſions, when they are mounting towards the meridian, they appear to fall, and after paſſing the meridian, to riſe. Hiſt. Acad. Scienc. 1719. p. 75.

M. Parent ſuggeſts a new method of taking *altitudes* at ſea, by a common watch. It is obvious, that in an oblique ſphere, the difference between the riſing and ſetting of two ſtars, on the ſame meridian, is greater, as they are farther diſtant from one another.

Now, the aſtronomical tables furniſhing us with tables of the right aſcenſions and declinations of all the fixed ſtars, it is eaſy, after obſerving the difference of time between the riſing of two ſtars, to diſtinguiſh that part of the difference which accrues from their different poſition from that which ariſes from the obliquity of the ſphere.—But ſuch difference is the preciſe height of the pole of the place of obſervation.

Indeed, the ſhip not being immoveable, but changing place between the two obſervations, ſeems to lay the method under ſome difficulty; but to this M. Parent anſwers, that a ſmall alteration either of the ſhip's longitude or latitude, will make no ſenſible error; and that if ſhe have gone a large diſtance between the two obſervations, it is eaſy reckoning how much it is, and accordingly allowing for it. See SAILING.

ALTITUDE, *the, of the Sun*, may be computed by the following rule, propoſed by Mr. Lyons for nautical purpoſes. By the rules in the Nautical Almanac, for 1771, find the logarithm ratio; ſubtract it from the riſing found anſwering to the given diſtance of time from noon, in the tables of the ſame Almanac; the remainder is the logarithm of a number, which ſubtracted from the natural ſine of the ſun's meridian *altitude*, leaves the natural ſine of the *altitude* at the required time. For finding the *altitude* of the moon or a ſtar, he gives the following rule. From the tables abovementioned, take out the riſing, correſponding to the horary angle in the diſtance of time from the ſtar's paſſing the meridian; add to it the logarithmic coſine of the ſtar's declination, and the logarithmic coſine of the latitude of the place; the ſum, abating twenty from the index, is the logarithm of a number, which ſubtracted from the natural ſine of the ſtar's meridian *altitude*, leaves the natural ſine of the *altitude* at the given time. Theſe rules are of great importance in determining the longitude at ſea. See Naut. Alm. for 1778.

In taking of *altitudes* from the viſible horizon, where great exactneſs is required, an allowance is to be made for refraction, and the height of the obſerver's eye above the ſurface of the ſea.

ALTITUDE *of the pole*, is an arch of the meridian, intercepted between the pole and the horizon.

The *altitude of the pole* coincides with the latitude of the place.

To obſerve the *altitude* or elevation of the pole, ſee POLE.

ALTITUDE *of the equator*, is the complement of the *altitude* of the pole to a quadrant of a circle. See ELEVATION *of the equator*.

To find the *altitude* of the ſtars, &c. by the globe, ſee GLOBE.

ALTITUDE *of the tropics* amounts to the ſame with what is otherwiſe called the *ſolſtitial altitude* of the ſun.

ALTITUDE *of the horizon*, or of ſtars ſeen in it, is variable by the refraction, according to the quantity of which the horizon is either elated or depreſſed more or leſs.

ALTITUDE *of the moon's atmoſphere* is thought, by ſome, to be much greater than that of the earth; the former being not leſs than ſixty four French leagues. But the exiſtence of this atmoſphere has been diſputed and denied by modern aſtronomers. See MOON.

M. de la Hire propoſed a method of diſcovering the *altitude* of the earth's atmoſphere, the hint of which was firſt given by Kepler, viz. by the magnitude of the arch whereby the ſun is ſunk below the horizon, when the CREPUSCULUM begins or ends.

ALTITUDE *of the aurora borealis* in 1719, has been much conteſted, viz. whether it were above the atmoſphere, or within the limits of it: the former opinion being defended by Dr. Halley, the latter by Mr. Whiſton. The name meteor, which is given it, ſeems to favour the latter.—Beſides, it appears not by any obſervation to have been above thirty-eight miles high. See AURORA *Borealis*. Phil. Tranſ. Nº 360.

ALTITUDE, in ſpeaking of fluids, is more frequently expreſſed by the term depth.

The ingenious Dr. Hales, in his Vegetable Statics, propoſed a method for meaſuring unfathomable depths of the ſea; on the principles of which Dr. Deſaguliers contrived an inſtrument called a SEA-GAGE, which was tried before the Royal Society; and is deſcribed in the Phil. Tranſ. Nº 405. A more particular deſcription of this inſtrument by Dr. Hales himſelf, is as follows.

Suppoſe AB (*Tab. Miſcellany, fig.* 20.) to be an iron tube, or muſquet-barrel, of any length, as fifty inches, having its upper end A well cloſed; if this tube be let down in this poſition about thirty-three feet into the ſea, a column of water of that height is nearly equal to the mean weight of our atmoſphere, and conſequently from a known property of the air's elaſticity, it will be compreſſed into half the ſpace it took up before, ſo that the water will aſcend half way up the tube; and if the tube be let down thirty-three feet deeper, the air will be compreſſed into $\frac{1}{3}$ of its firſt dimenſions, and ſo on $\frac{1}{4}$, $\frac{1}{5}$, $\frac{1}{6}$. &c. the air being conſtantly compreſſible in proportion to the incumbent weight; whence by knowing to what height the water has aſcended in the tube, we may readily know to what depth the tube has deſcended into the ſea.

Now to meaſure the depth of one of theſe columns of ſea-water: firſt, by a line let the iron tube, with a weight at its bottom, ſink about thirty-three feet, which depth in ſalt-water will nearly anſwer to the weight of the air at a mean height of the barometer; then draw up the tube, and obſerve how far the water roſe. If thirty-three feet of water is equal to one atmoſphere, then will the water riſe ſo high as to fill exactly one half of the tube. But if the water riſes higher or lower than half-way, then by the rule of three ſay, as the number to which the water riſes is to one, ſo is thirty-three to the number of feet, meaſuring the depth of the column required. For example, ſuppoſe the water riſes, when the tube is let down thirty-three feet, only $\frac{9}{10}$ of half-way, then ſay, 9 : 10 :: 33 : $36\frac{1}{2}$ feet the depth of each column, which being once known, the number of columns of water is to be multiplied by this number of feet, whereby the depth of the ſea in feet will be known.

But ſince, when the inſtrument has deſcended to the depth of 99 columns, or 99 times 33 feet, the air will be compreſſed into the $\frac{1}{100}$ part of 50 inches, that is, into half an inch, the diviſions both for ſome time and after that will be ſo very ſmall, that the difference in depth of ſeveral columns of water will not be ſenſible. So that an inſtrument of no greater length than this would ſcarcely give an eſtimate of half a mile's depth, that is 2640 feet, or 80 columns depth of water. The lengthening of this inſtrument to 4, 5, or 10 times this length, would obviate this defect, and make the difference of the degrees of deſcent much more ſenſible. But ſince it is impracticable to make a metalline tube of ſo great a length, and if it were made, would be ſo unweildy as to be eaſily broken, the difficulty may be obviated in the following manner.

Let there be a globoſe, metalline body, of iron or copper, nearly of this form (*fig.* 21.) K, L, M, N, Q, whoſe capacity within may be equal to nine times the capacity of the metalline tube, Z, K, L; let this globoſe body be firmly ſcrewed to the metalline tube, at K, L, with a leathern collar well ſoaked in ſome unctuous matter at the ſhoulder, or joining, thereby to ſecure that joint in the moſt effectual manner. Let there be a ſmall hole at X for the ſea-water to enter freely in, and let ſome coloured oil be poured into the globoſe body, to fill it up to the hole X. Let there be alſo provided a ſlender rod *d b*, ſcrewed, or faſtened into the metalline diameter *s s*, which diameter muſt alſo be made to ſcrew in and out, thereby to take out the rod at pleaſure; the rod muſt alſo have a ſmall button *d* faſtened to its upper end, which will prevent its being daubed by falling againſt the ſides of the tube.

The capacity of the tube muſt be eſtimated by pouring water in, when the rod and metalline diameter are fixed in their places.

Now ſince the lower veſſel is ſuppoſed to contain nine times as much air as the tube ZL, which is the ſame thing as if the tube were nine times as long, therefore the air in the globoſe veſſel will not all be forced within the capacity of the tube, till the veſſel has deſcended to the depth of nine columns, or nine times 33 feet; for then the air will be compreſſed within one tenth of the ſpace it firſt took up. Suppoſing, therefore, the inſtrument to have deſcended to the depth of 99 columns of water, or 99 times 33 feet=2367: then the air will be compreſſed within $\frac{1}{100}$ part of 500 inches (the capacity of the whole veſſel being ſuppoſed equal to a tube of that length) that is, within five inches of the top of the tube; and conſequently the rod *d b* will be found tinged with the oil, within five inches of its top.

Suppoſe again the inſtrument to have deſcended to the depth of 199 columns, of 33 feet each, then the air will be compreſſed within $\frac{1}{200}$ part of the whole, that is, nearly within $2\frac{1}{2}$ inches of the top of the tube. In this caſe the inſtrument will have deſcended 6567 feet; that is, one mile and a quarter, and 132 feet.

Suppoſe again the inſtrument to have deſcended to the depth of 399 columns, then the air will be compreſſed into $\frac{1}{400}$ part of the whole, that is, nearly within one inch and a quarter of the top of the tube. In this caſe the inſtrument will have deſcended two miles and a half, wanting 53 feet, which may probably be the greateſt depth of the ſea.

The larger the capacity of the veſſel K, L, M, N, Q the deeper will the gage be enabled to ſink, the inſtrument being made ſtronger, and its joints being ſecured in proportion.

The inſtrument being thus prepared, a larger buoy, *i*, muſt be fixed to it, which ought to be a ſolid piece of light wood, well tarred, to prevent the waters being preſſed into the ſap-veſſels; and as it may riſe at a conſiderable diſtance from the ſhip, it may be adviſeable to fix on the top of the buoy broad fans of tin, properly painted, ſo as to be eaſily ſeen.

In order to ſink the inſtrument, a weight muſt be fixed to it in the following manner. See the diagram. W is a weight of ballaſt, hanging by its ſheet ſhank T, in the ſocket *f f*, which ſocket is ſcrewed faſt to NQ. The ſhank is retained in its place by the ketch *k* of the ſpring O, while the machine is deſcending; but as ſoon as W touches the ground at the bottom of the ſea, the ketch O *k* ſinking by the deſcending force, a little below the upper part of the hole *k*, is thereby at liberty to fly back, and ſo lets go the weight; then the buoy riſes up to the ſurface of the water with the machine. Springs might alſo be fixed on the inſide of the ſocket *f f*, ſo as to fly back in the ſame manner, when the weight touches the ground.

It might be adviſeable to keep an exact account of the ſtay of the machine under water, which might be done by a watch, or by a pendulum vibrating ſeconds. As Dr. Hooke found upon trial, that a leaden ball which weighed two pounds, fixed to a wooden ball of the ſame weight, and both let down in fourteen fathom water, reached the bottom in ſeventeen ſeconds, and the detached wooden ball aſcended to the ſurface in ſeventeen more. See Phil. Tranſ. Lowthorp's Abr. vol. i. p. 258. So that if this machine deſcended and aſcended greater depths with the ſame velocity, it would reach to the depth of a mile in ſeventeen minutes, and reaſcend in the like time. This, however, might be a vague eſtimate, until experience has furniſhed a rule.

This machine was tried in various depths of the Thames, and anſwered very well, always returning, and leaving the ballaſt behind. It was afterwards tried near the Bermudas, when ſeveral ſhips were in company; but though a good look-out was kept for three or four hours, it was not ſeen to return.

ALTITUDE *of the ſea's ſurface* is not every where the ſame, as appears from the drift or CURRENTS ſetting ſtrong out of one SEA into another.

ALTITUDE *of the mercury*, in the BAROMETER, is marked by degrees placed on the face of that inſtrument, the variations of which are the chief object of *barometrical* obſervations.

The mean *altitude* of the mercury at London is about 29 inches.—The extreme *altitudes* are $27\frac{1}{2}$ inches, and $31\frac{1}{2}$ inches. Some ſuggeſtions have been made, as if the *altitude* of the mercury were regularly greater in the morning than in the evening; at leaſt ſomething of this kind was obſerved to hold for a conſiderable time at Berlin. Hiſt. Crit. Rep. Lett. tom. xiv. p. 239.

ALTITUDE *of the pyramids in Egypt* was meaſured ſo long ago as the time of Thales, by means of their ſhadow, which makes one of the firſt geometrical obſervations we have an exact account of. Plutarch has given an account of the manner of this operation, which according to this author, was done by erecting a ſtaff perpendicular upon the end of the ſhadow of the pyramid; and by two triangles made by the beams of the ſun, he demonſtrated, that there was the ſame proportion between the ſhadows as between the pyramid and the ſtaff. Stanl. Hiſt. Phil. P. i. p. 9.

ALTITUDE, in *Aſtrology*, denotes the ſecond of the five eſſential dignities, which the plants acquire in virtue of the ſigns they are found in.

In this ſenſe, *altitude* is otherwiſe called *exaltation*.

ALTITUDE *of the nonageſimal*, is the *altitude* of the 90th degree of the ecliptic, reckoned from the orient, or eaſt point. See NONAGESIMAL.

ALTITUDE, *refraction of*, is an arch of a vertical circle, as S *s* (*Tab. Aſtronomy, fig.* 28.) whereby the *altitude* SE, of a ſtar, or other body, is increaſed by means of the refraction.

ALTITUDE, *parallax of*, is the difference CB (*Tab. Aſtron. fig.* 27.) between the true and apparent place of a ſtar; or, the difference BC, between the true diſtance of a ſtar AB, and the obſerved diſtance AC, from the zenith A. The parallax diminiſhes the *altitude* of a ſtar, or increaſes its diſtance from the zenith.—To find the parallax of *altitude*, &c. ſee PARALLAX.

ALTITUDE *of motion*, is a term uſed by Dr. Wallis for the meaſure of any motion, eſtimated according to the line of direction of the moving force.

ALTITUDE, *circles of*. See CIRCLES.

ALTITUDE, *parallels of*. See PARALLELS.

ALTITUDE, *quadrant of*. See QUADRANT.

ALTITUDE *inſtrument*, *equal*, is that uſed to obſerve a celeſtial object, when it has the ſame *altitude* on the eaſt and weſt ſides of the meridian, or in the morning and afternoon. This inſtrument conſiſts of a teleſcope about thirty inches long (with two vertical, and three or five horizontal wires in its focus) ſupported on the end of an iron bar, or axis, thirty inches long, and about an inch in diameter; the axis being ſuſtained in a vertical poſition, by paſſing through a hole in one end of a braſs box, whoſe other, or lower end, ſuſtains the lower joint of the axis. The box, which is about twenty-one inches long, with ends about four inches ſquare, has only two ſides, which are fixed at right angles. From one of theſe ſides project four flat arms, with a hole in each, whereby the box is, by ſcrews, fixed in a vertical poſition to an upright poſt. On the lower end of the box lies a braſs plate, which ſlides in grooves, and can, by means of a ſcrew, be gently moved forwards or backwards; in this plate is a fine punched hole, to receive the ſmooth conical point, into which the lower end of the axis is formed. On the upper end of the box are two plates, which ſlide alſo in grooves; and, by the means of ſcrews, can be gently moved ſideways, till their angular notches embrace the axis, which, in this part, is made perfectly cylindrical, and very ſmooth To the upper part of the axis is fixed, by its radius, a braſs ſextant (or arch of 60°, to a radius of ſeven or eight inches) with the arch downwards, ſo that the center is juſt above the top of the axis: alſo a ſpirit-level is fixed at right angles acroſs the axis, juſt under the arch, ſo as to be clear of the upper end of the box. To the under part of the teleſcope is fixed a braſs ſemicircle, of the ſame radius with the ſextant, both arches having a common center-pin. In the ſemicircle is a groove cut through the plate parallel to its limb, to receive two ſcrew-pins, which go into the ſextantal arch, near its ends; by theſe ſcrew-pins, the two arches may be preſſed cloſe, and the teleſcope fixed in any deſired elevation; which might be nearly aſcertained, by graduating the ſemicircle, and putting a Vernier's ſcale on the ſextant.

When this inſtrument is uſed, the box is fixed to the poſt, and the axis put into the box, letting the conical point drop into the punched hole; the level is ſcrewed on, and the teleſcope is annexed, obſerving to inſert the center and arch-pins: then, by the help of the ſcrew-plates at the bottom and top ends of the box, the vertical poſition of the axis is corrected, ſo that the ſame end of the air-bubble in the level may ſtand at the ſame point through the whole revolution of the axis, which will thereby be known to be then truly vertical, ſo that the teleſcope will deſcribe a parallel of *altitude*. The tube, thus adjuſted, is to be directed to the ſun, or ſtar, and fixed at the deſired elevation, by preſſing the two arches together with the two ſcrew-pins. This inſtrument is very uſeful in adjuſting clocks, &c. and comparing *equal* and *apparent* time.

ALTO & BASSO, or *in* ALTO & in BASSO, in *Law*, ſignifies the abſolute reference of all differences, ſmall and great, high and low, to ſome arbitrator, or indifferent perſon.—*Pateat univerſis per præſentes, quod Willielmus Tylar de Yetton, & Thomas Gower de Almeſtre, poſuerunt ſe in* Alto & *in* Baſſo, *in arbitrio quatuor hominum*; viz. *de quadam querela pendente inter eos in curia.—Nos & terram noſtram* altè & baſſè *ipſius domini Regis ſuppoſuimus voluntati.*

ALTO *relievo*. See RELIEVO.

ALTOLIZOIM, among ſome *Chemiſts*, denotes the *lutum Paracelſi*, well beaten, calcined, and boiled to the form of an oil, called alſo *fel terræ*; becauſe it is a bitter ſalt.

ALTUMAL, a term uſed to denote the mercantile ſtyle, or dialect.

In this ſenſe, we meet with *altumal cant*, to denote the language of petty traders and tars.

ALVAH, the wood wherewith Moſes ſweetened the waters of Marah. Exod. ch. xv. ver. 25.

The name of this wood is not found in Scripture, but the Mahometans give it that of *alvah*, and pretend to trace its hiſtory from the patriarchs before the flood. Joſephus, on the contrary, ſays, that Moſes uſed the wood, which he found next lying before him.

ALVARID, among the Spaniſh Moors, denoted a judge. The word is alſo written *alvarilus*.—In this ſenſe, *alvaridus* amounts to much the ſame with what is otherwiſe called ALCAID.

ALVARISTS, in *Church Hiſtory*, a ſect or branch of modern Thomiſts, denominated from Alvares whoſe method and principles they follow.

The *Alvariſts* differ from the ancient Thomiſts, in that the former are aſſerters of ſufficient grace, the latter of efficacious grace. The former come near to the Jeſuits, the latter to the Janſeniſts.

ALUCITÆ, a genus of inſects of the *lepidoptera* order, in the Linnæan ſyſtem.

ALUCO, in *Ornithology*, the name by which authors have called the common white OWL, or, as we commonly call it, the barn-owl, or church-owl.

ALUDELS, in *Chemiſtry*, ſubliming pots, or veſſels uſed for the ſublimation of mineral flowers. *Tab.* CHEMICAL, &c. fig. 20.

Aludels are a large range of earthen tubes, or pots, without bottoms; fitted one over another, and diminiſhing as they advance towards the top.—The loweſt is adapted to a pot, placed in the furnace, wherein the matter to be ſublimed is lodged. And at the top is a head, to retain the flowers which aſcend the higheſt.

The *aludel*, which terminates this tube above, ought to be cloſed in its upper part, or to have but a very ſmall opening. The tube compoſed of theſe *aludels* is nothing but a kind of capital, or head, that may be enlarged or lengthened at pleaſure, and adapted to a cucurbit. This apparatus is intended to collect and retain dry and volatile matters, which may be reduced into flowers by SUBLIMATION. It may be employed for the preparation of flowers of *ſulphur*, of *arſenic*, of *antimony*, of benjamin, &c.

ALVEARIUM, in *Anatomy*, the bottom of the *concha*, or hollow of the auricle, or outer EAR.

The *alvearium auriculæ* is a cavity, terminating at the *meatus auditorius*, wherein that bitter yellowiſh excrement is collected, called *cerumen*, or ear-wax.

ALVEARIUM alſo ſignifies a bee-hive.

The word is formed of *alveus*, a *channel*, or *cavity*; in alluſion to the *alveoli*, or cells, in bee-hives.

Some of the ancients uſe alſo the word *alvearium* for a bee-houſe, more uſually called among us, APIARY.

ALVEARIUM is ſometimes alſo uſed figuratively, to denote a collection.

In which ſenſe, *alvearium* amounts to much the ſame with what we otherwiſe call *theſaurus*, *cornucopia*, or the like.

Vinc. Boreus has publiſhed an *alvearium* of law.

ALVEHEZIT, among *Arabian Writers*, denotes what we ordinarily call *falling-ſtars*, or STAR-SHOT.

ALVEOLI, in *Anatomy*, thoſe little ſockets in the jaws, wherein the teeth are ſet.

The *alveoli* are lined with a membrane of exquiſite ſenſe, which ſeems to be nervous, and is wrapt about the roots of each tooth; from whence, and from the nerve, proceeds that pain called *odontalgy*, or tooth-ach. Of theſe *alveoli* there are uſually ſixteen in each jaw.

ALVEOLI is more eſpecially uſed, among *Naturaliſts*, for thoſe waxen cells in the combs of bees, wherein their honey is depoſited.

ALVEOLUS, in *Natural Hiſtory*, the name of a marine body, found frequently foſſile, ſometimes lodged in the cavity, at the end of the *belemnitæ*, and ſometimes looſe; and in this laſt caſe, often ſo large, that we cannot ſuppoſe any *belemnitæ* ever to have exiſted ſo large as to have been able to contain it. We do not meet with theſe at this day in their recent ſtate, but what we find of them foſſile, are ever larger at one end, and tapering to a point at the other, and are compoſed of ſeveral hemiſpheric cells, like ſo many bee-hives jointed into one another, and having a *ſiphunculus*, or pipe of communication, like that in the thick *nautilus*. Theſe are ſometimes found perfect and whole, but much more frequently truncated, or wanting a part of their ſmaller end. Klein.

ALUESEN, in *Botany*, a name uſed, by ſome, for the *peucedanum*, or *hogs*-FENNEL.

ALVEUS properly denotes a channel.

Alveus is applied, by ſome *Anatomiſts*, to the tumid lacteal branches ariſing from the *receptaculum chyli* under the *diaphragm*.

ALVEUS is alſo uſed, in *Antiquity*, to denote a ſmall veſſel, or boat, made out of the trunk of a ſingle tree, by boring or cutting it hollow.

Such was that wherein Romulus and Remus are ſaid to have been expoſed.

ALVIDUCA, a term uſed by ſome writers for laxative or purgative medicines.

The word is compounded of *alvus* and *duco*, *I draw*.

ALUM, ALUMEN. See ALLUM.

ALUMTA, in *Botany*, a name given by ſome of the old Latin writers to the plant otherwiſe called *lutum* and *coniola*, and by the Greeks *cymene*. It was the ſame with our *geniſtella tinctoria*, or dyer's weed, and was uſed by the dyers, and by the ladies, to tinge their hair yellow, the colour that was eſteemed moſt beautiful in thoſe times.

ALUNGU, in *Natural Hiſtory*, is a word of the Malabar language, and the name given by the Malabarians to an animal reſembling a large lizard, except as to head and tail, which are both pointed. It is a German ell, and $\frac{5}{8}$ long, and its breadth is half an ell. It is a ſpecies of the MANIS of Linnæus, and belongs to the family of ANT-*eaters*, which have no teeth, but a long round tongue, with which they catch the ants. Phil. Tranſ. vol. lx. Nº 5. an. 1770.

ALUS, in the *Materia Medica* of the ancients, a name given to two different plants.

ALUSMA *Caramanica*, in *Botany*, a term uſed ſometimes to expreſs a plant growing in Caramania, and ſometimes a preparation of that plant, or pigment made from it. The word frequently occurs in the writings of Avicenna and Serapion.

ALVUS, among *Anatomiſts*, is ſometimes uſed to expreſs the lower belly, or *venter*.

ALVUS is more uſually taken among *Phyſicians*, for the ſtate and condition of the *fæces*, or excrements, contained within that cavity.

Thus, when a perſon is laxative, it is called *alvus liquida*; and when coſtive, *alvus adſtricta*.

They who are of a looſe belly in their youth are generally coſtive in their old age; and they who are bound in youth, are often looſe when old. A laxer ſtate in youth, and rather bound than looſe in old age, is moſt deſirable.

Binders of the belly are labour, ſitting in a chair, fuller's clay laid over the body, diminution of food, eating once a day inſtead of twice, little drinking, and that only after a full meal, reſt after meals. On the contrary, things which looſen the belly, are, walking and eating more than uſual, ſtirring after meat, intermixing draughts with eating; and it ought to be obſerved, that a vomit binds a looſe belly, and looſens a bound one; and that a vomit taken immediately after meat binds the belly, but delayed until a conſiderable time after, looſens the ſame. Celſus.

ALWAIDII, a ſect of Mahometans, who hold that all great crimes are unpardonable, and the criminals reprobated to eternity.

The *alwaidii* ſtand in oppoſition to the MORGII.—They attribute leſs efficacy to the true belief in the ſalvation of men, than the reſt of the muſſulmen.

ALYPIAS, in the *Materia Medica*, a ſpecies of *turbith*, preſcribed by ſome phyſicians for the purging of bile.

Some write the word *alypon*, and define it by white *turbith*. Galen uſed *alypum*, αλυπον, for a minorative, or medicine that gently purges.

ALYPON MONTIS CETI, otherwiſe WHITE TURBITH, a plant which grows in ſeveral parts of France, particularly in Provence and Languedoc. It is a kind of SENA.

ALYPUM, in *Botany*, a name given, by ſome authors, to a ſpecies of ſpurge, the TITHYMALUS *amygdaloides anguſtifolius*, or narrow-leaved almond ſpurge of Tournefort. See SPURGE.

ALYPUM is likewiſe a name given, by ſome authors, to a ſpecies of DOGS-*bane*, diſtinguiſhed by Mr. Tournefort, by the name of APOCYNUM *maritimum Venetum*, *ſalicis folio*, *flore purpureo*; the purple-flowered ſea *apocynum* of Venice, with willow-like leaves.

ALYPUM is alſo a name given to the *globularia* of Linnæus.

ALYSSON, in *Botany*, a name given, by ſome authors, to the MYAGRUM, or gold of pleaſure.

ALYSSON, *rough-leaved*, the SUBULARIA of Linnæus.

ALLYSUM, called *alyſſoides*, by Tournefort. See MADWORT.

ALYTARCHA, in *Antiquity*, a prieſt of Antioch in Syria, whoſe office was to lead up the *maſtigophori*, or *flagelliphori*, officers with whips in their hands, who attended at the games or combats of the *athletæ*, encouraged them to behave ſtoutly, and, on occaſion, ſerved to preſerve good order, and keep off the crowd.

The officer who preſided at the Olympic games was alſo ſometimes denominated *alytarcha*.

Some will have the *alytarcha* to be the ſame with the *hellenodicus*, of which opinion are Faber and Prideaux.

Van Dale ſhews them to be different offices; not but that the *alytarchi* might ſometimes be ſubſtituted for the *hellenodici*, to perform ſome parts of their function.

The *alytarchi* were the ſame with what were called, in ſome other places, *alytæ*.

ALZACHI, in the *Materia Medica*, the name given, by the Arabian *Phyſicians*, to that kind of gourd called in the ſhops the CITRUL, and by the people of ſome parts of Italy, the *anguria*. It is an oblong, and uſually crooked gourd, and contains in its cavity a conſiderable quantity of water, which is drank by people of the places where the plant is common, to quench thirſt. It contains ſeeds of an oblong figure, flatted, and covered with a hard ſkin.

ALZAGIAT, in the *Materia Medica*, a name given, by the Arabian writers, to all the vitriolic minerals. It is alſo written *zagi*, or ZEGI.

ALZARAC, in the *Materia Medica* of the Arabians, a name given to a kind of CAMPHOR, which was coarſe, and of a brown colour. It ſeems to have been the ſame with our rough camphor, as imported from the Indies, before being purified.

ALZIZ, in the *Materia Medica*, a name given by Serapio and Avicenna, to the roots of the *traſi*. The word Ziz is the name of a river in Africa, according to Leo; and the roots probably had this name from their being found in great plenty on the banks of that river, the *traſi* always growing in wet places.

ALZUM, in *Botany*, a name given, by the ancients, to the tree which produces the gum BDELLIUM. It is alſo written *alrum* and *aldum*, which laſt ſeems the proper way. The gum of this tree was called, by the Arabians, *mokel*, and the ſame word *mokel* is uſed as the name of a fruit of a palm-tree.

AMA, in *Eccleſiaſtical Writers*, denotes a veſſel wherein wine, water, or the like, were held, for the ſervice of the euchariſt.

In this ſenſe, the word is alſo written *amula*; ſometimes alſo *hama*, and *hamula*.

AMA is ſometimes alſo uſed for a wine-meaſure, as a caſk, pipe, or the like.

AMA, AME, or rather AMES, *αμης*, a ſort of cake. Aretæus uſes this word to expreſs the quantity of hellebore which is ſufficient for a doſe in ſtrong conſtitutions, when given in a *vertigo*.

AMABYR, or AMVABYR, in ſome *Ancient Cuſtoms*, the price of a maidenhead; or a ſum of money to be paid the lord upon marrying a maid of his manor.—This cuſtom is ſaid to have anciently obtained in Wales, where *amabyr* was paid to the prince: alſo in the honour of Clun belonging to the earl of Arundel, till earl Henry, in the time of queen Mary, in conſideration of ſixty pounds, releaſed it to all his tenants by the name of the cuſtom of *amabyr* and *chevage*.

AMADOW, a kind of *black-match*, tinder, or touch-wood, which comes from Germany. It is made of a ſort of large muſhrooms, or ſpungy excreſcences, which commonly grow on old trees, eſpecially oaks, aſh, and firs. This ſubſtance being boiled in common water, and afterwards dried and well beaten, is then put into a ſtrong lye prepared with ſalt-petre, after which it is again put to dry in an oven. The druggiſts ſell this match wholeſale in France, and ſeveral hawkers retail it.

Some give to the *amadow* the name of *pyrotechnical ſpunge*, becauſe of its aptneſs to take fire.

AMADOWRY, a kind of cotton which comes from Alexandria, by the way of Marſeilles.

AMAIN, or AMAYNE, a ſea term, uſed by a man of war, to his enemy; and ſignifying, *yield*.

Hence, *to ſtrike amain*, is, to lower, or let fall, the top-ſails.

The word is alſo written *amayne*.—Waving *amain*, is to make a ſign to another veſſel, by waving a bright ſword, or other thing, as a demand for ſtriking its top-ſails.—This is commonly done either in the fore-top, or on the poop.

AMAIN is alſo a term uſed in letting down a thing, by a tackle, into the hold, or elſewhere, in the lowering a yard, or the like, to denote, that the ſailors are to let go that part of the rope which they held before, and let down the thing eaſily, and by degrees.

AMALGAMA, or AMALGAM, in *Chemiſtry*, a maſs of MERCURY, united and incorporated with a METAL.

The word *amalgama* is formed of the Greek *αμα*, *together*, and *γαμειν*, *to join*; and is applied to the ALLAYS of metallic metals with *mercury*, which is capable of being *allayed* more or leſs eaſily with almoſt all metallic ſubſtances.

The *amalgama* of *mercury* with lead, is a ſoft, friable ſubſtance, of a ſilver colour.

By waſhing and grinding this *amalgama* with fair warm water in a glaſs mortar, the impurities of the metal will mix with the water; and by changing the water, and repeating the lotion again and again, the metal will be farther and farther purified.—Boerhaave mentions it as one of the greateſt ſecrets in chemiſtry, to contrive to bring off the liquor, at laſt, as clear and unſullied as when firſt poured on the *amalgama*; which, he ſays, might afford a method of making the nobler metals, or procuring them from the baſer.

This philoſophical way of purifying metals, may be eaſily applied to all the metals, except iron and copper.

AMALGAMATION is either done in the *dry*, or in the *humid* way.

AMALGAMATION *in the dry way*, is performed in a mortar for the purpoſe, deſcribed by Becher and others.

AMALGAMATION *in the humid way*, is when part of the metal is firſt diſſolved in its proper *menſtruum*, and afterwards precipitated into an *amalgama*, by the addition of MERCURY.

This operation is denoted by chemiſts by the letters A A A.

The *amalgams* of gold, ſilver, tin, lead, zink, biſmuth, and copper, with quickſilver, are all white; and when the quantity of metal is large in proportion to that of the mercury, they thicken into a kind of paſte.

All METALS, except iron and copper, ſpontaneouſly unite and *amalgamate* with mercury; but gold with the greateſt facility; ſilver the next; then lead, and tin; copper, and regulus of antimony, with difficulty; iron, and, as Mr. Gellert ſays, cobalt, ſcarce at all; but with all other metals and ſemi-metals, mercury may eaſily be *amalgamated*: The *amalgamation* of all metals with mercury is much facilitated by heat; but with reſpect to the metals which unite with difficulty with mercury, it cannot be effected without heat. All metals ought to be divided into very ſmall parts, when they are to be *amalgamated* by *trituration*, without fuſion or heat.

AMALGAMATION *of copper*.—The *amalgamating* mercury with copper is a very difficult proceſs, mercury not mixing well with that metal unleſs when in fuſion, and the heat ſufficient to keep it in that ſtate being great enough to evaporate the mercury. *Trituration*, however, may be made to ſupply the place of heat, firſt reducing the copper to an exceeding fine powder. This *amalgama* boiled in river water, and then diſtilled in a retort, and cohobated twice, leaves the copper, in form of a new metal, of the colour of gold, and more ductile than before. Shaw's Lectures, p. 433.

Amalgamations of copper may likewiſe be performed by diſſolving the metal in *aqua fortis*, diluting the ſolution with twelve times the quantity of pure water, then heating it, and putting into it poliſhed plates of iron; by this means the copper will be precipitated to the bottom, and the iron diſſolved. Pour off the liquor, and waſh the precipitated powder with hot water, till it become inſipid. The powder being well dried, and put into a glaſs mortar, with an equal quantity of hot mercury, an *amalgama* will be made.

AMALGAMATION *of gold* is uſually performed by heating the *laminæ* or plates of that metal red-hot; after which, quickſilver, previouſly heated, is to be poured upon them, and the mixture is to be ſtirred with a little iron rod, till it begins to riſe into ſmoke.—It is then thrown into a veſſel full of water, where it coagulates, and becomes manageable.

This *amalgamation* is in great uſe among goldſmiths and gilders; who, by this means, render gold fluid and ductile for their purpoſes.—Such mixture or *amalgama* being laid on any other metal, for inſtance, copper; and this afterwards placed on the fire to evaporate, the gold will be left alone on the ſurface of the copper; which makes what we call GILDING.

The blackneſs adhering to the *amalgama* may be waſhed away with water; and a great part of the mercury may be preſſed out through a linen cloth; and the reſt being evaporated in a crucible, by a gentle and gradual heat, the gold remains behind in an impalpable powder, which admits better of being burniſhed, than that which is procured by grinding of gold-leaf.—Gold retains about thrice its own weight of mercury. See *Tables of* AFFINITY.

The method of extracting gold by *amalgamation* is thus deſcribed by Dr. Lewis: the gold ſands, firſt cleared of groſſer particles by water, are dried, and a ſmall proportion, leſs than a hundredth part of their weight, of mercury, is poured on them; the whole is well kneaded together, that the mercury may penetrate, as much as poſſible, into all the interſtices between the grains; upon which it imbibes the atoms of gold it meets with, and the ſand is afterwards waſhed off with water. In the mines of the Spaniſh Weſt Indies, where the gold is bedded in ſtones, the ſtony matter is reduced to a very fine powder, that every atom of the gold may be laid open to the mercury. The powder is ſoaked for ſome time in a ſolution of common ſalt; the mercury is ſqueezed in through a linen cloth, ſo as to fall like dew all over the ſurface; and the mixture being well ſtirred and kneaded, a gentle heat is applied, by which the activity of the mercury is ſo far increaſed, that the incorporation of the gold with it, which in the cold requires about thirty days, is effected by this method in five or ſix days.

There is another method of expediting the *amalgamation*, deſcribed by Alonſo Barba. He puts the powder, with a ſuitable quantity of mercury and water, into a deep copper veſſel fixed in a furnace, and applies a fire ſufficient to keep the water boiling. He likewiſe employs a ſmall wooden mill to aſſiſt the ebullition of the water in giving motion to the earthy powder, which continually riſing and falling down again, is brought into frequent contact with the mercury at the bottom, ſo as to give out its gold to the mercury in as many hours as the common proceſs without heat requires days.

When the gold is judged to be united with the mercury, the earthy powder is waſhed off by water, ſo as to leave the *amalgam* clean. The gold-duſt, or filings, diſperſed through the ſweepings of the goldſmiths ſhops, are recovered alſo by *amalgamation* with mercury. Com. Phil. p. 193, &c.

AMALGAMATION *of iron.* It is well known, that this operation has been reckoned extremely difficult, if not abſolutely impoſſible. However, M. Navier ſucceeded in combining mercury with iron by the following proceſs. Having made ſtrong ſolutions of iron and of mercury ſeparately in diſtilled vinegar, he put equal quantities of each into a matraſs, which he placed in *balneo mariæ*. As ſoon as the liquor became very hot, there began to be formed on its ſurface, and within it, an extremely light, fine, white ſubſtance, reſembling ſnow, which evidently contained mercury and iron, in a ſaline form, intimately united with each other. The liquor being filtered, left behind this ſnowy ſubſtance, which, when waſhed and dried, appeared to be a ſilvery maſs, made by the union of innumerable cryſtals in the form of thin plates, without acidity or acrimony. Mem. de Math. & de Phyſ. vol. vi. Mem. 2.

AMALGAMATION *of lead* is thus performed. Melt a proper quantity of pure lead in an iron crucible, remove the veſſel from the fire, and when the metal is a little cooled, pour to it an equal weight of clean mercury, which will immediately enter the lead with a hiſſing noiſe. Stir the mixture well together with an iron rod, and when cold, it will appear in the form of a ſoftiſh brittle maſs, called the *amalgam* of mercury with lead.

Biſmuth promotes the action of mercury upon lead in a remarkable manner. Mercury impregnated with one fourth, one eighth, one twelfth its weight of biſmuth, diſſolves maſſes of lead, in a gentle warmth, without the agitation, or triture, or comminution, or melting heat, neceſſary for uniting lead with pure mercury. Lewis's Ed. of Neumann's Works, p. 93.

AMALGAMATION *of platina.* Dr. Lewis rubbed together one ounce of *platina* with ſix ounces of pure quickſilver, together with a little common ſalt and water, and a few drops of ſpirit of ſalt, in an iron mortar. After the grinding had been continued for about ſix hours, the grains of *platina* appeared to be coated with the quickſilver, ſo as to cohere together into a kind of imperfect *amalgam*. After repeating the experiment ſeveral times, and evaporating the mixture, he always found, upon examining the dark coloured powder, intermingled with ſhining particles which remained, that a part of the *platina* was diſſolved by the mercury, and that the undiſſolved grains were coated with it. Com. Phil. &c. p. 508.

AMALGAMATION *of ſilver* is performed much after the ſame manner with that of gold; or it may be previouſly diſſolved in *aqua fortis*, and then precipitated. Mr. Gellert obſerves concerning this *amalgam*, that its ſpecific gravity is not only greater than the intermediate ſpecific gravity of the mercury, and of the ſilver, but that it is even greater than the ſpecific gravity of mercury, although ſilver is much lighter. Metall. Chym. tom. i.

This *amalgam* is uſed in the operation of ſilvering, and alſo in making the *Arbor Dianæ*.

Method of extracting ſilver by *amalgamation* is this: waſh the ores, earths, ſtones, ſands, &c. in which ſilver lies hidden in its metallic form, and when well waſhed, infuſe them in very ſour vinegar, in a clean wooden, or glaſs veſſel; about one tenth part of alum muſt alſo be firſt boiled, and diſſolved in this vinegar; let the vinegar entirely cover the ore, and leave it thus for one or two days. Decant off the vinegar, and waſh the macerated powder in pure warm water, till the water becomes quite inſipid, when juſt poured upon it; dry the powder, and put it into an iron mortar; then add mercury four times the quantity of the dried powder, and with a wooden peſtle fitted to the ſize of the mortar with a large round head, beat the whole till every part of the powder is rendered of a blackiſh colour, by the minute globules of mercury mixt with it; at this time pour water on the whole, and continue rubbing it with the peſtle for ſome time; pour out the turbid water, and add freſh, till all the looſe powder is waſhed off; then dry the *amalgama* with a ſpunge. Cramer's Art of Aſſaying, p. 232.

To ſeparate the ſilver from this *amalgama*, ſpread a thin leather over a wide earthen or glaſs veſſel, fold it up in the form of a bag, and put the *amalgama* into it; tie the bag very firmly at the top, and ſqueeze it very hard, and the greateſt part of the mercury will be forced through into the veſſel placed underneath; untie the bag, and all the ſilver and gold, if there be any there, will be found remaining in it, with about an equal quantity of the mercury mixed with it. Put this paſte into a glaſs retort, ſet it in a ſand heat, adapt on a receiver, with a quantity of water in it; let the noſe of the retort be immerſed in the water, make a fire conſiderably ſtrong, and the mercury will all be driven into the receiver, falling into the water with a hiſſing noiſe. If you hear a crackling in the retort, diminiſh the fire a little; when no more quickſilver can be driven over by a great fire, let the retort grow cool, then take it away, and ſplit it by means of a thread dipped in brimſtone tied round the belly of the retort, and then ſet on fire: take out the maſs, and in an open fire run it, with the help of borax, into a maſs. Ibid.

AMALGAMATION *of tin* is made in the ſame way with that of lead. This is uſed for tinning looking-glaſſes, and for making mercury-balls, uſed in purifying water. Mr. Canton firſt obſerved, that a ſmall quantity of this *amalgama*, with a very little chalk or whiting, being rubbed on the cuſhion of a glaſs globe, or on the oiled ſilk-rubber of a tube, would contribute to increaſe the power of electricity; ſo that they might be excited by this means to a very great degree with very little friction, eſpecially if the rubbers be made more damp or dry, as occaſion may require. Phil. Tranſ. vol. lii. p. 461.

AMALGAMATION is alſo applied, in a leſs proper ſenſe, to a ſolution of ſulphur with mercury.

In this ſenſe *amalgamation* amounts to the ſame with mollification, or ſoftening; in which ſenſe the word is uſed by ſome ancient chemiſts.

AMALOZQUE, in *Zoology*, a name under which Nieremberg deſcribes a Mexican bird. The neck of this is red; it is of the ſize of the turtle, and lives about the lakes and rivers, but has not webbed feet; the breaſt, belly, and under-part of the wings are white; the tail is variegated with black and yellow, and it has two black circles, a finger's ſpace aſunder, round the neck and breaſt. It has a very long and ſlender beak, and feeds on the inſects common in watery places. Ray.

AMAN, a ſort of blue cotton cloth, which comes from the Levant by the way of Aleppo.

AMANDAVAS, in *Ornithology*, a ſpecies of the FRINGILLA, common in the Eaſt Indies.

AMANITA; ſee AGARICUS.

AMARACUS, among *Ancient Naturaliſts*; ſee SAMPSUCHUS.

AMARACUS, in *Botany*; ſee *Baſtard* FEVERFEW.

AMARADULUS, in *Botany*, a name ſometimes given to the woody NIGHTSHADE.

AMARANTH, an order of knighthood, inſtituted in Sweden by queen Chriſtina in 1645, at the cloſe of an annual feaſt, celebrated in that country, and called *Wirtſchaft*.

This feaſt was ſolemnized with entertainments, balls, maſquerades, and the like diverſions, and held from evening till the next morning.—That princeſs, thinking the name too vulgar, changed it into that of the *feaſt of the gods*, becauſe each perſon here repreſented ſome deity, according as it fell to his lot. The queen aſſumed the name of *Amarante*, that is, *unfading*, or *immortal*. The young nobility, dreſſed in the habit of nymphs and ſhepherds, ſerved the gods at the table.—At the end of the feaſt, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the maſques; and, in memory of ſo gallant a feaſt, founded a military order, called, in Swediſh, *geſcilſchafft*, into which all that had been preſent at the feaſt were admitted, including ſixteen lords, and as many ladies, beſides the queen. Their device was the cypher of *amarante*, compoſed of two A's, the one erect, the other inverted, and interwoven together; the whole incloſed by a laurel crown, with this motto, *dolce nella memoria*. Bulſtrode Whitlock, the Engliſh embaſſador from Cromwell to the court of Sweden, was made a knight of the order of *amarante*.—On which account it ſeems to be, that we ſometimes find him ſtyled Sir Bulſtrode Whitlock.

AMARANTH, AMARANTHUS, of the *monoecia pentandria* claſs; *flower-gentle*, or *prince's feather*, in *Botany*. The characters are theſe: it hath male and female flowers on the ſame plant. The flower hath no petals, but the empalement conſiſts of three or five leaves, which is common to both ſexes. The male flowers have in ſome ſpecies three, in others five ſlender ſtamina. The female flowers have three ſhort ſtyles; the ſeed-veſſel hath one cell, in which is lodged a ſingle globular ſeed. There are ſeveral ſpecies.

The ſpecies of this plant cultivated in gardens for their beauty, are raiſed on hot-beds; and in June or July may be planted into the borders of the pleaſure garden, ſhading them until they have taken new root; and in dry weather they ſhould be well watered.

All the ſpecies of this plant are drying and aſtringent, but heat not in a violent degree. Schroder recommends the flowers of the common large garden-kind dried and powdered, as good in diarrhœas, dyſenteries, hæmorrhages of all kinds, and incontinence of urine; but they are very little uſed in the preſent practice.

AMARANTH expreſſes a colour inclining to purple. The name is derived from the flower.

AMARANTHOIDES, in *Botany*, *globe amaranth*, or GOMPHRENA of Linnæus.

The culture and propagation of theſe plants is, in all reſpects, the ſame with that of the AMARANTH; only that they muſt have a greater ſhare of heat, and muſt be forwarded more in the ſpring.

The flowers of this plant are commonly known by the name of *everlaſting flowers*; and, if kept in a dry place, after having been gathered in their full perfection, and before they begin to decay on the plant, they will retain their full beauty many years.

AMARYLLIS, in the Linnæan ſyſtem of *Botany*, the name of a genus of plants of the *hexandria monogynia* claſs, called in Engliſh *daffodil-lily*, and by other botanical writers LILIO-*narciſſus*; the corolla is bell-ſhaped, with ſix petals; the ſtigma is divided into three ſegments.

AMATIDES, in *Natural Hiſtory*, a name given by Bartholomæus Anglus, and other writers of his time, to a ſtone, of which they recorded a wonderful virtue in reſiſting the fire.

AMATORII *muſculi*, in *Anatomy*, an appellation ſometimes given to thoſe muſcles of the eyes which give them a caſt ſideways, and aſſiſt in that particular look by ſome called *ogling*.

When the *abductor* and *humilis* act together, they give this oblique motion.

AMAUROSIS, in *Medicine*, a deprivation of ſight; the eye remaining fair, and ſeemingly unaffected.

The word is formed of αμαυροω, *I darken*.

Amauroſis is the ſame with what the Latins more uſually call *gutta ſerena*.

A *perfect amauroſis* is when the blindneſs is total; when there is ſtill a power of diſtinguiſhing light from darkneſs, the diſeaſe is called by M. de St. Ives an *imperfect amauroſis*. There is a periodical ſort which comes on inſtantaneouſly, continues for hours, or days, and then diſappears. The *nyctalops* is conſidered by ſome as a ſpecies of this diſeaſe. This diſorder muſt be carefully diſtinguiſhed from the *glaucoma*, or CATARACT, and a vertigo, which require different methods of treatment. If the *amauroſis* ſucceeds a fever, or comes upon the aged, or very infirm, a cure is not to be expected; if one eye fails, the other uſually ſoon follows. But if the caſe be ſlight, and the habit of the body robuſt, if it happens after the meaſles, or ſmall-pox, or in pubertine virgins, it is ſometimes cured.

Mr. Hey, ſurgeon at Leeds, mentions ſeveral caſes of patients afflicted with the *amauroſis*, who were relieved by being electrified. Med. Obſ. and Inq. vol. v.

This diſtemper is ſometimes denominated *ſuffuſio nigra*, the black cataract.

The *amauroſis* differs from the AMBLYOPIA, this being in an inferior degree. For methods of cure, &c. ſee Heiſter, Hoffman, St. Ives, &c.

AMAUSA, a name by which the chemiſts have called the PASTES made of lead and cryſtal with various admixtures, for imitating gems.

AMAXOBII; ſee HAMAXOBII.

AMAZON, in *Antiquity*, denotes a bold, courageous woman, capable of daring, hardy atchievements.

AMAZONS, in a more peculiar ſenſe, denote an ancient nation of warlike women, who founded an empire in Aſia Minor, upon the river Thermodoon, along the coaſts of the Black Sea.

The *Amazons* are ſaid to have formed a ſtate out of which men were excluded. What commerce they had with that ſex, was only with ſtrangers; they killed all their male children, and cut off the right breaſts of their females, to make them more fit for the combat.—From which laſt circumſtance it is, that they are ſuppoſed to take their name, viz. from the privative α, and μαζος, *mamma, breaſt*.

It is a point controverted, even among ancient writers, whether ever there really were ſuch a nation of *Amazons*?—Strabo, Palæphatus, and others, abſolutely deny it: on the contrary, Herodotus, Pauſanias, Diodorus Siculus, Trogus Pompeius, Juſtin, Pliny, Mela, Plutarch, &c. expreſly aſſert it.

Hippocrates mentions a law among the *Amazons*, whereby they were doomed to remain virgins, till ſuch time as they had ſlain three men of their enemies.—He adds, that the reaſon of their cutting off the right breaſt was, to make the right arm the ſtronger; as ſuppoſing this would now receive the whole nutriment, which would otherwiſe have been divided between both.

Some authors relate, that, inſtead of killing, they only twiſted the legs of their male children, to prevent their being able to contend with them for the maſtery.

Dr. Bryant, in his Analyſis of Ancient Mythology, explodes the above account of the etymology and eſtabliſhment of the *Amazons* as fabulous; and obſerves, that they were, in general, Cuthite colonies from Egypt and Syria, who formed ſettlements in different countries, and that they derived their name from *zon*, the *ſun*, which was the national object of worſhip. Vol. iii. p. 463.

M. Petit, a French phyſician, publiſhed a Latin diſſertation, in 1685, to prove, that there was really a nation of *Amazons*; it contains abundance of curious inquiries, relating to their habit, their arms, the cities built by them, &c.—On medals, the *Amazons* buſt is uſually armed with a little ax, called *bipennis*, or *ſecuris*, borne on the ſhoulder, and a buckler, in form of a half-moon, by the Latins called *pelta*, on the left arm.—Hence that of the poet:

> *Non tibia Amazonia eſt pro me ſumenda ſecuris,*
> *Aut exciſa levi pelta gerenda manu.*
> Ov. ex Pont.

We read of Scythian *Amazons* in Herodotus; of Lybian *Amazons*, in Diodorus Siculus; and of German *Amazons*, in Lucius Florus. Later geographers and travellers alſo ſpeak of Mingrelian and Georgian *Amazons*; *Amazons* in America, in Monomotopa, in the Philippine iſlands, in Denmark, &c.

The *Amazons* of South America, living on the banks of the great river which bears their name, make the greateſt figure in modern ſtory. They are repreſented as governed and led to war only by their queen. No men are ſuffered to live among them; though thoſe of ſome neighbouring nations are ſuffered to viſit them, at a certain ſeaſon, for the ſake of procreation. The females iſſuing from this commerce are bred up with care, and inſtructed in what relates to war and government; as to the males, they are ſent away into the country of their fathers.

Some modern geographers and travellers mention *Amazons* ſtill in being.—John de los Sanctos, a Portugueſe Capuchin, in his deſcription of Æthiopia, ſpeaks of a race of *Amazons* in Africa; and Æneas Silvius gives us a very preciſe account of a republic of real *Amazons*, in Bohemia, which laſted nine years; founded by the courage of a maid named Valaſca.

AMAZON is alſo applied, in a figurative ſenſe, to bees, becauſe among theſe inſects the females alone are commonly ſuppoſed to bear ſway.

Ariſtotle, treating of the breeding of bees, profeſſes himſelf ignorant of their ſex; and therefore, willing to keep up the prerogative of the males, calls their governor βασιλευς, *rex*, in which he has been followed by the generality of authors.

An ingenious writer of our own country, takes the liberty to ſtrain the ordinary ſignification of the word *rex*, and in ſuch places tranſlates it *queen*, this being an *Amazonian*, or female kingdom.

Mr. Warder has publiſhed a work under the title of the True *Amazons*, or the Commonwealth of BEES.

AMAZONIAN, ſomething relating to, or reſembling AMAZONS.

AMAZONIAN *kingdom*, is particularly uſed for a feminine one, or that wherein the females alone bear rule.

AMAZONIAN *habit*, in *Antiquity*, denotes a dreſs formed in imitation of the Amazons.

Martia, the famous concubine of the emperor Commodus, had the appellation *Amazonian*, becauſe ſhe charmed him moſt in a habit of this kind.—Hence alſo that prince himſelf engaged in combat, in the amphitheatre, in an *Amazonian* habit; and of all titles the *Amazonius* was one of thoſe he moſt delighted in.—In honour either of the gallant, or his miſtreſs, the month December was alſo denominated *Amazonius*.

Some alſo apply *Amazonian habit* to the hunting dreſs worn by many ladies among us.

AMAZONIUS is an appellation given to a kind of paſtil, or *troche*, anciently uſed againſt riſings of the ſtomach, and vomitings.—The ingredients of which it is compoſed,

poſed, are ſmallage, aniſe-ſeed, wormwood, myrrh, pepper, *caſtoreum*, *opium*, and cinnamon.

AMBA, in *Botany*, a name by which ſome authors have called the *manga Indica*, or MANGO-*tree*, called alſo *ambalam*, and *ambe*.

AMBACHT, in *Topography*, denotes a kind of juriſdiction, or territory, the poſſeſſor whereof has the adminiſtration of juſtice, both in *alto* and *baſſo*; or of what is called in the Scotch law a power of pit and gallows, i. e. a power of drowning and hanging.

In ſome ancient writers *ambacht* is particularly uſed for the juriſdiction, government, or chief magiſtracy of a city. The word is very ancient, though uſed originally in a ſenſe ſomewhat different. Ennius calls a mercenary, or ſlave hired for money, *ambactus*; and Cæſar gives the ſame appellation to a kind of dependents among the Gauls, who, without being ſlaves, were attached to the ſervice of great lords.

AMBAGES, *circumlocution*; an indirect diſcourſe, or phraſe, tending to expreſs or ſhew ſomething by a compaſs of words or ſentiments fetched from afar.

AMBAIBA, the name of a tree in Braſil, called by the Indians, *tipioca*. Ray's Hiſt. Plant.

AMBAITINGA, the name of a tree, whoſe leaves are ſo rough, that they may be uſed to poliſh hard wood. Ray's Hiſt. Plant.

AMBAR-*ſeed*, in the *Materia Medica*, a name by which ſome have called muſk-ſeed.

AMBARVALIA, in *Antiquity*, a feaſt, or ceremony, among the Romans, celebrated annually, in honour of the goddeſs Ceres, in order to procure a happy harveſt.

At theſe feaſts they ſacrificed a bull, a ſow, and a ſheep; which, before the ſacrifice, were led in proceſſion thrice around the fields; whence the feaſt is ſuppoſed to have taken its name: from the Greek *αμφι*, *about*; or the Latin *ambio*, *I go round*; and *arvum*, *field*.—Though others write it *ambarbalia*, and *ambarbia*, and deduce it from *ambire urbem*, *to go round the city*.

From the beaſts offered in ſacrifice, the ceremony was alſo called SUOVETAURILIA.

Some will have the *ambarvalia* to have been held twice a year; the firſt time towards the end of January, or, as others think, in April; and the ſecond time in July, or, as Roſinus imagines, in Auguſt; at the time when the harveſt was ripe, *maturis frigibus*. Which opinion is the more probable, in that Ovid, who, in his Faſti, deſcribes the feaſts in the firſt ſix months of the year, from January to June incluſive, ſays nothing of the *ambarvalia*.

The ſacrifice offered on this occaſion was hence called *ambarvale ſacrum*, and *hoſtia ambarvalis*.

The *ambarvalia* were of two kinds, *public* and *private*.

The *private* were thoſe ſolemnized by the maſters of families, accompanied with their children and ſervants, in the villages and farms out of Rome.—They walked three times round the grounds, every one being crowned with leaves of oak, and ſinging hymns in honour of Ceres. After the proceſſion, they went to ſacrifice.

The *ambarvale carmen* was a prayer preferred on this occaſion; whereof we have the *formula* preſerved in Cato.

The *public ambarvalia* were thoſe celebrated in the boundaries of the city; and in which the twelve FRATRES *arvales* officiated pontifically, walking at the head of a proceſſion of the citizens, who had lands and vineyards at Rome.

The prayer, or *formula*, here uſed, was *avertas morbum, mortem, tabem, nebulam, impetiginem, peſeſtatem*.

Some make a quinquennial as well as an annual *ambarvalia*, the one performed once every *luſtrum*, the other once a year.

The prieſts who chiefly officiated at the ſolemnity, were called *fratres* ARVALES.

AMBARVALIS *flos*, in *Botany*, a name given, by ſome authors, to the *polygala*, or milkwort.

AMBASSADOR; ſee EMBASSADOR.

AMBE, in *Anatomy*, a ſuperficial jutting out of a BONE.

AMBE, in *Surgery*, is alſo uſed as the name of an ancient inſtrument, with which they reduced diſlocated bones. —The *ambe*, or *commander*, is mentioned by Hippocrates, and has its partizans among the moderns, eſpecially for replacing the arm.

It conſiſts of an horizontal lever, and a fixed point made of a piece of wood ſtanding vertically, to the extremity of which the lever is jointed by a hinge. The patient ſitting, and his arm that is hurt being raiſed, the machine is puſhed forward under the arm-pit, as far as can be, *curandum*, ſays Hippocrates, *ut quam penitiſſimè alam ſubeat*. The arm is tied to this horizontal piece, and then an aſſiſtant bears upon the ſcapula and the clavicula, whilſt another preſſes down the lever, and thus makes the bone come into its place again.

The capital defect of the *ambe* is, that it puſhes the head of the bone into its cavity, before the extenſion and counter extenſion are made; the dangerous conſequences of which are, firſt, that the reduction is very difficult, becauſe the bone is not conducted by the ſame way it took in luxating itſelf, and that one meets with obſtacles from the parts that ſurround it, even the *ſcapula* itſelf, on which it articulates. Secondly, in making efforts for ſurmounting thoſe obſtacles, one runs the riſque of turning inwards the cartilaginous edge of the cavity of the *ſcapula*, or the *capſula ligamentoſa*. The third defect of the *ambe* of Hippocrates is, that it cannot move the luxated bone, but from below upwards; conſequently the machine is only proper in luxations directly downwards; and yet it is certain, that the arm luxates itſelf both outwards and inwards, and luxations forward are very frequent. In thoſe caſes, the *ambe* is uſeleſs, and being dangerous in luxations downwards, it follows, that this machine labours under very great defects.

Mr. le Cat, in the Phil. Tranſ. N° 469, has endeavoured to remedy theſe defects, by giving the deſcription and uſe of a new *ambe*, not ſubject to the inconveniencies of the old one.

AMBER, *ſuccinum*, or *karabe*, in *Natural Hiſtory*, &c. a yellow tranſparent ſubſtance, of a gummous or bituminous form or conſiſtence, of a reſinous taſte, and a ſmell like oil of turpentine; chiefly found in the Baltic ſea, along the coaſts of Pruſſia, &c. of uſe in medicine, and in divers arts.

The word is originally Arabic, *ambar*, or *anbar*, which ſignifies the ſame.

This ſubſtance has been of great repute in the world from the very earlieſt times we have any knowledge of; many years before Chriſt it was in eſteem as a medicine; and Plato, Ariſtotle, and Herodotus, and among the poets, Æſchylus, and others, have commended its virtues. In the times of the Romans it became in high eſteem as a gem; and in the luxurious reign of Nero, immenſe quantities of it were brought to Rome, and uſed for ornamenting works of various kinds. Long after this, Theodoric king of the Goths ſhewed a high eſteem for it. However well known, and however highly eſteemed this ſubſtance was in theſe ages, its nature and origin yet remained unknown through a long ſeries of time, and various conjectures were made about it in the different places where people were poſſeſſed of it among their gems.

The generality of the falſe accounts of *amber* have been owing to the ignorance of the perſons who have taken upon them to give the hiſtory of it: they have, in general, taken upon hearſay what they have related, or borrowed it from books they were not able to underſtand. Thus we find the many places in Aſia and Africa celebrated for producing large ſtores of *amber*, are taken upon credit from the old authors, who have mentioned *ambra* as being found there: theſe copiers not diſtinguiſhing, that *ambra* in theſe places is not given as the name of *ſuccinum*, or *amber*, but that of the rich perfume called *ambergris*, which is found there, though the real *amber* never was.

The name of *oriental amber*, ſo common with ſome, ſeems to have been alſo owing to a miſtake, but of another kind; the GUM *copal*, brought from the Eaſt Indies, is very like *amber*, and ſome of the fantaſtic writers in chemiſtry have called this by the forced name of *oriental amber*. Hence thoſe who read their works, without perfectly underſtanding them, have ſuppoſed that *amber* was common in the Eaſt Indies; and as all the gems of that part of the world are ſuperior to thoſe of other places, they began to call all the fine pieces of this foſſil, by the pompous name of *oriental amber*. But it is certain, that we have no authentic account of its ever having been found in any of thoſe regions. All the intelligent perſons, who have reſided in the Eaſt Indies, ſay, that they never ſaw or heard of *amber* being found there. And, upon the whole, it ſeems very rational to conclude, that *oriental amber* never exiſted, otherwiſe than in the error before mentioned, of calling COPAL by that name. This we are very well aſſured of, that the Chineſe, who are as cunning a people as any in the world, expend annually with us vaſt ſums of money in buying European *amber*, and have done ſo at all times ſince we have trafficked with them; and it is by no means to be ſuppoſed that they would purchaſe it of us, if they had it nearer home. Europe ſeems the only region of the world where *amber* is produced: it ſeems alſo to be produced almoſt all over Europe, but not in equal plenty, nor perfection; the German dominions, and the country about the Baltic, claim the prerogative above all other places. Hartman, who has given the above mentioned account of the errors of the ancients, &c. in regard to the places of its origin, has been too free in cenſuring the moderns for giving it to ſome parts even of Europe: he ſcruples to believe that Italy, Spain, and even England, produce *amber*;

but in this he errs: he ſuppoſes that *jet*, which is called by ſome *black amber*, being found in theſe places, has impoſed upon the authors of theſe accounts, and made them ſay *amber* was found there; but nothing is more certain, than that *amber*, and that of the fineſt kind in the world, is found in England at leaſt, if not in the other places where he doubts of its production.

Amber is at this time thrown on the ſhores of Yorkſhire, and many other places, and found even in our clay-pits; the pits dug for tile-clay, between Tyburn and Kenſington Gravel-pits, have afforded many ſpecimens; and that behind St. George's Hoſpital, at Hyde-park Corner, has afforded fine ſpecimens, one of which has been wrought into a beautiful cane-head of three inches long; and if we mention Dr. Woodward, and the other authors, who have themſelves taken it up, we ſhall have no room to doubt of its being real *amber*, not JET, as Hartman ſuppoſes.

Poland, Sileſia, and Bohemia, are famous for the *amber* dug up there at this time. Germany affords great quantities of *amber*, as well dug up from the bowels of the earth, as toſſed about on the ſhores of the ſea and rivers there. Saxony, Miſnia, and Sweden, and many other places in this tract of Europe, abound with it. Denmark has afforded, at different times, ſeveral quantities of foſſile *amber*; and the ſhores of the Baltic abound with it. But the countries lying on the Baltic afford it in greateſt abundance of all; and of theſe the moſt plentiful country is Pruſſia, and the next is Pomerania. Pruſſia was, as early as the times of Theodoric the Goth, famous for *amber*; for this ſubſtance coming into great repute with this prince, ſome natives of Pruſſia, who were about his court, offered their ſervice to go to their own country, where that ſubſtance, they ſaid, was produced, and bring back great ſtores of it. They accordingly did ſo; and from this time Pruſſia had the honour to be called *The Country of Amber*, inſtead of Italy, which had before undeſervedly that title.

The *amber* of Pruſſia is not only found on the ſea-coaſts, but in digging; and though that of Pomerania is generally brought from the ſhores, yet people, who dig on different occaſions in the very heart of the country, at times find *amber*. Phil. Tranſ. N° 248. p. 5. See MATRIX *Succini*.

Junker deſcribes, after Neumann, the Pruſſian *amber-mines*, which are the richeſt known.

Firſt, at the ſurface of the earth, is found a *ſtratum* of ſand. Immediately under this ſand is a bed of clay, filled with ſmall flints of about an inch diameter each. Under this clay lies a *ſtratum* of black earth, or turf, filled with foſſile wood, half decompoſed, and bituminous; this ſtratum is extended upon a bank of minerals, containing little metal, except iron, which are conſequently pyrites. Laſtly, under this bed the *amber* is found, ſcattered about in pieces, or ſometimes accumulated in heaps.

Naturaliſts are greatly divided as to the origin of *amber*, and what claſs of bodies it belongs to; ſome referring it to the vegetable, others to the mineral, and ſome even to the animal kingdom.—Its natural hiſtory, and its chemical analyſis, afford ſomething in favour of each opinion.

Pliny deſcribes it as 'a reſinous juice, ouſing from aged 'pines and firs (others ſay from poplars, whereof there 'are whole foreſts on the coaſts of Sweden), and diſ'charged thence into the ſea, where, undergoing ſome 'alteration, it is thrown, in this form, upon the ſhores 'of Pruſſia, which lie very low: he adds, that it was 'hence the ancients gave it the denomination *ſuccinum*; 'from *ſuccus, juice*.'

This opinion of the ancient naturaliſt ſeems confirmed by obſervations of many of the modern ones; particularly of the learned father Camelli. Phil. Tranſ. N° 290.

Some ſuppoſe it a BITUMEN, trickling into the ſea from ſubterraneous ſources; and there concreted into this form, and thrown aſhore by the waves. But as good *amber* has been found in digging at a conſiderable diſtance from the ſea, as that gathered on the coaſt.

Others ſuppoſe *amber* a compound ſubſtance.—Pruſſia, ſay they, and the other countries which produce *amber*, are moiſtened with a bituminous juice, which mixing with the vitriolic ſalts abounding in thoſe places, the points of thoſe ſalts fix its fluidity, whence it congeals; and the reſult of that congelation makes what we call *amber*; which is more or leſs pure, tranſparent, and firm, as thoſe parts of ſalt and bitumen are more or leſs pure, and are mixed in this or that proportion.

Mr. Brydone, in his Tour to Sicily and Malta, ſays, that the river Gearretta, formerly celebrated by the poets under the name of Simetus, throws up near its mouth great quantities of *amber*. Vol. i. Lett. 12. p. 282.

He mentions alſo a kind of artificial *amber*, not uncommon there, made, as he was told, from COPAL, but very different from the natural. Ib. p. 284.

If the people, who collect *amber* on the ſhores of the Baltic, were more curious and particular in their obſervations of the maſſes they find, we ſhould doubtleſs have much more lights into its true hiſtory and nature. There is no queſtion, but that ſome pieces of it are toſſed up there ſo imperfectly formed, that the proceſs of nature may be ſeen in their different ſtages. Pieces have been ſometimes found ſo ſoft, as to receive the impreſſion of a ſeal: theſe are always not only perfect *amber* in other reſpects, but they are obſerved to have a ſmell ſtronger than the common *amber* has. Theſe pieces ſometimes harden immediately, on being expoſed to the air, but ſometimes they retain this ſoftneſs many months. We have an account of ſuch a piece in the Philoſophical Tranſactions, which had retained this ſoftneſs a whole year, in which time it had lain among other pieces of *amber*; and of another maſs very ſoft on one ſide, and hard on the other, and containing in the ſoft part a fly buried. Phil. Tranſ. N° 57.

Hartman has evidently proved, that *amber* is formed of a BITUMEN, mixed with vitriol and other ſalts; and though this is allowed him in regard to the foſſile *amber*, many diſpute whether the ſea or *hauſtile amber*, as they expreſs it, be ſo produced. It is, however, very evident, that all *amber* is of the ſame origin, and probably all the *hauſtile amber* is firſt waſhed into the ſea out of the cliffs; though Hartman thinks it very poſſible, that ſome of it may be formed in the earth under the ſea, and be waſhed up thence. The *hauſtile*, or *ſea-amber*, is uſually finer to the eye than the *foſſile*; but the reaſon is, that it is diveſted of that coarſe coat with which the other is covered while in the earth. Hartman's Hiſt. Succini.

The chemiſts are as much divided on this head as the naturaliſts. *Amber* being found by diſtillation to yield an acid ſpirit, which precipitates into a ſalt, is inferred, by ſome, to be of a mineral nature; this being a circumſtance peculiar to that kingdom, and never found in the diſtillation of vegetables: to which may be added, that *amber* diſſolves in *alcohol*, not in water; and melts at the fire, and is inflammable; which are characters that ſeem to refer it to the claſs of ſulphurs, or bitumens.

Others, on the contrary, argue it to be of the vegetable kind, from its reſolving into the ſame principles with vegetables, viz. water, ſpirit, ſalt, and oil.—Boerhaave reſembles it to camphire, which is a concrete oil of the aromatic plants of hot countries, elaborated by heat into a cryſtalline form.

Amber, though fuſible with a ſmall fire, and concreting again when cold, yet differs from the metals, and other fuſible bodies of that kind, in this, that as ſoon as cold they are the ſame as before melting; but *amber*, when it has once been melted, is no longer *amber*, it loſes its beauty and hardneſs; and the true reaſon of this is, that being compoſed of BITUMEN and ſalt, the ſalt flies off in the heating, and leaves the remainder little better than the ſimple *reſiduum* of an evaporated *petroleum*, or any other liquid bitumen. There have been people, at different times, who have pretended to have an art of melting ſmall pieces of *amber* into a maſs, and conſtituting large ones of them; but this ſeems ſuch another undertaking as the making of gold; all the trials that have yet been made by the moſt curious experimenters, proving, that the heat which is neceſſary to melt *amber*, is ſufficient to deſtroy it. Phil. Tranſ. N° 248. p. 25.

Hartman indeed mentions an accident, which ſhews a poſſibility of many pieces of *amber* being combined into one by an operation of nature, though it never could be effected by art. A ſheep was once killed in Pruſſia, in whoſe ſtomach a large piece of *amber* was found, which was compoſed of ſeveral other ſmaller pieces, the joinings of all which might be ſeen, though as firm as the pieces themſelves. This is a proof that the creature had ſwallowed the whole in ſmall pieces with its food, and that nature, by the heat and juices of its ſtomach, had ſoftened thoſe pieces without melting them, ſo as to make them unite firmly, tho' not ſo as to be thoroughly blended with each other. Could art arrive at this, which it is not probable it ever will, even this is far ſhort of what is pretended of melting *amber*, and caſting it into what form is deſired.

There are ſeveral indications which diſcover where *amber* is to be found.—The ſurface of the earth is there covered with a ſoft ſcaly ſtone; and vitriol in particular always abounds there, which is ſometimes found white, ſometimes reduced into a matter, like melted glaſs, and ſometimes figured like petrified wood.

Amber aſſumes all figures in the ground: that of a pear, an almond, a pea, &c. In *amber* there have been ſaid to be letters found very well formed; and even Hebrew and Arabic characters.—Within ſome pieces of *amber* have likewiſe been found leaves, inſects, &c. included; which ſeems to indicate, either that the *amber* was originally in a fluid ſtate, or that having been expoſed to the ſun, it was once ſoftened, and rendered ſuſceptible of the leaves, inſects, &c. which came in its way. The latter of theſe ſeems the more agreeable to the *phænomenon*, becauſe thoſe inſects, &c. are never found in the centre of the pieces of *amber*, but always near the ſurface.

It is obſerved by the inhabitants of the places where *amber* is produced, that all animals, whether terreſtrial, aereal, or aquatic, are extremely fond of it; and that they frequently find pieces of it in their excrements, and in their bodies when opened.

The bodies of inſects, found buried in *amber*, are viewed with admiration by all the world; but of the moſt remarkable of theſe, many are to be ſuſpected as counterfeit, the great price, beautiful ſpecimens of this kind ſell at, having tempted ingenious cheats to introduce animal bodies in ſuch artful manners into ſeemingly whole pieces of *amber*, that it is not eaſy to detect the fraud. The factitious curioſities in *amber*, which are pretended to be pieces of this foſſil, with inſects embedded in it, are uſually no other than a hardened varniſh, not having the hardneſs, or other qualities of *amber*. Some few of them are *amber* melted, into which the inſects have been put in that ſtate, but theſe are very coarſe and brittle. Theſe two kinds of cheat are diſcovered by their want of hardneſs, or by obſerving the ſides of the piece, to find the joining where it has been ſplit.

Many ſpecies of the fly kind, however, are obviouſly and indiſputably lodged by nature there. Among this tribe of animals, the ſeveral ſpecies of the *ichneumon* fly are found the moſt numerous; the common houſe and fleſh flies are alſo frequently found thus preſerved; and it is remarkable, that of theſe ſome have preſerved, and others have wholly loſt their natural colours. Theſe are ſometimes found in cloudy pieces of *amber*, but much more frequently in the perfectly clear and fine ones; and in theſe many are ſeen plainly to be encruſted with a thin coat of the matter of the *amber*, ſeparate from the maſs.

Some of theſe, which are incloſed in it, are plainly ſeen to have ſtruggled hard for their liberty, and even to have left their limbs behind them in the attempt; it being no unuſual thing to ſee, in a maſs of *amber* that contains a ſtout beetle, the animal wanting one, or perhaps two of its legs; and thoſe legs left in different places, nearer that part of the maſs from which it has travelled. This alſo may account for the common accident of finding legs, or wings of flies, without the reſt of their bodies, in pieces of *amber*; the inſects, to which theſe have belonged, having, when entangled in the yet ſoft and viſcid matter of the *amber*, eſcaped, at the expence of leaving theſe limbs behind them. Drops of clear water are ſometimes alſo preſerved in *amber*. Theſe have doubtleſs been received into it while ſoft, and preſerved by its hardening round them. They are uſually contained in cavities too large for them, though ſometimes the holes are filled up. In ſome ſpecimens, the holes alone remain without any moiſture. Naturaliſts, who have been ſo curious as to examine this liquor contained in the *amber*, have found it to be of an auſtere taſte, like that in which vitriol had been diſſolved: others mention the having met with it wholly inſipid, and ſome taſting of ſea-ſalt. It is eaſy to account for a drop of water, of any of the three kinds, being found in *amber*, but the vitriolic water is the moſt natural there, as there is always great plenty of vitriol where the *amber* is found.

Beautiful leaves of a pinnated ſtructure, reſembling ſome of the ferns, or maiden-hairs, have been found in ſome pieces; but theſe are rare, and the ſpecimens of great value.

Mineral ſubſtances are alſo found at times lodged in maſſes of *amber*. Some of the pompous collections of the German princes boaſt of ſpecimens of native gold and ſilver in maſſes of *amber*; but as there are many ſubſtances of the marcaſite, and other kinds, that have all the glittering appearance of gold and ſilver, it is not to be too haſtily concluded, that theſe metals are really lodged in theſe beds of *amber*. Iron is found in various ſhapes immerſed in *amber*, and as it is often ſeen eroded, and ſometimes in the ſtate of vitriol, it is not impoſſible but that copper, and the other metals, may be alſo ſometimes immerſed in it in the ſame ſtate; and that the bluiſh and greeniſh colours, ſometimes found in the recent pieces of timber, may be owing, like the particles of the gem colours, to thoſe metals; but as the gems, by their denſe texture, always retain their colours, this lighter and more lax bitumen uſually loſes what it gets of this kind, by keeping ſome time. Small pebbles, grains of ſand, and fragments of other ſtones, are not unfrequently alſo found immerſed in *amber*.

There is one very eaſy way of diſtinguiſhing alſo whether theſe are real and natural curioſities, or whether art has been concerned in them; which is by examining at what depth in the maſs the creature lies. *Inſects* naturally embedded in *amber* are always found near its ſurface, or, at leaſt, there are few found otherwiſe. The artificially buried creatures are always lodged in or near the center. The reaſon of this is plain; for the artiſt knows the deeper the creature lies, the better his art will be concealed; and that if he had lodged it near the ſurface, the natural tranſparence of the thin plate of *amber* which lay over it, would have ſhewn the fallacy, by bringing the artificial hollow too near the eye. Phil. Tranſ. N° 248. p. 21.

The moſt remarkable property of *amber* is, that, when rubbed, it draws or attracts other bodies to it; and this, it is obſerved, it does, even to thoſe bodies which the ancients thought it had an antipathy to; as oily bodies, drops of water, ſweat of human bodies, &c.

Add, that by the friction it is brought to yield light pretty copiouſly in the dark; whence it is reckoned among the native *phoſphori*.

This property which *amber* poſſeſſes of attracting light bodies, was very anciently obſerved. Thales of Miletus, ſix hundred years before Chriſt, concluded from hence that it was animated. But the firſt perſon, who expreſly mentions this ſubſtance, is Theophraſtus, about the year 300, before Chriſt. The attractive property of *amber* is likewiſe occaſionally taken notice of by Pliny, and other later naturaliſts, particularly by Gaſſendus, Kenelm Digby, and Sir Thomas Brown; but it was generally apprehended that this quality was peculiar to *amber* and jet, and perhaps agate, till Gilbert publiſhed his treatiſe De Magnete, in the year 1600. From ηλεκτρον, the Greek name for *amber*, is derived the term ELECTRICITY, which is now very extenſively applied not only to the power of attracting light bodies inherent in *amber*, but to other ſimilar powers, and their various effects, in whatever bodies they reſide, or to whatever bodies they may be communicated.

Some diſtinguiſh *amber* with regard to its colours, into *yellow*, *white*, *grey*, and *black*.—But the two latter are properly of a different nature and denomination; the one called JET, the other AMBERGRIS.

The *white* is moſt valued for medicinal uſes, as being beſt digeſted, of the moſt odoriferous ſmell, and containing the greateſt quantity of volatile ſalt.—The *yellow* is moſt prized by thoſe who work it into beads, and other toys, by reaſon of its tranſparency.

There are two methods of rendering *amber* tranſparent; either by cementing lumps of it with ſand, during forty hours, in an iron pot; or by digeſting them, during twenty hours, in boiling rape-ſeed oil.

AMBER is the baſis of all varniſhes. For the method of diſſolving this ſubſtance into varniſh, ſee VARNISH.

But if *amber* could be diſſolved without impairing its tranſparency, or one large maſs be made of it by uniting ſeveral ſmall ones, it is eaſy to ſee what would be the advantages of ſuch a proceſs. The art of embalming might poſſibly be alſo carried to a great height by this, if we could preſerve the human corpſe in a tranſparent caſe of *amber*, as the bodies of flies, ſpiders, graſhoppers, &c. are to a great perfection. Something of a ſubſtitute of this kind we have in fine roſin, boiled to a great hardneſs, and perfect tranſparence; this being diſſolved by heat, and the bodies of ſmall animals ſeveral times dipped in it, they are thus coated with colophony, that in ſome degree reſembles *amber*; but this muſt be kept from duſt. Shaw's Lectures, p. 425.

For the methods of diſſolving *amber* in oils, the advantages of ſuch ſolutions, and a farther account of its preparation for varniſhes, the curious may conſult Dr. Lewis's Commerc. Phil. Techn. p. 366, & ſeq.

AMBER is reputed of ſome medicinal efficacy; being uſed in ſuffumigations, to remove defluxions; and in powder, as an alterant, abſorbent, ſweetner, and aſtringent.

In times of the plague, thoſe who work in *amber* at Koningſberg, are ſaid to be never infected; whence it is held a preſervative.—It is alſo eſteemed a lithontriptic, diuretic, and promoter of the *menſes*.

It is preſcribed in the *fluor albus*, in convulſions, and in all diſorders of the nerves. It is alſo given in coughs, and diſeaſes of the lungs; and is by ſome greatly recommended in inveterate head-achs. Its doſe is from one ſcruple to two.

Its preparations are,

Amber, *ſpirit of*, is an acid liquor, procured from *amber*, by pulverizing and diſtilling it with a ſand heat, with or without the addition of tobacco-pipes, bricks, ſand, &c.

It is chiefly uſed externally in rheumatic pains and aches; and internally, in inveterate gleets, &c.

Amber, *oil of*, is a fine, tranſparent, ponderous, yellow oil, procured after the ſpirit, by increaſing the degree of fire.—This, by rectification, becomes a good antihyſteric, and emmenagogue; being very ſubtile and penetrative.

To purify the dark muddy *oil of amber* drawn *per ſe*, take two pounds of good brandy, one of ſea-ſalt, half a pound of the oil; mix them, and diſtil them together, and a large proportion will come over very tranſparent, and finely coloured.

Amber, *volatile ſalt of*.—The principal chemical production of *amber*, is a peculiar acid ſalt; which riſes after the oil, and fixes in the neck of the retort, &c. Mr. Potts concludes from ſeveral experiments, that the acid of this *ſalt* is eſſentially different from the three mineral acids, and approaches neareſt to thoſe of the vegetable kingdom. See Acid *of Amber*.

It is a good cephalic, and detergent; and Quincy ſays, it extremely attenuates, and cuts, and penetrates, the moſt remote and minute receſſes; and thus ſcours, as it were, the whole nervous ſyſtem. Its chief tendency, he adds, is to ſecretion, and what it carries along with it, is by urine. It alſo contributes, with alexipharmics, to promote a *diaphoreſis*; and is ſcarce ever omitted in preſcription for chronic caſes, as epilepſies, palſies, &c. The great conſumption of this medicine, and the ſmall proportion that *amber* yields of it, occaſions it to be frequently adulterated with ſal ammoniac, nitre, cream of tartar, ſalt of coral, &c.

Amber, *tincture of*, is procured by digeſtion in ſpirit of wine with a ſand-heat.—It is preſcribed with the ſame intentions as the ſalt of *amber*.

Amber, *black, gagates*. See Jet.

Amber, *liquid*, and *balſam of*, ſee Balsam.

Amber-seed, or *muſk-ſeed*, is a ſeed that is ſomewhat like the millet, of a bitteriſh taſte, and brought dry to us from Martinico and Egypt.—The Egyptians uſe it internally, as a cordial, to fortify the heart, ſtomach, and head, and to provoke luſt.—It gives a grateful ſcent to the breath, after eating; but it is not proper for thoſe who are inclinable to vapours.

Amber-tree, *anthoſpermum*, in *Botany*, a genus of the *polygamia dioecia*. Its characters are theſe: it is male and female in different plants, and the male flowers have no petals. The female flowers have the ſame ſtructure as the male, but have no ſtamina; an oval germen is ſituated in the bottom, which becomes a roundiſh capſule, having four cells, and containing ſeveral angular ſeeds. There is but one ſpecies.

The beauty of this ſhrub is its ſmall evergreen leaves, which grow as cloſe as heath, and being bruiſed between the fingers emit a very fragrant odour.

It is but of late years, that this plant could be propagated by ſeeds, no female plants being in our gardens; they were, therefore, continued from cuttings, until ſeeds were procured from the Cape of Good Hope, from which both kinds were raiſed.

AMBERBEI, in *Botany*. See Centaury.

AMBERGRIS, Amber-grease, Ambra Grisia, a fragrant drug, that melts almoſt like wax; and is commonly of a greyiſh or aſh-colour, and is uſed both as a perfume, and a cordial.

It is found on the ſea-coaſts, in ſeveral countries; as, along the ſouthern, and eaſtern parts of Africa, Madagaſcar, the Maldives, ſome parts of the Mediterranean, and in the Weſt Indies, about the iſlands of Bermudas and Jamaica; alſo on the coaſts of Carolina, and the weſtern coaſts of Ireland. It is likewiſe ſaid to be found on the coaſts of Norfolk, and in the iſlands of Orkney. It is ſometimes whitiſh, browniſh, and ſtreaked with yellowiſh, blackiſh, &c.

There is a great variety of opinions among naturaliſts with regard to its origin and production: to rehearſe them all, would make a volume. Klobius recites eighteen, to which we could add half as many more.—The principal may be reduced to theſe which follow.

1. Some take it for the excrement of a bird, called in the Madagaſcar language *aſchibobuch*; which being melted by the heat of the ſun, and waſhed off the ſhore by the waves, they ſay is ſwallowed up by whales, who return it back in the condition we find it.

2. Others ſpeak of it as the excrement of a cetaceous fiſh; becauſe ſometimes found in the inteſtines, and ſometimes in the *fæces* themſelves, of ſuch animals. But to both theſe hypotheſes it is objected, that we have no inſtance of any excrement capable of melting like wax. Beſides, the error of theſe opinions may be detected by chemical experiments; the dung of all animals admitting of a ſolution in aqueous menſtrua, but obſtinately reſiſting the moſt highly rectified ſpirit of wine. Add, that if it were the excrement of a whale, it ſhould rather be found in ſuch places where thoſe animals abound, as about Greenland, &c. than about the Maldive iſlands, Soffala, Melinda, Cape Comorin, &c. where no whales are found.

3. Others take it for a kind of wax, or gum, which diſtils from trees, and drops into the ſea, where it congeals, and becomes *ambergris*.

4. Others, and particularly many of the orientals, imagine it ſprings out of the bottom of the ſea, as *naphtha* does out of ſome fountains.—They add, that the only ſprings hereof are in the ſea of Ormus, between the Arabian and Perſian gulphs. Edriſſi, who is of this opinion, in the firſt climate of his Geography, mentions pieces of *ambergris* on thoſe coaſts, weighing a full quintal.—Paludanus and Linſchotten alſo ſpeak of it as a ſort of bitumen, gradually working up from the bottom of the ſea, and hardening in the ſun.

5. Others take it for a ſea-muſhroom, torn up from the bottom by the violence of tempeſts; it being obſerved, that *ambergris* is never found but during the ſouth-weſt monſoons, after ſtorms.

6. Others aſſert that it is a vegetable production, iſſuing out of the root of a tree, whoſe roots always ſhoot toward the ſea, and diſcharge themſelves into the ſame.—This account we have in the Philoſophical Tranſactions, from one of the Dutch factors at Batavia; and the ſame is confirmed by Mr. Boyle.

7. Others ſuppoſe it a ſpongious kind of earth, which the working of the ſea waſhes from off the rocks, where, being lighter than water, it floats.—Others are of opinion, that it is a bituminous matter; that it is at firſt liquid, and runs into the ſea; and that it is there condenſed, and reduced into a maſs.

8. Others maintain, that *ambergris* is made from the honey-combs which fall into the ſea from the rocks, where the bees had formed their neſts.—This opinion ſeems to have ſomething of experience on its ſide; ſeveral perſons having ſeen pieces that were half *ambergris*, and half plain honey-comb; and others, again, having found large pieces of *ambergris*, in the middle of which, when broken, they diſcovered both honey-comb, and honey. But the error of this hypotheſis may be detected by chemical experiments; as honey likewiſe admits of a ſolution in aqueous *menſtrua*, but reſiſts the moſt highly rectified ſpirit of wine.

9. Dr. Boylſton, and Mr. Dudley, in the Philoſophical Tranſactions, aſſert, that the *ambergris* is a true, animal concrete, formed in balls, in the body of the male ſpermaceti whale, and lodged in a large oval bag, over the teſticles, at the root of the penis. Phil. Tranſ. N° 385, and 387.

It is certain, the whale-catchers have divers times found *ambergris* in their ſpermaceti whales, and that chiefly in the larger and older ſort; and it is from the informations of Mr. Atkins, and other whale-catchers, that Mr. Dudley chiefly drew his account.—But it is added, that it is not one ſpermaceti whale in a hundred that is found to have *ambergris*. Mr. Neumann abſolutely denies it to be an animal ſubſtance, as not yielding, in the analyſis, any one animal principle.—It may indeed, he ſays, be found in whales; but it muſt have been ſwallowed by them.

Mr. Neumann, chemiſt to the king of Pruſſia, after an ample recital of all the different opinions advanced by others, gives us his own; which is, that *ambergris* is a Bitumen, iſſuing out of the earth into the ſea; at firſt of a viſcous conſiſtence, but hardening, by its mixture with ſome liquid *naphtha*, into the form wherein we find it. Phil. Tranſ. N° 433, N° 434, N° 435. Mr. Cartheuſer is of the ſame opinion.

This opinion ſeems to be the beſt founded, and is ſtrengthened by this circumſtance, that *ambergris* is found in the greateſt quantities in the ſea, about the iſland of Madagaſcar, where the ſubterranean parts are ſuppoſed to be impregnated with bituminous matter.

The pieces are frequently ſeen compoſed of divers ſtrata, laid one over another, with ſtones and other bodies incloſed therein, and the ſtrata are ſometimes full of little ſhells, which ſeem a ſpecies of *concha anatifera*; whence it may be conjectured, that the *ambergris* has originally been in a fluid ſtate, or, at leaſt, that it has been diſſolved, and in that ſtate has formed itſelf afreſh, and inveloped ſuch bodies as happened to be in its way.

Ambergris is of conſiderable uſe among perfumers, who melt it over a gentle fire, and make extracts, eſſences, and tinctures of it.—It would be of more uſe in phyſic too, were not its ſmell apt to occaſion vapours.

There is a preparation, however, recommended by Hoffman, which is ſaid not to be attended with theſe ill conſequences. The preparation is made in the following manner.

Let the ſpirit of roſes, perfectly dephlegmated, be, not only once, but twice, at leaſt, drawn off from the ſalt of tartar, which is burnt, or calcined, in a vehement fire. By this means there is produced a ſpirit, which by its penetrating quality, enters into the inmoſt ſubſtance of the *ambergris*, and ſo ſeparates and reſolves its oleous contexture.

This, we are aſſured, will not excite commotions and agitations in a weak body, as does the common preparation of *ambergris*, which is made with a mixture of muſk or civet. Hoffm. Obſerv. Phyſic. Chem. lib. i. cap. 18.

It enters into the compoſition of many cordial, ſudorific, and alexeterial waters. But its chief virtue conſiſts in its antiſpaſmodic and ſedative qualities, ſimilar to thoſe of muſk and caſtor, and its power of relieving certain hyſterical, convulſive, and other nervous affections. It may be taken inwardly from half a grain to ten or twelve grains, or more; for as to doſes there can be no fixed rules about remedies and diſeaſes of theſe kinds.

Ambergris is very commonly counterfeited and adulterated. The firſt generally conſiſts of muſk, civet, ſtorax, laudanum, and aloes wood, mixed together; the latter of a large quantity of bullock's blood, duly flavoured with muſk and civet. It is one of the moſt agreeable perfumes; but muſt be proportioned ſo ſparingly, as that while it improves the ſmell of what it is added to, its own may not be felt.

Neumann gives the chemical characters of this bitumen, and its analyſis, by diſtillation. He diſtinguiſhes the ſophiſtications of *ambergris*, and obſerves, that it is totally ſoluble in oils and vinous ſpirits, and that it yields the ſame products as AMBER. See the particulars and the proofs of this in Neumann's Works, p. 239, & ſeq.

We have various inſtances in authors, of vaſt pieces of this matter: one of the largeſt that has been known in Europe, was brought by the Dutch Eaſt-India company, toward the cloſe of the laſt century, and kept in their houſe for ſome years. It was almoſt round; meaſured two feet in diameter, and weighed an hundred and eighty-two pounds. The great duke of Tuſcany offered fifty thouſand crowns for it. We are told, however, that one was taken up near the Cape of Good Hope, which weighed three hundred pounds; and another, if we may credit the relation, fifteen thouſand pounds. Phil. Tranſ. N° 263, N° 232.

AMBERGRIS may be known to be genuine by its fragrant ſcent, when a hot needle or pin is thruſt into it, and its melting like fat, of an uniform conſiſtence. Whereas the counterfeit will not yield ſuch a ſmell, nor prove of ſuch a fat texture.

One thing however is very remarkable, that this drug, which is the moſt ſweet of all the perfumes, ſhould be capable of being reſembled in ſmell, by a preparation of one of the moſt odious of all ſtinks. Mr. Homberg found, that a veſſel in which he had made a long digeſtion of the human *fæces*, acquired a very ſtrong and perfect ſmell of *ambergris*, inſomuch that any one would have thought a great quantity of eſſence of *ambergris* had been made in it. The perfume was ſo ſtrong and offenſive, that the veſſel was forced to be removed out of the elaboratory. Mem. Acad. Roy. 1700.

AMBERING is uſed, by ſome writers, to denote the giving a ſcent or perfume of *amber* to any thing.

This is otherwiſe called *enambering*. Hook, Phil. Collect. N° 4.

Dr. Hook mentions an extraordinary method of *ambering in infinitum*, i. e. with a ſmall quantity of *amber*, and other requiſites, *enambering* an hundred, or a thouſand pounds of ſugar, or the like, ſo as the firſt matter ſtill remains undecayed, to be uſed again. Ibid.

AMBIDEXTER, one who uſes both hands alike, the left as well as right, or in caſes where only the uſe of one is neceſſary.

The word is compounded of *ambo*, *both*, and *dexter*, *right hand*; by analogy to the Greek αμφιδεξιος, which ſignifies the ſame.

Women, according to the obſervation of Hippocrates, are never *ambidextrous*. But this is denied by ſome moderns, who give inſtances of the contrary; though it is owned, they are but few in compariſon of thoſe that are found in the other ſex.

It may be imputed to education and habit, that men as well as brutes are not all *ambidexters*, there being no difference of right and left in the nature of things. Nurſes are even forced to be at ſome pains to enure the infants under their care to forego the uſe of their left-hand. How far it may be our advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are infinite occaſions in life, when it would be better to have the equal uſe of both hands. Surgeons and oculiſts are of neceſſity obliged to be *ambidexters*; bleeding, &c. in the left-arm, or left-ankle, and operations on the left-eyes, cannot be well performed but with the left-hand. Divers inſtances occur in hiſtory, where the left-hand has been cultivated preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exerciſe both hands alike, without partiality either for the right or left; and Plato enjoins *ambidexterity* to be obſerved and encouraged in his republic.

In the Grecian armies, their more diſtinguiſhed ſoldiers, their pikemen and halbardeers, as thoſe who formed the firſt line of their battalions, were to be able to fight indifferently with left-hand or right. We find it mentioned in Scripture, that, on an extraordinary occaſion, the ſingle tribe of Gad produced 700 brave men, who fought with the left-hand as well as the right. And the Roman hiſtorians aſſure us, that they had gladiators who were trained up to the ſame exerciſe. An ingenious French writer is ſurpriſed, that among all the modern refinements in the art of war, none have thought of reſtoring the ancient practice of forming *ambidexters*, which it is certain might be of conſiderable ſervice in the way of ſtratagem.

AMBIDEXTER, in a legal ſenſe, denotes a perſon who takes money from both of the contending parties to further them in their cauſe.—In this ſenſe the word may be applied to a judge, juror, a ſollicitor, or the like.—The penalty on a juror, in ſuch caſe, is to forfeit DECIES TANTUM, ten times as much as he receives.

AMBIEGNA, in *Antiquity*, an appellation given to a victim, which was ſurrounded, or attended at the time of offering it, with other leſſer ones.

In this ſenſe, the word is alſo written *ambegui*. We read of *ambiegnæ oves* uſed in ſacrificing to Juno, which were ſheep, having brought forth twins, and offered up with their two lambs faſtened on either ſide.

AMBIENT, a term applied to ſuch things as encompaſs others round about.

The word is formed of *ambire*, *to encompaſs*.

Thus, the bodies ſituate around another body, are called *ambient*, and often the CIRCUM-AMBIENT bodies.—The whole body of air, becauſe it encompaſſes all things on the face of the earth, is often by phyſical writers called, by way of eminence, the *ambient*, or *ambient* air.

AMBIGENAL *hyperbola*. See HYPERBOLA.

AMBIGU denotes a kind of mixed entertainment, wherein both fleſh and fruit are ſerved together; ſo that it ſeems doubtful whether to denominate it a mere collation, or a meal.

AMBIGUOUS, ſomething dubious, obſcure, or which may be taken in different ſenſes. See EQUIVOCAL.

The word is formed of *ambo*, *both*, and *ago*, *I drive*; q. d. that which keeps the mind wavering, or in ſuſpenſe; not knowing which ſide to chooſe.

The anſwers of the ancient oracles were always *ambiguous*.

An anonymous writer has publiſhed a dictionary of *ambiguous* words. Lexicon Philoſophicum de Ambiguitate Vocabulorum, Francof. 1597. 4to.

Ambiguity is occaſioned either by a wrong choice of words, and the uſe of equivocal terms, or by an improper arrangement of them. *Ambiguities* of the laſt kind are either, where the arrangement leads to a wrong ſenſe, or where the ſenſe is left doubtful. Dr. Campbell expreſſes the former by the term equivocation, and appropriates that of *ambiguity* to the latter. See Elem. of Criticiſm, vol. ii. p. 20, 54; and Campbell's Philoſophy of Rhetoric, vol. ii. p. 28, 38.

AMBIT, AMBITUS, of a figure, in *Geometry*, denotes the *perimeter*; or the ſum of all the lines, that conſtitute, or include it.

Iſaac Voſſius has a particular inquiry concerning the *ambit*, or circumference of ancient Rome. That of the city he makes to be 60¼ miles, or *mille paſſus*, and that of the city and ſuburbs together 72 miles; exceeding ancient Babylon, whoſe *ambit* was only 60 miles.

AMBIT, *ambitus*, was particularly uſed, in *Antiquity*, to denote a ſpace of ground to be left vacant betwixt one building and another. By the laws of the Twelve Tables, houſes were not to be built contiguous, but an *ambit*, or ſpace of 2½ feet, was to be left about each, for fear of fire.

The *ambitus* of a tomb, or monument, denoted a certain number of feet, in length and breadth, around the ſame, within which the ſanctity aſſigned to it was limited. The whole ground wherein a tomb was erected, was not to be ſeparated from the common uſes; for this reaſon, it was frequent to inſcribe the *ambit* on it, that it might be known how far its ſanctity extended: thus, *in fronte pedes tot, in agrum pedes tot.*

AMBITUS, among the ancient Romans, the act of ſoliciting, or making intereſt, for offices, or honours.

The candidates, in this caſe, went about the city, and into all public places and aſſemblies, to beg votes; which was called *ambitus*; *am*, in the ancient Latin, ſignifying *circum*, *about*, and *ire*, *to go*.

Among the Romans, it differed from *ambition*, as the former lies in the act, the latter in the mind.

Ambitus was of two kinds, one lawful, and even laudable; the other infamous.

The firſt, called alſo *ambitus popularis*, was when a perſon offered his ſervice to the republic frankly, leaving it to every body to judge of his pretenſions as they found reaſonable.

This kind was not prohibited by any law, but always approved and practiſed by the beſt and greateſt men.

The means and inſtruments here made uſe of were various, 1. *amici*, or friends, under divers relations, including *cognati*, *affines*, *neceſſarii*, *familiares*, *vicini*, *tribules*, *clientes*, *municipes*, *ſodales*, *collegæ*. 2. *Nomenclatura*, or the calling and ſaluting every perſon by his name; to which purpoſe, the candidates were attended with an officer, under the denomination of *interpres*, or *nomenclator*. 3. *Blanditia*, or obliging perſons by ſerving them, or their friends, patrons, or the like, with their vote and intereſt on other occaſions. 4. *Prenſatio*, the ſhaking every perſon by the hand, offering him his ſervice, friendſhip, &c. 5. *Aſſiduitas*. 6. The *toga candida*, worn looſe. 7. *Benignitas*, the diſtributing largeſſes, *congiaria*, &c.

The ſecond kind was that wherein force, cajoling, money, or other extraordinary influence, was made uſe of.—This was held infamous, and ſeverely puniſhed, as a ſource of corruption, and other miſchiefs.

This kind of *ambitus* was at one time the great trade of Rome, and demanded a conſtant ſupply of great ſums of money. Tully aſſigns this as the cauſe of the high rate of intereſt, and tells us it had raiſed it from 4 to 8 per cent.—Bribery was come to the pitch of 80729*l.* per tribe; and there being no leſs than thirty-five tribes, it is obvious how expenſive this corruption was grown.—It is alſo well known where it ended.

Several laws were made againſt it, as the *Lex Acilia, Calpurnia, Aufidia, Bæbia, Æmilia, Cornelia, Fulvia, Fabia, Julia Auguſti, Julia Cæſaris, Licinia, Maria, Pœtelia, Pompeia, Tullia Vetus.*

In the year of Rome 321, the uſe of the *toga candida* was prohibited. In the year 398, the candidates were forbid to go to the markets and meetings in the neighbouring towns. In 571, ſevere penalties were laid on the givers of largeſſes. In 594, this was made puniſhable by baniſhment. In 697, heavy fines were impoſed. By the *Lex Tullia*, made in the conſulſhip of Cicero, the candidates were forbidden to beſtow any combats of gladiators on the people, to make any public feaſts, or to cauſe themſelves to be followed by a crowd of clients, for two years before they put in for any place.

A ſenator, who was guilty of a breach of this law, was puniſhed with ten years baniſhment; others were fined, and rendered incapable of any dignity for ever.

Ambitus was not only practiſed at Rome and in the forum, but in the meetings and aſſemblies of other towns in Italy, where numbers of citizens were uſually found, on account of trade and buſineſs.

The practice ceaſed in the city from the time of the emperors, becauſe poſts were not then to be had by courting the people, but by favour from the prince.

Perſons who had cauſes depending, practiſed the ſame, going about among the judges to implore their favour and mercy.

They who practiſed this were called *ambitioſi*. Hence we alſo meet with *ambitioſa decreta*, and *ambitioſa juſſa*; uſed for ſuch ſentences and decrees as were thus procured from the judges, contrary to reaſon and equity, either gratuitouſly, or for money.

Ambitus, in *Muſic*, a name ſometimes appropriated to ſignify the particular extent of each tone, or modification of grave and ſharp.

AMBIX, in *Ancient Writers*, denotes a veſſel of glaſs, or ſhell.

Hence the origin of the word *alembic*, which we ſometimes alſo find denoted by the word *ambix*.

AMBLE, Ambling, in *Horſemanſhip*, a peculiar kind of pace, wherein a horſe's two legs, of the ſame ſide, move at the ſame time.

The *ambling* horſe changes ſides at each remove; two legs of a ſide being always in the air, and two on the ground, at the ſame time: an *amble* is uſually the firſt natural pace of young colts; which, as ſoon as they have ſtrength enough to trot, they quit.—There is no ſuch thing as an *amble*, in the manege; the riding-maſters allowing of no other paces beſide walk, trot, and gallop: their reaſon is, that a horſe may be put from a trot to a gallop, without ſtopping him; but not from an *amble* to a gallop, without ſtopping; which loſes time, and interrupts the juſtneſs and cadence of the manege.

There are various practices and methods of diſcipline, for bringing a young horſe to *amble*; ſome chooſe to toil him in his foot-pace through new-plowed lands; which naturally inures him to the ſtroke required in the *amble*. But its inconveniences are, the weakneſs and lameneſs that ſuch diſorderly toil may bring on a young horſe.

Others attempt it by ſudden ſtopping, or checking him in the cheeks, when in a gallop; and thus putting him into an amazedneſs, between gallop and trot; ſo that loſing both, he neceſſarily ſtumbles upon an *amble*.—But this is apt to ſpoil a good mouth and rein, and expoſes the horſe to the danger of a hoof-reach, or ſinew-ſtrain, by over-reaching, &c.

Others prefer *ambling* by weights, as the beſt way; and to this end, ſome overload the horſe with exceſſive heavy ſhoes, which is apt to make him interfere, or ſtrike ſhort, with his hind feet.—Others fold leaden weights about the fetlock paſterns; which are not only liable to the miſchiefs of the former, but put the horſe in danger of incurable ſtrains, cruſhing of the coronet, and breeding of ring-bones, &c.—Others load the horſe's back with earth, lead, or the like maſſy ſubſtance; but this may occaſion a ſwaying of the back, overſtraining the fillets, &c.

Some endeavour to make him *amble* in hand, before they mount his back, by means of ſome wall, ſmooth pail or rail, and by checking him in the mouth with the bridle-hand, and correcting him with a rod on the hinder hoofs, and under the belly, when he treads falſe. But this is apt to drive a horſe to a deſperate phrenſy, before he can be made to underſtand what they would have of him; and to rear, ſprawl out his legs, and to make other antic poſtures, which are not eaſily quitted again. Others think to effect it by a pair of hind ſhoes, with long ſpurns or plates before the toes; and of ſuch length, that if the horſe offers to trot, the hind-foot beats the fore-foot. But this occaſions wounds of the back-ſinews, which often bring on an incurable lameneſs.

Some attempt to procure an *amble*, by folding fine, ſoft liſts ſtrait about his gambrels, in the place where he is gartered for a ſtiffle ſtrain; and turn him thus to graſs for two or three weeks, and afterwards take away the liſt.—This is a Spaniſh method, but diſapproved; for though a horſe cannot then trot but with pain, yet the members muſt be ſufferers; and though the *amble* be gained, it muſt be ſlow and unſightly; becauſe attended with a cringing in the hind-parts.—In effect, *ambling* by the tramel, as practiſed by us, appears the neareſt to nature, and the beſt and moſt aſſured way.

There are divers errors, however, uſually practiſed in this method: as, that the tramel is often made too long, and ſo gives no ſtroke, but makes a horſe hackle and ſhuffle his feet confuſedly; or too ſhort, which makes him volt and twitch up his hind-feet ſo ſuddenly, that by cuſtom it brings him to a ſtring-halt, from which he will ſcarce ever be recovered.—Sometimes the tramel is miſplaced, and to prevent falling put about the knee, and the hind-hoof.—In which caſe, the beaſt cannot give any true ſtroke, nor can the fore-leg compel the hind to follow it: or if, to evade this, the tramel be made ſhort and ſtrait, it will preſs the main ſinew of the hind-leg, and the fleſhy part of the fore-thighs; ſo that the horſe cannot go without halting before, and cringing behind.

As to the matter of the tramel; ſome make it all of leather, which is inconvenient; in that it will either ſtretch or break, and thus confound the certainty of the operation. In a true tramel, the ſide ropes are to be ſo firm, as not to yield a hair's breadth; the hoſe ſoft; and to lie ſo cloſe, as not to move from its firſt place; and the back-band flat, no matter how light, and to deſcend from the fillet ſo as not to gall.

When the horſe, by being trameled on one ſide, has attained to *amble* perfectly in the hand, it is to be changed to the other ſide, and that is to be likewiſe brought to rule.

When by this changing from one ſide to another, with a half-tramel, the horſe will run and *amble* in the hand readily and ſwiftly, without ſnappering and ſtumbling; which is ordinarily done by two or three hours labour; the whole tramel is to be put on, with a broad, flat, back-band, and both ſides trameled alike. See Tramel.

AMBLYGON, or **Amblygonium**, in *Geometry*, denotes a triangle, one of whoſe angles is obtuſe, or conſiſting of more than ninety degrees.

The word is compoſed of *αμϐλυς*, *obtuſe*; and *γωνια*, *angle*.

AMBLYOPY, **Amblyopia**, in *Medicine*, a diſeaſe of the eyes, otherwiſe called GUTTA *ſerena*, and *amauroſis*.

The word comes from *αμϐλυς*, *dull*; and *οπτομαι*, *I ſee*.

AMBO, or **Ambon**, a kind of pulpit or deſk, in the ancient churches, where the prieſts and deacons ſtood to read or ſing part of the ſervice, and preach to the people; called alſo *analogium*.

The term is derived from *αναϐαινειν*, *to mount*.—The *ambo* was mounted upon two ſides; whence ſome alſo derive the appellation from *ambo*, *both*.

The *ambo* was aſcended by ſteps; which occaſioned that part of the office performed there to be called the *gradual*.—The Goſpel was read at the top of the *ambo*; the Epiſtle a ſtep lower.

The modern reading deſks and pulpits have been generally ſubſtituted inſtead of the ancient *ambos*, though, in ſome churches, remains of the *ambos* are ſtill ſeen. In that of St. John de Lateran at Rome, there are two moveable *ambos*. M. Thiers inveighs againſt the diſuſe of the ancient *ambo*.—Thoſe by whom this innovation has been effected, he calls, by a new word, *ambonoclaſtes*. It was in the *ambo* that publication was made of feaſts, faſts, proceſſions, &c. Here were read the acts of the martyrs, the *ſancta ſanctis*, the diptychs, or commemoration of the dead; the letters of peace and communion, which one church ſent to another. Here new converts made their public profeſſion of faith, and biſhops their defence againſt accuſations brought againſt them. Here treaties of peace were ſometimes alſo concluded, and coronations of kings and emperors performed, &c.

Divers antiquaries hold, that the *ambo* was anciently the place from whence the biſhops and preſbyters made their ſermons; pulpits for that purpoſe having only been introduced by the mendicants at the beginning of the thirteenth century.

A late writer combats this opinion, and ſhews, that the uſual place from whence the ancients preached, was the ſteps of the altar; not but St. Chryſoſtom and St. Auguſtin both appear to have preached from the *ambo*; but this was looked on as a thing ſomewhat extraordinary.

AMBONOCLASTES, a name given, by a late writer, to the demoliſhers of the *ambos* uſed in the primitive church.

AMBONUM, in *Natural Hiſtory*, a term uſed, by ſome of the old writers, to expreſs the prominent tubercles on certain ſtones.

AMBREADA, thus they call the falſe or factitious amber, which the Europeans uſe in their trade with the negroes on the coaſt of Africa, and particularly on the river Senegal. There are ſome large and red pieces of it, a thouſand of which making twenty ropes or ſtrings, weigh three pounds. There are others ſmall, and alſo red, which weigh but two pounds and a half.

AMBROSE.—*St. Ambroſe in the wood*, by the Italians called *al nemo*, is an order of religious, confirmed in 1431, under the rule of St. Auguſtine.

The monks of *St. Ambroſe al nemo* wear the image of the ſaint engraven on a little plate, and make uſe of the Ambroſian office.

In the province of Berry in France, the title *fathers of St. Ambroſe* is alſo given to the canons regular of St. Auguſtine, becauſe their abbey at Bourges is dedicated to St. Ambroſe de Cahors.

AMBROSIA, in the *Heathen Theology*, &c. a delicious kind of food, whereon the gods were ſuppoſed to feed.

The word is compounded of the privative particle *α*, and *βροτος*, *mortal*; becauſe it rendered thoſe who fed thereon immortal, or becauſe it was the food of the immortals.

Lucian, rallying the poetical gods, tells us, that *ambroſia* and *nectar*, of which one is the meat, and the other the drink of the gods, were not ſo excellent as the poets deſcribe them; ſince theſe deities would leave them for blood and fat, which they come to ſuck from the altars like flies.

But though the *ambroſia* is commonly repreſented as the ſolid food of the gods, by way of contradiſtinction from the fluid, which was called *nectar*; yet the appellations are ſometimes inverted, and the name *ambroſia* given to the drink of the deities, as that of nectar to the meat.

Wedelius has a diſſertation on *ambroſia* and nectar, wherein he ſhews, that the term is ſometimes uſed to denote honey, ſometimes wine, ſometimes perfumes, and particularly ambergris; ſometimes the method or ingredients for embalming or preſerving dead bodies from putrefaction, and ſometimes alſo for a ſtate of unchangeableneſs, or immortality.

Ambrosia is alſo a ſplendid kind of title, given, by ſome phyſicians, to certain alexipharmic compoſitions, of extraordinary virtue.

In this ſenſe, *ambroſia*, *αμϐροσια*, amounts to much the ſame with *αθανασια*, *athanaſia*, as being ſuppoſed to conduce to immortality.

This name was particularly given to a famous antidote of Philip of Macedon, againſt all poiſons, bites, and ſtings of venomous creatures, as well as many internal diſeaſes.

Ambrosia is alſo uſed for a pure ſpirituous kind of medicine, artfully extracted from the groſs elementary parts of a body, and which being adminiſtered in the ſmalleſt doſe is of conſiderable virtue, and may be taken without diſguſt, or inconvenience.

In this ſenſe, *ambroſia* amounts to much the ſame with what we otherwiſe call QUINTESSENCE.

Nic. Abr. Frambeſa has a treatiſe on the preparation of theſe *ambroſiæ*. Ambroſiopœa, Lugd. Bat. 1628. 12mo. Francof. 1629. 4to.

Ambrosia, in *Botany*, the name of a genus of plants belonging to the *monoecia pentandria*; the characters of which are theſe: it hath male and female flowers on the ſame plant; the male flowers are of one leaf, funnel-ſhaped, and cut into five parts at the brim; the female flowers are placed under the male in the ſame ſpike; they have no petals, but an oval germen placed in the bottom of the empalement; the germen afterward becomes an oval capſule with one cell, incloſing one roundiſh ſeed. There are five ſpecies of this plant, which is perennial, and may be propagated by cuttings, or by ſeeds; if by the former, they ſhould be planted in a ſhady border, in either of the ſummer months. In a month or five weeks they will have good roots, and therefore ſhould be then taken up and potted; for when they are left longer in the full ground, they will grow very luxuriant, and will not ſo ſoon recover their removal as thoſe which are tranſplanted earlier. The plants are hardy, ſo may be expoſed to the open air in the ſummer; and in winter, if they are ſheltered in a common green-houſe with myrtles, and other hardy exotic plants, they will live ſeveral years.

The ſeed of this ſort ſeldom come up the ſame year when they are ſown in the ſpring; but thoſe which have fallen in autumn, have grown in the following year as well as thoſe ſown at the ſame ſeaſon.

It revives the heart and brain; it ſtops fluxes; it reſolves and fortifies; and is preſcribed both internally and externally.

Ambrosia is alſo uſed, by ſome of the *Ancient Writers*, to expreſs what they judged to be the food of the BEES.

This ſubſtance is, by ſome, taken to be a groſs or ſolid honey; and is contradiſtinguiſhed from the liquid or purer ſort, which is denominated *nectar*.

The *ambroſia* will not keep, and, if not ſpeedily ſpent, corrupts and turns ſour, making what is ſometimes called *coom*, or *ſtopping*, or, after the Greeks, *ſandarak*; highly offenſive and pernicious to the hive. See PAIN *des Abeiles*.

Ambrosia, in *Antiquity*, denotes a feaſt celebrated by the Aconians, in honour of Bacchus.

The *ambroſia* were alſo denominated *ehoa* and *lenæa*. They were held in the month called Lenæon.

AMBROSIAN *rite*, or office, denotes a particular office or formula of worſhip, uſed in the church of Milan, which is ſometimes alſo called the *Ambroſian* church.

The denomination takes its riſe from St. Ambroſe, archbiſhop of Milan, in the fourth century, who is uſually ſuppoſed to have been the author of this office. Yet ſome are of opinion the church of Milan had an office different from that of the Roman, and other churches of Italy, before the time of that father. In effect, till the time of Charlemaign, each church had its ſeveral office; and when in after-days the pope took on him to impoſe the Roman office on all the other churches of the weſt, that of Milan ſheltered itſelf from the impoſition, under the name and authority of St. Ambroſe; from which time, the phraſe *Ambroſian rite*, has obtained, in contradiſtinction to the Roman rite.

We alſo meet with the *Ambroſian chant*, or ſong; which was diſtinguiſhed from the Roman, in that it was ſtronger and higher.

The public library of Milan is alſo called the *Ambroſian Library*.

AMBROSIN, in *Middle Age Writers*, denotes a coin ſtruck by the lords or dukes of Milan, whereon was repreſented St. Ambroſe on horſe-back, with a whip in his right-hand. The occaſion of this coinage is ſaid to have been a viſion of that ſaint, who appeared to the Milaneſe general, in 1339, during the time of a battle.

AMBROSINIA, in *Botany*, a genus of the *gynandria polyandria* claſs of plants, with a ſingle-leaved and divided *ſpatha*.

AMBRY, the place where the arms, plate, veſſels, and every thing belonging to houſe-keeping, were formerly kept.

Hence, probably, the *ambry* at Weſtminſter was ſo called, becauſe formerly ſet apart for that uſe; or rather, from *aumonery*, a houſe adjoining to an abbey, in which the charities were laid up and diſtributed to the poor. The word is ſtill uſed in Scotland, in the ſame ſenſe.

AMBUBAJÆ, in *Antiquity*, a kind of wanton minſtrels about Rome, who lived by playing and dancing in places of reſort, and proſtituting their bodies for hire.

Authors ſpeak as if there had been a regular college, or community of *ambubajæ*, and that theſe were the ſame with what were otherwiſe called *tibicinæ*. Some ſuggeſt that the *ambubajæ* were of the male kind, only dreſſed in the habit of women.

Antiquaries have been greatly divided about the *ambubajæ*; ſome will have them to have come to Rome out of Syria; others ſuppoſe them to have been Roman women, though called by a name of Syriac origin.

Torrentius, Turnebus, and Pulmannus, derive the name from *ambu*, or *am*, an old Latin prepoſition, denoting *circum*, *about*, and *bajæ*, a delicious place near Naples; and maintain, that the *ambubajæ* were a kind of courtezans, who frequented the baths of that city. Cruquius is of a different opinion, taking the word *ambubajæ* to have been uſed for *ambubeja*, and primarily to denote a ſeller of *ambubeja*, an herb mentioned by ancient naturaliſts. Theſe ſellers of *ambubeja* being a kind of empirics, their name became afterwards applied to all charletans, and quacks.

Hoffman has a diſcourſe on the *ambubajæ*.

AMBUBEIA, in *Botany*, a name given, by ſome authors, to wild ſuccory.

AMBULANT, or AMBULATORY; they give in France the name of *ambulant* commiſſioners to thoſe commiſſioners, or clerks of the king's farms, who have no ſettled office, but viſit all the offices within a certain diſtrict, to ſee that nothing be done in them againſt the king's right, and the intereſt of the farm.

AMBULANT is alſo uſed to denote thoſe brokers at Amſterdam, or exchange agents, who have not been ſworn before the magiſtrates. They tranſact brokerage buſineſs, but their teſtimony is not received in the courts of juſtice.

AMBULATION, or walking. See EXERCISE.

AMBULATION, in *Phyſic*, is uſed by ſome for the ſpreading of a gangrene or mortification.

AMBULATORY, a term anciently applied to ſuch courts, &c. as were not fixed to any certain place; but held ſometimes in one place, and ſometimes in another.—In oppoſition to ſtationary courts.

The word is formed from *ambulare*, *to walk*.

The court of parliament was anciently *ambulatory*; ſo alſo were the courts of king's-bench, &c.

We ſometimes alſo ſay, in a legal ſenſe, a man's will is *ambulatory*, to the time of his death; meaning, that he has it always in his power to revoke it.

AMBULON, in *Botany*. See *Sweet* WILLOW.

AMBURBIUM, or AMBURBIALE *Sacrum*, in *Antiquity*, a religious feaſt, or ceremony, practiſed among the Romans, wherein they made proceſſions around their city. Hence alſo we have *amburbiales victimæ*, the victims carried along in the proceſſion, and afterward ſacrificed.

The word is compounded of *ambio*, *I go round*; or of *amb*, or *ambu*, an ancient prepoſition, ſignifying *around*, and *urbs*, *a city*.

Scaliger, in his notes on Feſtus, followed by many others, maintains the *amburbia* to be the ſame with *ambarvalia*. Servius, however, expreſly diſtinguiſhes between the *amburbia* and *ambarvalia*, and ſays, the one was performed in the city, the other in the country.

AMBURY, or ANBURY, a name given, by our farriers, to a kind of ſoft and ſpungy ſwelling growing on the bodies of horſes, ſomewhat ſore to the touch, and full of blood. The method of curing it is, to tie a horſe-hair very hard round it, at the root; in about a week after this, it will fall off, and the part is then to have ſome powder of verdigreaſe ſtrewed upon it, to prevent the return of the complaint, and finally to be healed up with the common green ointment.

This is the common method when the *ambury* is high and prominent; but ſometimes it is flat and low, with a broad baſe: in this caſe, it is impoſſible to take it off by ligature, and there is a neceſſity of having recourſe to a ſeverer operation. It muſt in this circumſtance be taken away either by the knife or fire: if the former way be agreed on, the method is this; the ſkin is to be drawn back tight, and then the whole ſwelling cut off cloſe to the common level of the reſt of the fleſh: if in the other way, an iron is to be heated red-hot, and applied to it, continuing it on till the whole is burnt down to the even fleſh. In both caſes, care muſt be taken not to ſpare in the cutting or burning, ſo as to leave any root behind, for then the complaint will be renewed. When it is taken off, the common ointment of hogs-lard and turpentine will complete a cure. There are ſome circumſtances, however, in which the knife and cautery may be both improper, as, if it grows in a ſinewy part, or the like; in this caſe, the proper method is, to eat out the core with oil of vitriol, or white ſublimate, and then ſtop the hole with flax dipped in honey, and lime unſlaked. Some for the firſt day or two dip it only in the white of an egg, and after that, in the mixture of quick-lime and honey; and this ſeems the better way.

Many of our farriers boaſt of a ſecret, which infallibly cures all kinds of protuberances of this kind, the preparation of which is this: Take three ounces of green vitriol, and one ounce of white arſenic, beat them to a coarſe powder, and put them into a crucible; place the crucible in the midſt of a charcoal-fire, ſtirring the ſubſtance, but carefully avoiding the poiſonous ſteams; when the whole grows reddiſh, take the crucible out of the fire, and when cool, break it and take out the matter at the bottom; beat this to powder in a mortar, and add to four ounces of this powder five ounces of *album rhoſis*; make the whole into an ointment, and let it be applied cold to warts, rubbing them with it every day: they will, by this means, fall off gently and eaſily, without leaving any ſwellings. It is beſt to keep the horſe quiet, and without working, during the cure. What ſores remain on the parts which the ſwellings fall off from, may be cured with the common application, called the *counteſs's* ointment.

AMBUSCADE, AMBUSH, AMBUSHMENT, a body of men who lie in a wood, &c. in readineſs to ruſh out upon, or incloſe an enemy unawares.—Or, the place wherein ſuch a corps hide themſelves.

AMBUSTIO, in *Medicine*, a BURN.

AMBUTUA. See PAREIRA *Brava*.

AMEA, in *Botany*, a name given, by the natives of Guinea, to a plant which they uſe in bleedings at the noſe, drying and powdering the leaves, and ſnuffing up the powder. It ſeems to be of the family of the plant called *pajamirioba*, by Sir Hans Sloane, in his Jamaica Catalogue. Its leaves are large and alated, and of a beautiful green, even when dried. Phil. Tranſ. Nº 232.

AMEDEI, *Amedians*, a congregation of religious in Italy, inſtituted in 1400.

Their name is formed of the Latin, *amans Deum*, q. d. *lover of God*, or rather of *amatus Deo*, *beloved of God*.

The *Amadei* wore a grey habit, and wooden ſhoes, had no breeches, and girt themſelves with a cord. They had twenty-eight convents, and were united by pope Pius V. partly with the Ciſtercian order, and partly with that of the Soccolanti, or wooden-ſhoe wearers.

AMEIVA, in *Zoology*, the name of a Braſilian ſpecies of lizard, reſembling the *taraguira* in figure, but having a bifid tail. This is Marcgrave's account of it; but Mr. Ray very judiciouſly queſtions the fact, not believing that there is in nature any ſuch ſpecies. Probably indeed it is only an accidental variety of the TARAGUIRA, or ſome other common lizard, perhaps from a wound, or other accident; perhaps from the egg, as we have lately ſeen from Barbadoes a ſnake with two heads, taken out of an egg of ſome common kind; for aſſuredly there never was any ſuch ſpecies as a two-headed ſerpent.

AMEL, ſee ENAMEL.

AMELLUS, in *Botany*, a name uſed, by ſome authors, to expreſs the CALTHA *paluſtris*, or *marſh*-MARYGOLD; and by Virgil, for the ASTER *atticus*.

AMELLUS is uſed by Linnæus to denote a genus of plants of the *ſyngeneſia polygamia ſuperflua* claſs.

AMEN, a church-term, uſed as the concluſion of all ſolemn prayers, &c. and ſignifying, *ſo be it*, or *fiat*.

The Hebrews had four kinds of *amen*. That juſt mentioned they called *amen paſt*; which was accompanied with the greateſt attention and devotion: in this ſenſe, the word has paſſed into almoſt all languages, without any alteration.

Some authors are of opinion, that the word *amen* is formed of the initial letters of theſe words, *Adonai Melech Neeman*, *Dominus Rex Fidelus*; an uſual expreſſion among the Jews, when they would give weight or ſanction to any thing they ſaid. In effect, it is known, that to expreſs the words אדני מלך נאמן *Adonai Melach Neeman*, in the ordinary way of abbreviatures; the rabbins only take the initial letters; which, joined together, are really the letters of the word אמן *amen*.

On the other hand, there are ſome of their Cabbaliſts, who according to their uſual manner of finding a hidden meaning in words, which they call *notaricon*, out of the letters of the word *amen* form the whole phraſe, *Adonai Melech Neeman*.

Yet it is certain alſo, that the word *amen* was in the Hebrew

brew tongue before ever there were any ſuch things as cabbala or cabbaliſts in the world; as appears from Deuteronomy, chap. xxvii. ver. 15.

The primitive of the word *amen* is the verb *aman*, which, in the paſſive voice, ſignifies to be true, faithful, conſtant, &c.—Hence came the noun אמן *amen*, which ſignifies *truth*. And, laſtly, of this noun *amen* they made a kind of affirmative adverb, which, when placed at the end of any phraſe, or propoſition, ſignifies, *ſo be it*, *be it true*, *I acquieſce in it*, &c. Thus, in the paſſage above cited from Deuteronomy, Moſes ordered the Levites to cry aloud to the people, *Curſed is he that makes any graven or molten image, &c. and all the people ſhall ſay, amen*, i. e. yes, may he be curſed, we deſire, we agree to it.—But at the beginning of a phraſe, as in ſeveral paſſages of the New Teſtament, it ſignifies, truly, verily.—When it is redoubled, or repeated twice together, as is always done by St. John, it has the effect of a ſuperlative; agreeably to the genius of the Hebrew tongue, and her two daughters, the Chaldee and Syriac.—In this ſenſe we are to underſtand *amen, amen, dico vobis.* The Evangeliſts uſually preſerve the Hebrew word *amen*, in their Greek αμην, though St. Luke ſometimes renders it by αληθως, *truly*, or ναι, *certainly*.

AMENABLE, or **AMAINABLE**, is applied in our law-books to a woman, who is ſuppoſed to be governable by her huſband.

It is likewiſe uſed to ſignify a right or power of bringing perſons before a particular juriſdiction: thus, we ſay, a perſon is *amenable* before ſuch a court, or magiſtrate.

AMEND, or **AMENDE**, in the French *Cuſtoms*, a mulct, or pecuniary puniſhment, impoſed by a ſentence of the judge; for any crime, falſe proſecution, or groundleſs appeal.

AMENDE HONORABLE denotes an infamous kind of puniſhment, uſed in France, &c. on traitors, parricides, ſacrilegious perſons, and other heinous criminals.

It conſiſts in this, that the offender is delivered up to the common hangman; who having ſtript him to his ſhirt, and put a rope about his neck, and a wax taper in his hand, leads him to the court, where he is to beg pardon of God, the king, the court, and his country.

Sometimes the puniſhment ends here; and ſometimes death, or the galleys, are added.

The phraſe *amende honorable* is alſo uſed by way of alluſion, where a perſon is condemned to come into court, or into the preſence of ſome perſon injured, and make an open recantation, aſk pardon, &c.

AMENDMENT, in a general ſenſe, a change made in a thing for the better.

Amendment amounts to much the ſame with melioration, reformation, correction, &c.

AMENDMENT is more particularly uſed for a MANURE laid on the ground, to fatten or enrich it.

AMENDMENT, in a literary ſenſe, is uſed to denote the corrections and other alterations made in the poſterior editions of books.

In this ſenſe, *amendments* are alſo denominated emendations.

AMENDMENT, in *Law*, the correction of an error committed in a proceſs, and diſcovered before judgment.

If the error be committed in giving judgment, *viz.* if a wrong judgment be given, there they cannot amend it; but the party aggrieved muſt bring his writ of error.—However, where the fault appears to be in the clerk who writ the record, it may be amended; chiefly if it be in matter of *fact*, not in point of *law*.

Original writs are not amendable at common law, for if the writ be not good, the party may have another: judicial writs may and have been often amended. Indictments of treaſon and felony, writs of appeal &c. are excepted out of the ſtatutes of *amendments*; though ſome things in them are *amendable* at common law. *Amendments* are uſually made in affirmance of judgments; and ſeldom or never to deſtroy them: and where *amendments* were at common law, the party was to pay a fine for leave to *amend*. Terms de Ley, 39. 8 Rep. 157. Palmer, 258. Mod. Caſ. 269. 3 Salk. 29.

AMENDMENT *of Bills in Parliament*, means ſome alteration made in the original draught; and we read of *amendments* of *amendments*, *amendments* of returns of repreſentatives, &c.

In caſes of wrong returns, ſo reported by the committee of privileges and elections, and voted by the houſe of commons, it is uſually ordered, that the returns be *amended* by the returning officer, according to the directions of the houſe, without iſſuing a new writ.

Amendments ought always to be in that houſe from whence the thing to be *amended* originally proceeded, though the directions for the *amendments* came from the other houſe. Hakew. Mann. of Paſſing Bills, p. 167.

AMENTACEOUS, in *Botany*, a term applied to the flowers of certain trees and plants, which are compoſed of a vaſt number of *apices*, or *antheræ*, hanging down in form of a rope, ſuch as the hazel, &c.

AMENTUM, among *Alchemiſts*, denotes *alumen ſciſſum.*

AMENTUM, in *Antiquity*, a leathern thong faſtened about the middle of a dart, or javelin, whereby, after caſting it at the enemy, it might be drawn back again to the owner.

The *amentum* ſerved alſo to increaſe the force of the ſtroke; for which reaſon, ſome of their great men refuſed to uſe it, as confiding wholly in the natural ſtrength of their own arms.

AMENTUM, in *Botany*, ſee CATKIN.

AMERADE, a kind of officers among the Saracens, anſwering to the governors of provinces among the Europeans.

The name is originally the ſame with that of *emir*.

AMERCEMENT, or **AMERCIAMENT**, in *Law*, a pecuniary puniſhment impoſed upon offenders, at the diſcretion of the court; frequently alſo called *miſericordia*.

There is this ſtated difference beteen fines and *amercements*; that fines are puniſhments certain, and determined by ſome ſtatutes; but *amercements* are arbitrary impoſitions, proportioned to the fault, and wholly at the mercy of the court.—Manwood, in his *Foreſt Law*, makes another difference; as if an *amercement* were a more eaſy and merciful penalty, and a fine a more ſharp and grievous one.

If *amercements* were too grievous, releaſe might be ſued by an ancient writ called *moderata miſericordia*.

Fines alſo are impoſed and aſſeſſed by the court; *amercements* by the country: and no court can impoſe a fine, but a court of record; other courts can only *amerce*. 8 Rep. 39. 41. A town ſhall be *amerced* for the eſcape of a murderer in the day time; and if the town be walled, it is ſaid it ſhall be ſubject to *amercement* whether by day or night. 3 Inſt. 53.

By the ſtatute of *Magna Charta*, a freeman is not to be *amerced* for a ſmall fault, but proportionable to the offence, and that by his peers. 9 Hen. III. c. 4.

In the new terms of the law, *amercement* is ſaid to be properly a penalty aſſeſſed by the peers or equals of the party *amerced*, for an offence done; for which he puts himſelf upon the mercy of the lord.

Amerciament royal is uſed by ſome to denote a pecuniary puniſhment laid upon a ſheriff, coroner, or ſuch-like officer of the king, by juſtices, for ſome offence or abuſe in his office.

AMERICAN *ſea-ſun-crown*; CORONA *ſolis marina Americana*, a name given by John Andrew Peyſſonel, M. D. F. R. S. to a marine inſect, becauſe of the reſemblance it bears to the flower called *corona ſolis*. The curious may ſee a very particular deſcription of it in the Phil. Tranſ. vol. l. part 2. N° 112. an. 1758. The gentleman who deſcribes it could not tell how it lived, or what its mechaniſm was, not being able, as he ſays, to diſtinguiſh either a mouth, or any *viſcera*, nor any other organ ſerving to its nouriſhment.

AMERICIMA, in *Zoology*, the name of a Braſilian ſpecies of lizard, very ſmall, being not above three fingers breadth long, and of the thickneſs of a ſwan's quill. Its body appears ſquare; its whole back is covered with deep grey ſcales, and its head, legs, and ſides, with brown ones, and its tail with blue. All of them are very gloſſy, and extremely ſmooth to the touch. Its feet are ſcarce thicker than hogs briſtles. It is generally eſteemed a poiſonous animal. See *Tab. of Quadrupeds and Serpents.* N° 35.

AMETHYST, in *Natural Hiſtory*, a precious ſtone, of a violet colour, bordering on purple, frequently yellowiſh or reddiſh.

Plutarch ſays, the *amethyſt* takes its name from its colour; which, according to him, reſembles that of wine mixed with water; and not from its preventing drunkenneſs: which, however, was a common opinion, and gave occaſion to its being hung about the necks of great drinkers.—Thoſe who aſcribe this virtue to the *Amethyſt*, derive its name from the privative α, and μεθυσκω, *to inebriate.* See GEM.

There are divers ſorts of *amethyſts.*—The oriental, which is the hardeſt, the ſcarceſt, and moſt valuable, and which is of a deep-purple colour; the German, which is of a *violet* colour; and the Spaniſh, which has the colour of a *panſy*.

This *gem* is pellucid, the ſeventh in degree of hardneſs from diamonds, fuſible by fire which alſo deſtroys its colour. It is found among *quartz*, and is probably only a coloured quartz cryſtal. This ſtone may be imitated by adding to a frit of cryſtal glaſs eight parts of magneſia and one part of zaffre. The purple of the *amethyſt* as well as the blue of the ſapphire, and the green of the emerald, are very periſhable, being all totally deſtroyed by a moderate degree of heat. *Lewis.*

There are ſome orientals alſo of a paler colour, and others white, and like the diamond.—There are alſo beautiful ones found in the Pyrenean mountains, and in thoſe of Auvergne.

Amethyſts are dug in a hill named St. Sigminont, two leagues from Vict in Catalonia.—They find the ſtones by following a vein of reddiſh or black earth, or a vein in the rock ſo coloured. They are all hexangular, and pointed like cryſtal. There are three ſorts: the beſt are the blackeſt or deepeſt violet; others are almoſt quite white; and ſome few are tinctured with yellow. Sometimes there is a great number found ſticking together, like the Briſtol diamonds; but theſe are never good: the beſt are found looſe in the chinks of the rock, in a fatty reddiſh or yellowiſh earth. They rake out this earth with long narrow knives, which enter the chinks; and then crumble it with their fingers to feel for the ſtones. Ray's Trav. p. 402.

The occidental *amethyſt* is not extremely hard, but may be cut with a leaden wheel, ſmeared with emery moiſtened in water.—It is poliſhed on a pewter wheel with *tripoli*.—It is eaſily engraven on, either in CREUX or RELIEVO.

Mr. Morin ſhewed Dr. Liſter a huge block of French *amethyſt*, 2 or 300 pounds weight. Ray ſpeaks of a mountain of *amethyſts*. Spars and cryſtals tinged red and yellow, &c. are ſold for *amethyſts*. The falſe ones come from Germany, are tinged by vapours in the mines, and contain ſome lead.

Amethyſts may be counterfeited with glaſs, to which the proper colour or ſtain is given. There were fine ones made in France, about the year 1690, which may even impoſe on connoiſſeurs, unleſs the ſtone be taken out of the collet.

The method of giving this colour to glaſs is as follows: Take cryſtal-frit, made with the moſt perfect and fine tarſo; then prepare a mixture of manganeſe in powder, one pound; zaffer prepared, one ounce and a half; mix theſe powders well together, and add to every pound of the frit, an ounce of this powder. Let it be put into the pots with the frit, not into the already made metal. When the whole has ſtood long enough in fuſion to be perfectly pure, work it into veſſels, and they will reſemble the colour of the *amethyſt*.

Some phyſicians diſtinguiſh a particular claſs of medicines, under the denomination of *amethyſta*, αμεθυϛα; under which they comprehend all preſervatives from drunkenneſs.

Among the medicinal qualities attributed to this ſtone, it is ſaid to be good to ſtop a looſeneſs, and to abſorb the acid particles, when too much abounding in the ſtomach; which virtue it has in common with other alkaline ſubſtances.

Amethyst, in *Heraldry*, ſignifies the purple colour in the coat of a nobleman, which in gentlemens eſcutcheons below that degree, is called *purpure*; and in thoſe of ſovereign princes, *Mercury*.

AMETHYSTEA, in *Botany*, *amethyſt*; a genus of the *diandria monogynia*. The characters are: the flower has one leaf, which is cut into five equal pointed ſegments at the brim; it hath two ſlender ſtamina, which ſtand under the upper lip. After the flower is paſt, the germen becomes four naked ſeeds, ſhut up in the empalement.

We know but one ſpecies of this genus, viz. *amethyſtea, Hort. Upſal.* 9. Mountain upright *amethyſt*. This plant is a native of the mountains in Siberia, from whence the ſeeds were ſent to the imperial garden at Peterſburgh.

It is annual, and hath an upright ſtalk, which riſes about a foot high, and towards the top puts out two or three ſmall lateral branches; theſe are garniſhed with ſmall trifid leaves, ſawed on their edges, and of a very dark green colour; at the extremity of the branches the flowers are produced in ſmall umbells; theſe are of a fine blue colour, as are alſo the upper part of the branches, and the leaves immediately under the umbel; ſo that though the flowers are ſmall, yet from their colour with thoſe of the upper part of the ſtalks, the plants make a pretty appearance, during their continuance in flower. If the ſeeds of this plant are ſown in the autumn, or are permitted to ſcatter, the plants will come up early in the following ſpring, and theſe will flower the beginning of June; but thoſe ſown in the ſpring will not flower until July.

When the plants come up, they will require no other care than to keep them clean from weeds, and where they are too cloſe, to thin them, for they do not thrive when tranſplanted; the ſeeds, therefore, ſhould be ſown where they are to remain.

AMETHYSTINE is applied, in *Antiquity*, to a kind of purple garment dyed of the hue of *amethyſt*.

In this ſenſe, *amethyſtine* differed from *Tyrian*, as well as from *hyacinthine* purple, being a kind of medium between both.

AMGAILA, or **Amgailam**, in the *Materia Medica* of the ancients, a name given by Avicenna, and others, to a plant ſometimes called ACANTHA *Arabica*, and *leucacantha* by the Greeks; the roots of which were called *bunkon*, and much uſed in medicine by the Arabian phyſicians.

The *amgaila*, called alſo *ſucaha*, or *zucahai*, is deſcribed as a prickly herb, having roots like thoſe of the cypreſs, formed of ſeveral joints, or knots. They were uſed in ſtomachic and cardiac compoſitions, and were choſen by their lightneſs and good ſmell.

AMIA, in *Zoology*, the name of a very large ſea-fiſh, called by ſome alſo *glaucus*, and by others *leccia*. It grows to a vaſt ſize, and in figure reſembles the ſalmon. It is very common in the Mediterranean, and grows to four or five feet long.

Amia is alſo the name of a fiſh called, by ſome authors, *pelamys*, but different both from the *pelamys ſarda*, more uſually called ſimply *pelamys*, and from the *pelamys* of the ancients, which was no other than the *thynnus*, or tunnyfiſh, at a certain time of its growth.

This is, in ſhape and figure, very like the mackrel; it is common in the Mediterranean, and is brought to the markets of Italy, &c.

The *amia* is a ſpecies of the SCOMBER, in the Linnæan arrangement, and alſo the name of a genus of *abdominal* fiſhes.

AMIABLE *numbers*, denote numbers which are mutually equal to the whole ſum of each other's aliquot parts.—Such are the numbers 284 and 220. See NUMBER.

AMIANTHUS, in *Natural Hiſtory*, the name of a genus of foſſils, of the claſs of the FIBRARIÆ; the characters of which are, that the bodies of it are flexile and elaſtic, and compoſed of ſhort and abrupt filaments. See *Tab. of Foſſils, Claſs* 1.

It has been a common error to confound the ſpecies of this genus one with another, and all with the ſeveral ſpecies of the *aſbeſtos*, the conſequence of which has been the loſs of the art of ſpinning, and working the ASBESTOS into incombuſtible cloth.

Dr. Grew, in his Coſmologia Sacra, printed at London in Engliſh in the year 1701, obſerves, that the *amianthus* is full of parallel threads like ſilk ſtuffs; and that it ſeems that diamonds, *amianthus*, and talc, both on account of their hardneſs, and becauſe fire cannot ſpoil them, are compoſed of earthy or ſtony particles properly ſo called; and that it may be inferred from hence, that thoſe bodies being of regular figures, are compoſed of regular atoms.

With regard to its medicinal virtues, not to ſpeak of the fabulous properties attributed to it by Pliny, and others, it is ſaid to reſiſt poiſon, and to cure the itch.

It is the lighteſt and ſofteſt of all ſtones; its fibres are ſo flexible, that cloth has been made of them. It is indiſſoluble by acids, and was long thought unfuſible by fire, till Monſ. d'Aſcet diſcovered, that by violent and long continued heat it is fuſible, and forms a black glaſs. By ſtrong heat it is whitened and hardened ſo as to ſtrike fire with ſteel, and become brittle. This ſtony concrete is of the talcy kind, though differing from talc in its external appearance. The ſhorter filaments that ſeparate in the waſhing of the ſtone, may be made into paper in the common manner. For the method of its preparation for manufacture into cloth, ſee Phil. Tranſ. N° 273, and Dr. Lewis in his edition of Neumann, p. 30.

The ſpecies of this genus, at preſent known in the world, are four, two of which are compoſed of larger, and two of finer or ſmaller filaments.

AMICABLE *benches*, *ſcamna amicabilia*, in *Antiquity*, are generally ſuppoſed to denote the ſeats in the Roman courts, whereon the advocates were placed.—Some think, that theſe had but little title to the denomination of *amicable*, and therefore will have the word to be here uſed for the benches whereon the *aſſeſſors*, or thoſe called *judices pedanei*, were placed.

Amicable *compounder*, *amicabilis compoſitor*, is uſed, by ſome ancient LAW-writers, for an ARBITRATOR.

Amicable, or *amiable compounder*, among the French, is a perſon who acts the part of a common friend, to reconcile two merchants or traders who have diſputes, or are at law together. He differs from the *arbiter*, in that, in order to make the two diſputants agree, he often prevails upon both to give up ſome part of their right or claim; which an *arbiter*, who performs the functions of a judge, is not, it ſeems, at liberty to do.

Amicable *Society*. See INSURANCE.

AMICIA, ſee ALMUCIUM.

AMICITIA.—*Tenure in* AMICITIA, *tenere in amicitiam*, is applied, in *Ancient Writers*, to land granted freely, and of mere good-will, to be enjoyed at the diſcretion of the donor.

AMICTUS, in our *Ancient Writers*, the uppermoſt of the ſix garments, worn by prieſts; the others are *alba*, *cingulum*, *ſtola*, *manipulus*, and *planeta*.—It was tied round the neck, *Ne inde ad linguam tranſeat mendacium*; and covered the breaſt and heart, *Ne vanitates cogitet*.

This garment is otherwiſe called *anabolagium*; ſometimes *ambolagium*, *anagolagium*, and *humerale*. In ancient Engliſh writers it is called *amitte*.

The *amict* is alſo worn by deacons, ſub-deacons, and *acoluthi*, when they officiate at the altar.

The prieſts and deacons, in ſome dioceſes, wear *amicts* on their heads, from All-ſaints to Eaſter; though, by the canons, they be expreſly forbid to wear the *amict*, without ſome conſiderable occaſion.

Mr. Thiers aſſerts, that the uſe of *amicts* was not introduced into the Latin church before the twelfth century. Dom. de Vert maintains the contrary, chiefly from a figure of St. Firmin, firſt biſhop of Amiens, ſuppoſed to have ſuffered martyrdom towards the beginning of the ſeventh century, whereon he is repreſented in his pontifical habit, with the *amict* on his head.

AMICTUS, in Roman *Antiquity*, denotes any upper garment worn over the tunica.

AMICULUM, in *Antiquity*, denoted an upper garment worn by the women.—The *amiculum* is ſaid to have differed from the *palla*; but wherein the preciſe difference lay does not appear. An *amiculum* was alſo in uſe among the men. This ſeems to have been the ſame with the *chlamys*, or *paludamentum*.

AMIDA, a god worſhipped by the Japaneſe, has many temples erected to him in the iſland of Japan, of which the principal is at Jedo. The Japaneſe have ſuch a confidence in their idol *Amida* that they hope to attain eternal felicity by the frequent invocation of his name. One of the figures of this idol is repreſented at Rome.

AMID-SHIPS, a nautical term, denoting the middle of a ſhip, either with regard to her length or breadth.

AMIESTES, cotton cloths which come from the Eaſt Indies.

AMILICTI, in the Chaldaic *Theology*, denote a kind of intellectual powers, or perſons in the divine hierarchy.

The *amilicti* are repreſented as three in number, and conſtitute one of the tryads, in the third order of the hierarchy.

AMINEUM *acetum*, a name by which ſome of the medical writers have called white-wine vinegar, to diſtinguiſh it from other kinds.

AMIRANTE, a great officer in Spain, anſwering to the lord high admiral in England.

AMISS *drawing*, ſee DRAWING.

AMISSA *lex*, ſee LEX.

AMITTERE *legem terræ*, a law-phraſe, ſignifying the forfeiture of the right of ſwearing in any court or cauſe; or the becoming infamous.

This is the puniſhment of a champion overcome, or yielding in the combat; of jurors found guilty in a writ of attaint; and of perſons outlawed. Vid. Glanvil. lib. ii. and ſee the ſtat. 5 Eliz. cap. 9. againſt *perjury*.

AM-KAS, in *Hiſtory*, a name given to a ſpacious ſaloon in the palace of the Great Mogul, where he gives audience to his ſubjects; and where he appears on ſolemn feſtivals with extraordinary magnificence. His throne is ſupported by ſix large ſteps of maſſy gold, ſet with rubies, emeralds, and diamonds; and is eſtimated at 60000000*l*.

AMMA, or HAMMA, a girdle or truſs uſed in ruptures; to hinder the inteſtines from bearing down too much.

AMMA, in *Middle Age Writers*, denotes a ſpiritual mother. In this ſenſe, the word was chiefly underſtood of an abbeſs, or ſuperior of a nunnery.

AMMAN, in the German and Belgic *Policy*, denotes a judge who has the cognizance of civil cauſes.

The word is alſo written *amant*. Thus it occurs in writers on the French officers, where it ſtands for a notary, or parochial officer, who draws acts or inſtruments.

AMMANNIA, in *Botany*, of the *tetrandria monogynia*, in the Linnæan ſyſtem; a plant, of which the characters are theſe. It has a bell-ſhaped empalement, divided at the brim into four ſlender parts; the flower hath no petals; it has four ſlender ſtamina, which are inſerted in the empalement; the empalement afterward becomes a round capſule with four cells, which are filled with ſmall ſeeds. There are two ſpecies of it; the firſt grows naturally in moiſt places in Jamaica, from whence Dr. Houſton ſent the ſeeds to England. It grows about a foot high, with an upright ſquare ſtalk, and long narrow leaves, ſet in form of a triangle, whoſe baſe half ſurround it. The ſecond ſort grows naturally in Virginia and Carolina; this is an annual plant, which riſes about a foot high, with red ſucculent ſtalks, putting out ſide branches, which grow oppoſite: the flowers are produced ſingle from the wings, on the lower part of the branches.

AMMI, in *Botany*, called *ammoides* by Boerhaave, ſee BISHOP'S *Weed*.

AMMI, or *Semen* AMMEOS, a kind of aromatic ſeed, of ſome uſe in medicine; the produce of the plant above-mentioned.

The ſeed is brought from the Levant: it is found to contain a great deal of eſſential oil, and volatile ſalt; and to be attenuating, apperitive, hyſteric, carminative, cephalic, and alexipharmic; being one of the four leſſer hot ſeeds.—It expels wind, provokes the menſes, &c. It is alſo thought to have the property of reſiſting poiſon, and to be good againſt the bites of ſerpents.

According to Lemery, the plant takes its name *ammeos* from *αμμος*, *arena*; its ſeed being very like grains of ſand.

AMMINEA *uva*, in *Botany*, a name given, by the old writers, to the grapes of a wild vine, common in the hedges of Italy, and ſome other places. They uſed to make wine of theſe grapes, which they mixed with other richer wines, and had in common uſe.

Some write the word *taminea*, inſtead of *aminea*.

AMMITES, in *Mineralogy*, a kind of figured ſtone, of a looſe open contexture, formed of a number of ſmall globular ſtones.

Ammites is the ſame with what is otherwiſe called *ammonites*. The word is derived from *αμμος*, *ſand*; in regard the *ammites* appears to the eye as a compoſition of large ſand.

The *ammites* is found in divers countries of Germany, &c. of different colours, as well as different degrees of hardneſs. It bears a near reſemblance to the COCCODES.

AMMOCŒTUS, in *Ichthyology*, a name given, by Geſner and ſome others, to the AMMODYTES, or ſand-eel; called alſo *tobianus*, by Schoneveldt and others.

AMMOCHOSIA, in the *Ancient Phyſic*, a kind of remedy, or operation for drying the body, by lying along on warm ſand, and having the body covered with it. Some prefer ſalt for this purpoſe to ſand.

AMMOCHRYSOS, a name given by authors, to a ſtone very common in Germany, and ſeeming to be compoſed of a golden ſand. It is of a yellow gold-like colour, and its particles are all very gloſſy, being all fragments of a coloured talc. It is uſually ſo ſoft, as to be eaſily rubbed to a powder in the hand; ſometimes it requires grinding to powder in a mortar, or otherwiſe. It is uſed only as ſand to ſtrew over writing.

The Germans call it *katzengold*; and there is another kind of it leſs common, but much more beautiful, conſiſting of the ſame ſort of gloſſy ſpangles, but thoſe not of a gold colour, but of a bright red, like vermilion.

AMMOCHYSUS, in *Natural Hiſtory*, a kind of gem, ſuppoſed to be the ſame with the *venturine*.

AMMODYTES, in *Zoology*, the name of a ſpecies of ſerpent, called alſo *ſerpens cornutus* by ſome, from certain protuberances on the head. It is about the ſize of the viper, and is of a yellowiſh or ſand colour. Its head is ſhaped like that of the viper, but its jaws are wider; and, in the upper part of its head, it has a ſort of wart-like excreſcence, which is ſuppoſed to reſemble a horn; and thence its name of *ſerpens cornutus*, as it has its other of *ammodytes*, or ſand-ſnake, from its ſand-like colour, or from its quality of ſometimes running under the ſands. It is found in Lybia, and in ſome parts of Italy.

AMMODYTES, in *Ichthyology*, the name of a genus of fiſh, the characters of which, according to Artedi, are theſe: the *branchioſtege* membrane contains on each ſide ſeven bones, but theſe are, in great part, hid by the *laminæ* of the *branchia*. The head is compreſſed, the body oblong and ſlender, nearly cylindrical, but a little compreſſed, and it has no belly-fins. The fiſh is of the *malacopterygious*, or ſoft-finned kind; and the characters of the ſpecies, enumerated by Artedi, are theſe: the lower-jaw is the longeſt; the lateral lines are double, or two on each ſide. The pectoral fins have each twelve rays; the back-fin has fifty-four; that of the anus twenty-eight. The tail is bifid, and has fifteen long rays; the mouth is toothleſs; the anus is nearer to the tail than the head. We call the fiſh the *ſand-eel*; Schoneveldt, the *tobianus*. The fiſh is commonly found at about half a foot deep under the ſand, when the tide has run out, and caught there with iron hooks, with which the fiſhermen pull them out.

The name is formed of *αμμος*, *ſand*, and *δυτης*, a *diver*, expreſſing the quality of this creature, to dive into, or bury itſelf under the ſand.

This genus belongs to the order of *apodes*, in the Linnæan ſyſtem.

AMMON, or HAMMON, in *Antiquity*, an epithet given to Jupiter in Lybia; where was a celebrated temple of that deity under the denomination of *Jupiter Ammon*.

There has been a great diſpute about the origin of this name.—Some derive it from *αμμος*, *ſand*; becauſe the temple was ſituate in the burning ſands of Libya; others borrow it from the Egyptian *anam*, a *ram*; as having been firſt diſcovered by that animal.—Others will have

Ammon to ſignify the ſun, originally derived from *Ham*; and the horns wherewith he is repreſented, the ſun-beams. Plutarch ſays, that of all the Egyptian names which ſeemed to have any correſpondence with the Zeus of Greece, *Amon* or *Ammon* was the moſt peculiar and adequate. Bryant's Mythol. vol. i. p. 5.

However this be, Jupiter *Ammon* was uſually repreſented under the figure of a ram; though in ſome medals he appears of a human ſhape, having only two rams horns growing out beneath his ears.

AMMONIAC.—*Gum* **AMMONIAC**, or as it is ſometimes, though improperly, called **ARMONIAC**, is a kind of gum, brought from the Eaſt Indies, and is ſaid to ooſe from an umbelliferous plant.

Dioſcorides ſays, it is the juice of a kind of *ferula* growing in Barbary; and that the plant which produces it was called *agaſyllis*.

Pliny calls the plant whence it flows, *metopion*; and ſays, the gum takes its name from the temple of Jupiter *Ammon*, nigh which it grows. But it is much to be queſtioned whether we have at preſent the *gum ammoniacum* deſcribed by the ancients; and indeed their deſcriptions of that drug ſeem to evince that we have not.

The good *ammoniac* ought to be in dry drops, white within, yellowiſh without, eaſily fuſible, reſinous, ſomewhat bitter, and of a very ſharp taſte and ſmell, ſomewhat like garlick. It ſhould alſo be of a pale colour, and not mixed with any ſcrapings of wood, ſtone, or ſand; this by the Greeks was called ϑραυσμα, *fragment*.—The other, which is full of ſtone or ſand, was called φυραμα, that is, *mixture*.

Some ſay, this gum ſerved the ancients for incenſe in their ſacrifices. It is a *gum* reſin, from an ounce of which ſix drams may be diſſolved by ſpirit of wine, or ſix drams, two ſcruples, and an half, may be diſſolved by water. Neumann.

It enters ſeveral medicinal compoſitions, as an attenuant and detergent, againſt diſorders ariſing from viſcidities, and grumes.—Outwardly applied, it is reſolutive and ſuppurative; and, as ſome ſay, will of itſelf draw out ſplinters, &c. This gum contains plenty of eſſential, or volatile oil, ſome phlegm, and earth.

Some diſſolve the gum in vinegar, and other liquors, and call theſe *lac ammoniaci*; much uſed in aſthmas, and obſtructions of the lungs. It is frequently alſo given in pills. It is often adulterated with common roſin.

AMMONIAC, *ſal*, is *natural* and *artificial*.

AMMONIAC, *ſal*, *natural*, is a neutral ſalt, compoſed of marine acid, and of volatile alkali; combinations of other ſalts with volatile alkalies, are alſo called, from the name of this ſalt, *ſal ammoniac*, more uſually written *armoniac*.

AMMONIAC, *ſal*, *natural*, uſed by the ancients, was found in the ſands of Lybia, near the temple of Jupiter *Ammon*, from whence it derives its name. It was ſuppoſed to be generated in theſe ſands from the urine of camels. Nor will this appear ſtrange, if we ſuppoſe theſe ſands to be naturally impregnated with common ſalt; for then the urine of theſe animals, by the intenſe heat of the ſun, muſt cauſe a fermentation, which will unite the acid of the common ſalt with the urinous ſalt, and conſequently produce *ſal ammoniac*. What the ancients called by this name is ſuppoſed to be a ſpecies of *ſal* gem. M. Lemery had a ſalt taken from mount Veſuvius, which they call *natural ſal ammoniac*. It was of a compact ſubſtance, pretty ponderous, very white, and the inſide cryſtalline; it would not attract much humidity from the air, had no ſmell, was of an acrid, ſaline taſte, and very much like that of *ſal ammoniac*. Hiſt. de l'Acad. Roy. des Scien. 1705.

The true modern *ſal ammoniac* is never found *native*, at leaſt in any tolerable pure ſtate, or in ſuch quantities as to anſwer the demands of artiſts.

AMMONIAC, *ſal*, *artificial*, or common *ſal ammoniac*, is chiefly brought from Egypt; and though there is hardly a more common drug, it is but very lately we have known in what manner it is made. M. Lemery, who was conſul at Grand Cairo, in the year 1720, has given us the following account of the method uſed by the Egyptians in making *ſal ammoniac*.

‘Concerning *ſal ammoniac* (ſays he), I ſhall obſerve, 1. The matter. 2. The veſſels that contain it. 3. The diſpoſition of the furnaces. 4. The manner of working. 5. The quantity and uſe of that ſalt.

‘1. The *matter* is pure ſoot, and nothing elſe; but ſuch as is ſwept from chimneys where they burn turfs of the dung of animals fed with ſtraw, which is the common fuel of the country. Theſe turfs, which are impregnated with alkaline and urinous ſalts, communicate to the ſoot certain properties, which it could not be expected to receive from the ſmoak of wood or coal, and yet are abſolutely neceſſary for the production of *ſal ammoniac*.

‘2. The veſſels which contain the matter, are exactly of the figure of bombs. They are great round glaſs bottles, a foot and a half in diameter, with a neck two fingers in height. They caſe over theſe bottles with a fat earth, and fill them with ſoot to four fingers ſhort of their neck, which continues void and open. They contain each about forty pounds of ſoot, which, at the end of the operation, yield ſix pounds or more of *ſal ammoniac*, according to the goodneſs of the ſoot.

‘3. The furnaces are built like our common ovens, excepting that their vaults are perforated with ſeveral longitudinal clefts; upon each cleft are four bottles, placed in ſuch a manner, that the bottom of the bottle being ſunk in, and expoſed to the action of the flame, only the neck of the bottle continues expoſed to the air, the parts of the cleft contained between the bottles being ſtrongly cloſed with cement. Every furnace has four clefts, and conſequently contains ſixteen bottles, and a very great laboratory conſiſts of eight furnaces, diſpoſed in two rooms; ſo that there are at once an hundred and twenty-eight bottles employed.

‘4. In each furnace, for three days and nights ſucceſſively, there is kept up a conſtant fire, made of the dung of animals, mixed with ſtraw. The firſt day the thick phlegm of the ſoot exhales in a thick fume through the neck of the bottle. On the ſecond, the acid and alkaline ſalts being ſublimed, coaleſce and harden near the necks of the bottles. The third day the coagulation continues, depurates, and is finiſhed. In the mean time, they make a ſmall hole in the ſide, a little below the neck of each bottle, to ſee if the matter be ſufficiently baked, and all the ſalt ſublimed. After making theſe obſervations, they carefully ſtop the hole with lute, and open it from time to time as they ſee occaſion. When the operation is finiſhed, they take out the fire, break the bottles, and ſeparate the aſhes from the ſublimed maſs, or *ſal ammoniac*, which is a round, white, tranſparent ſubſtance, three or four fingers thick.

‘5. In two towns of the Delta, near each other, a league from the city of Munſoure, there are twenty-five large laboratories, and ſome ſmall ones, which make every year fifteen hundred, or two thouſand quintals, of *ſal ammoniac*. In all Egypt beſide there are but three laboratories more, two of which are alſo in the Delta, and the other in Grand Cairo, which do not produce above twenty or thirty quintals of this ſalt.’ Mem. de l'Acad. Roy. des Scienc. 1720.

Some, however, doubt, whether ſo prodigious a quantity of ſoot can be furniſhed by ſuch a country as Egypt, whoſe climate is ſo warm, that fires are only uſed for culinary purpoſes, and for bagnios; and therefore conclude, that the Egyptians have had the addreſs to keep the proceſs a ſecret from the Europeans, and that they uſe ſome other materials than ſoot; and it is ſaid that very good *ſal ammoniac* may be made without any ſoot at all.

Ammoniac ſalt is principally uſed by whiteners of copper-veſſels, and goldſmiths; and is a noted drug with chemiſts and phyſicians. F. Sicara, a miſſionary, and an eye-witneſs, ſays they add a little ſea-ſalt, and urine of beaſts. Mem. de l'Acad. Roy. des Scien. 1720.

See the method of making *ſal ammoniac* in Egypt, as communicated by Dr. Linnæus, from his pupil Dr. Haſſelquiſt. His account does not eſſentially differ from that above recited. Phil. Tranſ. vol. li. N° 48. an. 1760.

AMMONIAC is ſometimes made by the chemiſts of urine, ſea-ſalt, and wood-ſoot, boiled into a maſs, and then ſublimed.

We are told, that at the works carried on lately at Newcaſtle, *ſal ammoniac* was made from *bittern* and urine; and it is farther ſaid, that from one hundred weight of ſalt made from *bittern*, ſold under the name of Epſom ſalt, and three hogſheads of urine, fifty-ſix pounds of *ſal ammoniac* may be procured.

AMMONIAC, *ſal*, *properties of*. It is ſoluble in four times its quantity of water; and if the ſolution be duly evaporated, it ſhoots into thin fibrous ſubſtances, reſembling feathers. *Sal ammoniac* neither coagulates milk, nor changes the colour of a ſolution of ſublimate. It makes a conſiderable effervescence with the vitriolic acid, attended with a great degree of cold. Expoſed to a conſiderable heat, it totally ſublimes; and if previouſly ground with metallic, and certain other ponderous ſubſtances, elevates ſome part of them along with itſelf, and concretes with the reſt into a maſs, which expoſed to a moiſt air, readily flows into a liquor. Mixed with a due quantity of alkaline ſalts, it yields, by a ſmall degree of heat, two thirds its weight of pure volatile alkali; what remains in the ſubliming veſſel, being diſſolved in water, and cryſtallized, readily aſſumes the form of cubical cryſtals, like thoſe of common ſalt, the properties of which it likewiſe poſſeſſes.—*Sal ammoniac* mixed with nitre, and injected into a red-hot crucible, boils up, and emits flaſhes of light, and thus betrays its animal original. Sublimed in a retort, with double its weight of chalk, it is ſaid to be increaſed in its weight. See Mem. de l'Acad. des Scien. 1735.

In this operation, as M. Duhamel has obſerved, a true decompoſition of the *ſal ammoniac* takes place by the intervention of the chalk; which combining with the acid of the ſalt, diſcharges its *fixable air*. This again combines with the volatile alkali of the *ſal ammoniac*, and occaſions that increaſe of weight, which Duhamel, and other chemiſts, erroneouſly aſcribed to a part of the calcareous earth carried off during the operation.

A mixture of quick-lime and *ſal ammoniac* ſet to ſublime, affords an exceeding penetrating ſpirit, but gives nothing in the form of a ſolid ſalt; if the quantity of lime be conſiderable, the volatile alkaline part of the *ſal ammoniac* will be almoſt totally abſorbed by it.

The volatile alkali obtained by this proceſs is called *volatile ſpirit* of *ſal ammoniac*; as it is cauſtic, or uncombined with *fixable air*, it is always in a liquid ſtate. Moreover, fixed alkali, either vegetable or mineral, and moſt metallic ſubſtances, are capable of decompoſing *ſal ammoniac*.

Laſtly, of all ſalts, *ſal ammoniac* moſt intenſely cools the water in which it is diſſolved, whoſe coldneſs in hot weather equals that of water ready to freeze.

From what has been ſaid, it appears, that *ſal ammoniac* is a neutral ſalt, compounded of a volatile alkaline ſalt, and an acid.

The *ſal ammoniac* derives its name from the various kinds of acid forming the compoſition. And accordingly we have *ſal ammoniac animal*, *nitrous*, *vitriolic*, and *vegetable*, denoting the different combinations of volatile alkali with theſe acids reſpectively. That formed by volatile alkali and vinegar is called *ſpirit of Mindererus*.

But it muſt be obſerved, that *ſal ammoniac* is a very different ſubſtance from moſt of the preparations made from it; for when alkaline ſalts are mixed with the crude *ſal ammoniac* they abſorb the acid, which renders the *ſal ammoniac* neutral; and then the volatile urinous ſalts, being freed from the acid, riſe in diſtillation.

Boerhaave ſays, that *ſal ammoniac* preſerves all animal ſubſtances from putrefaction; that its brine penetrates into the moſt minute parts; and that it is the nobleſt aperient, attenuant, reſolvant, ſtimulant, errhine, ſternutatory, diaphoretic, ſudorific, antiſeptic, and diuretic. It is made uſe of in ſundry mechanic buſineſſes, by the dyers and glaſs-makers, but eſpecially by thoſe who work on metals, for the purpoſe of ſoldering.

There are ſeveral preparations of this ſalt made uſe of in the preſent practice of phyſic, as,

AMMONIAC, *ſal, volatile*, made by ſubliming *ſal ammoniac* mixed with ſalt of tartar. It is uſed for pocket ſmelling bottles; but Boerhaave, with the greateſt appearance of reaſon, condemns the cuſtom of ſmelling to theſe ſalts as highly pernicious. Some put aromatics into the retort, which gives it a more agreeable ſmell. It is preſcribed in malignant fevers as a ſudorific.

AMMONIACI, *ſpiritus ſalis, ſpirit of ſal ammoniac*. This is a ſpirit diſtilled from *ſal ammoniac*, mixed with ſalt of tartar, or pot-aſh, and diſſolved in a proper quantity of water. Some uſe lime inſtead of ſalt of tartar, in order to increaſe its volatility; but this ſhould never be uſed internally.

The *aqua regia*, with which ſo many experiments are made, particularly in diſſolving gold, is made from *ſal ammoniac* and nitre. But the moſt celebrated medicine now in the ſhops from this ſubſtance, is the

Spiritus ſalis volatilis oleoſus, generally called *ſal volatile*, the oily ſpirit of volatile ſalt. This is a ſpirit diſtilled from *ſal ammoniac*, ſalt of tartar, and ſpirit of wine, impregnated with aromatic oil. There is alſo the

AMMONIACI, *ſpiritus ſalis, ſuccinatus*, ſpirit of *ſal ammoniac* with amber; which is reckoned to be cephalic, and exceedingly well ſuited to all nervous indiſpoſitions; its doſe is from ten drops to forty.

AMMONIAC, *fixed*, is a name given to the *reſiduum* formed by decompoſing *ſal ammoniac*, with a calcareous earth. It is a ſalt compoſed of that earth, and marine acid.

AMMONIACUM *regeneratum*, in *Chemiſtry*, the name given to a ſort of *ſal ammoniac*, procured by *chemiſtry* from its principles.

The method of preparing it is this: take four ounces of alkaline ſpirit of *ſal ammoniac*, dilute it with three times its weight of water, in a tall glaſs, and drop in ſpirit of ſea-ſalt, till the alkali is ſaturated, and no more efferveſcence happens. The ſaturation being nicely hit, the liquor will be ſcentleſs, and of the taſte of *ſal ammoniac*; let it be filtrated and evaporated, and it will ſhoot out a fine woolly ſalt; or if it be evaporated to a dryneſs, a white ſalt will remain, and either one or the other of theſe will be found to be true genuine *ſal ammoniac*, capable of riſing in flowers, and ſtanding all the teſts of the common *ſal ammoniac*.

The volatile alkali of animal and vegetable ſubſtances, which of itſelf indifferently receives all acids, is here determined, by the acid of ſea-ſalt, into a ſemi-volatile ſea-ſalt; hence the chemical rule, that acids are capable of determining alkalies into their own nature, ſeems to receive confirmation, while the alkali either gives fixedneſs, or volatility, as itſelf is fixed, or volatile; and therefore, as a large quantity of volatile alkali is continually generated from putrified animals and vegetables, if there was in nature a ſpirit of ſea-ſalt floating about in ſeveral places, *ſal ammoniac* would, in theſe places, be continually produced; and the ſame ſpirit meeting with a fixed alkali, produced from the aſhes of vegetables, would immediately produce a true fixed ſea-ſalt, as appears by the proceſs of the regenerated ſea-ſalt.

But though it is eaſy to manifeſt theſe fixed alkalies by experiments, yet it is very difficult to ſhew the exiſtence of ſuch acids in nature, unleſs we had the ſecret of Mr. Boyle, who, in his treatiſe of Mechanical Experiments, declares, that, by a ſecret and long continued digeſtion, ſea-ſalt may be ſo diſpoſed as to part with its acid, by a gentle heat, and that before its water, and without any addition of any other ſubſtance. Boerh. Chem. part ii. p. 261.

For the chemical hiſtory of this ſubſtance, ſee Neumann's Works, p. 312.

AMMONIS, *cornu*, in *Natural Hiſtory*. See CORNU *Ammonis*.

AMMONITÆ, in *Natural Hiſtory*. See SNAKE-*ſtone*, and Phil. Tranſ. abr. vol. x. part ii. p. 641.

AMMOSCHISTA, in *Natural Hiſtory*, a genus of ſtones of a laminated ſtructure, and ſplitting only horizontally, or into flat plates.

The *ammoſchiſta* are coarſe, harſh, and rough ſtones, of a very looſe texture, and appearing ſomething porous. They are conſiderably heavy, and compoſed of a large, coarſe, and obtuſely angular GRITT, ſurrounded, and in part held together, by a looſe earthy ſpar. They are very ſoft and friable in the maſs, but much more ſo when reduced to ſmall pieces. They make a violent efferveſcence with *aqua fortis*, and will not eaſily ſtrike fire with ſteel.

The ſpecies of *ammoſchiſta* are ſix.

AMMUNITION, in general, ſignifies all ſorts of warlike ſtores and proviſions, more eſpecially powder and ball. The word is *amonitio*, which, according to Du Cange, was uſed in the corrupt ſtate of that language for *ſubſiſtence*.

Ammunition, or gun-powder, may be prohibited to be exported at the king's pleaſure, by 12 Car. II. cap. 4. § 13.

By 1 Jac. II. cap. 8. § 2. *ammunition*, arms, utenſils of war, or gun-powder, imported without licence from his majeſty, are to be forfeited with treble the value. Such licence obtained, except for the furniſhing his majeſty's public ſtores, is to be void, and the offender to incur a premunire; and be diſabled to hold any office from the crown.

Whoever is curious to know the quantity of *ammunition* neceſſary for the ſiege of a place, may conſult the chevalier de St. Julien's treatiſe De la Forge de Vulcain; and the quantity requiſite for the defence of a place, will be found in Suireg de St. Remy's Memoires d'Artillerie.

AMMUNITION-*bread*, ſhoes, &c. what is provided for, and diſtributed to, the ſoldiers of an army or garriſon.

Such an officer has ſo many rations of *ammunition-bread*, &c.

AMNA, in *Phyſical Writers*, denotes the water found in limy ſoils, and which is conſequently tinged with a whitiſh colour, as in many places of England.

In this ſenſe, Paracelſus ſpeaks of the medical virtues and uſes of *amna*.

AMNESTY, or AMNISTY, a kind of general pardon, which a prince grants to his ſubjects, by a treaty or edict, wherein he declares, that he forgets and annuls all that is paſt, and promiſes not to make any farther inquiry into the ſame.

The word is αμνηστια, *amneſtia*; which was the name of an ancient law of this kind, paſſed by Thraſybulus upon the expulſion of the thirty tyrants out of Athens.—Andocides, an Athenian orator, whoſe life is written by Plutarch, and of whom we have an edition of the year 1575, gives us, in his Oration upon Myſteries, a *formula* of the *amneſty*, and the oaths taken thereupon.

Amneſties are uſually practiſed upon reconciliations of the ſovereign with his people, after rebellions, general defections, &c.

Amneſty is either general and unlimited, or particular and reſtrained, though moſt commonly univerſal, without condition or exceptions: ſuch as that which paſſed in

Germany, at the peace of Oſnabrug, in the year 1648.

Amneſty, in a more limited ſenſe, denotes a pardon granted by a prince to his rebellious ſubjects, uſually with ſome exceptions: ſuch was that granted by king Charles II. at his reſtoration.

Amneſty alſo, in a military ſenſe, ſignifies the pardon granted by a ſovereign to deſerters, on condition of their rejoining their regiments.

AMNIMODAR, in *Aſtrology*, the planet that rectifies a geniture, or rather a method of rectifying a nativity, and finding the preciſe degree in the horoſcope at the time of an infant's birth, from the condition of the planet, which had the rule in the laſt preceding conjunction, or oppoſition of the luminaries.

AMNIOS, or **Amnion**, in *Anatomy*, the innermoſt membrane, wherewith the *fœtus* of the womb is immediately inveſted.

The word ſeems to be derived from αμνος, a *lamb*; q. d. *pellis agnina, lamb's ſkin.*

The *amnios* is a white, ſoft, thin, tranſparent membrane; making part of the ſecundine, and lying under the *chorion*. The exiſtence of the *allantois* in human ſubjects is queſtioned; but the *amnios* is found in all animals both viviparous and oviparous. Dr. Hunter ſays, that the *amnios*, viewed in the microſcope, appears to have blood veſſels, but that they are really lymphatics.

It contains a limpid liquor, like a thin jelly-broth; which, becauſe the ſtomach of the *fœtus* is always found full of it, is ſuppoſed to be the matter of its nouriſhment.

But authors differ widely as to the quantity and quality of the liquor of the *amnios*.

The liquor of the *amnios*, according to Mr. Monro, ſerves to keep the *fœtus* and its membranes ſoft and extenſible, hinders them from cohering, and defends the *fœtus* from preſſure, or other violence, which it needs moſt to be protected from, while its parts are very tender.

It is a queſtion, however, whether the liquor of the *amnios* be a proper food for the *fœtus*. Mr. Monro is of opinion, that whether the liquor of the *amnios* be in a ſound or in a morbid ſtate, it appears to be very ill calculated for ſerving as food to be taken into the ſtomach of a *fœtus*.

It is alſo controverted, whether the liquor of the *amnios* paſſes into the ſtomach of the *fœtus*. Mr. Monro aſſerts, that the liquor of the *amnios* does not paſs into the ſtomach of the *fœtus*; and anſwers the arguments brought by ſeveral learned men for the contrary opinion. Medic. Eſſ. Edinb. *paſſim*.

On its outſide lies the *allantois*, or urinary membrane. In ſome ſubjects, the urinary membrane and *chorion* ſtick ſo cloſe to one another, that they appear to be but one. The *amnios* hath all its veſſels from the ſame origin as the *chorion*.

See ſome obſervations, proving that the *fœtus* is in part nouriſhed by the liquor *amnii*, by Malcolm Fleming, M. D. Philoſ. Tranſact. vol. xlix. part 1. N° 42. an. 1755.

AMNIS *alkaliſatus*, among *Chemiſts*, denotes water impregnated with an alkalious quality, by paſſing through a limy or other alkaline ſubſtance under ground.

This amounts to much the ſame with what Paracelſus calls AMNA.

AMNITES, in *Natural Hiſtory*, a name uſed by ſome for the *hammites*, or ſpawn ſtone, a ſtone ſuppoſed to be compoſed of the petrified ſpawn of fiſhes; but they are, in reality, a *congeries* of ſmall STALAGMITÆ, or dropſtones.

AMOEBÆUM, in the *Ancient Poetry*, denotes a kind of poem, or compoſition, wherein two parties ſpeak alternately in the ſame number of verſes, but ſo, as that he who anſwers either goes beyond, or contradicts the other.

The word is αμοιϐαιος, ſignifying *mutual*, or *alternate*. Hence alſo we meet with *epiſtolæ amœbææ*. Such, e. g. are thoſe of Pliny and Trajan.

AMOGABARI, a kind of ancient Spaniſh ſoldiery, in great repute for their bravery.—Theſe are otherwiſe denominated, in ſome writers, ALMUGAVEIRI.

AMOGLOSSUS, in *Zoology*, a name of a peculiar kind of flat fiſh, ſomewhat reſembling the ſoal, and called in ſome parts of England, the *lantern*. It is of a very ſlender, pellucid, and white body, never exceeds three inches in length, and is exceeding ſmooth to the touch, being covered only with a number of very thin ſcales, which fall off on touching it. Its fleſh is very finely taſted, and requires very little dreſſing.

AMOMI is uſed, by the Dutch traders, for what we otherwiſe call Jamaica pepper.

AMOMUM, in *Botany*. See Ginger.

Amomum *of Pliny*. See Solanum.

Amomum, in the *Materia Medica*, a ſmall and rich aromatic fruit, growing in bunches like grapes, valued highly for its medicinal virtues. It is commonly claſſed among the *ſeeds*.

The commentators on Pliny, and Dioſcorides, have never been able to agree upon the ancient *amomum*; the generality of them ſeek it in fruits different from ours.—Some will have the roſe of Jericho paſs for it.—F. Camelli is poſitive he has diſcovered the real *amomum* of Dioſcorides, and that it is the *tugus*, or *birao*, or *caropi*, growing in the Philippine iſlands; the grains or berries whereof are worn by the natives about their necks; both on account of their agreeable odour, and of their ſuppoſed virtue in preſerving from infection, curing the ſting of the ſcolopendra, &c. Phil. Tranſ. N° 248.

Scaliger is confident, that the *amomum* of the ancients was not a fruit, but the wood itſelf, which bore ſome reſemblance to a bunch of grapes, and was particularly uſed in embalming of bodies; and hence, ſays he, the term MUMMY was given to the bodies of Egyptians, embalmed with it. On this account, likewiſe, all medicines and unguents uſed in the embalming and preſerving dead bodies, were called AMOMIA.

The ancient *amomum* was of divers kinds; but the Armenian was moſt eſteemed. It was a heater, dryer, and aſtringent; uſed as a narcotic, to appeaſe pain, cure poiſonous bites, inflammations of the eyes, &c.

The true *amomum* of the ancients reſembles the muſcat grape, and grows like it, in cluſters; it is about the bigneſs of a large chich-pea, round, membranous, and divided into three cells, which contain ſeveral brown angular grains; of a very ſtrong aromatic taſte and ſmell; and is of the cardomom kind.

This fruit is brought from the Eaſt Indies; and makes part of the compoſition of Venice treacle.—It is of a hot, ſpicy taſte and ſmell.

Beſides this, there is likewiſe another paler ſeed, which bears the name *amomum*; but neither this nor the former are in much uſe in phyſic.

The modern *amomum*, uſed in the ſhops, under the denomination of *amomum vulgare*, or *amomum officinarum*, appears to be the ſeed of the *ſiſon* or *ſium* of the ancients, anſwering to what in Engliſh we call *baſtard-ſtone*-PARSLEY.

It is eſteemed a powerful diuretic, and is good in all nephritic caſes. It is alſo commended as an aperient in general, and preſcribed in obſtructions of the liver and ſpleen, and in ſuppreſſions of the menſes. The people in ſome parts of England bruiſe the ſeeds, and give them in warm ale, in colics; but thoſe of caraway, or aniſe, are better. See Skirret.

AMORÆANS, a ſect or order of *gemaric* doctors, or commentators on the Jeruſalem Talmud.

The word is otherwiſe written *amoræi*, and *amoraitæ*, *amoraim*.—The *amoræans* are alſo called, by Scaliger, *ſophiſtæ*; by Atling, γνωμολογι, or *ſpeakers of ſentences*; by Bartoloccius, *dicentes*, or *diſceptantes*, becauſe they conferred and diſputed together in a ſcholaſtic manner.

The *amoræans* ſucceeded the *miſchnic* doctors. They ſubſiſted 250 years; and were ſucceeded by the *ſeburæans*.

AMORE, in *Zoology*, the name of a genus of fiſhes, of which there are three ſpecies. 1. The *amore pixuma*. 2. The *amore guacu*. And, 3. The *amore tinga*.

The *amore pixuma* has a very broad head, and a very large mouth, but has no teeth. Its body is oblong, and its back and ſides are of a duſky iron colour. Its belly, which is protuberant, is white. Its ſkin is ſoft; and it has ſeven fins, beſide the tail, which is rounded at the end. Its fleſh is firm, and well-taſted.

The *amore guacu* is like the former, of an oblong figure; but it grows to ſix inches in length. Its head is thick, its gills large, and its mouth is furniſhed with ſmall teeth. Its eyes are ſmall, their pupil black, and the iris yellow. It has ſeven fins beſide the tail, which is long, and rounded at the end. This ſpecies is covered with ſomewhat large ſcales, and is of a ruſty iron colour, but ſomewhat paler on the belly than in any other parts.

The *amore tinga* is of the ſame ſhape with the former, but is much ſmaller, and is covered with whitiſh ſcales all over, but ſpotted with brown ſpots. Its tail is brown, and waved with different degrees of that colour. All the three ſpecies are eaten, but the firſt is eſteemed the beſt. They are caught about the American ſhores.

AMORPHA, *baſtard indigo*, in the Linnæan ſyſtem of *Botany*, a genus of plants, belonging to the *diadelphia decandria*, of which the characters are: the flowers are of the butterfly kind, having an oval concave ſtandard, but no wings, or keel; this is inſerted between the two upper ſegments of the empalement; the germen afterward becomes a reflexed, moon-ſhaped pod, having one cell, in which are lodged two kidney-ſhaped ſeeds. We know but one ſpecies of this genus.

This ſhrub grows naturally in Carolina, where formerly the inhabitants made a coarſe ſort of *indigo* from the young ſhoots, which occaſioned their giving it the title of *baſtard indigo*.

It riſes with many irregular ſtems to the height of twelve or fourten feet, with very long winged leaves, in ſhape like thoſe of the common ACACIA. At the extremity of the ſame year's ſhoots, the flowers are produced in long ſlender ſpikes, which are very ſmall, and of a deep purple colour. After the flowers are paſt, the germen turns to a ſhort pod, having two kidney-ſhaped ſeeds; but theſe do not ripen in England.

This ſhrub is become very common in all the gardens and nurſeries near London, where it is propagated as a flowering ſhrub, for the ornament of the ſhrubbery. It is generally propagated by laying down the young branches, which in one year will make good roots, and may then be taken off and planted, either in the nurſery, or the places where they are deſigned to remain.

AMORTIZATION, or AMORTISEMENT, in *Law*, the act of turning lands into mortmain, i. e. of alienating or transferring them to ſome corporation, guild, or fraternity, and their ſucceſſors.

The word is formed of the French *amortir*, *to extinguiſh*. See EXTINGUISHMENT.

The term is alſo uſed for the licence or privilege which the king or ſuperior lord grants, to enable ſuch a corporation, &c. thus to receive lands in MORTMAIN; which otherwiſe they cannot do.—There is always ſuppoſed to be ſome fine or acknowlegement paid the king, or the lord, in conſideration hereof; to make them ſatisfaction for ſeveral incidental dues and profits, which would have fallen to them in the common way; which are hereby cut off.

This practice was borrowed from the ancient *Lex Papiria*, whereby it was forbidden to conſecrate any land to religious uſes, without the conſent of the people.

AMOS, or the *Prophecy of Amos*, a canonical book of the Old Teſtament. This prophet boldly remonſtrates againſt the crying ſins that prevailed among the Iſraelites; and reproves the people of Judah for their ſenſuality and injuſtice. He terrifies them both with frequent threatnings, and pronounces that their ſins will at laſt end in the ruin of Judah and Iſrael. He begins with denunciations of judgment and deſtruction againſt the enemies of the Jews, and concludes with promiſes of reſtoring the tabernacle of David, and of erecting the kingdom of Chriſt.

AMOVING, the act of removing or expelling another from his place, office, or the like.—We have ſtatutes for *amoving* papiſts out of London and Weſtminſter, and ten miles round the ſame. 1 W. and M. cap. 9.

AMOVING *a guardian*, *amovendo cuſtode*. See CUSTODE.

AMPANA, in *Botany*, a name given, in the *Hortus Malabaricus*, to a genus of plants, ſince deſcribed by Linnæus, under the name of BORASSUS.

AMPELIS, in *Botany*, the *vine*. See VINE and VITIS.

AMPELIS, in the Linnæan ſyſtem of *Zoology*, the name of a genus of birds, of the order of the *paſſeres*; the diſtinguiſhing characters of which are, that the tongue is furniſhed with a rim, or margin, all round; the beak is of a convex form, and ſtraight.

AMPELIS is alſo the name of a bird, of the magpye-kind, called by ſome GARRULLUS *Bohemicus*. See ROLLER.

AMPELITES, canal coal, in *Natural Hiſtory*, a black *bituminous* ſubſtance, called alſo PHARMACITIS, and nearly reſembling pit-coal, inſomuch, that the difference between them is ſcarce ſenſible. Accordingly, Theophraſtus gives its deſcription under the claſs of theſe coals; and Dr. Woodward ſeems of the ſame opinion. The *ampelites* of the ſhops, according to him, is the ſame with our canal-coal found in Lancaſhire.

It differs from the common pit-coal, in that it is more friable and fat, and withal leſs compact and ſolid; which, it muſt be owned, does not agree with Woodward's deſcription of canal-coal, which he repreſents as very fine and hard, ſo as to take a pretty good poliſh.

The beſt, according to Dioſcorides, is that of a black colour, reſembling ſmall pieces of the *lapis piceus*, or pit-coal, equally gloſſy on all ſides, though, when kneaded up with a little oil, it readily melts.

It is found in many parts of England, in the ſame places with pit-coal. It is alſo to be met with in a quarry near Alençon, in France. It is uſed by huſbandmen, &c. to ſmear their vines with, againſt vermin, and is endued with a drying diſcuſſive power; on which account it is alſo uſed for the dying of hair.

It makes no efferveſcence with *aqua fortis*. Being applied to the belly, it is reputed good for killing worms. It is capable of a fine poliſh, and for that reaſon is turned into a vaſt number of toys, as ſnuff-boxes, and the like.

Ampelites is by ſome called vine-earth, becauſe it kills the worms that creep upon vines.

Libavius has treated at large of the *terra ampelites*.

AMPELOGRAPHIA, the natural hiſtory, or deſcription of the VINE.

The word is originally compounded of *αμπελις*, *a vine*, and *γραφη*, *deſcription*.

Phil. James Sachs has publiſhed an *Ampelographia, ſeu Vitis viniferæ ejuſque partium conſideratio Phyſica, &c.* Uratiſlav. 1661. 8vo.

AMPER, a local term uſed in Eſſex for a *tumor*, or *phlegmon*.

In this ſenſe, the word is alſo written *ampor*.

AMPHERES, in *Antiquity*, a kind of veſſels wherein each mariner wrought two oars at the ſame time, one with his right-hand, and the other with his left, anſwering to our *ſcullers*. This is alſo called AMPHERICUM.

AMPHIARTHROSIS, in *Anatomy*, a neutral or dubious kind of articulation; diſtinguiſhed from the *diarthroſis*, in that it has no conſpicuous motion; and from the *ſynarthroſis*, in its not being without ſenſible motion.

The word is derived from *αμφι*, *both*, and *αρθρωσις*, *articulation*, the *amphiarthroſis*—being compounded of both the other ſorts.—Whence ſome alſo call it *diarthroſis ſynarthroidalis*.

Of this kind is the articulation of the ribs with the *vertebræ*; and that of the *carpus* with the *metacarpus*.

AMPHIBALUM, among *Middle Age Writers*. See AMPHIMALLUM.

AMPHIBIA, in *Natural Hiſtory*, the third claſs of animals, whoſe eſſential characters are, according to Linnæus, that they have either a naked, or elſe a ſcaly body, with no grinders, or *dentes molares*, their teeth all ſharp and pointed, and without radiated fins; or, their heart has but one ventricle, and they reſpire through their lungs.

This claſs is divided into three orders, viz. *reptiles*, *ſerpents*, and the ſwimming *amphibia*, comprehending 24 genera, and 289 ſpecies.

AMPHIBIOUS, in *Natural Hiſtory*, a term applied to a ſort of animals which live both on land, and in the water; that is, which breathe the air, but paſs part of their time in the water, as affording them their chief food.

The word comes from *αμφι*, *utrimque*, *both ways*, and *βιος*, *vita*, *life*; as living in either place.

Such are the *frog*, *caſtor*, *otter*, *tortoiſe*, *ſea-calf*, *crocodile*, &c.—Moſt of the *amphibious* kind, the *caſtor* and *otter* excepted, have peculiar proviſions in their ſtructure, to fit them for ſo various a way of living; particularly in the heart, lungs, *foramen ovale*, &c.

In ſome of theſe animals, as the *frog*, *tortoiſe*, &c. the heart has but one cavity, with an artery to receive the blood coming out of it, and a vein to convey it thither. In others, the *foramen ovale* appears to be ſtill open for the paſſage of the blood from the *vena cava* to the *arteria venoſa*, without the help of breathing.

In the *caſtor* diſſected by the academiſts of Paris, though the *foramen* was not found actually open, yet the marks of it appeared; and the cauſe of its cloſure might well enough be accounted for, from the animal's having been detained a good while from the water, by which the part having been in diſuſe, it cloſed up. In the OTTER the caſe is different; there is no appearance of any thing like a *foramen*, and hence the neceſſity the creature is under of riſing, from time to time, above water, to take in air. Phil. Tranſ. N° 124.

The ſtructure of the feet of the CASTOR pronounces it *amphibious* at firſt ſight, the fore-feet being formed like thoſe of terreſtrial animals, who hold their food in their feet, e. gr. ſquirrels, while the hind-feet are faſhioned after the manner of river-fowl, with webs or membranes between the toes, as the gooſe, duck, &c.

A great part of the fly-kind may be ſaid, in one ſenſe, to be *amphibious*. Gnats drop their eggs in water, where hatching, the young live and breathe after the manner of fiſhes, till at length undergoing a metamorphoſis, they take wing, quit their native element, and become inhabitants of the air. May not ſwallows alſo be ranged under this claſs, which have been ſometimes found to paſs their winter aſleep under water, from which the warmth of the ſpring awakes, and calls them forth.

Elias Geiſsler has written expreſly concerning *amphibious* animals. M. Ottwald of Dantzick has left behind him anatomical obſervations on *amphibious* animals.

Dr. Hunter obſerves that, properly ſpeaking, there are no *amphibious* animals; for that fiſh cannot live long without air, though much longer than men. See two ingenious diſſertations on this ſubject by Dr. Parſons, in the Phil. Tranſ. vol. lvi. 1766.

The term *amphibious* is ſometimes alſo extended to men, who have the faculty of living a long time under water.

We have divers inſtances of ſuch *amphibious* men; the moſt remarkable is of a Sicilian, named the *Fiſh-Colas*. Kircher relates, that by a long habitude from his youth, he had ſo accuſtomed himſelf to live in water, that his nature ſeemed to be quite altered; ſo that he lived rather after the manner of a fiſh, than a man. See Brydone's Tour, vol. i. p. 77.—The PEARL-*fiſhers* alſo arrive at a ſurpriſing art of this kind.

AMPHIBIOUS *plants.* See PLANTS.

AMPHIBIOUS *bipes.* See BIPES.

AMPHIBLESTROIDES, in *Anatomy*, a tunic, or coat of the eye, more uſually called *retina.*

The word is compounded of αμφι, βληϛρον, *net*, and ειδος, *form*; on account of its net-like texture; whence the Latins alſo call it *retiformis.*

AMPHIBOLOGY, or AMPHIBOLIA, in *Grammar*, a fault in language, whereby it is rendered obſcure, and liable to be underſtood in a double ſenſe.

The word comes from αμφιϐολος, *ambiguous*, and λογος, *diſcourſe.*

Amphibology is chiefly uſed in reſpect of a phraſe; as equivocal is in reſpect of a word.

Of this kind was that anſwer which Pyrrhus received from the oracle: *Aio te, Æacida, Romanos vincere poſſe*; where the *amphibology* conſiſts in this, that the words *te* and *Romanos*, may either of them precede, or either of them follow, the words *poſſe vincere*, indifferently. See ORACLE.

The Engliſh language uſually ſpeaks in a more natural manner, and is not capable of any *amphibologies* of this kind: nor is it ſo liable to *amphibologies* in the articles, as the French, and moſt other modern tongues.

AMPHIBRACHYS, the name of a foot in the Latin and Greek poetry; conſiſting of three ſyllables, the firſt and laſt whereof are ſhort, and that in the middle long.

The word comes from αμφι, *circum*, and βραχυς, *brevis*, q. d. a foot ſhort at both ends, and long in the middle.—Among the ancients it is alſo called *janius*, and *ſcolius.* Diom. iii. p. 475.

Such are the words *ămārĕ. ăbīrĕ, pătērnŭs*, Ὅμη̄ρŏς, &c.

AMPHICOME, in *Natural Hiſtory*, a kind of figured ſtone, of a round ſhape, but rugged, and beſet with eminences, celebrated on account of its uſe in divination. The word is originally αμφικομη, q. d. *utrinque comata*, or *hairy on all ſides.*

AMPHICTYONS, AMPHICTYONES, in *Antiquity*, the deputies of the cities and people of Greece, who repreſented their reſpective nations in a general aſſembly; having a full power to concert, reſolve, and appoint, what they ſhould think fit, for the ſervice of the common cauſe.

Some ſuppoſe the word αμφικτιονες to be formed of αμφι, *about*, and κτιειν, or κτιζειν, becauſe the inhabitants of the country round about met here in council. Others, with more probability, from *Amphictyon*, ſon of Deucalion, whom they ſuppoſe to have been the founder of this aſſembly; though others will have Acriſius, king of the Argives, to have been the firſt who gave a form and laws to this body.

The *amphictyones* very much reſembled the ſtates general of the United Provinces; or rather, what in Germany they call the DIET of the empire.

Authors give different accounts of the number of the *amphictyons*, as well as of the ſtates who were entitled to have their repreſentatives in this council; according to Strabo, Harpocration, and Suidas, they were twelve from their firſt inſtitution, ſent by the following cities and ſtates; the Ionians, Dorians, Perrhæbians, Bœotians, Magneſians, Achæans, Phthians, Melians, Dolopians, Ænianians, Delphians, and Phocæans. Æſchines only reckons eleven, inſtead of the Achæans, Ænianians, Delphians, and Dolopians, he only gives theſe three, the Theſſalians, Œtans, and Locrians. Laſtly, Pauſanias's liſt only contains ten *amphictyons*; namely, the Ionians, Dolopians, Theſſalians, Ænianians, Magneſians, Melians, Phthians, Dorians, Phocians, and Locrians.

In the time of Philip of Macedon, the Phocæans were excluded the alliance, for having plundered the Delphian temple, and the Lacedæmonians were admitted in their place; but the Phocæans, ſixty years after, having behaved gallantly againſt Brennus and his Gauls, were reſtored to their ſeat in the *amphictyonic* council. Under Auguſtus, the city Nicopolis was admitted into the body; and to make room for it, the Magneſians, Melians, Phthians, and Ænianians, who till then had diſtinct voices, were ordered to be numbered with the Theſſalians, and to have only one common repreſentative. Strabo ſpeaks as if this council were extinct in the times of Auguſtus and Tiberius; but Pauſanias, who lived many years after, under Antoninus Pius, aſſures us it remained entire in his time, and that the number of *amphictyons* was then thirty.

The members were of two kinds; each city ſending two deputies, under different denominations, one called ιερομνημων, whoſe buſineſs ſeems to have been more immediately to inſpect what related to ſacrifices and ceremonies of religion; the other πυλαγορας, charged with hearing and deciding of cauſes and differences between private perſons.—Both had an equal right to deliberate and vote, in all that related to the common intereſts of Greece. The *hieromnemon* was elected by lot; the *pylagoras*, by plurality of voices.

Though the *amphictyons* were firſt inſtituted at Thermopylæ, M. de Valois maintains that their firſt place of reſidence was at Delphi, where, for ſome ages, the tranquillity of the times found them no other employment than that of being, if we may ſo call it, church-wardens of the temple of Apollo. In after-times the approach of armies frequently drove them to Thermopylæ, where they took their ſtation, to be nearer at hand to oppoſe the enemies progreſs, and order timely ſuccour to the cities in danger. Their ordinary reſidence, however, was at Delphi.

Here they decided all public differences and diſputes between any of the cities of Greece; but before they entered on buſineſs, they jointly ſacrificed an ox cut into ſmall pieces, as a ſymbol of their union. Their determinations were received with the greateſt veneration, and even held ſacred and inviolable.

The *amphictyons*, at their admiſſion, took a ſolemn oath never to diveſt any city of their right of deputation, never to avert its running waters; and if any attempt of this kind were made by others, to make mortal war againſt him: more particularly, in caſe of any attempt to rob the temple of any of its ornaments, that they would employ hands, feet, tongue, their whole power, to revenge it.—This oath was backed with terrible imprecations againſt ſuch as ſhould violate it; e. gr. May they meet all the vengeance of Apollo, Diana, Minerva, &c. their ſoil produce no fruit, their wives bring forth nothing but monſters, &c.

The ſtated terms of their meeting was in ſpring and autumn; the ſpring meeting was called Ἑαρινη Πυλαια, that in autumn Μετοπωρινὴ. On extraordinary occaſions, however, they met at any time of the year, or even continued ſitting all the year round.

Philip of Macedon uſurped the right of preſiding in the aſſembly of the *amphictyons*, and of firſt conſulting the oracle, which was called Προμαντεια.

The Romans never thought fit to ſuppreſs the meeting of the *amphictyons.*

AMPHIDROMIA, in *Antiquity*, a feaſt celebrated the fifth day after the birth of a child, called *dies luſtricus.*

AMPHIDRYON, in *Eccleſiaſtical Writers*, a veil or curtain uſually drawn before the door of the BEMA in ancient churches.

AMPHIMACER, a foot in the *Ancient Poetry*, conſiſting of three ſyllables; the firſt and laſt whereof are long, and that in the middle ſhort.

The word is derived from the Greek αμφι, *circum*, and μακρος, *longus*, by reaſon both extremes are long.

Such are the words *ōmnĭūm, cāſtĭtās*, γρᾱμμᾰτῶν, *&c.*

This foot is alſo called *creticus*, and ſometimes *feſcennius.*

AMPHIMALLUM, in *Eccleſiaſtical Writers*, is otherwiſe called *amphibalum*, and *amphibolum.*

Magri ſuggeſts the *amphimallum*, ſpoken of by eccleſiaſtical writers, to have been a garment peculiar to biſhops.

AMPHIPNEUMA, among *Ancient Phyſicians*, a great degree or ſpecies of difficult reſpiration.

AMPHIPOLES, in *Antiquity*, archons, or chief magiſtrates of the city of Syracuſe.

They were firſt eſtabliſhed by Timoleon, after his expulſion of Dionyſius the tyrant.—They governed Syracuſe for the ſpace of three hundred years; and Diodorus Siculus aſſures us, they ſubſiſted even in his time.

AMPHIPPII, in *Antiquity*, thoſe who practiſed riding on two horſes, by jumping from one to the other.

The word is Greek, αμφιπποι; they are ſometimes alſo called ιππαγωγοι, and ſometimes by corruption, αυιπποι. The appellation was given to a ſort of cavalry in the Grecian armies, who, for their conveniency, had two horſes a-piece, on which they rode by turns, leading the other.

AMPHIPRORÆ, in *Antiquity*, were ſhips which had prows at both ends, that no time might be loſt in turning them, and alſo on account of the rapidity of ſtreams, and narrowneſs of channels.

AMPHIPROSTYLE, in the *Ancient Architecture*, a kind of temple, which had four columns in front, and as many behind.

The word is derived from αμφι, *about*, προ, *before*, and ϛυλος, *column.*

AMPHISBÆNA, in *Zoology*, the name of a genus of ſerpents in the Linnæan ſyſtem. It goes with equal eaſe, as its name imports, either forward or backward.

Linnæus enumerates two ſpecies, viz. the fuliginous, and wihte. They are both ſound in America.

AMPHISBÆNA *aquatica*, a name given, by Bertrutius, Albertus, and ſeveral other authors, to that long and ſlender inſect, called by others the *ſeta aquatica*, and *vermis ſetarius*. It has the name *amphiſbæna*, from its going backwards or forwards with equal eaſe and celerity. The uſual ſize is four or five inches long, and the thickneſs of a large hair.

Dr. Liſter accidentally found out the origin of this worm, in his reſearches into the hiſtory of a very different ſort of inſect. Diſſecting one of the common black beetles dug up in a garden, he found in its belly two of theſe hair worms, or *amphiſbænæ*; and renewing the experiment on other beetles of the ſame ſpecies, he found that they uſually contained one, two, or three of theſe worms. As ſoon as the body of the beetle is opened, they always crawl out. When put into water, they will live a conſiderable time, and ſwim nimbly about; but often put up their heads above water, as if endeavouring to make their eſcape, and ſometimes faſtening themſelves by the mouth to the ſides of the veſſel, and drawing their whole bodies after them.

Theſe creatures are not only found in the waters, but buried in earth, and ſometimes on the leaves of trees, in our gardens and hedges. Phil. Tranſ. Nº 83.

AMPHISCII, in *Geography* and *Aſtronomy*, the people who inhabit the torrid zone.

The word comes from *αμφι*, *about*, and *σκια*, *ſhadow*.

They are thus denominated, as having their SHADOW turned ſometimes one way, and ſometimes another, i. e. at one time of the year to the north, and at another to the ſouth.

The *amphiſcii* are called alſo ASCII.

AMPHISMILA, or **AMPHISMELA**, an anatomical knife, edged on both ſides.

The word is formed from *αμφι*, *utrimque*, *on both ſides*, and *σμιλη*, *knife*.

AMPHITANE, in *Natural Hiſtory*, a name of a ſtone deſcribed by the ancients, and ſaid to have the power of the magnet, or loadſtone; but with this remarkable difference, that as that ſtone attracts only iron, ſo this is ſuppoſed to exert its influence only on gold. For this fabulous property, however, there does not appear to be the leaſt foundation.

AMPHITAPA, in *Antiquity*, a kind of carpets, or clothing, having a ſoft warm nap on each ſide.

AMPHITHEATRE, a ſpacious building of an oval figure, having its *area* or *arena* encompaſſed with ſeveral rows of ſeats, riſing gradually one over another; with porticos both within and withoutſide.

The word is derived from *αμφι*, *about*, and *ϑεατρον*, *theatre*, from *ϑεαομαι*, *contemplor*; ſo that an *amphitheatre*, ſtrictly ſpeaking, is a place whence a perſon may ſee all around him.

Among the ancients, the *amphitheatre* was appointed for the exhibiting of ſpectacles or ſhews to the people; as the combats of gladiators, thoſe of wild beaſts, and the *naumachia*, or *ſea-fight*.

Amphitheatres were at firſt only of wood; and it was not until the reign of Auguſtus, that Statilius Taurus built one for the firſt time of ſtone. The loweſt part was of an oval figure, and called *arena*, becauſe, for the conveniency of the combatants, it was uſually ſtrewed with ſand; and round the *arena* were vaults, ſtiled *caveæ*, in which were confined the wild beaſts appointed for the ſhews.

Above the *caveæ* was erected a large circular periſtyle *podium* adorned with columns. This was the place of the emperors, ſenators, and other perſons of diſtinction. The rows of benches were above the *podium*. Their figure was circular, and they were entered by avenues, at the end of which were gates called *vomitoriæ*.

Their theatre was built in form of a ſemicircle, only exceeding a juſt ſemicircle by one fourth part of the diameter; and the *amphitheatre* was nothing elſe but a double theatre, or two theatres joined together: ſo that the longeſt diameter of the *amphitheatre* was to the ſhorteſt, as $1\frac{1}{4}$ to 1.

There are *amphitheatres* ſtill ſtanding at Rome, at Pola, at Niſmes, &c. The *amphitheatre* of Veſpaſian, called the Coliſeum, and that at Verona in Italy, are the moſt celebrated now remaining of all antiquity.—Remains of *amphitheatres* are ſhewn alſo at Arles, Bourdeaux, &c.

The *amphitheatre* at Pola, an ancient republic of Iſtria, is very entire: it conſiſts of two orders of Tuſcan pillars, one over the other.—The lower have pedeſtals, which is extraordinary; this order having ſcarce ever more than *baſes* to ſupport them.

The *amphitheatre* of Titus is computed to have been capable of holding 85,000 ſpectators.—That of Verona is the beſt preſerved: for, though moſt of the great and beſt ſtones of the outſide are picked out, yet the great vault, on which the rows of the ſeats are laid, is entire; the rows alſo (which are 44 in number) are entire. Every row is a foot and a half high, and as much in breadth; ſo that a man ſits conveniently in them; and allowing for a ſeat a foot and a half, the whole will hold 23,000 perſons.

Pliny mentions an *amphitheatre* built by Curio, which turned on large iron pivots; ſo that of the ſame *amphitheatre* two ſeveral theatres were occaſionally made, whereon different entertainments were ſometimes preſented at the ſame time.

Mr. Brydone mentions an *amphitheatre* at Syracuſe, the theatre of which is ſo entire, that the *gradini* for ſeats ſtill remain; but it is a ſmall theatre, he ſays, in compariſon of that at Taurominum. Tour to Sicily, vol. i. p. 295.

AMPHITHEATRE, in *Gardening*, certain diſpoſitions of trees and ſhrubs on the ſides of hilly places, which, if the hill or riſing be naturally of a circular figure, always have the beſt effect. They are to be formed of ever-greens, ſuch as hollies, phillereys, lauruſtines, bays, and ſuch plants, obſerving to plant the ſhorteſt growing trees in the front, and thoſe which will be the talleſt behind, ſuch as pines, firs, cedars of Lebanon, &c.

Amphitheatres are alſo ſometimes formed of ſlopes on the ſides of hills, covered only with turf, and, when well kept, they are a great ornament to large gardens.

AMPHITHURA, in *Eccleſiaſtical Antiquity*, a name given to the veil, or curtain, which divided the chancel from the reſt of the church.

The word is *αμφιθυρα*, thus called, on account of its opening in the middle, after the manner of folding-doors.

AMPHITRITE, *αμφιτριτη*, from *circumferendo*, in the *Heathen Mythology*, the wife of Neptune, daughter of Nereus, and goddeſs of the ſea, ſometimes taken for the ſea.

AMPHITRITE, in *Zoology*, the name of a ſmall naked ſea inſect, of an oblong figure, with only one *tentaculum*, reſembling a piece of thread. There are ſeveral ſpecies of this animal, ſome of which are marginated, and variouſly furrowed, ſo as to bear ſome reſemblance to a quill.

AMPHODONTA, in *Zoology*, a deſignation given to animals which have teeth in both jaws, the upper as well as under.

The word is compounded of *αμφι* and *οδος*, *tooth*.

AMPHORA, in *Antiquity*, an earthen veſſel, which ſerved as a kind of liquid meaſure, among the ancient Greeks and Romans.

It is called in Homer *αμφιφορευς*, and by *ſyncope αμφορευς*, on account of its two *anſæ*, or *handles*, for carriage.—It is the ſame with the *quadrantale*.

But we meet with two kinds of *amphoræ* in ancient writers, the Italic and Attic.

AMPHORA, *Italic*, was that uſed by the Romans, and which is therefore ſometimes called the Roman *amphora*.

The Italian *amphora* was alſo called *quadrantale*, and ſometimes *cadus*. It contained 72 pounds of wine or water, 80 of oil, and 180 of honey.

The *amphora* was equal to 2 *urnæ*, or 3 *modii*, 6 *ſemodii*, 8 *congii*, 48 *ſextaries*, 96 *heminæ*, 192 *quartarii*, and 570 *cyathi*, amounting to about 7 gallons, one pint, Engliſh wine meaſure.

The ancient *amphoræ* were either *ſeſſile*, i. e. ſuch as would ſtand, or *non ſeſſile*, terminating in a ſharp bottom. Of both which kinds, we meet with figures on ancient medals.

The *amphora capitolina* was the ſtandard of this meaſure, which was kept in the Capitol to adjuſt others by.

Suetonius tells us of a man, who ſtood for the queſtorſhip, and who drank an *amphora* of wine at one meal, with the emperor Tiberius.

Suppoſing the *amphora* to have been a cube of four feet each ſide, as Politian aſſerts it to have been, we may venture to ſay, that ten of the greateſt drinkers on earth could not have emptied it. Buddæus's computation is much more reaſonable; he makes the *amphora* of wine amount to about $4\frac{1}{4}$ gallons Paris meaſure.

AMPHORA, *Attic*, was that uſed by the Greeks, and therefore ſometimes alſo called the Grecian *amphora*.

The Attic *amphora* was one third part bigger than the Italic; ſo that as the latter contained 2 *urnæ*, or 48 *ſextaries*, the former contained 3 *urnæ*, or 72 *ſextaries*, amounting to about 10 gallons $5\frac{1}{2}$ pints, Engliſh wine meaſure. This was called *αμφορευς*, ſometimes alſo *κεραμιον*, and, by way of diſtinction from the Roman kind, *μετρητης*.

AMPHORA was ſometimes alſo uſed as a dry meaſure, containing three buſhels; the ſtandard whereof was kept at Rome in the Capitol, to prevent falſe meaſures.

AMPHORA is alſo uſed to denote the largeſt liquid meaſure in uſe among the Venetians. The *amphora* contains four *bigots*, ſeventy-ſix *muſtachi*, or two boats, or *muids*.

AMPHORA, in *Aſtronomy*, a name given to the ſign more uſually called AQUARIUS.

AMPHORARIUM *vinum*, in *Antiquity*, denotes that which is drawn or poured into *amphoræ*, or *pitchers*, by way of diſtinction from *vinum doliare*, or *caſk-wine*.

The Romans had a method of keeping wine in *amphoræ* for many years, to ripen, by faſtening the lids tight down with pitch or GYPSUM, and placing them either in a place where the ſmoak came, or under-ground.

AMPHOTEROPLON, among *Civilians*, denotes a kind of naval inſurance, where the inſurers run the riſque both of the going out and return of a veſſel.

In this ſenſe, the word ſtands oppoſed to HETEROPLON, where only the voyage outwards is inſured.

AMPHOTIDES, in *Antiquity*, a kind of defence, or armour for the ears, worn by the ancient Pugiles, to prevent giving their adverſaries a handle by that part.

Authors have been in the dark as to the nature and office of the *amphotides* Some explain them as a ſort of helmet for covering the noſe and ears.

Fabretti firſt aſcertained their real uſe, from the figure of a *Pugil*, which had *amphotides* over its ears, joined by a piece coming over the forehead, and tied with ſtrings under the chin.

AMPLEXATIO, or *Baſiatio*, among *Alchemiſts*, denotes a kind of union betwixt their *philoſophical mercury*, which they call the white female, and by which they mean *regulus* of antimony, and the red huſband, by which they mean *gold*. This embracing, ſome of them expreſs in terms not very decent.

AMPLIATION is uſed, by ſome writers, for the act of enlarging the compaſs or extent of a thing.

On a medal of the emperor Antoninus Pius, we find the title *ampliator civium* given him, on account of his having extended the *jus civitatis*, or right of citizenſhip, to many ſtates and people before excluded from that privilege. In effect, this prince is generally ſuppoſed to have made the famous conſtitution, whereby all the ſubjects of the empire were made citizens of Rome. M. Spanheim refutes this notion, and makes the emperor Caracalla to have been the author of that conſtitution.

AMPLIATION, in the Roman *Law*, denotes the act of deferring a judicial ſentence, either as the cauſe is not clear, or in favour of him againſt whom it is to paſs.

Ampliation differed from *comperendination*, as the former was granted on the mere motion or pleaſure of the judge, the latter at the petition of one or both the parties. Beſides, the former was not limited to any certain time, whereas the latter could not be extended beyond the third day.—Beſides, *ampliation* might be repealed, which *comperendination* might not.

The firſt introduction of *ampliation* was in favour of the *rei*, or perſons accuſed. But it was afterwards uſed on other occaſions; e. gr. when certain witneſſes were wanting, or the crime or the fact had not been ſufficiently proved for a final deciſion, or the kind or meaſure of puniſhment was not agreed on, &c.

In theſe caſes, the prætor ſignified his intention, by pronouncing the word *amplius*, or the letters *N. L.* for *non liquet*, by which he denoted that the cauſe was not clear, but that a ſecond action muſt be brought.

The perſon whoſe ſentence, whether of condemnation or abſolution, was thus deferred, was ſaid to be *ampliatus*.

Hence the phraſes, *bis ampliatus*, *tertiò abſolutus eſt reus*.

AMPLIATION is alſo uſed, among *Schoolmen*, to denote the acceptation of a term for a different time from that ſignified by the verb in the propoſition, e. gr. *juſtus peccavit*, i. e. *before he ſinned he was juſt*.

AMPLIFICATION, in *Rhetoric*, part of a diſcourſe or ſpeech, wherein a crime is aggravated, a praiſe or commendation heightened, or a narration enlarged, by an enumeration of circumſtances; ſo as to excite the proper emotions in the ſouls of the auditors.

Such is the paſſage in Virgil, where inſtead of ſaying merely that Turnus died, he *amplifies* the circumſtances of his death.

> *—Aſt illi ſolvuntur frigore membra,*
> *Vitaque cum gemitu fugit indignata ſub umbras.*

The maſters of eloquence make *amplification* to be the ſoul of diſcourſe.—Longinus ſpeaks of it as one of the principal means which contribute to the ſublime; but he cenſures thoſe who define it a diſcourſe which magnifies things; this equally agreeing to the ſublime, the pathetic. &c.—The ſame author diſtinguiſhes *amplification* from the ſublime by this, that the latter conſiſts wholly in the elevation of words and ſentiments, whereas the former conſiſts alſo in their multitude: the ſublime is ſometimes found in a ſingle thought; but *amplification* cannot ſubſiſt, excepting in abundance.

There is likewiſe a difference between the *amplification*, and the proof; becauſe the one ſerves to clear the point, and the other to heighten and exaggerate it.

There are two general kinds of *amplification*; the one of *things*, the other of *words*.—The firſt is produced in divers manners; as, 1. By a multitude of definitions: thus it is Cicero *amplifies* on hiſtory: *Hiſtoria eſt teſtis temporum, lux veritatis, vita. memoriæ, magiſtra vitæ, nuntia vetuſtatis.*—2. By a multitude of adjuncts; of which we have a fine inſtance in Virgil's lamentation for Cæſar's death, by enumerating the many prodigies and monſters that either preceded or ſucceeded it.—*Vox quoque per lucos vulga exaudita ſilentes ingens, & ſimulacra modis palentia miris viſa ſub obſcurum noctis*; *pecudeſque locutæ, infandum! ſiſtunt amnes, terræque dehiſcunt*; *et meſtum illacrymat templis ebur, æraque ſudant.*—3. By a detail of cauſes and effects.—4. By an enumeration of conſequences.—5. By compariſons, ſimilitudes, and examples, &c.—6. By the contraſt of antithets, and by rational inference.

Amplification by words is effected ſix ways.—1. By uſing metaphors.—2. By hyperboles.—3. By *ſynonyma*.—4. By ſplendid and magnificent terms; as that of Horace, *Scandit æratas vitioſa naves cura, nec turmas equitum relinquit, ocyor cervis, & agente nimbos ocyor euro.*—5. By *periphraſes*, or circumlocutions.—6. By repetition.—To which may be added, by gradation.

AMPLITUDE *of the range of a* PROJECTILE, denotes the horizontal line ſubtending the path in which it moved.

AMPLITUDE, in *Aſtronomy*, an arch of the horizon, intercepted between the true eaſt or weſt point, and the centre of the ſun, or a ſtar, at its riſing or ſetting: ſo that the *amplitude* is of two kinds; *eaſtern*, or *ortive*; and *weſtern*, or *occiduous*.

The eaſtern and weſtern *amplitudes* are alſo called *northern* and *ſouthern*, as they fall in the northern and ſouthern quarters of the horizon.

The complement of the eaſtern or weſtern *amplitude* to a quadrant, is called the *azimuth*.

To find the ſun's or a ſtar's *amplitude*, either riſing or ſetting, by the globe, ſee GLOBE.

To find the ſun's *amplitude* trigonometrically; having the latitude and the ſun's declination, given—Say, as the coſine of the latitude is to the radius, ſo is the ſine of the preſent declination to the ſine of the *amplitude*.—Suppoſe, e. gr. the latitude 15° 30′, and the declination 11° 50′:

Sine comp.	15° 30′	ſubtr. from radius,	0,0160895
Sine of declin.	11° 50′	+	9,3118926
			9,3279821

Amplitude required 12° 15′.

AMPLITUDE, *magnetical*, is an arch of the horizon, contained between the ſun at its riſing, and the eaſt or weſt point of the compaſs; or it is the difference of the riſing or ſetting of the ſun, from the eaſt or weſt points of the compaſs.

It is found by obſerving the ſun, at its riſing or ſetting, by an azimuth compaſs. If the compaſs had no variation, the *magnetical amplitude* would be the ſame as the true one.

AMPOTIS, *αμπωτις*. It ſignifies properly the receſs or ebb of the tide. But Hippocrates, who was of Cos, one of the Grecian iſles, and muſt have had many opportunities of obſerving the tides, very elegantly applies this word to the receſs of humours, from the circumference of the body to the internal parts.

AMPTRUARE, in *Antiquity*, denoted a kind of dancing performed by the chief of the *ſalii*, and anſwered with a correſpondent motion by others in the *chorus*.

This is ſometimes alſo called *amburvare*; the anſwer of the *chorus* was particularly called *redamtruare*.

AMPULLA, in *Antiquity*, an oil-vial with a large belly, uſed for unctions at the baths.

The word *ampulla* was alſo uſed for a drinking veſſel uſed at table.

AMPULLA, among *Eccleſiaſtical Writers*, denotes one of the ſacred veſſels uſed at the altars.

The word is ſometimes alſo written in Engliſh *ampul*.

Ampullæ were alſo uſed for holding the oil uſed in chriſmation, conſecration, coronation, &c.

Among the ornaments of churches, we find frequent mention made of *ampuls*, or *vials*. In the inventory of the cathedral of Lincoln, we meet with *ampuls* of cryſtal, variouſly enriched with ſilver-feet and covers; one containing a tooth of St. Chriſtopher, another a tooth of St. Cecily, another a bone of the head of St. John Baptiſt.

AMPULLA, *Knights of St. Ampulla*, belong to an order inſtituted by Clovis I. king of France; at the coronation they bear up the canopy, under which the *ampulla* is carried in proceſſion

AMPULLA, a ſpecies of *bulla*, in the Linnæan arrangement of *worms*.

AMPULLACEÆ *conchæ*, in *Natural Hiſtory*, a name by which ſome authors have called a genus of ſhells, named by others *conchæ globoſæ*, and *dolia*, and by the French naturaliſts *tonnes*. See DOLIUM.

AMPUTATION, in *Chirurgery*, the operation of cutting off a limb, or other part of the body, with an inſtrument.

The uſual method of performing it, in the inſtance of a leg, is as follows.—The proper part for the operation being four or five inches below the knee, the ſkin and fleſh are firſt to be drawn very tight upwards, and ſecured from returning by a ligature two or three fingers broad: above this ligature another looſe one is paſſed, for the gripe; which, being twiſted by means of a ſtick, may be ſtraitened to any degree at pleaſure.

Then, the patient being conveniently ſituated, and the operator placed on the inſide of the limb, which is to be held by one aſſiſtant above, and another below the part deſigned for the operation; and the gripe being ſufficiently twiſted, to prevent too large an hæmorrhage, the fleſh is with a ſtroke or two to be ſeparated from the bone with the diſmembring knife. Then the *perioſteum* being alſo divided from the bone with an inſtrument called a *cataline*, ſaw the bone aſunder with as few ſtrokes as poſſible.—When two parallel bones are concerned, the fleſh that grows between them muſt likewiſe be ſeparated before the uſe of the ſaw.

This being done, the gripe may be ſlackened, to give an opportunity for ſearching for the large blood-veſſels, and ſecuring the hæmorrhage at their mouths, either by the actual cautery, the ligature, ſtitching them up, applying vitriol buttons, or the like. After this a dry pledget of lint, or one dipped in ſpirit of wine, and ſprinkled with *diapente*, may be applied to the ſtump: then looſen the firſt ligature, and pull both the ſkin and fleſh as far as conveniently may be, over the ſtump, to cover it; and ſecure them with the croſs-ſtitch, made at the depth of half or three quarters of an inch in the ſkin.

It remains to apply over the whole ſtump two large pledgets, dipped in oxycrate, dried, and afterwards charged with aſtringents; over theſe to apply a plaſter of the deminio, or ſimple diachylon; over all theſe, an ox-bladder, wetted in oxycrate; and finally, over all, a croſs-cloth pretty tight, ſecured with rollers.

After all this, the gripe may be ſlackened, ſo as to be made eaſy to the patient; or even entirely taken away, after he is put to bed; in which he muſt lie with the ſtump ſomewhat raiſed; an aſſiſtant for twelve or fourteen hours keeping faſt the dreſſing with his hand, to prevent any violent hæmorrhage.—In three or four days the dreſſing may be removed; and proper digeſtives mixed with aſtringents, applied; having an actual cautery, or ſome powerful ſtyptic, in readineſs, in caſe of a violent hæmorrhage at the firſt opening. M. Sabourin, ſurgeon of Geneva, is recorded in the hiſtory of the Royal Academy of Sciences, an. 1702, for an improvement in the method of *amputation*, propoſed to that academy; the whole ſecret conſiſts in ſaving a piece of fleſh and ſkin, a little lower than the place where the ſection is to be, wherewith the ſtump is to be afterwards covered. The advantages hereof are, that, in leſs than two days time, this fleſh unites with the extremes of the divided veſſels, and ſo ſaves the neceſſity either of binding the ends of thoſe veſſels with thread, or of applying cauſtics or aſtringents; which are methods very dangerous, or at leaſt very incommodious: and, that the bone thus covered up, does not exfoliate. This method of Meſſrs. Sabourin and Verduin, is called *l'operation de l'amputation à lambeau*.

Dr. Motherby, in his Medical Dictionary, ſays, that in the year 1674, Mr. Morell, a French ſurgeon, introduced the *tourniquet*, as it is now uſed; but the firſt mention of the inſtrument is in the Currus Triumphalis è Terebintho, Lond. an. 1679, from which book it alſo appears, that the operation *de l'amputation à lambeau*, was then the practice of the Engliſh ſurgeon, who publiſhed it.

In the year 1713, it is ſaid in the Collect. Acad. tom. iii. p. 517. that M. Sabourin, a ſurgeon of Geneva, had diſcovered the method of what is called *amputation à lambeaux*, and that he came that year to Paris, to propoſe it to the academy, with a view of introducing it into practice in the courſe of a war that was then beginning. It is added, that he diſcloſed it without reſerve or preſumption, and in a manner that did him great honour; but that the academy declined adopting the practice, ſuſpended its judgment, and waited for the additional recommendation of experience.

Many and important improvements on the methods of *amputation* have been made in this century, in the courſe of which the crooked needle, and moſt other parts of the *apparatus* in this branch of ſurgery, have either been introduced or improved. The double-edged knife, called the *cataline*, formerly uſed to clear away the *perioſteum*, is now laid aſide, as unneceſſary or hurtful; it having been diſcovered, that in conſequence of ſcraping off the *perioſteum*, an exfoliation ſometimes follows from the ſubjacent bone.

In moſt *amputations* the operation ſhould be performed the breadth of a finger, or more, above the ſphacelated or otherwiſe injured part. The *trochar* ſhould be ſo applied, as that it may preſs upon the chief artery of the limb to be taken off. The practice of making a ſhort ſtump is moſt general; but others prefer amputating between the calf of the leg and the ankle, in caſes that will admit of ſaving ſo much of the leg; and are confident, that the motion of the long ſtump is more eaſy than that of a ſhort one. Mr. White, and Mr. Bromfield, are entirely of this opinion.

The uſe of ſpunge as a part of the dreſſing, as ſoon after the *amputation* as the digeſtion is begun in the ſtump, is recommended by Mr. Kirkland, to prevent the evil, and ſometimes fatal conſequences, of an abſorption of the matter from the wound, after the inflammation is gone off, particularly when the digeſtion does not proceed kindly. See Lond. Med. Obſ. & Inq. vol. ii. art. 23. p. 278.

According to his method, ſo ſoon as the digeſtion is complete, the wound is firſt covered with thin layers of dry lint, over them pieces of fine ſpunge are applied, which imbibe the thinneſt part of the matter from the lint, and that which remains becomes too thick to be abſorbed. Vide Eſſays Phyſic. and Liter. Edinb. vol. iii. art. 22. See a general account of the caſes that are ordinarily ſuppoſed to indicate and require *amputation*, and the various methods of amputating particular parts, &c. Med. Dict. Sharp's Operations of Surgery, and Crit. Inq. Heiſter's Surgery; Bilguer's Diſſert. on Amputation; Le Dran's Operations, &c.

AMSDORFIANS, in *Church Hiſtory*, a ſect of proteſtants, in the ſixteenth century; ſo denominated from their leader *Amſdorf*.

Saunders repreſents them as maintaining, that good works were not only unprofitable, but even oppoſite and pernicious to ſalvation.

AMSEGETES, in *Antiquity*, thoſe whoſe grounds abutted on the highway. Vid. Feſt. de Verb. ſignif. in voc. The laws of the Twelve Tables decree, *amſegetes viam muniunto*.

AMTRUSTIO, in *Ancient Charters*, denotes a ſworn or liege tenant, or vaſſal, of the ancient French or German kings.

The word is alſo written *antruſtio*. Spelman derives it from the German *ampt*, *office*, *buſineſs*, and the Engliſh *truſtee*.

AMULET, AMULETUM, a kind of external medicament, to be worn about the neck, or other part of the body, to prevent, or remove, diſeaſes.

The word *amulet* is formed from *amoliri*, *to remove*.

Such are quills of quickſilver, or arſenic, which ſome hang on the neck, or wear under the ſhirt, againſt the plague, and other contagious diſeaſes; as alſo the blood-ſtones worn by others againſt hæmorrhages; and that worn by the women of the Eaſt Indies to bring the *menſes*.

Amulets are alſo frequently no other than a ſort of ſpells, or charms; conſiſting of quaint words and characters, ſuppoſed to have the virtue of warding off ill.—Pliny makes frequent mention of them.

The Greeks called this kind of remedies φυλακτηρια, *phylacteries*; περιαπτα, *periapta*; αποτελεσματα, περιαμματα, βρεϐια and εγκολπια. The Latins call them *amulata*, *appenſa*, *pentacula*, *&c.*

Some think this word derived from *amula*, a ſmall veſſel with luſtral water in it, anciently carried in the pocket by the Romans, for the ſake of purification and expiation. This laſt opinion appears the more probable, in that ſome *amulets* were made in the ſhape of little veſſels, as appears from the teſtimony of Pliny, who obſerves, that pieces of amber, cut in form of little veſſels, were hung about childrens necks for *amulets*.

Amulets are by ſome conſidered as a natural ſpecies of *taliſmans*. Others rather make *taliſmans* a ſpecies of *amulets*. The *bulla*, worn by the ancients; the *abraxas* of the Braſilidians, &c. were alſo *amulets*.

The ancients made great uſe of gems for *amulets*: the whole Eaſt, according to Chiflet, wore a kind of jaſper for this purpoſe.

That ſpecies of *amulets* compounded of poiſons, uſed as preſervatives from the plague, are more particularly denominated *zenechta*.

Under *amulets*, ſome alſo include medicinal or other ſubſtances fixed to brutes, or even plants, to preſerve them from certain diſeaſes and dangers.

Charms, words, ſcrolls, magic figures and numbers, make a large claſs of *amulets*, to which the Turks are ſtill greatly devoted. Their *amulets*, called *chaimaili*, are little bits of paper of two or three fingers breadth, rolled up in pieces of ſilk, containing ſhort prayers or ſentences out of the Alcoran, with circles and other figures, in which they inſcribe the name of Jeſus, the figure of the croſs, &c. They hang them about their necks, or place them under their arm-pits, or in their boſom near their hearts, and eſpecially when they go to war, as a preſervative againſt the dangers of it.

The pope is ſuppoſed to have the virtue of making *amulets*, which he exerciſes in the conſecrating of *Agnus Dei's*, &c.

Amulets are now much fallen from the repute they were anciently in; yet the great Mr. Boyle alledges them as an inſtance of the ingreſs of external effluvia into the habit; in order to ſhew the great poroſity of the human body. —He adds, that he is perſuaded ſome of theſe external medicines do anſwer: for that he himſelf, having once been ſubject to bleed at the noſe, and reduced to uſe ſeveral remedies to check it, found the moſs of a dead man's ſkull, though only applied ſo as to touch the ſkin till the moſs was warm thereby, the moſt effectual of any. The ſame Mr. Boyle ſhews how the effluvia, even of cold *amulets*, may, in tract of time, pervade the pores of a living animal; by ſuppoſing an agreement between the pores of the ſkin, and the figure of the corpuſcules. Bellini has demonſtrated the poſſibility of the thing in his laſt propoſitions, De Febribus; and the like is done by Dr. Wainwright, Dr. Keill, &c.

AMULET, in a more particular ſenſe, is reſtrained to ſuch medicines, as do not operate by any phyſical virtue, or to thoſe wherein there is no proportion between the cauſe and effect.

In this ſenſe medicines, which operate by effluvia, odors, and the like, do not belong to the claſs of *amulets*.

In this ſenſe alſo thoſe eſſence-veſſels worn by hyſterical women on their breaſts, called by the Greeks *καρδιοφυλακια*, and by the Latins *domus pectoris*, were not properly *amulets*.

AMULET is ſometimes alſo applied, in a more extenſive ſenſe, to all medicines, whether internal or external, whoſe virtue or manner of operation is *occult*.

AMULET, in *Cookery*. See OMELET.

AMULETICS, in *Medicine*, is uſed by ſome writers for what is more frequently called an *amulet*.

Amuletics amount to the ſame with what are otherwiſe called *ſympathetics*, and are chiefly uſed of late times to ſtop bleeding; ſuch are the *perſicaria*, *lapis hæmatites*, dried toads, &c. alſo againſt warts, *ſarcomas*, &c.

Sir Kenelm Digby's ſympathetic powder is one of the principal *amuletics* in caſes of hæmorrhages; and with many, the *ancora ſacra*.

AMUND, in *Ancient Writers*, denotes a perſon free or diſcharged from tuition or wardſhip.

The word is alſo written *aamund*, *amond*, and *amont*; and is compounded of the privative *a*, and the Saxon *munde*, *defence*, *tuition*.

AMURACORY, in ſome *Writers of the Middle Age*, denotes a kind of Turkiſh ſoldiery belonging to the corps or order of Janizaries.

They ſeem to be the ſame with thoſe otherwiſe called *Saraptarii* and *Pocillatores*.

AMURCA, in *Pharmacy*, a medicine made of the refuſe or recrement of expreſſed OLIVES.

Amurca being boiled in a copper-veſſel to the conſiſtence of honey becomes a drug of ſome uſe in medicine, being reputed an aſtringent and drier; and as ſuch ſometimes preſcribed in ulcers, as well as againſt diſeaſes of the teeth, eyes, &c.

Hippocrates applies the term *amurca*, to a crude, immature, putrid ſtate of the liver.

Some authors have alſo given the name *amurca* to the juice or fluid found in the RENES *ſuccenturiati*.

AMY, in *Law*, the perſon next of kin to an orphan, or infant, who is to be intruſted for him; properly called PROCHEIN *amy*.

The word in French literally ſignifies *friend*.

AMY, *alien*, is a foreigner here, ſubject to ſome prince, in friendſhip with us.

AMYGDALA, in *Natural Hiſtory*, the name of a ſpecies of ECHINUS *marinus*, of the genus of the BRISSOIDES.

AMYGDALÆ, in *Surgery*, denotes ſuperfluous fleſh growing at the root of the tongue.

AMYGDALÆ, in *Anatomy*. See ALMONDS.

AMYGDALE. See ALMOND.

AMYGDALATE, an artificial milk, or emulſion, made of blanched almonds, &c.

AMYGDALOIDES *lapis*, in *Natural Hiſtory*, the name given by authors to a ſtone which reſembles the kernel of an almond in figure. It is no natural foſſil, but the petrified ſpine of an ECHINUS *marinus*, or ſea-urchin, of the nature of the LAPIS *Judaicus*, but wanting the pedicle or ſtalk of that ſpine.

AMYGDALUS, in *Botany*, the ALMOND-*tree*.

AMYLON, in *Ancient Writers*, a kind of aliment anſwering, as ſome apprehend, to our furmity.

The word is Greek, *αμυλον*, thus called, becauſe made *ſine mola*.

AMYLUM. See STARCH.

AMYNTA, in *Literary Hiſtory*, a beautiful paſtoral comedy, compoſed by Taſſo; the model of all dramatic pieces wherein ſhepherds are actors. The *Paſtor Fido*, and *Filli di Sciro*, are only copies of this excellent piece.

AMYNTICA *emplaſtra*, in *Pharmacy*, defenſative, or ſtrengthening plaſters.

AMYNTOR properly denotes a perſon who defends or vindicates a cauſe. The word is *αμυντωρ*, formed of the verb *αμυνω*, *I defend*, or *avenge*.

In this ſenſe, Mr. Toland entitles his defence of Milton's life, *Amyntor*, as being a vindication of that work againſt Mr. Blackall, and others, who had charged him with queſtioning the authority of ſome of the books of the New Teſtament, and declaring his doubt that ſeveral pieces under the name of Chriſt and his Apoſtles, received now by the whole Chriſtian church, were ſuppoſititious.

AMYRALDISM, a name given by ſome writers to the doctrine of univerſal grace, as explained and aſſerted by Amyraldus, or Moſes Amyraut, and others his followers, among the reformed in France, towards the middle of the ſeventeenth century.

This doctrine principally conſiſted of the following particulars, viz. that God *deſires* the happineſs of all men, and none are excluded by a divine decree; that none can obtain ſalvation without faith in Chriſt; that God refuſes to none the *power* of *believing*, though he does not grant to *all* his aſſiſtance, that they may improve this power to ſaving purpoſes; and that many periſh through their own fault. Thoſe who embraced this doctrine were called UNIVERSALISTS, though, it is evident, they rendered grace *univerſal* in words, but *partial* in reality, and are chargeable with greater inconſiſtencies than the SUPRALAPSARIANS.

Amyraldiſm is ſaid to have been a ſyſtem worked up, to bring on a reconciliation with the Lutherans.

AMYRBERIS, in *Botany*, a name uſed by ſome authors to expreſs the BARBERRY-*tree*.

AMYRIS, in *Botany*, a genus of the *octandria monogynia* claſs, with a four-toothed calyx, four oblong petals, a four-cornered ſtigma, and a pulpy berry.

AMZELL, in *Zoology*, the name of a bird of the *merula*, or black-bird kind, of which there are two ſpecies. The ring-*amzell*, or *merula torquata*, and the *merula montana*, called ſimply the *amzell*.

The ring-*amzell* is a little larger than the common black-bird. Its back is of a duſky blackiſh brown, and its throat and breaſt are beautifully variegated with ſpots and ſtreaks of white, and the lower part of the throat is adorned with a fine broad white ring, whence the bird has its name: this ring is of a lunated ſhape, the points ending at the ſides of the neck. The wings and tail are blackiſh, but are ſomewhat variegated with white in the female; the white looks greyiſh. The female is ſaid alſo by ſome not to have the ring round its neck, and has by that means been miſtaken for the *merula montana*, or common *amzell*. This feeds on inſects and on berries. It is common about the Peak in Derbyſhire, and is there called the rock-*owzell*.

The common *amzell*, or *merula montana*, differs from this, in that it has no ring round the throat, which is variegated with a browniſh-red, and with ſpots of black, and the belly with grey and black ſpots. It ſeems however not determined certainly, whether this is any other than the female of the ring-*amzell*.

ANA, āā, in *Medicine*, denotes an equal quantity of any things, whether in liquid, or in dry meaſure.

Hence *anatica proportio* is uſed by ſome writers to ſignify the *ratio*, or *proportion of equality*.

ANA, in *Matters of Literature*, a Latin termination, adopted into the titles of ſeveral books in other languages.—*Anas*, or *books in ana*, are collections of the memorable ſayings of perſons of learning and wit; much the ſame with what we otherwiſe call TABLE-*talk*.

Wolfius has given the hiſtory of books in *ana*, in the preface to the Caſauboniana. He there obſerves, that though ſuch titles be new, the thing itſelf is very old; that Xenophon's books of the deeds and ſayings of Socrates, as well as the dialogues of Plato, are *Socratiana*; that the apophthegms of the philoſophers, collected by Diogenes Laertius; the ſentences of Pythagoras, and thoſe of Epictetus; the works of Athenæus, Stobeus, and divers others, are ſo many *anas*. Even the *Gemara* of the Jews, with ſeveral other oriental writings, according to Wolfius, properly belong to the ſame claſs. To this head of *ana* may likewiſe be referred the *Orphica*, the *Pythagoræa*, *Æſopica*, *Pyrrhonea*, *&c.*

Scaligerana was the firſt piece that appeared with a title in *ana*. It was compoſed by Iſan de Vaſſan, a young Champanois, recommended to Joſ. Scaliger, by Caſaubon.—Being much with Scaliger, who was daily viſited by the men of learning at Leyden, De Vaſſan wrote down whatever things of any moment he heard Scaliger ſay.—And thus aroſe the *Scaligerana*, which was not printed till many years after, at Geneva, in 1666. Patin. Let. 431.—Soon after came the *Perroniana*, *Thuana*, *Naudæana*, *Patineana*, *Sorberiana*, *Menagiana*, *Anti-Menagiana*, *Furetiana*, *Chevræana*, *Leibnitziania*, *Arlequiniana*, *Poggiana*, *&c.*

ANA is uſed among ſome occult philoſophers to denote the human mind. Hence, according to ſome, is derived the word *anaſapta*, a dæmon invoked to the aſſiſtance of a ſick perſon.

ANABAPTISM, ſee ANABAPTISTS, *infra.*

ANABAPTISTON. See ABAPTISTON.

ANABAPTISTS, a name given to Chriſtians, who maintain that *baptiſm* ought always to be performed by immerſion; that it ought not to be adminiſtered to children before the age of diſcretion, or that at this age it ought to be re-adminiſtered to thoſe who have been baptiſed in their infancy, becauſe, they ſay, the adminiſtration of this ſacrament is neither valid nor uſeful, if it be done by ſprinkling only, and not by immerſion; or if the perſons who receive it, be not in a condition to give the reaſons of their belief.

The word *Anabaptiſt* is compounded of *ανα*, *new*, and *βαπτιςης*, a *baptiſt*; and this general denomination has been indiſcriminately applied to people of very different principles and practices; though many of them object to the name, and hold nothing in common, excepting ſome or other of the abovementioned opinions concerning BAPTISM.

The NOVATIANS, the CATAPHRYGIANS, and the DONATISTS, may be conſidered as a kind of *Anabaptiſts* in the earlier ages, though not then denoted by this name; for they contended, that thoſe Chriſtians of the catholic church, who joined themſelves to their reſpective parties, ſhould be rebaptiſed. But we muſt not claſs under the ſame denomination thoſe biſhops of Aſia and Africa, who, in the third century, maintained, that *baptiſm*, adminiſtered by thoſe whom they called heretics, was not valid, and therefore that ſuch of them as returned into their churches ought to be rebaptiſed. Nor does it appear, that there is ſufficient authority to affirm, that the *Vaudois* and the *Albigenſes* were predeceſſors of the modern *Anabaptiſts*.

It was not till a little after the time when the Lutherans ſeparated from communion with the Romiſh church, that the *Anabaptiſts* began to make a noiſe in Germany. Storck, Stubner, and Munzer, were the firſt diſciples of Luther, who, about the year 1521, were ſtiled *Anabaptiſts*. But well knowing that their opinions were very different from Luther's doctrine, they availed themſelves of his abſence to diſſeminate them in Wittemburgh, and had the addreſs to over-reach the piety of Melancthon. Their principal purpoſe was to gain over the populace, and to form a conſiderable party. To effect this, ſays Bayle, they were induſtrious and active, each in his own way. Storck wanting knowledge, boaſted of inſpiration; and Stubner, who had both genius and erudition, laboured at commodious explications of Scripture. Not contented with diſcrediting the court of Rome, and decrying the authority of conſiſtories, they taught, that men being intitled under the Goſpel to equal liberty, could not be juſtly ſubjected to any civil power, nor erect ſuperiorities over each other; that, as all magiſtracy was an uſurpation on Chriſtian freedom, no true Chriſtian could be either magiſtrate, or ſubject, nor conſequently pay any impoſt, give any oath, or bear arms; that violence and arms ought never to be made uſe of, excepting againſt princes, and people in power, from whom they were permitted to revolt, as from ſo many uſurpers, who were to be pulled down, in order to erect the kingdom of God. They pretended that Chriſtians being all free, equal, and independent, there ought to be no tribunal among them, nor laws, nor any diſtinction of property, but that every thing ſhould be in common, nor any reſtraints with regard to the number of wives which they might marry. In other reſpects they affected ſingular auſterity, recommending macerations, faſtings, and the utmoſt ſimplicity of apparel. Their ſermons were for the moſt part declamations againſt the communion of the reformed; and they were inceſſantly exhorting every body to join with them, who, as they ſaid, were ſent of God, to re-eſtabliſh the kingdom of his ſon. They made high promiſes to all who would unite with them to exterminate the impious; if this maſſacre proved the epocha for the commencement of Chriſt's reign upon earth, when the juſt, meaning themſelves, were to reign alſo, inſtead of the unrighteous uſurpers of authority. They moreover affected to ſpeak with a kind of contempt concerning external worſhip, the ſacraments, the miniſtry, and even the word of God, with a view to enhance the merit of the extacies, viſions, and inſpiration, to which they pretended, and on which they valued themſelves. They dealt much in predictions, eſpecially concerning the nearneſs of the laſt judgment; and finally, to give greater *eclat* to their party, they rebaptiſed all thoſe who joined them; and to make their practice ſucceed, they taught that baptiſm adminiſtered to infants was void.

Munzer took the lead of this party; and, in 1525, aſſembled a numerous army of aſſociates; but this inſurrection was ſoon ſuppreſſed, and Munzer put to an ignominious death. Many of his followers, however, ſurvived, and propagated their opinions through Germany, Switzerland, and Holland. In the year 1533, they formed a new community at Munſter, under the direction of two *Anabaptiſt* prophets, John Matthias, a baker of Haerlem, and John Blockholdt, a journeyman taylor of Leyden. Having made themſelves maſters of the city, they depoſed the magiſtrates, confiſcated the eſtates of ſuch as had eſcaped, and depoſited the wealth they amaſſed together in a public treaſury, for common uſe. They made preparations of every kind for the defence of the city, and ſent out emiſſaries to the *Anabaptiſts* in the Low Countries, inviting them to aſſemble at Munſter, which was now dignified with the name of Mount Sion, that from hence they might be deputed to reduce all the nations of the earth under their dominion. Matthias, who was the firſt in command, was ſoon cut off in an act of phrenſy by the biſhop of Munſter's army; and was ſucceeded by Blockholdt, who was proclaimed, by a ſpecial deſignation of heaven, as he pretended, king of Sion, and inveſted with legiſlative powers, like thoſe of Moſes. The extravagancies of Blockholdt were too numerous to be recited; it will be ſufficient to add, that the city of Munſter was taken after a long ſiege, and an obſtinate reſiſtance; and Blockholdt, the mock monarch, was puniſhed with a moſt painful and ignominious death. The *Baptiſts* in England and in Holland, or, as they are there called, the *Mennonites*, are very different from thoſe who firſt gave riſe and name to the ſect.

It muſt be acknowledged, that the firſt inſurgents in Germany had been grievouſly oppreſſed; and that they took up arms principally in defence of their civil liberties: nor ſhould ſubſequent extravagancies of violence be attributed to their religious principles, much leſs charged on their ſucceſſors.

The ſequel of their hiſtory, and diſtinguiſhing tenets, may be ſeen under the articles ANTI-PÆDO-BAPTISTS, MENNONITES, WATERLANDIANS, &c.

ANABASII, in *Antiquity*, the COURIERS who travelled on horſe-back, or in chariots, for the greater expedition.

The word comes from the Greek *αναϐασις*, *mounting*.

ANABASIS, *αναϐασις*, *aſcenſion*, derived from *αναϐαινω*, *to aſcend*.

ANABASIS, in *Medicine*, the ſtate of a diſeaſe in its growth.

ANABASIUS, a name given by Pliny to a plant, which he calls alſo *ephedra*, and deſcribes as hanging down from the branches of large trees, in form of tufts of hair. The plant deſcribed by Pliny, and others of the ancients, under this name, is the USNEA, or long hairy tree-moſs.

ANABATA, in *Ancient Cuſtoms*, a cope, or ſacerdotal veſt, to cover the back and ſhoulders of the prieſt.

It is otherwiſe called *anaboladium*, formed of *αναϐαλλεσθαι*, *to caſt over or cover*.

The word *anabala* ſeems to be uſed in the ſame ſenſe.

ANABATHRA, in *Ancient Writers*, denote a kind of ſteps or ladder, whereby to aſcend to ſome eminence. In this ſenſe we read of the *anabathra* of theatres, pulpits, &c. *Anabathra* appears to have been ſometimes alſo applied to ranges of ſeats riſing gradually over each other.

ANABATHRA is more particularly applied to a kind of ſtone-blocks raiſed by the highway ſides, to aſſiſt travellers in mounting or alighting, before the uſe of ſtirrups was invented.

The firſt author of this contrivance, among the Romans, was C. Gracchus, brother of Tiberius.

ANABIBAZON, in *Aſtronomy*, the DRAGON'S *tail*.

ANABLATUM, in *Botany*, a name uſed by ſome authors for the *ſquammaria*, or tooth-wort, called *dentaria* by others.

ANABLEPS, in the *Artedian Syſtem of Ichthyology*, the name of a new genus of fiſh, of the *malacopterigious* kind, the characters of which are theſe: the *branchioſtege* membrane contains ſix bones, and there is only one ſmall fin at the extremity of the back. There is a ſpecimen of this fiſh in the great collection of Albertus

Seba in Holland. The *anableps* is a ſpecies of the *cobitis*, in the Linnæan ſyſtem.

ANABOLÆUM, in *Antiquity*, denotes any kind of upper garment worn over the coat or tunic.

This is otherwiſe called *anabole*.

ANABOLEUS, among the *Ancients*, a ſervant whoſe office was to aſſiſt in mounting on horſeback.—Theſe were in uſe before the invention of ſtirrups, or of thoſe ſtones called *anabathra*.

ANABOLEUS is alſo uſed by Euſtathius, to denote a ſmall piece of iron, whereon the foot was ſet, in order to mount; from which Buddæus infers, that the ancients had ſtirrups or foot-boards; to which Lipſius objects, that it does not appear this *anaboleus* was any pendent part fixed to the ſaddle, after the manner of our ſtirrups, but rather a portable engine brought by a ſervant, and placed by the horſe's ſide.

ANABROCHISMUS, in the *Ancient Phyſic*, the operation of taking away offenſive hairs in the eye-lids.

The manner of performing the *anabrochiſmus* is deſcribed by Gorræus.

ANABROSIS, in *Medicine*, otherwiſe called *diabroſis*, the iſſuing of blood at a hole worn in a vein by corroſion.

The word is αναϐρωσις, q. d. *eroſio*.

ANACA, in *Zoology*, the name of a Braſilian ſpecies of PAROQUETTE. It is of the ſize of a lark; its beak is brown and crooked; the crown of its head is covered with feathers of a liver-colour, and there are circles of brown ones near its eyes. Its throat is grey; the upper part of its neck and its ſides are green; its belly is of a reddiſh brown; its back green, with a pale brown ſpot, and its tail a pale brown. There is a deep blood-red mark at the top of each wing, the reſt of the wings is green, except their extremities, which are bluiſh. Its thighs are covered with green feathers, and its legs and feet are grey.

ANACALYPTERIA, in *Antiquity*, feaſts celebrated among the heathens on the day that the bride was permitted to lay aſide her veil, and to be ſeen in public.

They were thus called from ανακαλυπτειν, *to uncover*.

According to Suidas, it alſo means the preſents which were made to the bride by her huſband's relations and friends on that day.

ANACAMPSEROS. See PURSLANE.

ANACAMPTERIA, in *Eccleſiaſtical Antiquity*, denote little hoſpitals, or inns, for the entertainment of the poor and ſtrangers, built adjoining to the ancient churches.

ANACAMPTIC ſignifies as much as *reflecting*; and is frequently uſed in reference to echoes, which are ſaid to be ſounds produced *anacamptically*, or by reflection.

Hence, alſo, *anacamptics*, is by ſome uſed for the ſcience of reflected rays; otherwiſe called CATOPTRICS.

ANACANDAIA, in *Zoology*, the name of a ſpecies of ſerpent found in the iſland of Ceylon, and very miſchievous among the cattle, whence it is called BUBALINUS.

ANACARDIUM, in *Botany*, the caſhew-nut, or *acajou*, a genus of the *enneandria monogynia* claſs. For the characters, ſee ACAJOU.

We have but one ſpecies of this genus, viz.

ANACARDIUM, *Hort. Cliff.* 161. This tree grows to a conſiderable height in its native country, which is the Weſt Indies. But in England the plants are with great difficulty preſerved; though by their firſt ſhoot from the ſeeds, they appear ſo ſtrong and vigorous, as to promiſe a much greater progreſs, than they are ever ſeen to make here.

The milky juice of this tree will ſtain linen of a deep black, which cannot be waſhed out again; but whether this has the ſame property with that of the eaſtern *anacardium*, has not yet been fully experimented; for the inſpiſſated juice of that tree is the beſt ſort of lack which is uſed for ſtaining of black in China or Japan. Phil. Tranſ. vol. xlix. part ii. p. 872; and Dr. Lewis's Commercium, Phil. Techn. p. 329, &c.

ANACARDIUM, in *Medicine*, the fruit of the above mentioned tree, brought from the Eaſt Indies, anciently in great eſteem as a cephalic.

The word is formed of ανα and καρδια, *heart*, on account of the figure of this fruit, which bears ſome reſemblance to a heart.

The pith or medullary part of the *anacardium* is extremely pungent and acrimonious; whence the ancients made great uſe of it in cold diſeaſes of the head, particularly to ſtrengthen the memory; but the abuſe of it ſometimes making them ſtupid, delirious, or even mad, the moderns rarely venture on the uſe of it, at leaſt not without great correctives.

ANACARDIUM *antarticum* is alſo uſed by ſome for the CAJOU-*fruit*. This is alſo called by others *anacardium occidentale*, and is ordinarily uſed for the true, or eaſtern kind.

ANACATHARSIS, in *Medicine*, properly denotes a purgation by ſpitting; in which ſenſe, it ſtands contradiſtinguiſhed from *catharſis*, or evacuation downward.

In this ſenſe is the word uſed by Hippocrates and Galen; agreeably alſo to this Blaſius reſtrains *anacatharſis* to expectoration. Only Blancard, on what authority does not appear, extends *anacathartic* medicines to all thoſe which work upwards, by the glands of the head, whether vomitories, ſternutatories, or maſticatories.

ANACATHARSIS is alſo a name given by civil lawyers to the *Baſilicon repetitæ prælectionis* made by order of the emperor Conſtantine Porphyrogenitus.

It was thus called as being a review or correction of the Baſilicon.

ANACATHARSIS, among *Divines*, denotes the clearing up ſome obſcure paſſage, by a ſpiritual, or anagogical interpretation.

ANACATHARTIC, is uſually underſtood of a vomit, or a purging medicine that works upwards.

The word comes from ανα, *upwards*, and καθαιρω, *I purge*.

ANACEIA, an Athenian feſtival in honour of the Dioſcuri.

It took its name from thoſe deities, who were alſo called Ανακες, and honoured with a temple called Ανακειον, *Anacæum*.

The ſacrifices offered at that time were named Ξενισμοι, becauſe thoſe deities were ξενοι, or *ſtrangers*; and conſiſted of three offerings, which were called Τριτιαι. Athenæus mentions plays acted in honour of theſe deities.

ANACEPHALÆOSIS, in *Rhetoric*, a recapitulation, or a ſhort and ſummary repetition of the heads of a diſcourſe.

The word comes from ανα, which in compoſition ſignifies *again*; and κεφαλη, *head*.

ANACHORESIS, denotes a withdrawing from ſociety, or retiring into ſolitude.

The *anachoreſis* was not allowed to perſons, before they had ſpent thirty years in the community.

ANACHORET, a hermit or devout perſon, living alone in ſome deſart, to be farther out of the reach of the temptations of the world, and more at leiſure for meditation.

The word comes from αναχωρεω, *I retire into a ſolitary place*.

Such were St. Anthony, St. Hilarion, &c. Paul the Hermit was the firſt of the tribe of *anachorets*.

When many of the habitations of *anachorets* were placed together in the ſame wilderneſs, at ſome diſtance from one another, they were all called by one common name, *laura*, which, as Evagrius informs us, differed from a *cænobium*, or *convent*, in that a *laura* conſiſted of many cells divided from each other, where every monk provided for himſelf; but a *cænobium* was one habitation, where the monks lived in ſociety, and had all things in common.

Anachorets, popularly *anchorets*, were very numerous among the Greeks, conſiſting principally of monks; who not caring for the fatigues and offices of the monaſtery, purchaſe a little ſpot of ground, with a cell, whither they retreat, and never appear in the monaſtery again, excepting on ſolemn days. Theſe are ſometimes alſo called *aſcetæ* and *ſolitaries*.

They have their chapel, and after prayers apply themſelves to the culture of their vineyards, olives, fig-trees, and the like, which afford them proviſion for the year.

Theſe *anachorets* only differ from the conventual monks, in that they have leſs intercourſe with the world, and live but in ſmall bodies.

The *anachorets* of Syria and Paleſtine retire into the moſt obſcure and unfrequented places; hiding themſelves under rocks and mountains, and living on the ſpontaneous productions of the earth.

There have alſo been *anachorets* in the weſt. Peter Damian, who was of the order of hermits, frequently ſpeaks of them with great praiſe. He repreſents them as by far the moſt perfect ſort of monks; holding them in much higher opinion and veneration than the *cænobites*, or monks reſiding in monaſteries.

Many of theſe retire, with the leave of their abbots, and have an allowance from the monaſtery.—The people, on account of their piety, preſent them with good ſums of money, which they carefully hoard up, and at their death bequeath to the monaſtery they had belonged to.

ANACHORITA, in *Eccleſiaſtical Writers*, a name ſometimes given to the cells of recluſes.

By the ancient canons, no *anachorita* could be erected without conſent of the biſhop.

ANACHRONISM, in *Chronology*, an error in computation of time; whereby an event is placed earlier than it really happened.

The word is compounded of ανα, *higher*, and χρονος, *time*.

Such is that of Virgil, who placed Dido in Africa at the time of Æneas; though, in reality, ſhe did not come there till 300 years after the taking of Troy.—An error on the other ſide, whereby a fact is placed later and lower than it ſhould be, is called a *parachroniſm.*

ANACLASTIC *glaſſes, vitra anaclaſtica,* a kind of ſonorous phials, or glaſſes, chiefly made in Germany, which have the property of being flexible, and emitting a vehement noiſe by the human breath.—They are alſo called vexing glaſſes, by the Germans, *vexier glaſer,* on account of the fright and diſturbance they occaſion by their reſilition.

The *anaclaſtic* glaſſes are a low kind of phials with flat bellies, reſembling inverted funnels, whoſe bottoms are very thin, ſcarce ſurpaſſing the thickneſs of an onion peel: this bottom is not quite flat, but a little convex. But upon applying the mouth to the orifice, and gently inſpiring, or as it were ſucking out the air, the bottom gives way with a horrible crack, and from being convex, becomes concave. On the contrary, upon expiring or breathing gently into the orifice of the ſame glaſs, the bottom with no leſs noiſe bounds back to its former place, and becomes gibbous as before.

The *anaclaſtic* glaſſes firſt taken notice of were in the caſtle of Goldbach; where one of the academiſts *Naturæ Curioſorum,* having ſeen and made experiments on them, publiſhed a piece expreſly on their hiſtory and *phænomena.* Roſini Lentilii Oribaſii Sched. de Vitris Anaclaſticis. Vid. Ephem. Acad. N. C. Dec. 2. Ann. 3, p. 489, ſeq. Their figure may be ſeen in the book above cited.

They are all made of a fine white glaſs. It is to be obſerved in theſe, 1. That if the bottom be concave at the time of inſpiration, it will burſt, and the like will happen if it be convex at the time of expiration. 2. A ſtrong breath will have the ſame effect even under the contrary circumſtances.

ANACLATICS, that part of OPTICS which conſiders refracted light.

Anaclatics is the ſame with what we more uſually call *dioptrics.*

ANACLETERIA, in *Antiquity,* ſolemn feaſts celebrated in honour of kings and princes when they came of age, and took upon them the adminiſtration of the ſtate, and made a ſolemn declaration thereof to the people.

The word is formed of *ανα* and *καλεω, voco, I call.*

ANACLETICUM, in the *Ancient Art of War,* a particular blaſt of the trumpet, whereby the fearful, and flying ſoldiers were rallied, and recalled to the combat.

ANACLINOPALE, in *Antiquity,* a kind of wreſtling, wherein the champions threw themſelves voluntarily on the ground, and continued the combat by pinching, biting, ſcratching, and other methods of offence.

The *anaclinopale* ſtood contradiſtinguiſhed from the *orthopale,* wherein the champions were erect. In the *anaclinopale,* the weaker combatant ſometimes gained the victory.

ANACLINTERIA, in *Antiquity,* a kind of pillows on the dining-bed, whereon the gueſts uſed to lean.

The ancient tricliniary beds had four *ενηλατα,* one at the head, another at the feet, a third at the back, and a fourth at the breaſt. That on which the head lay, was properly called by the Greeks, *ανακλιντηριον,* or *ανακλιντρον*; by the Romans *fulcrum,* ſometimes *pluteus.*

According to other writers, *anaclinteria* is more properly underſtood of the backs of chairs whereon we lean.

ANACOINOSIS, *communicatio,* a figure in *Rhetoric,* when we conſult the adverſary, or appeal to the judges what ought, or could have been done on ſuch an occaſion.

Such is that of Cicero, *Quæro, ſi te hodie domum tuam redeuntem, coacti homines et armati, non modo limine tectoque ædium tuarum, ſed primo aditu veſtibuloque prohibuerint, quid acturus ſis?* Cicero pro Cecin.

ANACOLLEMA, in *Phyſic,* denotes a liniment or other medicine applied to the forehead, to ſtop or prevent defluxions of the eyes.

The word is formed of *ανακολλαω, conglutino.*

Anacollemata make a ſpecies of medicines called *frontalia.* The qualities required are, to be drying, cooling, thickening, aſtringent, conglutinant, &c.

To the claſs of *anacollemata* belong bran, manna, myrrh, *terra ſamia, acacia,* &c.

Jungken deſcribes an *anacollema frontale* for ſtopping hæmorrhages at the noſe.

ANACOLUTHON, among *Ancient Grammarians,* denotes an incoherence, or a conſtruction which does not hang together. This is uſually ſignified by the appellation of a figure, which ought rather to be denominated an inaccuracy.

ANACONDO, in *Zoology,* is a name given in the iſle of Ceylon, to a very large and terrible RATTLE-SNAKE, which often devours the unfortunate traveller alive, and is itſelf accounted excellent and delicious fare.

ANACREONTIC, in the Greek and Latin *Poetry,* ſomething invented by Anacreon; or in the manner and taſte of Anacreon, a poet of Teios, who lived upwards of 400 years before Chriſt, famous for the delicacy of his wit, and the exquiſite, yet eaſy and natural, turn of his poeſy. —We have ſeveral of his odes ſtill extant; and there are few of the modern poets who have not written *Anacreontics* in imitation of them. They are moſtly compoſed in verſes of ſeven ſyllables; or rather of three feet and a half; ſpondees and iambics, though ſometimes anapæſts. Hence, verſes in that meaſure are uſually called *Anacreontics,* or *Anacreontic verſes.*

ANACRISIS, among the *Ancient Greeks,* is uſed for a kind of trial, or examination, which the *archons,* or chief magiſtrates of Athens, were to undergo, before their admiſſion into that office.

The *anacriſis* ſtands diſtinguiſhed from the *docimaſia,* which was a ſecond examination, in the *forum.*

The *anacriſis* was performed in the ſenate houſe. The queſtions here propoſed to them were concerning their family, kindred, behaviour, eſtate, &c.

Some maintain that all magiſtrates underwent the *anacraſis.*

ANACRASIS, in the *Civil Law,* denotes a ſearch or inquiry into the truth by examination of witneſſes.

ANACROSIS, in *Antiquity,* denotes a part of the Pythian ſong, wherein the combat of Apollo and Python are deſcribed.

The *anacroſis* was the firſt part, and contained the preparation to the fight.

ANACTON *pædon,* in *Antiquity,* a feſtival held at Amphyſſa, the capital of Locris, in honour either of the Dioſcuri, or of the Curetes, or Cabiri, about which authors are not agreed.

ANACYCLUS, in *Botany,* a genus of plants of the *ſyngeneſia polygamia ſuperflua* of Linnæus, being the ſame with the *ſantolinoides* of other authors. It is a ſort of camomile, of little beauty, and of no known uſe.

ANADAVADÆA, in *Zoology,* the name of a ſmall bird of the Eaſt-Indies, which has the beak of the chaffinch, and the feet of the lark. It is ſometimes brought over to England alive in cages, and will live here very comfortably.

ANADEMA, among the *Ancients,* denotes an ornament of the head, wherewith victors at the ſacred games had their temples bound.

The word is formed of *αναδεσμαι, to be bound round.*

Some confound the *anadema* with the *diadema,* worn by the ancient Perſian kings.

Anademata are alſo mentioned by ancient writers among the ornaments of the heads of women.

According to ſome, *αναδεμα* anſwers to what the Latins call *redimiculum.*

ANADIPLOSIS, *αναδιπλωσις,* denotes a repetition of the laſt word of the former verſe or member in the beginning of the next; e. gr.

> *Addit ſe ſociam timidiſque ſupervenit Ægle,*
> *Ægle Naïadum pulcherrima*——
> ————*ſequitur pulcherrimus Aſtur,*
> *Aſtur equo fidens*————————

If children, then heirs, heirs of God, and joint heirs with Chriſt.

ANADIPLOSIS, in *Medicine,* denotes the redoubling or return of the paroxyſm of a fever, chiefly of a ſemitertian.

This is otherwiſe called *epanalepſis,* and *epanadiploſis.*

ANADOSIS, in the *Ancient Medicine,* denotes the diſtribution of the aliment, by the veſſels of the body.

In this ſenſe, *anadoſis* makes a part of nutrition or DIGESTION.

ANADROMOUS, in *Ichthyography,* a term of diſtinction among fiſhes, denoting ſuch as have their times of going from the freſh water to the ſalt, and afterwards returning back to the freſh water again.

The word is derived from *ανα, back again,* and *δρομος, a courſe.* The *truttaceous* fiſhes are many of them of this kind, and the method nature has appointed for their courſe of changes ſeems to be this; they are firſt produced from the ſpawn in freſh water rivers; they live there till they acquire ſome ſtrength and ſize, and then ſeek the ſalt water to feed more at large in, and grow to their full extent: at which period they return into the freſhes again to lay their ſpawn, that their young brood may have the ſame advantages which they had before, of being placed firſt in freſh water. Some uſe the word *catanadromi* in the ſame ſenſe.

ANADUOMENE *Venus,* in the Grecian *Mythology,* anſwered to the *Sea-Venus* in the Roman, and was the appellation given to one of the chief deities of the ſea. The moſt celebrated picture in all antiquity was that of this goddeſs by Apelles; and the famous Venus of Medici is a *Sea-Venus.*

ANADYSIS, among *Ancient Divines*, denotes the ceremony of the emerſion in BAPTISM.

In which ſenſe, αναδυσις ſtands contradiſtinguiſhed from καταδυσις, or *immerſion.*

ANÆDEIA, in *Antiquity*, a denomination given to a ſilver ſtool placed in the *aræopagus*, on which the defendant, or perſon accuſed, was ſeated for examination.

The word is αναιδεια, which imports *impudence*; but according to Junius's correction it ſhould rather be αναιτια, q. d. *innocence.*

The plaintiff, or accuſer, was placed on an oppoſite ſtool called *hybris*, or *injury*; here he propoſed three queſtions to the party accuſed; to which poſitive anſwers were to be given. The firſt, are you guilty of this fact? The ſecond, how did you commit the fact? The third, who were your accomplices?

ANAERETA, in *Aſtrology*, a place in the heavens, at which the *apheta* arriving, an infant born at that time, is pronounced by aſtrologers, in danger of death.

The word is Greek, and literally imports a *cutter off.* In this ſenſe, *anaereta* ſtands oppoſed to *apheta.*

Anaereta, among the Greek *Aſtrologers*, amounts to the ſame with what the Arabs call *ahazin.*

ANAESTHESIA, αναισθησια, in *Medicine*, a privation of ſenſe, or of the faculty of perceiving external objects. The ſpecies or degrees of this are, *ſtupor*, *hebetudo*, *depravatio*, &c.

ANAGALLIDASTRUM. See CENTUNCULUS.

ANAGALLIS, in *Botany.* See PIMPERNEL.

ANAGALLIS *Aquatica* is called by *Botaniſts*, *veronica aquatica*, or *becca bunga*; in Engliſh, BROOK-LIME.

ANAGLYPHA, in *Ancient Writers*, denote veſſels, or other things, adorned with ſculpture in *baſſo relievo*; and hence the *anaglyphic* art is the art of carving, chaſing, engraving, or imboſſing plate.

ANAGLYPHICE, or ANAGLYPTICE, denotes that ſpecies of ſculpture wherein the ſtrokes or figures are prominent, or imboſſed; and is contradiſtinguiſhed from *diaglyphice*, where the ſtrokes are indented.

The word comes from the Greek αναγλυφω, *exſculpo.*

ANAGNOSES, or ANAGNOSMATA, in the Greek *Church*, denotes an eccleſiaſtical book, containing the leſſons read at divine ſervice, in the ſeveral feaſts, &c. of the year.

ANAGNOSTA, or ANAGNOSTES, among the *Ancients*, denotes a kind of ſervant retained in the families of perſons of rank, to read to them at meals.

Theſe were called by the Greeks αναγνωϛαι, and by the Romans *lectores*; ſometimes alſo *a ſtudiis.*

Even private families, who lived any thing politely, were not without this kind of literary ſervants. Servius makes mention of a female *anagnoſta*, under the denomination of *lectrix.* Sometimes the maſter himſelf performed the office of reader. The emperor Severus read himſelf at table. Martial mentions one Ligurinus, who read his own poems at dinner, to the great diſguſt of the gueſts.

Among the Greeks there were alſo *anagnoſtæ* in their theatres for public reading of the poets.

Some ſpeak of the *anagnoſtæ*, as a ſpecies of *acroamata*, from which, however, in propriety, they differed.

Cornelius Nepos relates of Atticus, that no *acroama* was ever heard at his meals, but an *anagnoſtes.* He never ſupped without reading, ſo that the minds of his gueſts were no leſs agreeably entertained than their appetites. The ſame cuſtom Eginhard obſerves was kept up by Charlemain, who at table had the hiſtories and acts of ancient kings read to him. This cuſtom ſeems to have been a relique of that of the ancient Greeks, who had the praiſes of great men and heroes ſung to them, while at table.

The ancient monks and clergy kept up the like uſage, as we are informed by St. Auguſtin. Sidonius praiſes a man of quality in his time, who, in this reſpect, lived a clerical life, though he was no prieſt.

Bilbergius, and Th. Raynaud, have diſſertations expreſs on *anagnoſtæ.*

ANAGNOSTIC, in *Middle Age Writers*, is ſometimes uſed for an epiſtle, or other writing.

ANAGOGIA, in *Antiquity*, ſolemn ſacrifices to Venus at Eryx, in Sicily, where ſhe was honoured with a magnificent temple.

The name of this ſolemnity was derived, απο τȣ αναγεσθαι, i. e. *from returning*; becauſe the goddeſs was ſaid to leave Sicily, and return to Afric, at that time.

ANAGOGICAL, *tranſporting*, ſomething that raiſes the mind to things eternal and divine; the great objects of the next life.

The word is derived from αναγωγη, *carrying away*, which is formed of the prepoſition ανα, *upwards*; and αγωγη, *leading.*

The term is principally uſed in ſpeaking of the divers ſenſes of Scripture.—The *literal* ſenſe is the firſt, and natural ſenſe; the *myſtical* ſenſe is founded on the natural ſenſe, from whence it is taken by analogy or compariſon, by ſimilitude or reſemblance of one thing to another; and is divided into ſeveral kinds.

Where it regards the church, and matters of religion, it is called the *allegorical* ſenſe.

Where it regards our morals, it is called the *tropological* ſenſe.

And where it regards eternity, or the life to come, it is called the *anagogical* ſenſe.

ANAGOGY, ANAGOGE, a rapture or elevation of the ſoul, to things celeſtial and eternal.

Anagogy, in a more particular ſenſe, denotes the application of the types and allegories of the Old Teſtament to ſubjects of the New; thus called, becauſe the veil being here drawn, what before was hidden is expoſed to open ſight.

Some of the fathers place αναγωγη, in oppoſition to ιϛορια, *hiſtory.*

ANAGOGY, in *Medicine*, denotes the return of humours, or the rejection of a matter upwards, or by the mouth.

Anagogy amounts to the ſame with what is otherwiſe called *anabole.*

ANAGOGY, αναγωγια, in *Ancient Hiſtory*, denotes a looſe education or diſcipline.

ANAGRAM, ANAGRAMMA, a tranſpoſal of the letters of a name; with a combination thereof in ſome new manner, ſo as to exhibit one or more words, either to the advantage or diſadvantage of the perſon to whom it belongs.

The word is formed from ανα, *backwards*, and γραμμα, *letter.*

Thus, the *anagram* of Galenus is *angelus*; that of Logica, *caligo*; that of Alſtedius, *ſedulitas*; that of Sir Edmundbury Godfrey, *I find murdered by rogues*; or, *by Rome's rude finger die*; that of Loraine, is *alerion*; on which account it was, that the family of Loraine took *alerions* for their armoury.—Calvin, in the title of his Inſtitutions, printed at Straſburg in 1539, calls himſelf *Alcuinus*, which is the *anagram* of Calvinus, and the name of an eminently learned perſon in the time of Charlemaign, who contributed greatly to the reſtoration of learning in that age. Barclay, in his Argenis, *anagrammatizes* Calvinus by a leſs creditable name, *Uſinulca*; and Rabelais, to be revenged of the ſame Calvin, who had made an *anagram* of his name, found in that of Calvin, *Jan. Cul.*

Such as keep cloſe to the definition of *anagram*, take the liberty to omit or retain the letter H, and that letter only; but ſuch as ſtand up for the poetical licence, make bold ſometimes to uſe E for Æ, V for W, S for Z, and C for K; and *vice verſa.*

This way of writing was ſcarce known among the ancients: Daurat, a French poet in the reign of Charles IX. is uſually ſaid to be the firſt that broached it; yet Lycophron, who wrote under Ptolemy Philadelphus, about 280 years before Chriſt, appears to have been no ſtranger to the art of making *anagrams.* Canterus, in his *Prolegomena* to Lycophron, gives us two of his pieces in this kind; the firſt on the name of king Ptolemy, Πτολεμαιος, in which he found απο μελιτος, *of honey*; to inſinuate the ſweetneſs and mildneſs of that prince; the ſecond was on queen Arſinoe, Αρσινοη, of whom he made Ιον Ἡρας, *Juno's violet.*

There are two ways of making *anagrams*: for, 1. Some only conſiſt in dividing a ſingle word into ſeveral: thus the ænigma of the god Terminus, mentioned by Aulus Gellius, lib. xii. cap. 6. is founded on the *anagram* TER MINUS; and thus *ſuſtineamus* yields *ſus tinea mus.* This kind alone ſeems to have been uſed among the Romans.

The ſecond is, where the order and ſituation of the letters is changed: ſuch are thoſe abovementioned; and alſo theſe, *Roma*, *Maro*, *Amor*; *Julius*, *Livius*; *Corpus*, *Porcus*, *Procus*, *Spurco.*

To find all the *anagrams* any name will admit of, *algebraically*, ſee COMBINATION.

The fineſt and happieſt of all the *anagrams* extant, is that on the queſtion put by Pilate to Jeſus Chriſt; *Quid eſt veritas?* which *anagrammatically* makes, *Eſt vir qui adeſt:* the *anagram*, here, is the beſt and juſteſt anſwer that could poſſibly be given.

Beſides the ancient kind of *anagram*, there have been new ones invented: as, the mathematical *anagram*, invented in 1680, by which the abbot Catelan found, that the letters of the name of Lewis XIV. made *vrai herôs*, i. e. *true hero.*

We are now likewiſe furniſhed with the numerical *anagram*, more properly called *chronogram*; where the numerical letters (i. e. ſuch as in the Roman cyphering ſtood for numbers) taken together, according to their numerical values, expreſs ſome epocha: of which kind is that diſtich of Godart on the birth of Lewis XIV. in the year 1638, on a day wherein there was a conjunction of the eagle with the lion's heart:

eXorIens DeLphIn aqVILæ CorDIſqVe LeonIs
CongreſſV gaLLos ſpe LætItIaqVe refeCIt.

ANAGRAMMATIST, a maker or compoſer of *anagrams*.

Thomas Billon, a Provençal, was a celebrated *anagrammatiſt*, and retained by Lewis XIII. with a penſion of 1200 livres, in quality of *anagrammatiſt* to the king.

Lipenius gives a long liſt of *anagrammatiſts*.

Thomas Billon has given a ſet of prophecies in *anagrams*; Gul. Blancus, the art of compoſing *anagrams*.

ANAGROS, a meaſure for corn, uſed in ſome cities in Spain, containing ſomewhat more than the Paris *mine*.

This is otherwiſe called *anegros*.

Four *anagros* make a *cahi*, four *cahis* a *tanega*.

ANAGYRIS, in *Botany*, ſtinking bean TREFOIL, a genus of the *decandria monogynia*. The characters are: the flower is of the butterfly kind, the ſtandard is heart-ſhaped, and much longer than the empalement; the wings are oblong, plain, and longer than the ſtandard, as is alſo the keel. The germen afterward becomes a large oblong pod, in which are lodged ſeveral kidney-ſhaped ſeeds. We have but one ſpecies in England, viz.

Anagyris foliis ovatis floribus lateralibus. Stinking bean *trefoil*, with oval leaves, and flowers proceeding from the wings of the ſtalks. This ſort grows wild in the ſouth of France, as alſo in Spain and Italy. It is a ſhrub which uſually riſes to the height of eight or ten feet, and produces its flowers in April and May, which are of a bright yellow colour growing in ſpikes, ſomewhat like thoſe of the LABURNUM.

Tournefort, however, enumerates two ſpecies. Tourn. Inſt. p. 647.

The leaves of the *anagyris* are reſolutive, and its ſeed emetic.

ANALECTA, the fragments, or offalls of meat, which dropped from the table on the ground.

Analecta was alſo uſed for a ſervant appointed to gather up the offalls of the tables.

In this ſenſe, the word is ſometimes alſo written *analectes*. Satellius Quadratus, in the way of deriſion, adviſed Calviſius Sabinus, a man of great wealth, and much affectation of learning, but with little memory, and leſs genius, to keep *analectæ, ut grammaticos haberet analectas*; a phraſe which has occaſioned much diſpute among critics and antiquaries.

ANALECTA, is likewiſe, in a literary ſenſe, uſed for a collection of ſmall pieces or compoſitions.

The word is formed of αναλεγω, *I gather*.

ANALEMMA, a planiſphere, or projection of the SPHERE, on the plane of the meridian, orthographically made, by ſtrait lines and ellipſes; the eye being ſuppoſed to be at an infinite diſtance, and in the eaſt or weſt points of the horizon.

The word is derived from αναλημμα, of αναλαμϐανω, *reſumo, I take backwards*.

The *analemma* was invented by John de Royas, a Spaniard. The advantages of this above the *aſtrolabes* of Ptolemy and Gemma Friſius, are, that all the lines proceeding from the eye are parallel to each other, and perpendicular to the plane of projection; conſequently not only the equator is a right line, as in the *aſtrolabe* of Gemma Friſius, but all the parallels to the equator are ſo too; ſince, in virtue of the infinite diſtance of the eye, they are all in the ſame caſe, as if their plane paſſed through the eye: for the like reaſon, the horizon, and its parallels, are alſo right lines. On the other hand, whereas in the two former *aſtrolabes* the degrees of circles converted into right lines become very ſmall towards the center, and large towards the circumference, they become here ſmall towards the circumference, and large towards the center: ſo that their figures will be no leſs altered in this than in the others. Add, that moſt of the circles here degenerate into ellipſes, which are often difficult to deſcribe.

ANALEMMA is alſo uſed for a *gnomon*, or *aſtrolabe*, conſiſting of the furniture of the ſame projection, drawn on a plate of braſs, or wood; with an horizon, or *curſor*, fitted to it.

Its uſe is for finding the time of the ſun's riſing and ſetting, the length of the longeſt day in any latitude, and the hour of the day.

The *analemma* is alſo of conſiderable uſe among *Dialliſts*, for laying down the ſigns of the zodiac, with the length of days, and other matters of furniture, upon dials.

ANALEPSIS, the reſtauration of a body waſted by diſeaſe, by the uſe of a nutritious diet.

ANALEPSIS is alſo uſed for the method of hanging a broken or diſlocated member, eſpecially the hand, in a ſling. This operation to the arm is called *analepſis*, to the foot *theſis*.

ANALEPTICS, in *Medicine*, reſtoratives; or remedies proper to reſtore the body, when waſted or emaciated, either by the continuance of a diſeaſe, or by the want of food.

The word is derived of αναλαμϐανω, *I re-eſtabliſh*.

ANALOGICAL *ſyllogiſm*. See SYLLOGISM.

ANALOGISM, in *Medicine*. See ANALOGY.

ANALOGISM, among *Logicians*, the arguing from the cauſe to the effect.

ANALOGISTA, among *Civil Law Writers*, a tutor who is not obliged to give an account of his conduct.

Perſons dying ſometimes appointed friends to be tutors to their children, with this clauſe, that they ſhould be *analogiſtæ*.

Some lawyers hold, that this did not exempt a tutor guilty of glaring miſmanagement, from being called to account, and puniſhed accordingly.

ANALOGIUM, in *Eccleſiaſtical Writers*, denotes an *ambo*, or reading-deſk.

ANALOGIUM is ſometimes alſo uſed for a *martyrology*, or *obituary* of a monaſtery.

ANALOGY, in *Philoſophy*, a term denoting a certain relation, proportion, or agreement, which ſeveral things bear to each other in ſome reſpects, though different in others.

The word is Greek, which the Latins uſually render by *comparatio*, and *proportionalitas*.

The ſchoolmen define *analogy* to be a reſemblance, joined with ſome diverſity: its foundation, according to them, is laid in the proportion of ſeveral things, conſidered as that proportion proceeds upon different conſiderations.

Thus, a ſound animal, a ſound food, and a ſound propoſition, agreeing in this, that they have a common denomination, but the reaſon or quality whereon the denomination is founded, different, are ſaid to have an *analogy*, or to be *analogous*. Accordingly, *analogous* things are defined to be ſuch as have a common name, but the thing immediately ſignified by that common name, different; yet with ſome correſpondence or relation diſcernible therein.

Philoſophers uſually diſtinguiſh three kinds of *analogy*, viz. of *inequality*, where the reaſon of the common denomination is the ſame in nature, but not in degree or order: in which ſenſe, animal is *analogous* to man and brute.—Of *attribution*; where, though the reaſon of the common name be the ſame, there is a difference in its habitude or reſpect thereto: in which ſenſe, healthy is *analogous* both to a man, and an exerciſe.—Of *proportionality*; where, though the reaſons of the common name do really differ, yet they bear ſome proportion to each other. In this ſenſe, the gills of fiſhes are ſaid to be *analogous* to the lungs in terreſtrial animals; and thus, the eye and the underſtanding are ſaid to bear an *analogy* to each other.

Reaſonings by *analogy* may ſerve to explain and illuſtrate, but not to prove any thing; yet is a great deal of our philoſophizing no better founded.

From a few *data*, a few points known and allowed, we reaſon by *analogy*, and deduce a number of others. It is thus that moſt branches of knowledge are extended to their preſent dimenſions. There are but few things actually obſerved, few experiments made; and all the obſervations and experiments we have are only ſingular. Such an effect was found from ſuch an individual body, under ſuch and ſuch circumſtances. We infer, that what has been obſerved of one body under ſuch circumſtances, will, from the *analogy* and uniformity in the works of the Creator, equally hold in all other bodies of the ſame ſpecies under the like circumſtances. Thus, without having recourſe to experiment, we never heſitate to conclude, that the fruit of trees of the ſame ſpecies will have the ſame taſte and properties. This has many times drawn us into great errors; it continues every day to lead us into new ones, and may be ſaid to be the ſource of moſt of the miſtakes committed in purſuit of ſcience. But nevertheleſs, while mankind extend their thoughts toward unknown and inacceſſible objects, they have no other guide to direct their reſearches but the ſuppoſed correſpondence between the objects they are acquainted with, and thoſe which are the ſubjects of their inveſtigation.

The *analogy* between the three kingdoms of plants, animals, and minerals, has been the ſource of a variety of diſcoveries, either real or imaginary: hence it is we have learnt, that ſtones vegetate; that plants breathe; that the ſap circulates in them; that generation is performed by eggs in the human kind; that the planets have their atmoſpheres, their inhabitants, their trees, their ſeas, &c. Indeed, if we will follow whither *analogy*, real or imaginary, will lead us, there is no end of ſcience.

As to divine and ſupernatural matters, it is aſſerted we know nothing of them, but by *analogy*; that is, by the mediation and ſubſtitution of thoſe ideas we have of ourſelves and other natural beings. Our ideas of God himſelf ariſe from this ſpring; we have no direct and immediate perception of him. The knowledge we have of the Supreme Being, is only an obſervation of his works, and a reflection of the mind, which ſhews what power, wiſdom, &c. appear neceſſary to enable him to produce them. Having no proper ideas of his perfections, we give them the names of thoſe faculties of men, which we judge neceſſary. See an excellent Treatiſe on the *Analogy* of Religion, natural and revealed, to the Conſtitution and Courſe of Nature, by biſhop Butler: in which, by evincing the *analogy* or likeneſs that ſubſiſts between the ſyſtem of things and diſpenſation of providence, with revelation informs us of, and that ſyſtem of things and diſpenſation of providence, which experience and reaſon informs us of, i. e. the known courſe of nature, he is led to aſcribe both to the ſame author and cauſe.

ANALOGY, in *Grammar*, denotes the ſuitableneſs, or agreeableneſs of a word or phraſe to the common rules, or forms of language.

In this ſenſe, *analogy* ſtands oppoſed to ANOMALY.

ANALOGY, in reſpect to language, denotes a conformity with other points already eſtabliſhed, ſerving as a rule, or model, for the making of new words and phraſes ſimilar to thoſe already in uſe.

Or, *analogy* may be conſidered as a general or eſtabliſhed uſage, applied in ſimilar caſes, to certain words, phraſes, or conſtructions, not yet eſtabliſhed. Or, *analogy* is only a particular uſage which, in certain caſes, is inferred from a general uſage already eſtabliſhed.

Grammarians are divided into two parties. Some, with Sanctius, contend, that the *analogy*, or reaſon, reigns through all the parts, all the phraſes and dictions of the Latin tongue. On the contrary, others, with Perizonius, aſſert, that there are many phraſes, contrary to *analogy* and reaſon, derived all originally from the populace. Such, e. gr. are, *Nemo homo*, *deorſum verſum*, &c.

Varro and Cæſar wrote expreſly on the *analogy* of Latin words, but their works are now loſt. Jac. Operarius has endeavoured to ſupply that loſs, by tracing the *analogy* of 20,000 Latin words. Fab. Bib. Lat. lib. i. cap. 10.

ANALOGY *of conjugation*, *analogia conjugationis*, is not only when a verb is conjugated like another, but agrees with it in the quantity of the ſyllables.

Thus *clamo* is conjugated like *amo*, and *clamabam* pronounced like *amabam*.

ANALOGY *of declenſion*, *analogia declinationis*, is not only when a noun, pronoun, or participle, is declined like another, but agrees with it in reſpect of the quantities of the ſyllables.

Thus, e. gr. *mater* is declined like *pater*, *ſaltans* as *amans*, *ſuus* as *tuus*. So *pennarum* is pronounced as *menſarum*, and *funeris* as *muneris*.

ANALOGY *of doctrine*, among *Critics*, is one of the great rules to which regard is to be had in the interpretation of authors.

We are firſt to learn from the author himſelf, the general ſyſtem which he follows; and as no writer is to be eaſily ſuppoſed to contradict himſelf, our interpretation is to be ſo conducted, as that nothing be admitted which is contrary to, or tends to overthrow this ſyſtem.

Thus, in interpreting an author who follows the Platonic ſcheme, we are to prefer a ſenſe which is conſiſtent with the Platonic doctrine, to another which is contrary to it, unleſs there be ſome evident proof, that the author contradicts himſelf, or aſſerts things which are inconſiſtent.

ANALOGY, in *Rhetoric*. See COMPARISON.

ANALOGY, in *Geometry*, denotes a ſimilitude of ratios, or proportions.

ANALOGY *of faith*, among *Divines*, denotes that relation which the ſeveral articles of faith bear to each other.

Analogy of faith ſtands oppoſed to tradition and authority, which is the great rule of interpretation among catholics. By this it is required, that whether we interpret Scripture, or explain the doctrines of Chriſtianity, all our poſitions and explanations be conſiſtent with the *analogy* of our faith, and thoſe evident propoſitions deduced from Scripture.

Tortſchius, Antonius, Franckius, &c. have written expreſly on the *analogy of faith*.

ANALOGY, in *Medicine*, is a certain relation or reſemblance between diſeaſes, in virtue whereof, we may reaſon and conclude from one to another, and treat them all much in the ſame manner; e. gr. a pleuriſy, being a ſpecies of inflammation, produced like inflammations of other parts, is to be treated like them, relaxing the ſolids, which are too much ſtretched, and giving free paſſage for the humours.

This method of deduction was called, by the ancients, *medicina rationalis*, or *dogmatica*, in oppoſition to the *empirica*, called alſo *epilogiſm*, which was conducted by appearances only, without theory.

ANALYSIS, in a general ſenſe, is the reſolution of ſomething compounded into its conſtituent parts.

ANALYSIS, in *Logic*, is a method of applying the rules of reaſoning, to reſolve a diſcourſe into its principles, in order to a diſcovery of its truth, or falſhood.—Or it is an examination of ſome diſcourſe, propoſition, or other matter, by ſearching into its principles, and ſeparating and opening its parts; in order to conſider them more diſtinctly, and arrive at a more preciſe knowledge of the whole.

The word is αναλυσις, which literally ſignifies *reſolution*; formed of ανα and λυω, *ſolvo*, *I ſolve*.

Analyſis makes one great branch or ſpecies of method; called alſo RESOLUTION.

It is particularly uſed for the reduction of an imperfect ſyllogiſm to a perfect one. This is otherwiſe called REDUCTION.

The order of the *ſyntheſis* is contrary to that of the *analyſis*, one beginning where the other ends. The two methods cannot always be uſed indifferently; the *analyſis* is moſt proper for the diſcovery of truth, and SYNTHESIS for teaching and explaining it in a ſyſtematical way. Hence ſome call *analyſis* the method of invention.

ANALYSIS, in *Mathematics*, may be divided into *ancient* and *modern*.

The modern *analyſis* is what is often called *algebra*; but they ought to be diſtinguiſhed, algebra being only a part of the *analytic* art.

The moderns are at ſome loſs concerning the *ancient analyſis*, i. e. concerning the art or method whereby the ancients reſolved problems, and invented theorems. Some traces of their method are extant in Pappus, Apollonius, and Euclid; and Dr. Hook ſuſpects, that their *analyſis* went backwards through almoſt all the ſame ſteps, by which their demonſtrations went forwards.

That this might often be the caſe, ſeems evident to any one who has ſtudied Euclid with care. They have indeed left us no precepts of their art. This, like almoſt all others, muſt be acquired by imitation of the excellent examples left us by the Greeks. Men of genius among the moderns, who had ſtudied the works of the ancient geometers, have been thereby enabled to imitate them, and penetrate into their methods: the works of Huygens and Newton, and of late, the treatiſe of Conic Sections by Mr. Simpſon, profeſſor of Mathematics in the univerſity of Glaſgow; as alſo ſeveral parts of Mr. Maclaurin's Treatiſe on Fluxions, are evident proofs of this.

Weigelius has endeavoured to retrieve the ancient *analyſis* of Ariſtotle, from Euclid, and other ancient geometricians.

ANALYSIS is divided by ſome authors into *ſimple* and *compound*.

ANALYSIS, *ſimple*, is that employed in ſolving problems reducible to ſimple EQUATIONS.

ANALYSIS, *compound*, or *complex*, that which gives the expreſſions or ſolutions of problems in compounded EQUATIONS.

ANALYSIS is farther divided, with regard to its object, into that of *finites*, and that of *infinites*.

ANALYSIS *of finite quantities*, is what we otherwiſe call *ſpecious arithmetic*, or ALGEBRA.

ANALYSIS *of infinites*, called alſo the new ANALYSIS, is particularly uſed for the *method of* FLUXIONS, or the *differential calculus*.

ANALYSIS *of powers*, denotes the reſolving them into their ROOTS.

In this ſenſe *analyſis* amounts to the ſame with what we otherwiſe call EVOLUTION.

We find divers other kinds of *analyſis* treated of by mathematical writers, as the *analyſis* of *indiviſibles*, &c. M. Leibnitz ſpoke of an *analyſis ſitus*, different from the *analyſis* of magnitudes.

The *analyſis* of geometrical curves ſhews their properties and internal conſtitution, their curvature, points of inflexion, ſtation, retrogradation, variation, &c.—In this *analyſis*, curves are uſually conſidered as polygons compoſed of an infinite number of infinitely little ſides; but this ſuppoſition is neither accurate nor neceſſary, though it ſometimes affords convenient hints for invention.

F. Reynau of the *Oratory* has given a large ſyſtem of algebra under the title of *analyſis*. F. Caſtel cenſures it as not ſufficiently methodical or ſyſtematical. The great diviſions and members are loſt in the multitude of particular rules and methods.

ANALYSIS *of ideas*, that whereby an idea is reſolved into the ideas of its ingredients, and the ideas of theſe again into ſimple ones, till at length we arrive at the moſt ſimple.

ANALYSIS, *grammatical*, is that employed about words, their etymons, homonymas, or various acceptations, ſynonymas, conſtructions, uſes, and the like.

Paſor has given a grammatical *analyſis* of the difficult words in Heſiod, &c. Sturmius has publiſhed a method of making the *analyſis* of Latin words.

ANALYSIS, *rhetorical*, is that which examines the connections, tropes, figures, and the like, inquiring into the propoſition, diviſion, paſſions, arguments, and other apparatus of rhetoric.

Several authors, as Freigius and others, have given *analyſes* of Cicero's orations, wherein they reduce them to their grammatical and logical principles; ſtrip them of all the ornaments, and additions of rhetoric, which otherwiſe diſguiſe their true form, and conceal the connection between one part and another. The deſign of theſe authors is to have thoſe admired harangues, juſt ſuch as the judgment diſpoſed them, without the help of imagination; ſo that here we may coolly view the force of each proof; and admire the uſe Cicero made of rhetorical figures, to conceal the weak part of a cauſe.

A collection has been made of the *analyſes* formed by the moſt celebrated authors of the ſixteenth century, in three volumes folio.

Analysis is alſo uſed, in *Chemiſtry*, for the decompounding of a mixed body; or the ſeparation of the principles and conſtituent parts of the compounded ſubſtance.

To *analyſe* bodies, or reſolve them into their component parts, is indeed the chief object of the art of chemiſtry. Chemiſtry furniſhes ſeveral means for the decompoſition of bodies, which are all founded on the differences of the properties belonging to the different principles of which the body to be analyſed is compoſed. If, for example, a body be compoſed of ſeveral principles, ſome of which have a great, and others a moderate degree of volatility, and, laſtly, others are fixed, its moſt volatile parts may be firſt ſeparated by a gradual heat, in diſtilling veſſels, and then the parts, which are next in volatility, will paſs over in diſtillation, and laſtly, thoſe parts which are fixed, and capable of reſiſting the action of fire, will remain at the bottom of the veſſel.

There are two methods of *analyſis* which chemiſts make uſe of; *analyſis* by *fire*, and *analyſis* by *menſtrua*. The laſt is at leaſt of as extenſive utility as the firſt, ſince it takes place in almoſt all the operations of chemiſtry. The operation called by chemiſts PARTING, ought to be conſidered as the true *analyſis* by *menſtrua*. It is true, that in many caſes, the *analyſis* by *menſtrua*, as well as the *analyſis* by *fire*, is incomplete. Frequently it is neceſſary, in order to make a perfect *analyſis* of bodies, to unite theſe two methods, by *fire* and by *menſtrua*, ſo that the one may be made to aſſiſt the other; and from theſe combined means a decompoſition reſults much more perfect and more accurate, than could have been obtained by either of them ſeparately. Nothing more need be ſaid here on *analyſis* in general; the ſubject is ſo extenſive, that to make particular applications of it, we ſhould be obliged to conſider all the objects in chemiſtry. Thoſe who know the uſe of general principles, will apply theſe to particular operations, and longer details would be ſatiguing and uſeleſs to others. It is, nevertheleſs, proper to mention the general articles which relate to this. See therefore EXTRACTION, DECOMPOSITION, DISTILLATION, SUBLIMATION, PRECIPITATION, and SOLUTION.

All bodies by a chemical *analyſis* reſolve into water, earth, ſalt, ſulphur, and mercury, though every body does not afford all theſe parts; but ſome more, ſome fewer, of them, according to the kingdom they belong to. The *analyſis* of vegetables is eaſy; that of foſſils, particularly of metals, and ſemi-metals, difficult.

The many *analyſes* that have been made of plants by Bourdelin, and others, have generally proved uſeleſs with regard to any diſcoveries of the properties and virtues of the plants analyſed. The moſt ſalutary plants, in this way of treatment, yield much the ſame principles as the moſt poiſonous. The reaſon apparently is, that the too great action of the fire, in diſtillation, changes the plants, and their principles: on this account, inſtead of diſtillation, M. Boulduc has made his *analyſes* by decoction only. Vid. Mem. Acad. R. Scienc. an. 1734. p. 139. Hiſt. 63.

Some bodies of the foſſil tribe conſiſt of particles ſo very minute, and ſo firmly united, that the corpuſcles thereof need leſs heat to carry them off, than to ſeparate them into their principles: ſo that the *analyſis* is impracticable in ſuch bodies.--Hence ariſes the difficulty of *analyſing* ſulphur.

Analyſis of metals, and metallic minerals, conſiſts in what they call the MERCURIFICATION of them: the *analyſis* of other bodies is performed by *diſtillation*, *lixiviation*, &c.

The order of matters which ariſe in analyſing vegetable and animal bodies is different, according as thoſe bodies have been fermented or not; if they have, the ſpirits and volatile ſalts ariſe firſt, then aqueous liquors, then fœtid oil, after which a *caput mortuum*, which by *calcination* and *lixiviation*, is reduced to a fixed ſalt, and inſipid earth. In bodies unfermented, the aqueous parts riſe firſt, afterwards the reſt ſucceed in the ſame order as above.

The anatomical diſſection of an animal, is alſo a kind of *analyſis*.

Analysis is alſo uſed for a kind of ſyllabus, or table of the principal heads or articles of a continued diſcourſe; diſpoſed in their natural order and dependency.

Analyſes are more ſcientifical than alphabetical indexes; but they are leſs uſed, as being more intricate.

Analyſis is likewiſe uſed for a brief, but methodical illuſtration of the principles of a *ſcience*; in which ſenſe it is nearly ſynonymous with what we otherwiſe call a *ſynopſis*.

ANALYST, a perſon who analyſes a thing, or makes uſe of the *analytical* method.

Some reſtrain the word more peculiarly to denote a mathematician, who makes a great uſe of the algebraic method or *calculus* in geometry, in excluſion of the *ſynthetic*, or ſtrict geometrical method.

In which ſenſe *analyſt* amounts to much the ſame with *computiſt* or *calculator*.

In a ſenſe not unlike this, Dr. Berkeley, an ingenious writer, gives the title *analyſt* to a book againſt the modern *geometry*, or doctrine of FLUXIONS.

ANALYTIC, **Analytical**, ſomething that belongs to, or partakes of, the nature of analyſis.

Thus we ſay, an *analytical* demonſtration; *analytical* inquiry; *analytical* table, or ſcheme; *analytical* method, &c. The *analytic* method ſtands oppoſite to the *ſynthetic*.

ANALYTICS, **Analytica**, the ſcience, or doctrine, and uſe of *analyſis*.

The great advantage of the modern mathematicians above the ancient, is in point of *analytics*.

The authors on the ancient *analytics* are enumerated by Pappus, in the preface to his ſeventh book of mathematical collections; being, Euclid, in his *Data*, and *Poriſmata*; Apollonius, *De Sectione Rationis*; Apollonius, in his *Conics*, *Inclinations*, and *Tactions*; Ariſtæus, *De Locis Solidis*; and Eratoſthenes, *De Mediis Proportionalibus*. But the ancient *analytics* were very different from the modern.

To the modern *analytics* principally belongs *algebra*; the hiſtory of which, with the ſeveral authors thereof, ſee under ALGEBRA.

The chief writers upon the analyſis of infinites are, its inventor, Sir Iſaac Newton, in his *Analyſis per Quantitatem Series, Fluxiones, & Differentias, cum Enumeratione Linearum tertii ordinis*; and *De Quadrata Curvarum*; and M. Leibnitz, in *Act. Eruditor.* an. 1684. The Marquis De l'Hôpital, in his *Analyſe des Infiniment petites*, 1696. Carre, in his *Methode pour la Meſure des Surfaces, la Dimenſion des Solides, &c. par l' Application du calcul integral*, 1700. G. Manfredi, in a poſthumous piece, *De Conſtructione Æquatiorum differentialum primi gradus*, 1707. Nic. Mercator, in *Logarithmotechnica*, 1668. Cheyne, in *Methodus Fluxionum inverſa*, 1703. Craig, in *Methodus figurarum lineis rectis & curvis comprehenſarum Quadraturas determinandi*, 1685; and *De Quadraturis figurarum curvilinearium & locis*, &c. 1693. Dav. Gregory, in *Exercitatio Geometrica de Dimenſione figurarum*, 1684; and Nieuwentiit, in *Conſiderationes circa Analyſeos ad Quantitates infinitè parvas applicatæ principia*, 1695.—The ſum of what is found in l'Hôpital, Carre, Cheyne, Gregory, and Craig, is collected into one volume, and very well explained, by C. Hayes, under the title of a Treatiſe of Fluxions, &c. 1704. And the ſubſtance of moſt of the reſt in Pere Reyneau's *Analyſe demontrée*, 2 vols. 4to. 1728. De Moivre alſo, Maclaurin, and Mr. T. Simpſon, may be added to the number.

Analytics, in *Literary Hiſtory*, is particularly uſed to denote certain writing of Ariſtotle under this title.

Ariſtotle's *Analytics* conſiſt of four books, two under the denomination of *former*, Αναλυτικων προτερων, and as many under that of *latter*, υϛερων.—They belong to the claſs of his *acroamatic* works Fabr. Bibl. Græc. lib. iii. cap. 6.

Analytics is alſo uſed by ſome for a part of LOGIC, which teaches to decline and conſtrue reaſon, as grammar does words.

ANAMNESEIS, from ανα and μναομαι, *I remember*, in *Ancient writers*, denote encomiums of perſons who had behaved well in war, or on other occaſions, rehearſed before the emperors of Conſtantinople, to put them in mind of beſtowing ſuitable rewards.

ANAMNESTICS, in *Medicine*, are uſed by ſome writers, to denote thoſe ſigns which help to diſcover the paſt ſtate of a patient's body: in which ſenſe it ſtands oppoſed to PROGNOSTICS.

Theſe are otherwiſe called *rememoratives*.

Anamnestic is alſo applied by Blancard to remedies proper for reſtoring or ſtrengthening the memory.

Such according to this author are all ſpirituous things.

ANAMORPHOSIS, in *Perſpective* and *Painting*, a monſtrous projection; or a repreſentation of ſome image, either on a plane or curve ſurface, deformed and diſtorted; which at a certain diſtance ſhall appear regular, and in proportion.

The word is compounded of ανα and μορφη, *form*.

To make an *anamorphoſis*, or monſtrous projection on a plane.—Draw the ſquare ABCD (*Tab. Perſpective, fig.* 19. N° 1.) of a bigneſs at pleaſure, and ſubdivide it into a number of areolas, or leſſer ſquares.—In this ſquare, or reticle, called the *craticular prototype*, let the image to be diſtorted be drawn. Then draw the line *a b* (*fig.* 19. Nº 2.) equal to AB; and divide it into the ſame number of equal parts, as the ſide of the prototype AB; and in E, the middle thereof, erect the perpendicular EV, ſo much the longer; draw VS perpendicular to EV, ſo much the ſhorter, as the image is deſired to be more diſtorted. From each point of diviſion draw right lines to V, and join the points *a* and S, by the right line *a* S. Through the points *d e f g* draw lines parallel to *a b*; then will *a b c d* be the ſpace which the monſtrous projection is to be delineated in; called the *craticular ectype*.

Laſtly, in every *areola*, or ſmall *trapezium* of the ſpace *a b c d*, draw what appears delineated in the correſpondent *areola* of the ſquare ABCD: by this means you will obtain a deformed image, which yet will appear in juſt proportion to an eye diſtant from it the length EV, and raiſed above the height VS.

It will be diverting to manage it ſo, that the deformed image may not repreſent a mere chaos, but ſome other image: thus, we have ſeen a river with ſoldiers, waggons, &c. marching along the ſide of it, ſo drawn, that when viewed by an eye in the point S, it appears to be the ſatirical face of a man.

An image alſo may be diſtorted mechanically, by perforating it here and there with a needle, and placing it againſt a candle or lamp; and obſerving where the rays, which paſs through theſe little holes, fall on a plane, or curve ſuperficies; for they will give the correſpondent points of the image deformed; by means whereof, the deformation may be completed.

ANAMORPHOSIS, *to draw the, or deformation of an image, upon the convex ſurface of a cone.*—It is manifeſt from the former caſe, that all here required is, to make a *craticular ectype* on the ſuperficies of the cone, which ſhall appear to an eye duly placed over its vertex, equal to the craticular prototype.

Let the baſe, or periphery, ABCD, therefore, of the cone (*fig.* 20.) be divided by diameters into any number of equal parts; and let ſome one radious be likewiſe divided into equal parts; and through each point of diviſion draw concentric circles: thus will the craticular prototype be made.—With double the diameter AB, as a radius, deſcribed the quadrant EFG (*fig.* 21.) ſo as the arch EG be equal to the whole periphery: then this quadrant, folded duly up, will form the ſuperficies of a cone, whoſe baſe is the circle ABCD.—Divide the arch EG into the ſame number of equal parts as the craticular prototype is divided into; and draw radii from each of the points of diviſion. Produce GF to I, ſo that FI = FG; and from the centre I, with the radius IF, draw the quadrant FKH; and from I to E draw the right line IE. Divide the arch KF into the ſame number of equal parts as the radius of the craticular prototype is divided into; and draw radii through each of the points of diviſion, from the centre I, meeting EF, in 1, 2, 3, &c. Laſtly, from the centre F, with the radii, F 1, F 2, F 3, &c. deſcribe the concentric arches.—Thus will the craticular ectype be formed, the *areolæ* whereof will appear equal to each other.

Hence what is delineated in every *areola* of the craticular prototype, being transferred into the *areolæ* of the craticular ectype, the images will be diſtorted or deformed; yet an eye being duly raiſed over the vertex of the cone, will perceive it in juſt proportion.

If the chords of the quadrants be drawn in the craticular prototype, and chords of the fourth part in the craticular ectype, all things elſe remaining the ſame, you will have the craticular ectype in a quadrangular pyramid.

And hence it will be eaſy to deform any image, in any other pyramid, whoſe baſe is any regular polygon.

Becauſe the eye will be more deceived, if from contiguous objects it cannot judge of the diſtance of the parts of the deformed image; therefore, theſe kinds of deformed images are to be viewed through a ſmall hole; and when they are made to appear like the objects which they are intended to repreſent, by means of a mirrour of any particular conſtruction, theſe *anamorphoſes* are ſaid to be *reformed*. See MIRROUR.

ANANAS, in *Natural Hiſtory*, by ſome called *nanas*, by others *jayama*, and by us popularly the *pine-apple*, on account of the reſemblance it bears to the cones of pines and firs, is a fine Indian fruit, which grows on an herbaceous plant, with leaves likes thoſe of the aloe. See PINE-APPLE.

ANAPÆST, ANAPÆSTUS, a FOOT in the Greek and Latin poetry, conſiſting of two ſhort, and one long ſyllable, being the reverſe of the dactyl.

The word is derived from αναπαιω, *contra ferio*, becauſe, in dancing this meaſure, the ground was ſtruck in a contrary order from what it was in the dactyl. Whence the Greeks called it αντιδακτυλος. Diom. iii. p. 474.

Such are the words *lĕgĕrēnt*, *ſăpĭēns*, κῠρῐȣ̄ς.

ANAPÆSTIC, or ANAPÆST, is ſometimes uſed in a ſubſtantive ſenſe.

Such is the *anapæſtus Ariſtophanæus*, in Cicero, which is a verſe conſiſting of eight feet, as

Axena ponti per freta colchos denique delatus adhæſi.

Vid. Cic. in Orat. cap. 56. Fabr. Theſ. in voc. *Anapæſtus*.

This is otherwiſe called *anapæſtus octonarius*.

ANAPÆSTIC, in an adjective ſenſe, ſomething relating to, or compoſed of *anapæſts*.

ANAPÆSTIC *kind, genus anapæſticum*, is a ſort of verſe compoſed of pure Ariſtophanic or Parthenaic *anapæſts*.

Anapæſtic verſes are either Ariſtophanic or Pindaric. *Anapæſticus Ariſtophanæus*, called alſo *Parthenaicus*, conſiſts of three *anapæſts*, and one long ſyllable, but ſo as that inſtead of the firſt two *anapæſts* as many ſpondees may be uſed.

Its type ſtands thus:

⏑⏑–	⏑⏑–	⏑⏑–	⏑
––	––		–

Venient cito ſæcula quum jam
Socius calor oſſa reviſet
Animataque ſanguine vivo
Habitacula priſtina geſtet
Lacrymas ſuſpendite cuncti
Mors hæc reparatio vitæ eſt. Bona.

Pindaric anapæſt admits, in the firſt place, either of an *anapæſt* or a ſpondee; in the ſecond, only of an *anapæſt*; in the third, of an *anapæſt* or a ſpondee; in the fourth, either of a ſpondee or a trochee.

As in the following type:

⏑⏑–	⏑⏑–	⏑⏑–	––
––		––	–⏑

In ſumma pericula venturi
Multos timor ipſe mali mittit.

ANAPHORA, in *Rhetoric*, a figure whereby one or more words are repeated in the beginning of ſeveral ſentences or verſes.

The word is αναφορα, ſignifying *repetition*.

Such, e. gr. is this of the Pſalmiſt: *The voice of the Lord is powerful: the voice of the Lord is full of majeſty: the voice of the Lord ſhaketh the wilderneſs.*

ANAPHORA is uſed, in the *Ancient Medicine*, for the rejection of matter by the mouth.

Hence alſo we meet with the term *anaphorici*, αναφορικοι, uſed for thoſe labouring under an *hæmoptoe*, who bring up blood from the lower part by the mouth.

ANAPHORA, among *Eccleſiaſtical Writers*, denotes the hoſt or ſpecies offered in the *euchariſt*.

ANAPHORA is alſo uſed to denote the rehearſing a perſon's name from the DIPTYCHS in the liturgy.

ANAPHORA is alſo a title given to thoſe little Syriac liturgies, wherein are contained the prayers after the *oſculum pacis*. Ignatius, patriarch of the Marionites, enumerates forty of theſe *anaphoræ*.

ANAPHORA, in *Aſtrology*, denotes the ſecond houſe, or that part of heaven which is thirty degrees diſtant from the HOROSCOPE.

The term *anaphora* is alſo ſometimes promiſcuouſly applied to ſome of the ſucceeding houſes; as the ſecond, fifth, eighth, and eleventh. In this ſenſe *anaphora* amounts to the ſame with *epanaphora*, and ſtands oppoſed to CATAPHORA.

ANAPHORA is alſo applied by ſome to the oblique aſcenſions of the ſtars.

ANAPHRODISIA, from ανα and Αφροδιτη, *Venus*, denotes impotency in reſpect of venery. Some alſo uſe it for a want of deſire or inclination to the ſex.

In this ſenſe, the academiſts *Naturæ Curioſæ* give an extraordinary inſtance of this kind, in a perſon otherwiſe healthy and robuſt. Eph. Acad. N. C. Dec. 1. ann. 8. Obſ. 94.

ANAPHYSEMATA, from ανα and φυω, *I ſend forth*, in ſome *Ancient Writers*, denotes winds iſſuing from under ground, at the clefts or apertures thereof.

Theſe are ſometimes called by latter writers *apogæi*.

ANAPLASIS, from ανα and πλασσω, *I form*, in *Medicine*, the complete reſtitution of a broken bone, ſo as the two ends meet and cloſe exactly together. This is the ſame with what is otherwiſe called *diaplaſis*.

ANALAPSIS alſo ſignifies a renutrition of the extenuated fleſh.

ANAPLEROSIS, in the general ſenſe, denotes REPLETION.

Anaplerosis is more particularly uſed to denote that part of ſurgery, whereby things wanting are ſupplied.

In which ſenſe, *anaplerosis* amounts to the ſame with what we otherwiſe call appoſition, or PROSTHESIS.

ANAPLEROSIS, in the *Civil Law*, is a name which ſome give to the four laſt books of Juſtinian's code.

ANAPLEROTICS, in *Medicine*, ſuch remedies as incarnate, and fill up ulcers and wounds with new fleſh.

The word comes from αναπληροω, *I fill up*.

Anaplerotics are the ſame with what we otherwiſe call INCARNATIVES.

ANAPODOPHYLLON, in *Botany*. See DUCK's-*foot*.

ANARCHI, in *Antiquity*, a name given by the Athenians to four ſupernumerary days in their year, during which they had no magiſtrates.

The Attic year was divided into ten parts, according to the number of tribes, to whom the precedency in the ſenate fell by turns.

Each diviſion conſiſted of thirty-five days; what remained after the expiration of theſe, to make the lunar year complete, which, according to their computation, conſiſted of three hundred and fifty-four days, were employed in the creation of magiſtrates, and called αναρχοι ἡμεραι, and αρχαιρεσιοι.

ANARCHY, the want of government in a nation, where no ſupreme authority is lodged, either in the prince, or other rulers; but the people live at large, and all things are in confuſion.

The word is derived from the Greek privative α, and αρχη, *principality*.

All kinds of ſtates are ſubject to *anarchies*. We read of civil *anarchies*, eccleſiaſtical or ſpiritual *anarchies*, and even *anarchies* in the republic of letters.

Anarchy is ſuppoſed to have reigned after the deluge, before the foundation of monarchies. We ſtill find it obtain in divers parts, eſpecially of Africa and America; e. gr. among the Itinois, who are obſerved by travellers to live in a perfect independency of any ſuperior; among the Californians, where every family makes its own laws, as well as religion; in Chili, where every maſter of a family is a king; in the Marian iſlands, where neither prince nor law is known, but every perſon governs himſelf according to his own will; and to mention no more, among the Hottentots, where the only reſemblance of government is, that in each neighbourhood, the eldeſt is the firſt in honour, and his advice chiefly followed, not from any civil authority he is veſted with, but on account of his ſuperior experience.

Some extend the idea of *anarchy* farther, ſo as to make it comprehend all the more popular governments.

In this ſenſe, *anarchy* amounts to much the ſame with DEMOCRACY.

Hobbs, in this ſenſe, calls the Roman commonwealth an *anarchy*.

It has been ſometimes controverted which of the two is beſt, a ſtate of *anarchy*, or of tyranny and arbitrary power. This controverſy, however, does not appear to be of any great uſe; it is of little purpoſe to determine which is beſt, ſince a ſtate of *anarchy* naturally, nay neceſſarily, paves the way for deſpotiſm; and confuſion is always the parent of oppreſſion.

ANARCHY is alſo applied to certain troubleſome and diſorderly periods, even in governments otherwiſe regular. —In Germany, the ſpace from the election of Richard duke of Cornwall, to that of duke Rud. of Hapſburg, is commonly called the *anarchy*, or *interregnum*.

In England, the period between the death of Cromwell and king Charles's reſtoration, is commonly repreſented as an *anarchy*. Every month produced a new ſcheme or form of government. Enthuſiaſts talked of nothing but annulling all the laws, aboliſhing all writings, records, and regiſters, and bringing all men to the primitive level. No modern nation is more ſubject to *anarchies* than Poland; where every interval between the death of one king, and the election of another, is a perfect picture of confuſion, inſomuch that it is a proverb among that people, Poland is governed by confuſion.

The Jewiſh hiſtory preſents numerous inſtances of *anarchies* in that ſtate, uſually denoted by this phraſe, *that in thoſe days there was no king in Iſrael, but every man did that which was right in his own eyes*; which is a juſt picture of an *anarchy*. The firſt *anarchy* we read of in that commonwealth, is that which enſued on the death of Joſhua, who leaving no ſucceſſor, the government devolved to the elders of the tribes, who ruled each according to his own will. After the death of theſe elders, the *anarchy* became complete.

ANARGYRUS, from α and αργυριον, *money*, in *Ancient Writers*, denotes a perſon without money, though otherwiſe ſufficiently accommodated with land, and other effects.

In a like ſenſe, we ſometimes alſo meet with the word *anargyria*, uſed by lawyers for the condition of a perſon without ready money.

Mart. Phil. Fabricius has a diſſertation expreſs *De Exceptione Anargyriæ*.

ANARGYRI, in *Eccleſiaſtical Hiſtory*, is an appellation given to certain ſaints in the Greek church, who having been phyſicians, gave not only their advice, but their remedies, *gratis*.—They are alſo called *argentinopes*.

ANARRHAPHE, from ανα and ραφη, *ſuture*, in *Surgery*, denotes a kind of ſuture or retraction of the upper eye-lid, when relaxed and hanging over the eye.

This is by ſome alſo called *ſutura blepharica*, by others *abbreviatio*, *contractio*, *collectio*, or *ſuſpenſio ſuperioris palpebræ*.—It is uſed in the *phalangoſis*, *ptoſis*, or *chaloſis*; where the ſight is obſtructed, by a *prolapſus* of the part, or the eye-lid itſelf is too thick beſet with briſtly hairs both within and without.

ANARRHICAS, in *Ichthyology*, the name given by Artedi, to the fiſh called by others the LUPUS *marinus*. It is a genus of the order of *apodes*, in the Linnæan ſyſtem.

ANARRHINON, in *Botany*, a name given by ſome of the ancients to the plant called by others LYCHNIS *agria*, and by others *antirrhinum*. Pliny tells us, that this plant reſembled flax; that it had ſcarce any root; that its flower was of the colour of the hyacinth, and its fruit reſembled the noſe of a calf. It is from this reſemblance that we at this time call the plant *calve's ſnout*. Dioſcorides ſays, that it was like the *anagallis*.

ANARTHRA, from α and αρθρον, *joint*, a claſs of naked inſects, diſtinguiſhed from all others, by having neither wings nor limbs. To this claſs belong all kinds of worms and leeches.

ANAS, *duck*, in the Linnæan ſyſtem of *Zoology*, the name of a large genus of birds, of the general order of ANSERES. The diſtinguiſhing characters of this genus are, that the beak is convex, and ends in an obtuſe point. The birds of this genus are the ſwan, gooſe, widgeon, &c. See DUCK.

ANAS *campeſtris*, in *Zoology*, the name of a bird common in France, and uſually called TETRAX, and *canne petriere*. It is of the ſize of a pheaſant, and of the nature of the *buſtard*, having no hinder toe; it runs very ſwiftly, and ſits on the ground as the duck does in the water, whence it has its name.

ANASARCA, from ανα and σαρξ, *fleſh*, in *Medicine*, a ſort of univerſal dropſy, wherein the whole ſubſtance of the body is ſtuffed or bloated with pituitous humours.

This diſtemper is ſometimes alſo called *cataſarca*, ſometimes *hypoſarcidium*, ſometimes *epiſarcidium*, ſometimes *aqua inter cutem*, or *intercus*, becauſe this pituitous humour ſpreads itſelf through the fleſh. Serenus Samonicus elegantly calls it *lymphaticus error*; Albucaſis calls it a dropſy by infiltration.

Anaſarca is a peculiar ſpecies of univerſal dropſy, differing from both the *aſcites* and *tympanites*. It differs from the *aſcites* in that, though it uſually ariſes from the ſame cauſes, the waters in an *aſcites* do not poſſeſs the upper parts of the body, at leaſt while the patient keeps in an erect poſture, which they do in the *anaſarca*.

Some diſtinguiſh between the *anaſarca* and the *leucophlegmatia*, in that the latter comes from the *pituita*, the former from an ichorous ſeroſity diſcharged in the very habit of body; apparently through the fault of the lymphatic veſſels.

The *anaſarca* ſometimes ſtops at half its growth; in which caſe it is called by the ancients *phlegmatia*, where the bloating is conſpicuous, yet ſoft and looſe.

In an *anaſarca*, the legs ſwell at firſt, eſpecially towards night, and then pit remarkably; the urine is pale, the appetite decays; at length the ſwelling riſes higher, and appears in the thighs, belly, breaſt, and arms. The face becomes pale and cadaverous; the fleſh ſoft and lax; and a difficulty in reſpiration comes on, attended with a ſlow fever.

The uſual method of cure among us is much the ſame as that of the *aſcites*. The ancients had a peculiar method adapted to it.

Ætius relates, from Aſclepiades, the manner of curing an *anaſarca*. This is by making inciſions on the inſide of the leg, about four fingers breadth above the ankle, as deep as generally thoſe in bleeding are made. At firſt a little blood iſſues out, afterwards there is a continual diſcharge of water, without any inflammation, ſo that the aperture cannot be cloſed, till the humour is ſpent, and the ſwelling gone down; and this drain cures the diſtemper, without any internal medicine.

Leonides ſays farther, that if the inciſions in the legs do not make a diſcharge quick enough, ſome ought to be made in other parts of the body; in the thighs, in the arms, or in the *ſcrotum*, if ſwelled, by which means a great quantity of watry matter may be evacuated.

The operation itſelf is mentioned by Hippocrates, and had been practiſed from his time down to our days, with ſucceſs; though ſometimes mortifications have been known to enſue.

In ſome caſes the *anaſarca* appears to have been advantageous, inſomuch that a cure of it has killed the patient.

Dr. Dovar's cure for an *anaſarca* is an electary compoſed of ſteel prepared with ſulphur and crude antimony, each an ounce, *diagridium* four ounces; make a fine powder of theſe; then add as much of any ſyrup as will make a ſoft electary.

ANASSAS, in *Natural Hiſtory*, the name of a fruit very common in Guinea, and in ſome other parts of Africa. It is very beautiful to the eye, and not leſs agreeable both to the taſte and ſmell, and is by ſome accounted the fineſt fruit in the world. The deſcriptions we meet with of it are very imperfect; but as there is nothing in them that contradicts its being the PINE-APPLE, it may be that fruit, and if ſo it deſerves all the praiſe that is given it.

ANASTASIS, a Greek word adopted into the Engliſh language, which denotes a reſurrection.

Chiflet has given us a diſſertation on Childeric's tomb, under the title of *Anaſtaſis Childerici*. Treuer has publiſhed the figure of a man and woman in the ancient German habit, as found in an ancient urn, under the title of *Anaſtaſis veteris Germani Germanæque Fœminæ*.

ANASTASIS, among *Ancient Phyſicians*, denotes a riſing up to go to ſtool. It likewiſe ſignifies a migration of humours, when expelled from one place, and obliged to remove to another.

ANASTATICA, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs; ROSE *of Jericho*. The characters are: the flower hath four roundiſh petals, placed in form of a croſs; the ſeed-veſſel in this is blunt-pointed, bordered, and crowned, and the valves open oblique to the ſtyle.

Anaſtatica, Hort. Cliff. 328. This plant grows naturally on the ſands, near the borders of the Red Sea, and in many parts of Syria.

It hath had the epithet of ROSA *Mariæ* given to it by the monks, who have ſuperſtitiouſly ſuppoſed that the flowers open on the night that our Saviour was born. But the truth is, the dry woody plant being ſet for ſome time in water, will dilate and open, ſo as to diſcloſe the ſeed-veſſels and ſeed. This has been done when the plants have been many years gathered; ſo that ſome curious perſons preſerve them in their repoſitories of curioſities, for the ſingularity of this property.

This plant is propagated by ſeeds, which ſhould be ſown the beginning of April, on a border of light ſandy earth, where it is deſigned to remain; for it will not bear tranſplanting. If the ſeaſon proves favourable the plants will flower in Auguſt; but unleſs the autumn proves warm and dry, they will not ripen their ſeeds in England.

ANASTOMASIS, or ANASTOMOSIS, in *Anatomy*, is ſometimes uſed to expreſs ſuch aperture of the mouths of the veſſels as lets out their contents.

The word is formed of ανα, *through*, and ϛομα, *mouth*.

ANASTOMASIS is more frequently uſed to denote the opening of two veſſels into one another; or the union and juncture of the mouths of two veſſels, whereby they come to communicate with one another.

There are various *anaſtomaſes* of this kind, e. gr. of an artery with an artery, a vein with a VEIN, and of a vein with an ARTERY.

The circulation of the blood in the *fœtus* is effected by means of the *anaſtomaſes*, or inoſculations of the *vena cava* with the pulmonary vein; and of the pulmonary artery with the *aorta*.

The circulation is alſo performed in adults by the *anaſtomaſes*, or continuation of the capillary arteries with the veins.

After the circulation of the blood through the heart, lungs, and large blood-veſſels, was demonſtrated by Harvey, it was only gueſſed how the extremities of the arteries tranſmitted the blood to the veins; till Leewenhoeck's microſcopes had diſcovered the continuations of the extremeties of thoſe veſſels, in fiſh, frogs, &c.—However, there were not wanting thoſe who doubted of the like continuations of the extremities of the arteries and veins in human bodies, and quadrupeds; ſince thoſe animals it had hitherto been chiefly ſeen in ſatisfactorily, were either ſuch fiſh, or amphibious kinds, as have but one ventricle in their hearts, and whoſe blood is actually cold; beſide that in them it does not circulate with ſuch rapidity, as in animals whoſe hearts have two ventricles. This difference in the principal organs of circulation moved Mr. Cowper to make experiments on animals whoſe organs differ only from the human in their groſs figure, and not in their intimate ſtructure.—The reſult was a plain diſcovery of the like inoſculations of the arteries and veins, in the *omentum* of a cat.

George Frederic Francus, of Frankenau, a phyſician of Copenhagen, publiſhed, in the year 1705, a learned and copious work, intituled, *Anaſtamaſis Retecta*.

It is a queſtion among *anatomiſts*, whether the uterine arteries and veins *anaſtomoſe* with the veins and arteries of the ſecundines. Mr. Alex. Monro holds the negative, and he thinks that ſeveral inconveniencies are avoided by the want of this *anaſtomaſis*. Med. Eſſ. Edinb. vol. ii. p. 133, &c.

ANASTOMATICS, or ANASTOMATIC *medicines*, are ſuch as have a faculty of opening and dilating the cavities of the veſſels; and by that means of making the blood circulate the more freely.

The word comes from αναϛομοω, *I unſtop*.

ANASTROUS *ſigns*, in *Aſtronomy*, an appellation given to the *duodecatimoria*, or the twelve portions of the ecliptic which the ſigns poſſeſſed anciently, but have deſerted by the preceſſion of the *æquinox*.

ANASTROPHE, from ανα and ϛρεφω, *I turn*, in the *Ancient Military Art*, denotes the return of a battalion to its former ſtation, after a turn or evolution either to the right or left.

The *anaſtrophe* ſtands oppoſed to the *epiſtrophe*.

ANASTROPHE alſo denotes a grammatical figure, whereby a prepoſition, which regularly ought to precede, is placed after its caſe, e. gr. *Saxa per et ſcopulos*.

ANASTROPHE, in *Rhetoric*, denotes a quaint inverſion of the order of the words in a ſentence, e. gr. *ut ſcire poſſis ad quo te expediat loqui*, for *quoad expediat te loqui*.

ANATHEMA, from ανα and τιθημι, *I lay up*, in *Antiquity*, denotes a preſent offered to ſome god, and hung up in his temple.

Making preſents to the gods was a cuſtom even from the earlieſt times, either to pacify them when angry, or to obtain ſome future benefit, or as a grateful acknowledgment of ſome paſt favour. They conſiſted of crowns and garlands, garments, cups of gold, or other valuable metals, and any other things which conduced to the ornament, or the enriching of the temples.

Theſe were commonly termed αναθηματα, and ſometimes ανακειμενα; from their being depoſited in the temple where they ſometimes were laid on the floor, ſometimes hung upon the walls, doors, pillars, or the roof, or any other conſpicuous place. Sometimes the occaſion of the dedication was inſcribed either upon the thing itſelf, or when the matter of that could not bear an inſcription, upon a tablet hung up with it.

When any perſon left his employment, or way of life, it was cuſtomary to dedicate the inſtruments belonging to it, as a grateful commemoration of the divine favour and protection. Thus in an ancient Greek epigram we find a fiſherman makes a preſent of his nets to the nymphs of the ſea. Shepherds hung up their pipe to Pan, or ſome of the country deities, as we find done by one in Tibullus. So Lais, decayed with age, dedicates her mirror to Venus. Pauſanias has left us a particular deſcription of the *anathemata* in the Delphian temple, which was the richeſt of any in Greece.

The term *anathema* alſo occurs in a like ſenſe applied to Chriſtian offerings.

The *anathemata*, or ornaments of the ancient churches, are otherwiſe called in eccleſiaſtical writers *donaria*.

Such in particular were thoſe called εκτυπωματα, anſwering to the votive tablets of the heathens. Alſo pictures, moſaics, inſcriptions, and at length images, ſtatues, crucifixes, &c.

Cebes's beautiful Tablature of Human Life, is ſaid, in the introduction to it, to have been among the αναθηματα, in the temple of Saturn.

ANATHEMA, in an eccleſiaſtical ſenſe, denotes an EXCOMMUNICATION, attended with execrations and curſes.

In this ſenſe, the word is uſually written in Greek αναθεμα, to diſtinguiſh it from an offering to the gods, called αναθημα; though it is certain ſeveral of the Greek fathers do not obſerve this diſtinction; but uſe αναθημα indifferently for either.

There are two kinds of *anathemas*; the one *judiciary*, the other *abjuratory*.

The former can only be pronounced by a council, a pope, biſhop, or other qualified perſon; and differs from a ſimple excommunication in this, that an excommunication only prohibits the criminal from entering within the church, or from holding communion with the faithful; whereas an *anathema* cuts him off from the body, the ſociety, and even the commerce of the faithful, and delivers him over to the *Devil*.

The latter kind of *anathema* uſually makes a part of the ceremony of ABJURATION; the convert being obliged to *anathematize* the *hereſy* he abjures.

The critics and commentators are divided about the manner wherein St. Paul wiſhes to be *anathema* for his brethren. Romans, ch. ix. 3. See ACCURSED.

In ancient cenſures we meet with an extraordinary *formula*, called *maranatha*; and authors are divided concerning its import and uſe.

St. Chryſoſtom ſays it is a Hebrew word, ſignifying *the Lord is come*; and he particularly applies it to the confuſion of thoſe who ſtill abuſe the privilege of the Goſpel, notwithſtanding that the Lord was come among them.

St. Jerom ſays it was more a Syriac than a Hebrew word, though it had ſomething in it of both languages, ſignifying *our Lord is come.* But he applies it againſt the perverſeneſs of the Jews and others who denied the coming of Chriſt, making this the ſenſe of the apoſtle; *if any man love not the Lord Jeſus Chriſt, let him be anathema, the Lord is come.*

According to this ſenſe, *maranatha* could not be any part of the form of *excommunication*, but only a reaſon for pronouncing the *anathema* againſt thoſe who expreſſed their hatred againſt Chriſt, by denying his coming, either in words, as the Jews did who blaſphemed him, and called Jeſus *anathema* or accurſed, or elſe by wicked works, as thoſe who lived profanely under the name of Chriſtians. Others of the ancients interpret the word of the future coming of Chriſt, particularly St. Auſtin, who ſays, *maranatha* is a Syriac word ſignifying *the Lord will come.* And he particularly applies it againſt the Arians, who could not be ſaid, as he uncharitably thought, to love the Lord, becauſe they denied his divine nature. Dr. Hammond and others will have *anathema maranatha* to have anſwered to the third and higheſt degree of excommunication among the Jews, called *ſhammatha.*

Balduinus, Deutrohmannus, Durrius, Stevartius, and others, have written expreſly concerning *anathemas.* Hen. Labertus, a German writer, has given an *Anathematologia*, or a diſcourſe on the church curſes. See a form of the *anathema* denounced againſt robbers in the middle ages, in Bouquet's Recueil des Hiſt. tom. x. p. 517. The Engliſh reader may ſee it in the An. Regiſt. vol. xii. an. 1769. p. 147.

ANATHEMATIZING, the act of pronouncing an *anathema.* In which ſenſe it amounts to the ſame with *excommunicating.* The term is not only applied in ſpeaking of perſons, but of doctrines and opinions.

ANATHEMATISM denotes the ſame with *anathema*, or imprecation.

ANATHREPSIS, in *Medicine*, amounts to much the ſame with ANALEPSIS.

ANATICULA, a diminutive of *anas*, and uſed by the old Roman *Authors*, as a term of fondneſs, to expreſs the paſſion of love. There is another of the ſame kind from a different bird *palumbula.*

My little duck, my little dove, were the moſt endearing terms the lovers of thoſe times could uſe; nor was this the cuſtom of the Romans only, but the Greeks, as far back as Ariſtophanes, have it.

ANATIFERA *concha*, in *Natural Hiſtory*, the name of a genus of ſhells, the characters of which are theſe: it is a ſhell-fiſh of the multivalve kind, being of a triangular figure, flat, and compoſed of five ſhells faſtened to a long pedicle, and furniſhed with fourteen hairs. Of this genus of ſhell-fiſh, the cabinets of the curious afford us four ſpecies.

This genus of ſhells obtained this ſtrange name from an erroneous opinion, that they produced ducks, or a ſpecies of wild-fowl of that kind, the name ſignifying a ſhell producing *ducks.*

ANATOCISM, ANATOCISMUS, an uſurious contract, wherein the intereſts ariſing from the principal ſum are added to the principal itſelf, and intereſt exacted upon the whole.

The word is originally Greek, but uſed by Cicero in Latin; whence it is deſcended into moſt other languages. It comes from the prepoſition *ανα*, which in compoſition ſignifies *repetition* or *duplication*, and *τοκος*, *uſury.*

Anatociſm is what we properly call *intereſt upon intereſt*, or *compound intereſt.*

This is the worſt kind of uſury, and has been ſeverely condemned by the Roman law, as well as by the common laws of moſt other countries.

ANATOMY, the art of diſſecting, or artificially taking to pieces the ſolid parts of animal bodies; in order to an exact diſcovery of their ſtructure and œconomy.

The word is *ανατομη*, q. d. *ſection* or *cutting*; formed of *ανατεμνω*, *I cut aſunder.*

Anatomy makes a great branch of that diviſion of medicine called *phyſiology.*

It is ſometimes divided, with regard to its end, into *ſpeculative* and *practical*; a diviſion of very little moment.— It is alſo divided, with regard to its ſubject, into *human* and *comparative.*

ANATOMY, *comparative*, is that which conſiders brutes, and other animals, and even vegetables; chiefly with a view to illuſtrate the human ſtructure.

There is ſome diſpute among phyſicians and naturaliſts concerning the uſefulneſs of comparative *anatomy.* On the one hand it is urged, that the parts leſs apparent in one animal, are found more diſtinct and conſpicuous in another; ſo that the knowledge of the ſtructure of the former, may be improved by analogy, from that of the latter. On the other hand it is objected, that the diverſity is ſo great between one animal and another, according to the different manners of life they are intended for, that it is never ſafe concluding by mere analogy, from the ſtructure of one to that of the other. Malpighi has been very large in the refutation of this objection.

ANATOMY, *human*, which is abſolutely and properly denominated ANATOMY, is that employed on the human body; by ſome called alſo *anthropology.*

The ſubject of *anatomy*, viz. the body, is variouſly divided into parts, *organical*, and *inorganical*; *ſimilar*, and *diſſimilar*; *ſpermatic*, &c.

Its more obvious diviſion is into *ſolids* and *fluids*, or into the containing and contained parts.

Under the ſolids come the bones, muſcles, nerves, arteries, veins, cartilages, ligaments, membranes, &c.— Under the fluids come chyle, blood, milk, fat, lymph, &c. See each under its proper article.

But ſome divide *anatomy*, with regard to its objects, into OSTEOLOGY and SARCOLOGY.

The firſt treats of the bones and cartilages; the ſecond is ſubdivided into *ſplanchnology*, which comprehends the hiſtory of the internal parts, and more particularly of the viſcera; *myology*, or the doctrine of the muſcles; and *angeiology*, which treats of the veſſels, viz. the nerves, arteries, veins, and lymphatic veſſels.

Others divide *anatomy* with regard to its objects, into that of living bodies, and that of dead carcaſſes.

Herophilus and Eraſiſtratus, we are told by Celſus, diſſected living perſons: condemned criminals were ſent to the former by princes, on purpoſe that they might have an opportunity of ſeeing the parts in their natural ſtate, before any alterations induced in them by diſeaſes or death.

The bodies of perſons who have ſuffered a violent death, among which thoſe who have been hanged, or loſt their lives by ſtrangulation with a cord, are the moſt proper, and to be preferred before the reſt. It is for that reaſon that Riolan rejects thoſe dead carcaſſes which have been ſuffocated in the water, as improper for *anatomy*; though Galen uſed moſt frequently to drown ſuch of his living creatures, as he had choſen for his anatomical operations.

Anatomy is by others divided into *medicinal* and *phyſical.*

ANATOMY, *phyſical*, *anatomia phyſica*, is that employed in enumerating and deſcribing the ſeveral ſolid parts of the body, as bones, cartilages, membranes, muſcles, tendons, nerves, ligaments, arteries, veins, lympheducts, &c. deſcribing their figure, ſituation, connection, &c.

ANATOMY, *medicinal*, *anatomia medica*, is that which, to the former inquiries, adds that of the office and uſe of the ſeveral parts, and their concern in health or diſeaſes. Some give a particular ſpecies of this under the denomination of chirurgical *anatomy.*

Some conſiderable phyſicians have endeavoured to check a minute ſtudy of *anatomy*, as of no uſe in phyſic. It is in reality but a ſmall part of the ſcience, as it now ſtands, that falls under immediate conſideration in the medicinal practice. It ſeems enough for a phyſician to know the number, ſituation, communication, and uſe of the parts, without loſing time in a minute inveſtigation of their intimate ſtructure, not excepting the ſmalleſt fibres, of which they are compoſed.

Others again recommended an exact and curious knowlege of *anatomy*, which does not barely include the ſituation of one, or other of the viſcera, or the magnitude, colour, figure, and order of the internal parts, but is of very wide extent. For, ſay they, it is neceſſary to inſpect, with all our curioſity, the peculiar ſtructure of each part, which we ſee to be formed with the higheſt art and ſkill; to find out its uſe, what function it performs in the body, what connection it has with the other members, and to comprehend what influence it has, after a wonderful manner, on different and remote parts.

Such a knowlege of *anatomy* they eſteem as a moſt firm foundation, on which the whole body of medicine may ſecurely reſt. If this be removed, all rational explications in medicinal matters muſt fail, practice is in danger, and even *medicine* itſelf falls to ruin. The uſe of *anatomy*, in *ſurgery*, they add, is ſo undoubted, that none but ſuch as are little verſed in the *medicinal* art, will have the raſhneſs to deny it.

Anatomy is not only of uſe in *medicine*, but alſo in *painting*, *deſigning*, *ſtatuary*, &c. Leonardo da Vinci, and all the great maſters, ſtudied it with particular application. Titian took ſo much delight in it, that he deſigned the figures for Veſalius's *Anatomy.* M. de Piles, under the fictitious name of Tortebat, and de Roſſi at Rome, have publiſhed books of *anatomy* particularly accommodated to this uſe. A tranſlation of this has been given in England, under the title of *Anatomy* improved and illuſtrated, with regard to the Uſe thereof in Deſigning.

ANATOMY, *its hiſtory.*—With reſpect to the antiquity of *anatomy*, it ſeems ſcarcely poſſible, but that the ſlaughter of beaſts for the uſe of man, caſualties, murders, and the accidents of war, muſt have furniſhed mankind with a general knowledge of the ſtructure of the parts, in very early ages of the world. But it is not very certain at what period it began to be cultivated as a *ſcience.* This however muſt have been very early, eſpecially if we pay any regard to Manetho, the famous Egyptian writer, who, according to the report of Euſebius, relates that Athotis, an Egyptian king, wrote ſome treatiſes of *anatomy.* This king, if the Egyptian chronology was to be depended on, lived many ages before Adam. This, however falſe with reſpect to time, amounts to a ſort of proof of the antiquity of this *ſcience.* It is inferred that Solomon was no ſtranger to the ſtructure of the human body, from ſome paſſages in the twelfth chapter of the book of Eccleſiaſtes.

It is very certain however that before, or at leaſt in the days of Homer, *anatomy* was much cultivated; ſince this author appears to have had a competent knowlege of the parts, and to have been very well verſed in the enunciation of wounds, as the moderns call it, ſo as to give an accurate account of their effects in almoſt all the parts of the body.

But Hippocrates is the firſt author, at leaſt extant, who treated of *anatomy* ſcientifically. This writer, conſcious of his noble and exalted genius, publiſhed many *anatomical* obſervations, which, though disjoined and ſcattered here and there in his works, yet make up an entire body of *anatomy,* when taken together; but that he made it his principal buſineſs to underſtand and explain the bones of the human body, is plain from thoſe valuable books upon Fractures, and the Joints, which evidently diſcover his perfect knowlege of, and intimate acquaintance with, the bones; and that his diligence, his induſtry, and ſkill in this way, might the more effectually be tranſmitted to future ages, he conſecrated, if we may believe Pauſanias, a brazen ſkeleton to the Delphian Apollo.

The writings of this great man are interſperſed with many things relating to the blood, which ſeem to ſhew ſome knowlege of the circulation, and alſo of the ſecretion of the various humours. Dr. Douglas has pointed out ſuch of them as ſeem to be the moſt glaring and unexceptionable proofs of this.

Galen, by general conſent of writers, is the prince of *anatomiſts.* By his early application, his unwearied aſſiduity, great ſagacity, and penetration of mind, as well as dexterity of hand, he not only carried the art infinitely beyond what had been done by thoſe before him, but even to that perfection wherein we find it at this day, abating only ſome few diſcoveries made by modern anatomiſts. In reality, many of the diſcoveries with which late writers plume themſelves, are due to him. Dr. Douglas enumerates ſeveral of the diſcoveries made by Galen in the ſtructure and uſe of the parts of the human body.

Anatomy ſuffered with the other *ſciences* by the invaſions of the Goths and Vandals, and at length ſunk into total barbariſm; from which it was reſtored in the fourteenth century by Mundinus, a Milaneſe, who compoſed rudiments of that art in the year 1315, which, notwithſtanding the barbarous ſtyle wherein they are written, remain ſtill in eſteem, and are the only ſyſtem now taught in ſome of the principal ſchools in Italy. The ſtatutes of the univerſity of Padua expreſly enjoin the profeſſors to follow the text of Mundinus in their lectures and expoſitions.

Some with Fallopius rather aſcribe the honour of the reſtoration of *anatomy* to Jac. Berengarius, called alſo Carpus or Carpenſis, who lived two hundred years after Mundinus. He ſet out with commenting on that author, but afterwards wrote a much better book on the ſubject, of his own; in order to which he diſſected above one hundred bodies. Some have even charged him with the crime of Herophilus. It is alleged that he bore an implacable hatred to the Spaniards; and that, having got ſome of them into his cuſtody, he intended to have proceeded to diſſection, but his deſign being diſcovered, he was baniſhed. Others deny the charge, and give other reaſons for his exile.

The honour of reforming *anatomy,* and bringing it to its preſent perfection, is commonly aſcribed to Veſalius, whoſe inclination to this ſcience was ſo great, that, when a boy, he could not forbear diſſecting moles, dormice, cats, and the like. As he grew up, his paſſion increaſed; when bodies were wanting for ſkeletons, he would ſteal them from the gibbets; for which he was expelled Louvain, as he himſelf informs us. Bodies which he dug out of their graves, he would keep ſeveral weeks in his bed-chamber. He publiſhed his famous work on the ſtructure of the human body at twenty-eight years of age. He was chief phyſician to the emperor Charles V. and Philip II. of Spain; but growing weary of a court-life, he undertook a pilgrimage to Jeruſalem, and died in his return. The motive of this expedition is attributed to his opening the body of a young Spaniard of quality, ſuppoſing him dead; whereas, when he came to the heart, he found it ſtill beating. Others give a different account of his misfortunes.

The writers of *anatomy* may be divided into ſuch as either treat on the ſubject *profeſſedly* or *occaſionally.*

Under the latter are comprehended *phyſicians, natural hiſtorians,* thoſe who treat of human nature, and of brutes. Among the *profeſſed* writers on *anatomy,* ſome treat of the whole ſubject, others only of a part.

The ancient writers in *anatomy,* Hippocrates, Democritus, Ariſtotle, Galen, and others, looked upon this as the moſt important part of phyſic, and that, without which the uſes of the parts of an human fabric, and conſequently the cauſes of diſeaſes incident to it, could no way be diſcovered. And yet this art, uſeful as it is, was entirely diſcontinued for ſeveral ages; till in the ſixteenth century it began to flouriſh afreſh.—The diſſection of a human body was looked upon as ſacrilege before that time; and we have ſeen a conſultation which the emperor Charles V. appointed to be held by the divines of Salamanca, in order to be ſatisfied, whether or no it were lawful, in point of conſcience, to diſſect a dead carcaſe?—We may add, that to this day the uſe of anatomy and ſkeletons is forbid in Muſcovy: the firſt as inhuman, the latter as ſubſervient to witchcraft: and Olearius aſſures us, that one Quirin, a German ſurgeon, being found there with a ſkeleton, hardly eſcaped with life; and the ſkeleton after being ſolemnly dragged about the ſtreets, was burnt in form. Boyle's Uſefulneſs of Philoſophy.

After Veſalius, a Flemiſh phyſician, who died in 1564, ſucceeded Carpus, Sylvius, Fernelius, Fallopius, Euſtathius, Fabricius, Pareus, Bauhinus, Hoffman, Riolanus, &c.

Theſe were followed by others, to whom ſome of the fineſt diſcoveries in *anatomy* are owing.—Aſellius, in the year 1622, diſcovered the lacteal veins, though he modeſtly declines the honour of this diſcovery, and ſays they were known to Hippocrates, Eraſiſtratus, and Galen; and in 1628, the immortal Harvey publiſhed his admirable diſcovery of the circulation of the blood.—Pecquet diſcovered the reſervoir of the chyle, and the thoracic duct, in 1651.—Rudbecks, a Swede, and Bartholine, a Dane, found out the lymphatic veſſels, in 1650, and 1651. Wharton, in 1655, diſcovered the lower ſalival ducts; and Steno the upper ſalival ducts, thoſe of the palate, the noſtrils, and eyes, in 1661. Wirtſungus, in 1642, diſcovered the pancreatic duct.—Willis, who came after him, publiſhed an anatomy of the brain, and nerves, in a manner much more exact than had been done before him; yet he had omitted ſome conſiderable things, which were afterwards obſerved by Vieuſſens.—In ſhort, Gliſſon treated particularly of the liver; Wharton of the glands; Havers, of the bones; Graaf, of the pancreatic juice, and the parts of generation; Lower, of the motion of the heart; Thurſton, of the reſpiration; Peyer, of the glands of the inteſtines; Brown, Cowper, and Douglas of the muſcles; and Drelincourt, of the conception of the ova in women, the placenta, and the membranes of the *fœtus*; Dryander, of the head; Hoffman and Rudius, of the uſe of the parts; Rufus, Epheſius, and Camerarius, of the names of the parts; Galen, Cappivaccius, Hippolitus, Boſcus, and Lacuna, of the art of diſſecting; Horſtius, on the art of preſerving carcaſes; and Monro of *oſteology,* and *comparative anatomy.* Malpighi, who died in 1694, is one of thoſe to whom *anatomy* owes the moſt: he made a great number of diſcoveries in the lungs, brain, liver, ſpleen, glands, and lymphatics, by help of the microſcope, &c. Nor muſt it be omitted, that Ruyſch, who died in 1727, has let great light into many of the finer and more intricate parts of the human frame, particularly the glands, by means of his injections.

An account of the later diſcoveries controverted between Monro, Hunter, and Hewſon, who all claim the merit of firſt making them, ſhall be given under the articles LYMPHATICS and LACTEALS. The reader may find a particular information about them, and the pretenſions of the different claimants, in Monro's Inaugural Diſſertation.

Among thoſe who treat of the whole ſubject of *anatomy,* Winſlow is moſt deſervedly eſteemed This author's works has been tranſlated into Engliſh by Dr. George Douglas. We have alſo an excellent compendium of *anatomy* by Heiſter. The merit of Albinus's Tables, and of his writings, is well known; as is that of Mr. Cheſelden; ſo that, after reading Heiſter, Winſlow, Monro, and Cheſelden, conſulting the Tables of Veſalius and Albinus, a ſtudent may, we believe, conſider other books rather curious than neceſſary.

Manget and Le Clerc, two phyſicians of Geneva, have given us a *Bibliotheca Anatomica,* containing all the new diſcoveries that have been made in this art, but with many miſtakes, the detecting of which has been undertaken by Morgagni, who has publiſhed ſeveral volumes with that view, under the title of *Adverſaria Anatomica*.

Anatomy is alſo uſed for an artificial repreſentation of the ſtructure and parts of the human body in metal, plaſter, wax, or the like.—In this ſenſe we ſay, the wax-work *anatomy*. R. Dickenſon, ſtatuary, finiſhed an human *anatomy* in plaſter of Paris, repreſenting a man ſtanding upright, with his ſkin flayed off.

There is likewiſe a wax-work *anatomy*, ſaid to have been invented by Gaetano Giulio Zumba, a Sicilian of Syracuſe. Yet M. des Noues, who learnt it of him, and probably made ſome improvements in it, bringing it to Paris, arrogated the chief honour of it to himſelf. Some prefer before all the reſt, for public lectures and courſes, the uſe of real parts of dead bodies prepared by injection. *Anatomical* injections, are either of mercury, or mixtures of equal parts of biſmuth, lead, and tin. Neumann.

The inconveniencies that attend the diſſecting of dead carcaſſes, have occaſioned the invention of another cleanlier and more durable kind of ſubjects. Reiſelius contrived a human ſtatue, wherein the circulation of the blood was repreſented to the ſight, and ſomething of the like kind was ſhewn by M. Chovet; and more lately ſtill by Madam. Bicheron, who has brought this art to great perfection. See her obſervations on the artificial *anatomy*, in the Memoirs of the Acad. des Scienc. an. 1759. Hiſt. 94.

Anatomy is ſometimes uſed to denote the ſubject to be anatomized. Thus (by 39 H. VIII. cap. 22.) the company of barbers and ſurgeons may have and take yearly four perſons condemned, adjudged, and put to death for felony, for *anatomies*; and to make inciſion of the ſame dead bodies.

And by 25 Geo. II. cap. 37. the bodies of felons convicted of murder, in the county of Middleſex, or city of London, are, after execution, to be delivered to the hall of the ſurgeon's company, to be diſſected and anatomized; and in caſe ſuch conviction and execution ſhall happen to be in any other county, or place, in Great Britain, then the body of ſuch murderer ſhall be delivered by the ſheriff, &c. to ſuch ſurgeon as the judge ſhall direct.

Anatomy is alſo uſed, in an improper ſenſe, for the ANALYSIS of mixt bodies.

In this ſenſe the chemiſts ſometimes call their art *ſpagyrical anatomy*, *anatomia ſpagyrica*.

In which ſenſe we ſometimes ſay the *anatomy* of vitriol, the *anatomy* of ſulphur, the *anatomy* of Rheniſh wine, &c.

Anatomy is alſo uſed, in a leſs proper ſenſe, to denote the art of reſolving compound bodies into ſimple ones.

In this ſenſe any kind of compound body may be conſidered as the object of *anatomy*; that is, any body wherein there are divers parts joined together; even the taking aſunder an artificial, political, or moral being, may, in this ſenſe, come under *anatomy*.

Anatomy is alſo uſed *figuratively*, for an exact ſearch or examination of the parts of a diſcourſe, buſineſs, or the like: in which ſenſe we ſay the *anatomy* of a book, a doctrine, or the like.

Anatomy *of plants* may be conſidered as a branch of comparative *anatomy*, otherwiſe called *dendronatomy*.

The parts of PLANTS which come under anatomical conſideration are, the root, wood, bark, pith, fruit, leaves, flowers, &c.

The *anatomy* of vegetables is chiefly owing to the induſtry of Malpighi, and Dr. Grew, though conſiderably promoted alſo by Ruyſch, who by a peculiar method of injection has produced divers ſkeletons or ſyſtems of veſſels of fruits, leaves, and the like. Something of the ſame kind has alſo been done by Thummigius.

Some pretend to make F. Fabri the father of this *ſcience*; and alledge that Malpighi took many of his diſcoveries from him. Dr. Highmore in his book of Generation, Dr. Sharrock on the Propagation of Plants, and Dr. Hook in his *Micrographia*, have alſo given ſome obſervations tending this way, though only collaterally.

ANATRIPSIS, from ανα and τριϐω, *I wear*, in the *Ancient Medicine*, denotes friction.

The word is ſometimes alſo writen ſimply TRIPSIS.

ANATRON, or NATRON, a kind of native ſalt-petre, or nitre, found in Egypt. It is of a cineritious colour, and bitter taſte, approaching to ſal ammoniac.

It is the produce of a huge lake, on the ſurface of which it is gathered, in form of a ſcum.

Anatron is alſo uſed for the ſalt and ſcum of the compoſition of glaſs, when in fuſion.

When pounded, it yields a kind of powder; which being diſſolved in the air, or in a proper liquor, becomes common ſalt, after coagulation.

The *anatron* ſkimmed from glaſs fuſion is the ſame with what others call *ſel vitri*, or *gall* of *glaſs*.

Anatron is likewiſe the name of a nitrous juice, which condenſes in vaults, arches, and other ſubterraneous places.

Anatron is alſo uſed by ſome writers, for a compound ſalt, made of quicklime, alum, vitriol, common ſalt, and nitre; uſed as a flux to promote the fuſion and purification of metals.

Anatron, laſtly, is uſed for the TERRA *Saracenica*; of which there are ſeveral kinds, black, red, and blue.

ANATROPE, ανατροπη, from ανατρεπω, *to ſubvert*; a ſubverſion literally, or relaxation of the ſtomach, attended with a loſs of appetite, vomiting, and nauſea.

ANAUDIA, among *Naturaliſts*, denotes dumbneſs, or a want of the uſe of ſpeech.

Anaudia is, by ſome, made to differ from *aphonia*, as the former is owing to a defect of the nerves of the tongue, the latter to that of the nerves of the *larynx*.

Infants and mutes are *anaudi*, αναυδοι, not *aphoni*, αφωνοι.

ANAVINGA, in *Botany*, a tree of middle ſize, that grows in Malabar in the Eaſt Indies, eſpecially about Cochin. It is an evergreen, and its fruit or berries are ripe in Auguſt.

The juice of the berries drank, excites ſweat, cures malignant diſtempers, and keeps the body ſoluble. A decoction of the leaves in water makes a fit bath for ſuch as are afflicted with pains in the joints.

ANAUMACHION, from α, ναυς, *ſhip*, and μαχομαι, *I fight*, in *Antiquity*, the crime of refuſing to ſerve in the fleet.—The puniſhment aſſigned for this offence was infamy.

ANAX, in *Ancient Writers*, denotes a hero or a god.

The word ſeems formed of the Hebrew *anacim*, or *enacim*, which ſignifies the ſame.

Some will have it originally to import giants, called alſo γηγενεις, *earth-born*. Cicero aſſures us, that the three eldeſt ſons of Jupiter, called Διοσκυροι, were alſo denominated *anaces*.

ANAXAGORIA, in *Antiquity*, a feſtival obſerved in honour of Anaxagoras.

The occaſion of its being inſtituted was this; Anaxagoras dying at Lampſacus, the magiſtrates of that city aſked him, whether he deſired any thing to be done for him? He replied, that on the anniverſary of his death the boys ſhould have leave to play.

ANAXIMANDRIANS, a name given by ſome writers to the followers of Anaximander. Theſe are otherwiſe denominated *hylopathii*; and ſtand oppoſed to the *atomiſts*. The *Anaximandrians* make the moſt ancient ſect of *philoſophical atheiſts*; they allow of nothing in nature but bodies. Theſe bodies, they aſſert, admit of qualities which produce and deſtroy each other, in a circle without beginning or end.

ANBERTKEND, in the *Eaſtern Language*, a celebrated book of the Brachmans, wherein the Indian *philoſophy* and *religion* are contained.

The word in its literal ſenſe denotes the ciſtern, wherein is the water of life.

The *anbertkend* is divided into fifty *beths*, or diſcourſes, each of which conſiſts of ten chapters.

It has been tranſlated from the original Indian into Arabic, under the title of *Morat al Maani*, q. d. *the marrow of intelligence*.

ANBLATUM, in *Botany*. See APHYLLON.

It is alſo named by Linnæus LATHRÆA, &c.

ANBURY, in *Farriery*. See AMBURY.

ANCA, in *Middle Age Writers*, denotes the thigh or hind-leg.

In which ſenſe, the word is alſo written ANCUS.

ANCESTORS, *progenitors*; or thoſe from whom a perſon is deſcended; excluſive of his immediate parents.

The word is derived from the Latin *anceſſor*, written, by contraction, for *anteceſſor*, q. d. *goer before*.

Moſt nations have paid honours to their *anceſtors*.

It was properly the departed ſouls of their fore-fathers that the Romans worſhipped under the denominations of *lares*, *lemures*, and houſhold gods.

Hence the ancient tombs were a kind of temples, or rather altars, wherein oblations were made by the kindred of the deceaſed.

The Ruſſians have ſtill their anniverſary feaſts in memory of their *anceſtors*, which they call *roditoli ſabot*, q. d. *kinsfolk's ſabbath*, wherein they make formal viſits to the dead in their graves, and carry them proviſions, eatables, and preſents of divers other kinds. They interrogate them, with loud lamentable cries, What they are doing? How they ſpend their time? What it is they want, and the like.

The Quojas, a people of Africa, offer ſacrifices of rice and wine to their *anceſtors*, before ever they undertake any conſiderable action. The anniverſaries of their deaths are always kept by their families with great ſolemnity. The king invokes the ſoul of his father and mother to make trade flouriſh, and the chace ſucceed.

The Chineſe ſeem to have diſtinguiſhed themſelves above all other nations in the veneration they bear their *anceſtors*. By the laws of Confucius, part of the duty which children owe their parents, conſiſts in worſhipping them when dead. This ſervice, which makes a conſiderable part of the natural religion of the Chineſe, is ſaid to have been inſtituted by the emperor Kun, the fifth in order from the foundation of that ancient empire. Bibl. Un. tom. vii.

The Chineſe have both a ſolemn and ordinary worſhip which they pay their *anceſtors*. The former is held regularly twice a year, viz. in ſpring and autumn, with much pomp. A perſon who was preſent at it gives the following account of the ceremonies on that occaſion:

The ſacrifices were made in a chapel well adorned, where there were ſix altars furniſhed with cenſers, tapers, and flowers. There were three miniſters, and behind them two young acolites; he that officiated was an aged man, and a new Chriſtian. The three former went with a profound ſilence, and frequent genuflexions towards the five altars, pouring out wine: afterwards they drew near to the fixth, and when they came to the foot of the altar, half bowed down, they ſaid their prayers with a low voice. That being finiſhed, the three miniſters went to the altar, the prieſt took up a veſſel full of wine, and drank; then he lifted up the head of a deer or goat: after which taking fire from the altar, they lighted a bit of paper; and the miniſter of the ceremonies turning towards the people, ſaid with a high voice, that he gave them thanks in the name of their *anceſtors* for having ſo well honoured them; and in recompence he promiſed them, on their part, a plentiful harveſt, a fruitful iſſue, good health and long life, and all thoſe advantages that are moſt pleaſing to men.

All the Chineſe, pagans as well as Chriſtians, give their *anceſtors* another ſimpler and more private worſhip. To this end they have in their houſes a niche or hollow place, where they put the names of their deceaſed fathers, and make prayers, and offerings of perfumes and ſpices to them at certain times, with bowing, &c. They do the like at their tombs.

It has been a queſtion warmly agitated of late years, whether the worſhip which the Chineſe pay their *anceſtors* be religious, or only of a civil nature. The Jeſuits, who not only allow their neophytes, or new converts, to join in it, but even aſſiſt in it themſelves, are neceſſitated to maintain the latter, to ſkreen themſelves from the charge of idolatry; the Dominicans, and other miſſionaries, maintain the former, and prohibit the ſervice as abſolutely unlawful.

The Jeſuits argue, that with relation to the firſt inſtitution, thoſe honours might be given to our *anceſtors*, ſince at firſt they appear to have been only civil; even though they ſhould ſince, through the ſuperſtitious diſpoſition of the people, have degenerated into idolatry. But it is anſwered, that by this argument the moſt groſs worſhip of idols might be authoriſed, becauſe all idolatry appears at firſt only to have been civil worſhip, as is maintained in the book of Wiſdom, chap. xiv. ver. 15.

The Jews ſettled in China are ſaid to worſhip their *anceſtors* like the heathens, and with the ſame ceremonies, except that they offer not ſwine's fleſh. Near their ſynagogue they have a hall, or court of *anceſtors*, wherein are niches for Abraham, Iſaac, &c.—The Jeſuits alſo conformed, and were permitted by their general to conform to this, and many other ſuperſtitious cuſtoms of the Chineſe. See the proof of this in Paſchal's Provincial Letters, *paſſim*.

There is one peculiarity of another kind, wherein the Chineſe ſhew their regard for their *anceſtors*; in proportion as any of their deſcendants are preferred to a higher degree or dignity, their dead *anceſtors* are at the ſame time preferred and ennobled with them. The kings Ven, Van, Veu, Van, and Cheu, Cum, who were deſcended from vaſſal kings, when they mounted the imperial throne, raiſed their *anceſtors* from the vaſſal or depending ſtate wherein theſe had lived, to the dignity of emperors; ſo that the ſame honours were for the future rendered them, as if they had been emperors of China. The ſame example was followed by the ſubſequent kings, and now obtains among the grandees and literati; all now worſhip their *anceſtors*, according to the rank which they themſelves hold in the world. If the ſon be a mandarin, and the father only a doctor, the latter is buried as a doctor, but ſacrificed to as a mandarin. The like holds in degradations, where the condition of the fathers is that of their ſons. Bibl. Un. tom. vii.

The law diſtinguiſhes between *anceſtor*, and *predeceſſor*; the former being applied to a natural perſon, as ſuch an one, and his *anceſtor*; and the latter to a body politic or corporate, as a biſhop, and his *predeceſſors*.

Ancestor, *diſability by the act of*; ſee **Disability**.

ANCESTREL, in *Law*, ſomething relating to a man's anceſtors.—Thus,

Ancestrel, *homage*, ſignifies homage that hath been done or performed by one's anceſtors.

Ancestrel, *action*; ſee **Action**.

ANCHILOPS, from αγκυλη, *contraction*, and ωψ, *eye*; in *Medicine*, denotes an abſceſs, or collection of matter between the great angle of the eye, and the noſe.

The ſame abſceſs when broken is no longer denominated *anchilops*, but **Ægilops**.

Strictly ſpeaking, the *anchilops* is only a tumour not yet exulcerated; nor is the tumour always within the *ſaccus lacrymalis*, but ſometimes only near it.

If the *anchilops* be ſuffered to remain too long, or be unſkilfully managed, it degenerates, the ſtagnating humours corrupt, and an ulcer is produced.

It makes a ſpecies, or rather a degree, of the **Fistula** *lacrymalis*.

Care muſt be had to examine ſtrictly, whether the abſceſs opens into the lacrymal bag, or whether it be only ſuperficial, between the ſkin and the orbicular muſcle. In the latter caſe, there is no occaſion to fear its changing to a *fiſtula*, if the matter be not lodged between the bag and the muſcle.

When the tumour is broke, and the tears flow involuntarily, whilſt the *os lacrymale* is not carious, it is an *ægylops*; but when the ulcer is of a long ſtanding, deep, fetid, and the *os lacrymale* becomes carious, it is a **Fistula**.

The *anchilops* is ſometimes attended with an inflammation, and then reſembles a **Phlegmon**; but when not inflamed, it approaches nearer to thoſe tumours called *atheromata*, *ſteatomata*, and *melicerides*.

Its cure is by reſtriction and exciſion; tying it at the root on the *glandula lacrymalis*; and when ready, cutting it off.

ANCHIROMACUS, in *Middle Age Writers*, denotes a kind of veſſel, which, on account of its nimble ſailing, was uſed for the conveyance of anchors, and other neceſſary utenſils of ſhips.

In this ſenſe, the word is alſo written *ancyromagus*, *anchiromachus*, *ancyromacus*, *angromagus*, *anquiromagus*, and *anguiromagus*.

ANCHOR, **Anchora**, an inſtrument uſed at ſea, and in rivers, to retain and faſten a veſſel by.

The word comes from the Latin *ancora*, or *anchora*, of the Greek αγκυϱα, which comes from αγκυλος, *incurvus*, *crooked*.

An *anchor* is a large, ſtrong piece of iron, crooked at one end, and formed into two barbs, reſembling a double hook; and faſtened at the other end by a cable.

The goodneſs of the *anchor* is a point of great importance; the ſafety and conſervation of the veſſel depending principally upon it.—Great care is to be taken, that the metal it is made of be neither too ſoft, nor too brittle; the latter rendering it liable to break, and the former to ſtraiten.

Anchors, *method of making*. The ſhank, arms, and flukes, are firſt forged ſeparately; then the hole is made at one end of the ſhank for the ring, which being alſo previouſly forged, is put into the hole of the ſhank, and the two ends ſhut together. After which the arms are ſhut to the ſhank, one after the other, and the *anchor* is finiſhed.

Proof is made of *anchors*, by raiſing them to a great height, and then letting them fall again on a kind of iron block placed acroſs for the purpoſe.—To try whether the flukes will turn to the bottom, and take hold of the ground, they place the *anchor* on an even ſurface, with the end of one of the flukes, and one of the ends of the ſtock reſting on the ſurface; in caſe the *anchor* turns, and the point of the fluke riſes upwards, the *anchor* is good.

Travellers tell us of people in the Indies who make uſe of wooden *anchors* in their navigation.—The inhabitants of the iſland of Ceylon, in lieu of *anchors*, uſe huge round ſtones; and, in other places, their *anchors* are a kind of machines of wood, loaden with ſtones. Sometimes bags of ſand have been made uſe of, but theſe chiefly obtained in rocky places, where *anchors* would not take hold.

In England, France, and Holland, *anchors* are made of forged iron; but in Spain they are ſometimes made of copper, and likewiſe in ſeveral parts of the South ſea.

The parts of an *anchor* are, 1. The *ring*, into which the cable is faſtened. 2. The *beam*, or *ſhank*, which is the longeſt part of the *anchor*. 3. The *arm*, which is that which runs down into the ground: at the end of which is, 4. The *flouke*, or *fluke*, by ſome called the *palm*; being that broad and piked part, with its barbs, like an arrow-head, which faſtens into the ground. 5. The *ſtock*, a piece of wood faſtened to the beam, near the ring, ſerving to guide the fluke, ſo that it may fall right, and fix in the ground.

The firſt *anchors* of iron had only a fluke on one ſide.

The contrivance was completed by Eupalamius, who made them fluked both ways; though ſome aſcribe the honour of this to Anacharſis the Scythian.

All *anchors* have now two arms; not but they might ſtill be uſed with only one arm, which ſtructure would have this advantage, that they would be lighter, and yet in fine weather would hold equally firm with the double kind. The reaſon of having two arms is, that the *anchor* may always take, in order to which it is neceſſary that it be very heavy; beſides, that *anchors* with a ſingle arm would require more preparation for ſervice.

For the proportions of *anchors*, according to Manwaring, the ſhank is to be thrice the length of one of the flukes, and half the length of the beam. According to Aubin, the length of the *anchor* is to be four tenths of the greateſt breadth of the ſhip; ſo that the ſhank, e. gr. of an *anchor* in a veſſel thirty feet wide, is to be twelve feet long. When the ſhank is, for inſtance, eight feet long, the two arms are to be ſeven feet long, meaſuring them according to their curvity. As to the degree of curvity given the arms, there is no rule for it; the workmen are here left to their own diſcretion.

Aubin, in his Marine Dictionary, gives a table from a Flemiſh writer, wherein the lengths of the ſhanks of *anchors*, for veſſels of all widths, is computed, as well as the weights of the *anchors*, from a veſſel eight feet wide within, which requires an *anchor* $3\frac{1}{5}$ feet long, weighing thirty-three pounds; to a veſſel forty-five feet wide, which demands an *anchor* eighteen feet long, and weighing 5832 pounds.

He likewiſe obſerves, that the *anchor* of a large heavy veſſel is ſmaller, in proportion, than that of a leſſer and lighter one. The reaſon he gives, is, that though the ſea employs an equal force againſt a ſmall veſſel as againſt a great one, ſuppoſing the extent of wood upon which the water acts to be equal in both, yet the little veſſel, by reaſon of its ſuperior lightneſs, does not make ſo much reſiſtance as the greater; the defect whereof muſt be ſupplied by the weight of the *anchor*.

From theſe, and other hydroſtatic principles, the following table has been formed; wherein is ſhewn, by means of the ſhip's breadth within, how many feet the beam or ſhank ought to be long, giving it $\frac{4}{10}$ or $\frac{2}{5}$ of the ſhip's breadth within: by which proportion may be regulated the length of the other parts of the *anchor*. In this table is repreſented likewiſe the weight an *anchor* ought to be for a ſhip from 8 feet broad to 45, increaſing by 1 foot's breadth; ſuppoſing that all *anchors* are ſimilar, or that their weights are as the cubes of the lengths of the ſhanks.

Breadth of the Veſſel.	Length of the Anchor.	Weight.
Feet.	Feet.	Pounds.
8	$3\frac{1}{5}$	33
9	$3\frac{3}{5}$	47
10	4	64
11	$4\frac{2}{5}$	84
12	$4\frac{4}{5}$	110
13	$5\frac{1}{5}$	140
14	$5\frac{3}{5}$	175
15	6	216
16	$6\frac{2}{5}$	262
17	$6\frac{4}{5}$	314
18	$7\frac{2}{5}$	373
19	$7\frac{3}{5}$	439
20	8	512
21	$8\frac{2}{5}$	592
22	$8\frac{4}{5}$	681
23	$9\frac{1}{5}$	778
24	$9\frac{3}{5}$	884
25	10	1000
26	$10\frac{2}{5}$	1124
27	$10\frac{4}{5}$	1259
28	$11\frac{1}{5}$	1405
29	$11\frac{3}{5}$	1562

42	$16\frac{4}{5}$	4742
43	$17\frac{1}{5}$	5088
44	$17\frac{3}{5}$	5451
45	18	5832

M. Bouguer directs to take the length of the ſhank in inches, and to divide the cube of it by 1160 for the weight. The reaſon is obvious; becauſe the quotient of the cube of 201 inches, which is the length of an *anchor* weighing 7000lb. divided by the weight is 1160, and therefore by the rule of three, this will be a common diviſor for the cube of any length, and a ſingle operation will ſuffice.

M. Bouguer, in his *Traité de Navire*, gives the following dimenſions of the ſeveral parts of an *anchor*. The two arms generally form the arch of a circle, whoſe centre is three eighths of the ſhank from the vertex, or point where it is fixed, to the ſhank; and each arm is equal to the ſame length, or the radius; ſo that the two arms together make an arch of 120 degrees: the flukes are half the length of the arms, and their breadth two fifths of the ſaid length. With reſpect to the thickneſs, the circumference at the throat, or vertex of the ſhank, is generally made about the fifth part of its length, and the ſmall end two thirds of the throat; the ſmall end of the arms of the flukes, three fourths of the circumference of the ſhank at the throat. Theſe dimenſions ſhould be bigger, when the iron is of a bad quality, eſpecially if caſt iron is uſed inſtead of forged iron.

Veſſels that ſail on rivers have at leaſt one *anchor*; thoſe which ſail in the canals of Zealand, have two *anchors*; but thoſe which go to ſea have always three, four, or more.

There are three kinds of *anchors* commonly uſed: the *kedger*, the *grapnel*, and the *ſtream-anchor*.

The diſtinctions of *anchors* are taken from their uſe, and the proportion they bear in the ſhip, where they are employed; for that which in one ſhip would be called but a *kedger*, or *kedge*-ANCHOR, in a leſſer would be a *ſheet*-ANCHOR.

ANCHOR, *kedge*, is the ſmalleſt, which, by reaſon of its lightneſs, is firſt to ſtop the ſhip in *kedging* a river.

This is what the Dutch ſailors call *werp*-ANCHOR, the French *ancre a touer*. It ought to weigh 450 pounds.

The *grapnel* is an *anchor* for a ſmall ſhip or boat.

ANCHOR, *ſtream*, is a ſmall *anchor* faſtened to a ſtream-cable, wherewith to ride in rivers, and gentle ſtreams, and to ſtop a tide withal in fair weather.

ANCHOR, *ſheat*, or *ſheet*, is the biggeſt and ſtrongeſt, being that which the ſeamen call their laſt hope; never to be uſed but in great extremity.

This is what the Romans called *anchora ſacra*; the Dutch *plegt-anker*, and *ſtop-anker*; the French *maitreſſe-ancre*, or *grande-ancre*.

The other *anchors* are called by the name of the firſt, ſecond, and third *anchor*; by any of which the ſhip may ride in any ſeaſonable weather, ſea-gate, or tide.—Theſe are ſomething bigger one than another, and uſually when they ſail in any ſtreights, or are near a port, they carry two of theſe at the bow; in which reſpect they are alſo called by the name of firſt and ſecond bowers.

ANCHOR, *ſecond*, called by the Dutch *boeg-anker*, or *daagelyks-anker*, is that ordinarily made uſe of.

ANCHOR, *croſs*, called by the Dutch *tuy-anker*, or *vertuyanker*, and by the French *ancre d'affourche*, is a middling *anchor* thrown acroſs or oppoſite to another.—This ought to weigh 1500 pounds, or near as much as the ſecond *anchor*.

ANCHOR, *riding at*, in the *Sea Language*, the ſtate of a veſſel moored and fixed by her *anchors* at ſome proper ſtation.

Where a great number of veſſels are moored in the ſame port, care is to be taken by the pilots, or thoſe who have the command, that each ſhip be at a due diſtance from the reſt, to prevent their running foul of each other; alſo that they be neither too near, nor too far from land. The proper ſpace betwixt veſſels is, from two to three cables length.

ANCHOR, *dropping or let fall the*, otherwiſe called caſting *anchor*, imports the letting it down into the ſea.

In ſome caſes it is neceſſary to drop two *anchors* oppoſite to each other, one of them to keep the ſhip firm againſt the tide, or flow, the other againſt the ebb.

ANCHOR, *weighing*, imports the act of withdrawing, or recovering the *anchor* into the veſſel, in order for ſailing.

The *anchor* is ordinarily weighed, or recovered, by means of a CAPSTAN, or WINDLASS.

ANCHOR, *dragging*, is when the *anchor* gives way, or loſes its hold in the ground by the force of the wind, or ſea, and the veſſel drives from the place.

ANCHOR, *clearing the*, ſignifies the getting the cable off the fluke.

Generally alſo, when they let fall the *anchor*, they uſe this term, to ſee that the buoy-rope, nor any other ropes, hang about it.

ANCHOR, *fetching, or bringing home the*, denotes the weighing it in the boat, and bringing it aboard the ſhip.

The *anchor* is ſaid to come home, when the ſhip drives away with the tide or ſea.—This may happen, either becauſe the *anchor* is too ſmall for the burden of the ſhip, or becauſe the ground is ſoft, and oozy; in ſuch places ſhoeing is uſed.

ANCHOR, *ſhoeing the*, denotes putting boards on the flukes, in the form of flukes themſelves, to make it broader than before, uſed when they are obliged to *anchor* in bad ground, to prevent the ſhip from driving.

This is what the French mariners call *breder l' ancre*, and the Dutch *t' anker bekleeden*.

In ſome caſes they have been known to tallow the *anchors*, where the ground being ſoft, the ordinary would not hinder them from coming home. Manwaring ſaw an inſtance of tallowing the *anchor* in Porto Tareen by Tunis. The reaſon of the advantage is hard to aſſign; he ſuppoſes it to be, that the tallow ſinks deeper into the ooze, and finds ſome harder ground at the bottom, than the other.

Other terms and words of command relating to the *anchors* are, *the anchor is a peeke*, that is, when heaving up the *anchor*, the cable is right perpendicular betwixt the hawſe and the *anchor*: *the anchor is cock-ball*, when the *anchor* hangs right down by the ſhip's ſide: this word is given by the maſters, when they are ready to bring the ſhip to an *anchor*: *the anchor is foul*, that is when the cable, by the turning of the ſhip, is hitched, or got about the fluke; which will not only cut the cable aſunder, but hinder the *anchor* from holding.

On this account, when they come to an *anchor* where there is a tide, they lay out two *anchors*, by which means on the turning of the tide the ſhip winds up clear of either.

Anchor, in *Architecture* and *Sculpture*, denotes an ornament in form of an *anchor*, or arrow's-head; frequently carved on the ovolo of the capital, in the Tuſcan and Ionic orders, as well as in the bed-moulding of Ionic and Corinthian corniches.—See *Tab. Archit. fig.* 10.

The *anchors* are uſually intermixed with repreſentations of eggs; whence the *echinus*, or ovolo itſelf, is popularly called *eggs* and *anchors*.

Anchor, *anchora*, in *Literary Matters*, the figure of an *anchor*, repreſented in ancient books; which is of two kinds, *ſuperior* and *inferior*. The *ſuperior*, &c. is where the crooked part is uppermoſt, uſed to denote a thing or paſſage ſtrongly expreſſed.

The *inferior* is where the crooked part is at the bottom, to denote a thing poorly or meanly ſet forth.

Anchor is alſo uſed, in a leſs proper ſenſe, for any thing that holds another thing faſt, or prevents its driving.

In this ſenſe, ſea-muſcles are ſaid *to ride at anchor*, by a ſort of threads the thickneſs of a large hair, which they emit out of the body, to the number ſometimes of a hundred and fifty, which faſtening to the ſtones and other adjacent bodies, keep them firm in their place.—The ſame is done by the PINNA *marina*.

Anchor, in *Heraldry*, is the emblem of Hope; and is taken for ſuch in a *ſpiritual*, as well as in a *temporal* ſenſe.

Anchor, a meaſure. See Anker.

ANCHORAGE, ground fit to hold a ſhip's *anchor*, ſo that ſhe may ride ſafely.

The beſt ground for a ſhip to anchor in is ſtiff clay, or hard ſand; and the beſt riding at anchor is when a ſhip is land-locked, and out of the tide.

Anchorage, in *Law*, denotes a duty taken of ſhips for the pool of the haven, where they caſt anchor.

The ground in all ports and havens being the king's, no man can let an anchor fall in any port, without paying for it to the king's officer appointed by patent.

ANCHORED, or Ankered, in *Heraldry*.—A croſs *anchored*, or *ancree*, is a form of croſs, ſo called, becauſe the four extremities reſemble the fluke of an anchor.

This croſs is ſo like the CROSS *molin*, that the reſemblance has occaſioned many miſtakes in heraldry.

ANCHOVY, in *Matters of Commerce*, &c. a little ſea-fiſh, much uſed by way of ſauce, or ſeaſoning.

The word is derived from the Spaniſh *anchova*, or rather from the Italian *anchioe*, which ſignifies the ſame.

Scaliger deſcribes the *anchovy* as of the herring kind, about the length of a finger, having a pointed ſnout, a wide mouth, and no teeth, but gums as rough as a ſaw.—Others make it a ſort of ſardine, or pilchard: but others, with better reaſon, hold it a peculiar ſpecies, very different from either.

The *anchovy* is caught in the months of May, June, and July, on the coaſts of Catalonia, Provence, &c. at which ſeaſon, it conſtantly repairs up the ſtraits of Gibraltar, into the Mediterranean. Collins ſays, they are alſo found in plenty on the weſtern coaſts of England and Wales.

The fiſhing for them is chiefly in the night-time; when a light being put on the ſtern of their little fiſhing-veſſels, the *anchovies* flock round, and are caught in the nets. But then it is aſſerted to have been found by experience, that *anchovies* taken thus by fire, are neither ſo good, ſo firm, nor ſo proper for keeping, as thoſe which are taken without fire.

When the fiſhery is over, they cut off the heads, take out their gall and guts, and then lay them in barrels, and ſalt them.—The common way of eating *anchovies* is with oil, vinegar, &c. in order to which they are firſt boned, and the tails, fins, &c. ſlipped off.—Being put on the fire, they diſſolve almoſt in any liquor. Or they are made into ſauce by mincing them with pepper, &c.

Some alſo pickle *anchovies* in ſmall delft, or earthen pots, made on purpoſe, of two or three pounds weight, more or leſs, which they cover with plaſter, to keep them the better. *Anchovies* ſhould be choſen ſmall, freſh pickled, white on the outſide, and red within. They muſt have a round back; for thoſe which are flat or large, are often nothing but ſardines. Beſide theſe qualities, the pickle, on opening the pots or barrels, muſt be of a good taſte, and not have loſt its flavour.

ANCHUSA, in *Botany*, called alſo *bugloſs* and *alkanet*, a plant of the *pentandria monogynia* claſs, of which the characters are: the flower is of one leaf, having a cylindrical tube; at the brim it is cut into five obtuſe ſegments, which ſpread open. The germen afterwards becomes four oblong, blunt ſeeds, ſhut up in the empalement.

It grows with us only in gardens, and flowers in June. The roots only are uſed. Parkinſon highly commends the infuſion of the bark in *petroleum*, as excellent in freſh cuts and green wounds. At preſent it is very little uſed.

The common *alkanet*, *anchuſa offic.* is brought from Languedoc and Provence; being the root of the *bugloſſum radice rubra, ſive anchuſa vulgatior*. The root is aſtringent, and proper in hæmorrhages of all kinds; it is employed to colour ointments, &c. It muſt be boiled in oil; for it does not readily communicate its tincture to water. The ancients uſed it as a coſmetic. See its hiſtory, as a colouring drug, in Neumann's Works, p. 337.

ANCHYLOBLEPHARON, from αγκυλη, *hardneſs*, and βλεφαρον, *eye-lid*; in *Phyſic*, a diſtemperature of the eye-lids, wherein they ſometimes cohere to each other, and ſometimes to the globe of the eye itſelf. This is eaſily diſtinguiſhable from the ſlight glewing up of the eye-lids occaſioned by the ſmall-pox, or other the like cauſes.

This diſorder is ſometimes brought with an infant into the world, ſometimes it comes upon adults by a fleſhy excreſcence from the angles of the eyes, and ſometimes it happens from accidents, as blowing up of gun-powder, and the like. This is always dangerous, and difficult of cure, but moſt ſo when the eye-lids grow to the *cornea*. They are to be divided by a blunt-pointed pair of ſciſſars, and when ſeparated from each other, it muſt be tried whether they adhere to the eye; if they do, they muſt be ſeparated with great caution with a blunt-pointed ſcalpel; but there is, in this caſe, great danger of injuring the ſight: when ſeparated, they muſt be kept from touching one another, to prevent their cohering again, by lint, or a plate of lead.

ANCHYLOPS, in *Medicine*; ſee Anchilops.

ANCHYLOSIS, Ancyle, or Ancylosis, in *Phyſic*, is when a juncture or articulation becomes immoveable.

The word is derived from αγκυλη, *a hardneſs* or *contraction of a joint*.

Anchyloſis bears an affinity to contractures, ſhrinkings, or witherings of the parts.

This ſymptom ſometimes happens in fractures near the joints, where the nutritious juice oozes into the cavities thereof.

This diſeaſe, when once formed, is incurable, but while yet freſh, is ſometimes removed by motion, friction, and the uſe of diſcutient medicines.

ANCI, in Greek γαλιαγκωνες, *weaſel-elbowed*, from γαλη, *a weaſel*, and αγκων, *an elbow*. So Hippocrates calls thoſe, who from ſlipping the head of the *os humeri* into the *ala*, have an arm ſhorter and ſmaller than it ought to be, and the cubit or elbow of a weaſel; whence they are called by ſome *muſtelani*, which fully expreſſes the Greek word, or barely *anci*. The diſorder that gives occaſion for the name, happens either in the womb, where the *os humeri* ſuffers a luxation, from too much moiſture; or in tender years, by means of an abſceſs deeply ſeated about the head of the *os humeri*.

ANCIENT, or Antient, in its uſual ſenſe, denotes a thing, which exiſted in times long ago.

The word comes from the French *ancien*, of the Italian *anciano*, and that of the Latin *antiquus*, which denotes the ſame.

In which ſenſe *ancient* ſtands oppoſed to *modern*.

Ancient differs from *antique* as the *genus* from its *ſpecies*.

We ſay *ancient* nations, *ancient* architecture, ſculpture, philoſophy, &c. *ancient* manner, ceremonies, poets, phyſicians, and the like.

Ancients, in *Church Diſcipline*; ſee Elders.

Ancients, in *Inns of Court*, imports a diſtinction of a certain degree.—Thus, the ſociety of Gray's Inn conſiſts of *benchers*, *ancients*, *barriſters*, and *ſtudents* under the bar: here the *ancients* are the elder barriſters.

In the inns of Chancery there are only *ancients*, and ſtudents, or clerks; and among the *ancients*, one is yearly the principal, or treaſurer.—In the Middle Temple, *ancients* are ſuch as have gone through, or are paſt their reading.

Ancient is ſometimes alſo uſed in a military ſenſe, for the colours, or an ENSIGN.

Ancient, in the *Naval Armament*, is the FLAG, or ſtreamer, borne in the ſtern of a ſhip.

Ancient *demeſne*, or *demain*, in *Law*, is a TENURE, whereby all manors belonging to the crown in William the Conqueror's, and St. Edward's time, were held.

The numbers, names, &c. hereof were entered by the Conqueror, in a book called *Domeſday Book*, yet remaining in the Exchequer; ſo that ſuch lands as by that book appeared to have belonged to the crown at that time, are called *ancient demeſne*.

The tenants in *ancient demeſne* are of two ſorts; one who hold their lands frankly by charter: the other by copy of court-roll, or by the verge, at the will of the lord, according to the cuſtom of the manor.

The advantages of this tenure are, 1. That tenants holding by charter cannot be rightfully impleaded out of their manor; and, when they are, they may abate the writ, by pleading the tenure. 2. They are free from toll for all things relating to their livelihood, and huſbandry; nor can be impanelled on any inqueſt.

Theſe tenants held originally by plowing the king's land, plaſhing his hedges, and the like ſervice, for the maintenance of his houſehold; and it was on this account that ſuch liberties were given them, for which they may have writs of *monſtraverunt* to ſuch as take the duties of toll, &c.

No lands are to be accounted *ancient demeſne*, but ſuch as are held in ſocage. Whether land be *ancient demeſne* or not, ſhall be tried by the Book of DOMESDAY.

Ancient *differences*, in *Heraldry*; ſee BORDURES.

ANCIENTY, in ſome *Ancient Statutes*, is uſed for elderſhip or ſeniority.

The elder ſiſter can demand no more than her other ſiſters, beſide the chief meſne, by reaſon of her *ancienty*. This word is uſed in the ſtatute of Ireland, 14 Hen. III.

ANCLABRIS, in the *Religion of the Ancient Romans*, denoted a table in temples, whereon the prieſts eat their portion of the ſacrifices and oblations.

ANCLE, *luxated*, in *Surgery*.—The *ancle* is ſubject to be luxated, either in running, in jumping, or even in walking; and that in all four directions, either inward or outward, backward or forward. When the *ancle* is luxated inward, the bottom of the foot is turned outward; and on the contrary, when it is luxated outward, the bottom of the foot is turned inward, which latter caſe is indeed much more frequent than the others. If it is diſlocated forward, the heel becomes ſhorter, and the foot longer than it ſhould be; and if backward, the contrary ſigns to theſe will appear. The *ancle* however can ſcarce poſſibly be luxated outwards, unleſs the *fibula* be ſeparated from the *tibia*, or elſe quite broken, which may happen to the external *ancle*; nor is it uncommon for a luxation of the *ancle* to be attended with very grievous ſymptoms, eſpecially when occaſioned by ſome great external violence. Nor can it indeed well happen otherwiſe in this caſe, ſince the diſtortion of the foot muſt neceſſarily overſtrain the adjacent tendons, ligaments, and nerves, and thence excite very violent pains, and other bad ſymptoms; or the veins and arteries may alſo be very eaſily lacerated, which will occaſion a large extravaſation of blood about the whole foot, and too often give riſe to a gangrene.

It is however neceſſary to obſerve, that the *ancle* is not always luxated, after it has been violently ſtrained by leaping, or turning the foot on one ſide; for it ſometimes happens that the *ancle* is not diſlocated on theſe occaſions, but only the parts violently contuſed and ſtrained. The *ancle*, when truly luxated, is more or leſs difficult to be reduced, according to the violence of the force by which the accident was occaſioned. The moſt ready way, however, of reducing a luxation of the *ancle*, is to place the patient upon a bed, ſeat, or table, letting the leg and foot be extended in oppoſite directions by two aſſiſtants, while the ſurgeon replaces the bones with his hands and fingers in their proper ſituation. When the foot is by this means reſtored to its proper poſition, it is to be well bathed with oxycrate and ſalt, and then carefully bound up with a proper bandage. The patient muſt be enjoined to keep his bed for a conſiderable time, till the bad ſymptoms are gone, and the *ancle* has recovered its ſtrength ſo far, as to bear the weight of the body, without any uneaſineſs or danger.

We have an account of the *menſes* regularly evacuated at an ulcer of the *ancle*, in the Medic. Eſſ. Edinb. vol. iii. art. 9.

ANCON, in *Anatomy*, denotes the curvation or flexure of the arm, whereon we reſt in leaning.

This is otherwiſe called OLECRANUM.

Ancon, in *Architecture*, is uſed to denote the corners or quoins of walls, croſs beams, or rafters.

Ancon alſo is uſed in the *Ancient Architecture*, to denote the two parts or branches of a ſquare, which meet in an angle reſembling the letter L.

Ancon is alſo uſed by Vitruvius, to denote a kind of *menſulæ*, or tables before doors, bent ſomewhat after the manner of *volutes*, ſo as to reſemble the letter S.

In this ſenſe, *ancones* amount to the ſame with what the Greeks call ϖροθυρίδες, *prothyrides*.

Ancon is particularly applied in the *Ancient Architecture*, to the brackets, or ſhouldering-pieces, called CONSOLES and CORBELLS by the moderns.

Ancon was alſo uſed by the Carthaginians, to denote a dark priſon or dungeon. Suidas mentions one of this kind, in which Gelimer uſed to put all who diſpleaſed him; from which Beliſarius delivered many merchants of the Eaſt, whom the tyrant intended to put to death.

Ancon is alſo applied to the angles or flexures of rivers; ſometimes alſo to the tops of mountains.

ANCONÆUS *Muſculus*, in *Anatomy*, the ſixth muſcle of the elbow ſo called, as being ſituate behind the folds of the *ancon*, or elbow.—See *Tab. Anat.* (*Myol.*) *fig.* 7. *n.* 46.

It ariſes from the back part or the extremities of the *humerus*, paſſes over the elbow, and is inſerted into the lateral and internal part of the *cubitus* about three or four fingers breadth above the *olecranum*.—Its uſe is to aſſiſt in extending the arm.

Some anatomiſts make the following diſtinctions, according to Winſlow.

Anconæus *externus*, a long muſcle, lying on the outer part of the back-ſide of the os *humeri*, from its neck to the external condyle.

Anconæus *internus*, a muſcle ſhorter, and more fleſhy than the *anconæus externus*, and lying towards the inner part of the lower half of the os *humeri*.

Anconæus *major*, a long fleſhy muſcle lying on the back-ſide of the os *humeri*.

Anconæus *minor*, a ſmall muſcle obliquely triangular, lying in the oblong *foſſula* on the outſide of the *olecranum*.

ANCONY, in the *Iron Mines*, a bloom wrought into the figure of a flat IRON bar, about three feet long, with two ſquare rough knobs, one at each end.

The proceſs for bringing the iron to this ſtate is this: they firſt melt off a piece from a ſow of caſt iron, of the proper ſize; this they firſt hammer at the forge into a maſs of two feet long, and of a ſquare ſhape, which they call a *bloom*; when this is done, they ſend it to the finery, where, after two or three heats and workings, they bring it to this figure, and call it an *ancony*. The middle part beat out at the finery is about three feet long, and of the ſhape and thickneſs the whole is to be; this is then ſent to the chafery, and there the ends are wrought to the ſhape of the middle, and the whole made into a BAR.

ANCREE, in *Heraldry*, the ſame with ANCHORED.

ANCTERES, in the *Ancient Medicine*, ſeem to have been the ſame, at leaſt to have anſwered the ſame uſes, as our SUTURES.

Some alſo ſpeak of a ſtrong kind of ſticking plaſter under this denomination.

ANCTERIASMUS, in *Medicine*, the operation of applying a *fibula* to cloſe the too patent lips of wounds.

This is alſo called by Latin writers, *infibulatio*.

Ancteriasmus is more particularly uſed to denote the paſſing a *fibula* through the prepuce of the ancient ſtage-players and buffoons.

ANCUBITUS, among *Ancient Phyſicians*, denotes a diſeaſe of the eyes, wherein there is an appearance of ſand, or little ſtones ſprinkled on them.

This is otherwiſe called PETRIFICATION.

ANCUS, a name for ſuch as have an arm bent crooked, ſo that they cannot extend it.

ANCYLE, in *Antiquity*, denotes a ſmall kind of brazen ſhield, ſaid to have fallen from heaven into the hands of Numa Pompilius, at the ſame time that a voice was heard, that Rome ſhould be miſtreſs of the world, while ſhe preſerved that ſhield.

Though there was but one *ancyle* that fell from heaven, yet were there twelve preſerved; Numa, by the advice, as it is ſaid, of the nymph Egeria, having ordered eleven others, perfectly like the firſt, to be made by Veturius Mamurius, that if any ſhould attempt to ſteal it, as Ulyſſes did the Palladium, they might not be able to diſtinguiſh the true *ancyle* from the falſe ones.

Theſe *ancylia* were preſerved in the temple of Mars; and were committed to the care of twelve prieſts, or *ſalii*, inſtituted for that purpoſe.

They were carried every year, in the month of March, in proceſſion all around Rome; and the thirtieth day of that month they were again depoſited in their place.

Ancyle; ſee ANCHYLOSIS.

ANCYLOBLEPHARON, *inviſcatio*, or *adglutinatio palpebrarum*, a diſeaſe wherein the eye-lids are ſtuck faſt, or glued together.—The cure is by manual operation.

ANCYLOGLOSSUS, ανκυλογλωσσος, one that is tongue-tied, or has an impediment in his ſpeech, ariſing from a contraction of the *frænum* of the tongue.

This diſeaſe is alſo called *ancyloglоſſum*, which is either *natural*, i. e. born with the infant, or *accidental*, occaſioned uſually by ſome ulcer under the tongue, which leaves behind it a hardneſs, or *eſchar*. It is the common opinion of midwives, that none are born without this infirmity; and hence one of the firſt things after a birth, is to cut the ſtring of the infant's tongue.

The effect of the *ancyloglоſſum* is not only to hinder the uſe of ſpeech, but in children it alſo diſables them from ſucking. The cure is performed by a careful ſection of the *frænum*, ſo as not to hurt the nerves, or other veſſels. This operation is never to be performed, where the infant is able to thruſt its tongue ſtraight out of the mouth. Fabricius ab Aquapendente complains ſeverely on the officiouſneſs of midwives, who, without ever examining the condition of the *frænum*, practiſe the operation promiſcuouſly on all infants, from an opinion, that without it the child would never be able to ſpeak. But, according to this author, there is ſcarce one child in 100,000 in whom this ligament needs any cutting at all. In ſome parts of Italy the midwives nouriſh a long nail on their right thumb, which is faſhioned after the manner of a knife's point, wherewith, as ſoon as the child is born, they cut the ligament. In other places, from a vain opinion that there is ſomething malignant in the nail, the operation is performed with the edge of a piece of money.

The operation is painful to the infant, and is ſometimes followed by inflammations, and even death itſelf.

ANCYLOME, αγκυλομηλη, from αγκυλος, *crooked*, and μηλη, a *probe*. A ſurgeon's crooked probe, or a probe with a hook.

ANCYLOSIS, ſee ANCHYLOSIS.

ANCYROIDES, αγκυροειδης, is uſed by ſome writers in *Anatomy* for the proceſs or ſhooting forth of the ſhoulder-bone, in form of a beak; otherwiſe called *caracoides*.

ANDA, *G. Piſon*; is a tree of Braſil, the wood of which is ſpungy and light; the leaf longiſh, fibrous, and pointed; the flower large and yellow; and the fruit a grey nut, which encloſes, under a double rind, two kernels of the taſte of cheſnuts. The fruit is ſaid to be purgative, and a little emetic: two or three of the kernels are a doſe. They extract oil by expreſſion from theſe kernels, with which the natives anoint their limbs. The rinds of the fruit are eſteemed proper to ſtop a looſeneſs; thrown into ponds, they kill the fiſh.

ANDABATÆ, in *Antiquity*, a kind of GLADIATORS, who fought hoodwinked; having on a ſort of helmet that covered the eyes, and even the face.

They were called *andabatæ*, *quaſi* αναϐαται, *aſcenſores*, becauſe they fought mounted on horſeback, or out of chariots.

Some ſay, the *andabatæ* fought in the dark, or late at night, after the *circenſia* were over. There were two men in the chariot, viz. the driver, or *auriga*, and the παραϐατης, who was alſo called αναϐατης, q. d. *adſcenſor*, or *mounter*; whence, by corruption, the Latins formed their *andabata*.

It has been diſputed among critics, whether the *andabatæ* were a people who actually fought blindfold, in their wars, or a ſet of combatants who only practiſed this method of fighting for exerciſe ſake.

ANDELANGA, in *Middle Age Writers*, occurs as part of the *formula* of divers donations.

In this ſenſe, we meet with *donare per andelangam & feſtucam*, *vendere & tradere per andelangam*, &c. Some will have the term properly to denote what we call an *andiron*; others a long ſtaff, or rod, which it is known was much uſed in the act of putting into poſſeſſion.

The word is ſometimes alſo written *andelangus*, *andelago*, *andilago*, or *andalagus*, &c.

ANDENA, in *Ancient Writers*, denotes a ſwath in mowing.

The word is likewiſe uſed to ſignify as much ground as a man can ſtride over at once.

ANDERENÆ, *ſal*, in *Natural Hiſtory*, a name given, by many of the old writers, to the nitre of the ancients, or NATRON. Some have, ſince their time, applied it to our common nitre; and it has been wondered at, that the accounts do not agree with the ſubſtance. But it is to be obſerved, that the nitre, or *natron*, of the ancients, is a fixed ſalt, approaching to the nature of *pot-aſh*, and not at all inflammable with ſulphur, as our nitre is. It is therefore no wonder if the things related of the one ſhould not be found to agree with the other.

ANDIRA, or ANGELYN, in *Botany*, *G. Piſon*; a tree in Brazil, the wood of which is hard, and proper for building. Its bark is of an aſh-colour; its fruit is of the ſhape and ſize of an egg, green at firſt, but growing blacker by degrees. It is covered with a hard rind, incloſing a grain, or yellowiſh kernel, of a bitteriſh, aſtringent taſte.

They pulverize this nut, and give it for worms; but not more than one ſcruple; for more than this is ſaid to be poiſonous.

ANDIRA, in *Zoology*, is an animal called alſo *andira-guacu*, a kind of bat in Braſil; the largeſt of which are as big as our pigeons: they call them horned bats, from a ſort of excreſcence, or pliant body, above their beak. Some of theſe are very dangerous; for they get into chambers in the night, and ſo ſubtilly open the veins in the feet of thoſe who are in bed, that they are not perceived but by the flowing of the blood, which is difficult to be ſtopped. The inhabitants reckon the tongue and heart of that animal among poiſons.

ANDIRIAR, in *Botany*, the name by which Rhaſes, and ſome others, expreſs the FABAGO.

ANDORINHA, in *Zoology*, a name by which the Portugueſe in the Braſils call the Braſilian ſwallow, more uſually known by its Braſilian name *tapera*.

ANDRACHNE, in *Botany*, ſee *Baſtard* ORPINE.

ANDRACHNE is alſo a name given, by the ancients, ſometimes to a tree of the ARBUTUS, or ſtrawberry-tree kind, and ſometimes to the herb PURSLAIN. Some of the later Latin writers have alſo called it *porcala*, and ſome of the later Greeks have called it *cairobotanon*.

ANDRAPODISMUS, in *Ancient Writers*, the ſelling of perſons for ſlaves.

Hence alſo *andrapodiſtes*, ανδραποδιστης, a *dealer in ſlaves*, more particularly a *kidnapper*, who ſteals men or children, to ſell them; a crime the Theſſalians were noted for.

ANDRAPODOCAPELI, in *Antiquity*, a kind of dealers in ſlaves. The *andrapodocapeli* had a particular proceſs of taking off moles, and the like disfigurements on the faces of the ſlaves they kept for ſale, by rubbing them with bran.

At Athens ſeveral places in the forum were appointed for the ſale of ſlaves. Upon the firſt day of every month, the merchants brought them into the market, and expoſed them to ſale, whilſt the crier ſtanding upon a ſtone erected for that purpoſe, called the people together.

ANDREW, *Knights of St. Andrew*, or the thiſtle. See THISTLE.

Knights of St. Andrew, is alſo an order inſtituted by Peter the Great of Muſcovy, in 1698; the badge of which is a golden medal, on one ſide of which is repreſented St. Andrew's croſs, and on the other, are theſe words, *Czar Pierre, monarque de tout la Ruſſia*. This medal being faſtened to a blue ribbon, is ſuſpended from the right ſhoulder.

ANDREW'S *Croſs*, is a badge worn in the hat, by the people of Scotland, on the day of the feaſt of that ſaint.

It conſiſts of blue and white ribbands, diſpoſed into a croſs, or *ſaltier*; and is intended as a commemoration of the crucifixion of St. Andrew, the tutelary ſaint of Scotland.

ANDRIA, in *Antiquity*, a name given by the Cretans to the public entertainments, at which whole cities, tribes, or other bodies of men, were preſent.

The hall, or place of eating, where theſe entertainments were held, was denominated *andrion*, in the uppermoſt part of which was a conſtant table ſet apart for ſtrangers.

ANDRIA is alſo uſed by ſome naturaliſts, to denote a *ſpecies* of hermaphrodite, wherein the female ſex has the predominancy.

ANDRODAS, in *Ancient Writers*, denotes the ſixty-third year of man's life.

This is otherwiſe called *annus Ægyptius*, and *climacter magnus*.

ANDROGYNA, in *Botany*, plants bearing male and female flowers on the ſame root.

ANDROGYNUM, in *Eccleſiaſtical Writers*, is uſed to denote *matrimony*, or even one of the parties married.

ANDROGYNUM, *balneum*, denotes a bath common to both ſexes.

ANDROGYNUS, or ANDROGYNOUS, an HERMAPHRODITE, or one born with two ſexes, being male and female in the ſame perſon.

The word comes from ανδρογυνος, a compound of ανηρ, *man*, and γυνη, *woman*, q. d. *man-woman*.

The aſtrologers alſo give the appellation *androgynous* to ſuch of the planets as are ſometimes hot, and ſometimes cold; as mercury, which is reputed hot and dry when near the ſun, and cold and moiſt when near the moon.

ANDROIDES, an AUTOMATON, in the figure of a man; which, by virtue of certain ſprings, &c. duly contrived, walks, and performs other external functions of a man.

The word is compounded of ανηρ, ανδρος, *man*, and ειδος, *form*.

Albertus Magnus is recorded as having made a famous *androides.*

ANDROLEPSY, Androlepsia, in *Antiquity.*—If an Athenian were killed by a citizen of ſome other place, and ſuch city refuſed to deliver up the criminal to puniſhment, it was held lawful to take three inhabitants of that city, and puniſh the homicide in them.—This the Greeks called *androlepſia*, and the Romans CLARIGATIO. The word is formed of *ανηρ, man*, and *λαμϐανω, capio, I take.*

Some authors alſo uſe *androlepſia* for REPRISALS.

ANDROMACHI *theriaca*, or *treacle of* ANDROMACHUS, in *Pharmacy*, is a capital alexipharmic compoſition; called alſo *Venice Treacle.*

ANDROMEDA, in *Aſtronomy*, a conſtellation of the northern hemiſphere, repreſenting the figure of a woman chained.

It is ſuppoſed to have been formed in memory of *Andromeda*, daughter of Cepheus and Caſſiopeia, and wife of Perſeus, by whom ſhe had been delivered from a ſea-monſter, to which ſhe had been expoſed to be devoured for her mother's pride. Minerva tranſlated her into the heavens.

Dr. Hook thinks he has diſcovered the hidden meaning of the ſtory of *Andromeda.* Vid. Poſt. Works, p. 401.

The ſtars in the conſtellation *Andromeda*, in Ptolemy's catalogue are twenty-three, in Tycho's twenty-three, in Hevelius's forty-ſeven, in Mr. Flamſtead's no leſs than ſixty-ſix.—They are as follow.

Situation of ſtars.	Bayer's Char.	Signs	Longitude			Latitude			Magnitude

Andromeda, in *Botany*, of the *decandria monogynia.* We have no Engliſh name for this plant. The characters are, that the empalement of the flower is cut into five ſmall acute ſegments. The flower is of one leaf, oval, and bell-ſhaped, and is divided into five parts at the brim, which are reflexed. It hath ten ſtamina; the germen afterwards turns to a round, pentagonal veſſel, having five cells, which are filled with ſmall round ſeeds. Mr. Miller enumerates five ſpecies, moſt of which are natives of America.

Andromeda, in *Middle Age Writers*, denotes a kind of garment made of rams-ſkins.

ANDRON, or Andrum, in *Antiquity*, an apartment in houſes aſſigned for the uſe of the men. This was otherwiſe denominated *androna*, and *andronitis.*

The *andron* ſtood oppoſed to the GYNECÆUM, or apartment of the women.

The Greeks alſo gave their dining-rooms the title *andron*, becauſe the women had no admittance to feaſts with the men.

ANDRONA, in *Ancient Writers*, denotes a ſtreet, or public place, where people met and converſed together.

In ſome writers *androna* is more expreſly uſed for the ſpace between two houſes. In which ſenſe, the Greeks alſo uſe the term *ανδρωνας*, for the way or paſſage between two apartments.

The word is ſometimes alſo written *andra, andrion*, and *andronium.*

Androna is alſo uſed, in *Eccleſiaſtical Writers*, for that part in churches deſtined for the men. Anciently it was the cuſtom for the men and women to have ſeparate apartments in places of worſhip, where they performed their devotions aſunder; which method is ſtill religiouſly obſerved in the Greek church.

The *ανδρων*, or *androna*, was in the ſouthern ſide of the church, and the womens apartment on the northern.

ANDRONION, in *Phyſic*, the name of a paſtil, invented by an ancient phyſician named Andro, ſaid to have been of great efficacy againſt the carbuncle and HERPES.

Its ingredients, according to Ægineta's preſcription, are the *ſquamæ* of copper, *æs uſtum, ſal armoniac, alumen rotundum*, ſhavings of verdigris, and frankincenſe, all wrought up with wine. Celſus gives another recipe, and Aetius a third.

ANDROPHAGI, among *Ancient Geographers*, denotes man-eaters.

Theſe are more uſually called *anthropophagi.*

Herodotus, and Pomp. Mela, ſpeak of a nation of *androphagi* in Scythia.

ANDROPOGON, in *Botany*, a genus of the *polygamia monoecia.*

ANDROSACE, in *Botany.* We have no Engliſh name for this plant. The characters are, that the flowers grow in an umbel ſet in an involucrum, and is divided into five parts. It hath five ſmall ſtamina within the tube, the empalement afterward becomes a round capſule of one cell, which is full of round ſeeds. It is of the *pentandria monogynia* claſs.

Mr. Miller enumerates three ſpecies.

The *androſaces* approach much to the nature of the auricula, but differs from the ſtructure of the flower.

Androſace is ſo called, from its bringing relief to men, q. d. *ανδρι ακος φερυσα.* It is aperitive, and good for the dropſy, for retention of urine, and for the gout.

ANDROSÆMUM, in *Botany*. See *St.* JOHN'*s Wort.*

ANDROTOMY, or ANDRATOMY, the *anatomy* or DISSECTION of human bodies.

It is thus called in oppoſition to *zootomy*, which is uſed to denote that of brutes.

Anatomy is the *genus*, and comprehends all diſſections in general, whether of men, beaſts, or plants; and *androtomy* and *zootomy* are the *ſpecies.*

ANDRUM, in *Phyſiology*, a local diſeaſe, epidemical among the people of Malabar, being a peculiar ſpecies of *hydrocele*, or watery tumour of the *ſcrotum.*

The *andrum*, in the language of the country, is alſo called *perical*; ſometimes paraphraſtically, *andu wajaku*, q. d. *a popular water rupture.*

Its origin is derived from the vicious quality of the country waters, impregnate with corroſive muriatic ſalts, the ſource of moſt other diſeaſes that effect the Malabarians.

Its ſigns, or ſymptoms, are an eryſipela of the *ſcrotum*, returning every new moon, by which the lymphatics being eroded, pour a ſerous ſaline humour into the cavity of the *ſcrotum.*

The *andrum* is incurable; thoſe once ſeized with it, have it for life; but it is not dangerous, nor very troubleſome, to thoſe uſed to it; though ſometimes it degenerates into a hydroſarcocele.

The means of prevention is by a heap of ſand fetched from a river of the province Mangatti, and ſtrewed in the wells. This is practiſed by the rich. As to the cure, they have only a palliative one, which is by inciſion, or tapping and drawing off the water from the *ſcrotum*, once in a month or two.

ANDRYALA, in *Botany*, of the *ſyngeneſia polyg. æqual.* 820. Downy SOW-THISTLE. The characters are, that it hath a ſhort round hairy empalement; the flowers are compoſed of many hermaphrodite flowers, which are uniform and of one leaf, ſtretched out like a tongue on one ſide. The germen is ſituated at the bottom of each floret; and becomes afterward, a ſingle oval ſeed, crowned with a down.

Mr. Miller enumerates two ſpecies, which are natives of the ſouthern parts of Europe.

ANECDOTES, ANECDOTA, a term uſed by ſome authors, for the titles of *Secret Hiſtories*; but it more properly denotes a relation of detached and intereſting particulars.

The word is Greek, *ανεκδοτα*, q. d. *things not yet known*, or *hitherto kept ſecret.*

Procopius gives this title to a book which he publiſhed againſt Juſtinian, and his wife Theodora; and he ſeems to be the only perſon among the ancients, who has repreſented princes ſuch as they are in their domeſtic relation.—Varillas has publiſhed *anecdotes* of the houſe of Medicis.

ANECDOTES is alſo an appellation given to ſuch works of the ancients as have not yet been publiſhed.

In which ſenſe, M. Muratori gives the name *Anecdota Græca* to ſeveral writings of the Greek fathers, found in the libraries, and firſt publiſhed by him.—F. Martene has given a *Theſaurus Anecdotarum Novus*, in folio, 5 vols.

ANEE, in *Commerce*, denotes a corn-meaſure, uſed in ſome provinces of France, particularly in Languedoc and Maconnois.

It is otherwiſe called *aſnee.*

The *anee* is not ſo properly a meaſure, as a denomination, or aſſemblage of a certain number of other meaſures.

The *anee* at Lyons conſiſts of ſix *bichets*, equal to one *ſeptier* and three buſhels, Paris meaſure. At Macon, the *anee* is ſomewhat more.

ANEE is alſo uſed for a quantity of wine, ſuppoſed to be an aſs's load; and is fixed to eighty pots.

ANELE, or ANIL, the ſame with *indigo.* 23 El. cap. 9.

ANEMIUS *furnus*, among *Chemiſts*, a wind-furnace; uſed to make fierce fires for melting, &c.

The word is formed of *ανεμος*, *wind.*

ANEMOMACHIA, in ſome *Ancient Writers*, denotes a whirlwind, or hurricane.

In which ſenſe, we ſometimes alſo meet with *anomozale*, *anemotaraxis*, &c.

ANEMOMETER, a machine wherewith to meaſure the ſtrength of the wind.

The word is compounded of *ανεμος*, *wind*, and *μετρον*, *meaſure.*

The *anemometer* is variouſly contrived. In the Philoſophical Tranſactions we have one deſcribed, wherein the wind being ſuppoſed to blow directly againſt a flat ſide, or board, which moves along the graduated limb of a quadrant, the number of degrees it advances ſhews the comparative force of the wind.

Wolfius gives the ſtructure of another, which is moved by means of ſails, A B C K (*Tab. Pneumatics, fig.* 17), like thoſe of a wind-mill; which raiſe a weight, L, that, ſtill the higher it goes, receding farther from the centre of motion, by ſliding along an hollow arm K M, fitted on to the axis of the ſails, becomes heavier and heavier, and preſſes more and more on the arm, till being a counterpoiſe to the force of the wind on the ſails, it ſtops the motion thereof. An index, then, MN, fitted upon the ſame axis at right angles with the arm, by its riſing or falling, points out the ſtrength of the wind, on a plane divided like a dial-plate into degrees.

It is objected to this machine, however, that it requires a conſiderable wind to make it work. Leutmannus has contrived another, wherein the ſails are horizontal, and are more eaſily driven about, and will turn what way ſoever the wind blows.

M. d'Ons en Bray invented a new *anemometer*, which of itſelf expreſſes on paper, not only the ſeveral winds that have blown during the ſpace of twenty-four hours, and at what hour each began, and ended, but alſo the different ſtrength, and velocities, of each. V. Mem. Acad. Scienc. an. 1734. p. 169.

ANEMONE, in *Botany*, wind-flower, a genus of the *polyandria polygynia* claſs. Its characters are, that the flower is naked, having no empalement, and conſiſts of two or three orders of leaves, or petals, which are oblong, and diſpoſed in three ſeries over each other. It hath many germens collected into a head, which afterward become ſo many ſeeds incloſed with a down, which adhere to the foot-ſtalk, and form an obtuſe cone.

Mr. Tournefort enumerates 168 ſpecies; Mr. Miller, however, mentions no more than 6.

The proper ſoil and culture of the many varieties of this beautiful flower are theſe: for the ſoil, take a quantity of freſh light ſandy loam, or hazel-earth from a common, or dry paſture, not dug above eight or ten inches deep; mix this with a third part its quantity of rotten cow-dung, and lay it up in a heap; turn this over at leaſt once a month, and every time pick out the ſtones and break the clods. After this mixture has been twelve months made, it will be fit for uſe.

The beds of this earth muſt be prepared in September, and ſhould be made eight inches deep, if it be in a wet ſoil; but if in a dry one, three or four inches will be ſufficient; three weeks after this has been laid in, ſtir it for ſix inches deep with a ſpade, and then with a ſtick draw lines each way of the bed, at four inches diſtance, ſo that the whole may be in ſquares; then make a hole three inches deep in the center of each ſquare, and plant a root in each; and when all are planted, rake the earth of the whole bed ſmooth, ſo as to cover the roots two inches thick. The ſeaſon of planting theſe roots for forward flowers, is the middle of September, and for the later in October: this is beſt done at a time when there are gentle rains. Some roots ſhould alſo be ſaved to be planted after Chriſtmas, for fear of accidents to the former from very hard weather.

Theſe uſually flower three weeks after thoſe planted in autumn. In the beginning of April the early planted roots will begin to flower, and they will keep in flower near a month, if the weather prove favourable, and they are properly ſhaded with mats, laid over hoops in the greateſt heat of the day: the ſecond, and laſt planted ones, will follow theſe; and, in the whole, there will be at leaſt two months fine flowering.

Toward the latter end of May the firſt planted roots will loſe all their leaves, and they muſt be then taken up and waſhed clean, and laid to dry on mats in the ſhade; after which they are to be put up in paper bags, and hung up till the time of planting them comes on again. The later planted ones are to be taken up alſo as ſoon as their leaves are decayed, and not ſuffered to remain to make new ſhoots; for then it is too late to remove them.

They are propagated two ways, either by dividing the roots, or by ſowing. The roots are to be divided as ſoon as they are taken up out of the ground: they will ſucceed if broken into as many parts as there are eyes or buds in them; but they flower moſt ſtrongly, if not parted too ſmall.

The way, by ſowing is this: chooſe firſt ſome good kinds of *anemones*, plant theſe early, and they will produce ripe ſeed three weeks after the flower firſt blows. This muſt be carefully gathered, and in Auguſt it ſhould be ſowed in pots or tubs, or a very well prepared bed of light earth, rubbing it between the hands with a little dry ſand, to prevent ſeveral of the ſeeds from clinging together, and ſpreading them as even as poſſible all over the bed; after this a light hair-bruſh ſhould be drawn many times over the ſurface of the bed, to pull aſunder any lumps of ſeed that may yet have fallen together; obſerving not to bruſh off the ſeed, and as much as poſſible not to bruſh it into heaps. When this is done, ſome light earth, about a quarter of an inch deep, ſhould be ſifted over the bed. If the weather be hot, the bed muſt be at times covered with mats laid hollow, and gently watered.

In about two months after ſowing, the plants will appear, if the ſeaſon has been favourable, and they are to be carefully defended from the hard froſts by proper covering, and from the heat of the ſun afterwards by a moveable reed-fence. As the ſpring advances, if the weather be dry, they muſt be gently watered, and when their green leaves decay, there muſt be a quarter of an inch more earth ſifted over them, and the like again at Michaelmas; and the bed muſt be kept clear from weeds, and the following ſpring they will flower.

The *anemones* are good for pains of the head, and for inflammations; help diſeaſes of the uterus, and procure milk into the breaſts. Taken in ptiſan, or applied to the part in wool, they provoke the menſes. The root, chewed in the mouth, draws out phlegm, and makes the teeth ſound; and the decoction thereof cures inflammations in the eyes.

All the *anemones* are acrimonious and deterſive, drawers, and endued with the faculty of opening the mouths of the veins.

Anemonies, *ſea*, a ſpecies of the ACTINIA, the hiſtory of which has been lately elucidated by the abbé Dicquemarre. He has already diſcovered four or five different ſpecies of them. They vary in their ſize, ſhape, and colour; but are generally found to reſemble a truncated cone, and many of them are of an uniform colour, whilſt others are ſpotted either in regular ſtripes, or in a more irregular manner. They are found adhering to rocks or ſtones in the ſand, or in oyſter-beds; and they are obſerved to ſtretch out their limbs and mouth, in order to lay hold of any thing that touches the ſurface of the ſand, &c. where they lie. This accurate obſerver could eaſily diſtinguiſh theſe animals from plants by their progreſſive motion, by the means they make uſe of to ſeize their prey, and to defend themſelves, by their deglutition, digeſtion, and evacuations, and alſo by the propagation of their ſpecies. He accordingly claſſes them among ſpontaneous animals.

The *anemonies* have a wonderful faculty of reproduction; for, by many experiments, M. Dicquemarre aſcertained this property, and he conjectures that it is owing to their gelatinous texture. Their limbs budded out ſucceſſively after ſeveral amputations. Nay, ſome of them were diſſected through the body; and the baſis, together with that part of the ſtump which was left ſurvived, projected new limbs, and the animal moved and eat bits of muſcles, which are its uſual nouriſhment. They appeared to bear a conſiderable degree of heat, and to live in a vacuum, at leaſt in a very rare air; and they require, for a very conſiderable time, no other food than what they find diſſeminated in ſea-water.

Anemonies are irritable to ſuch a degree, that light very much affects them, though to appearance they have no eyes; and by means of this property, the Abbé has made uſe of them for indicating the different changes of temperature in the atmoſphere; and he gives the following account of this new kind of *barometers.*—The ſea-water, in which the *anemonies* are placed, muſt be renewed every day, and this muſt be their only nouriſhment; and the obſervation ſhould be made at intervals equally diſtant from the renewals of the water. If the *anemonies* be ſhut and contracted, there is reaſon to apprehend an approaching ſtorm; that is, high winds, and a rough, agitated ſea. When they are all ſhut, but not remarkably contracted, they forebode a weather ſomewhat leſs boiſterous, but ſtill attended with gales, and a rough ſea. If they appear in the leaſt open, or alternately and frequently opening and cloſing, they indicate a mean ſtate both of winds and waves. When they are quite open, tolerably fine weather, and a ſmooth ſea, may be expected. And laſtly, when their bodies are conſiderably extended, and their limbs divergent, they ſurely prognoſticate fixed, fair weather, and a very calm ſea. The glaſs in which they are depoſited may be ſwung at ſea, in the ſame manner as the compaſs, ſo that the rolling of the ſhip may agitate the water as little as poſſible. Theſe animals are viviparous; for ſeveral of them brought forth eight, ten, and twelve young ones, in the hand. They feed upon wandering nettles, or ſea-jellies; and they are all fit for food. Upon being removed into freſh water, they acquire a pale colour, their coat becomes flabby, and they ſoon die. Phil. Tranſ. vol. lxiii. part 2. vol. lxv. part 2. and vol. lxvii. part 1. See ACTINIA, ANIMAL *flower*, URTICA *Marina*, &c.

ANEMONOSPERMOS, in *Botany*. See ARCTOTIS.

ANEMOSCOPE is ſometimes uſed for a machine invented to fortel the changes of the wind.

The word is derived from *ανεμος*, *wind*, and *σκεπτομαι*, *I conſider*.

It has been obſerved, that HYGROSCOPES made of cat's-gut, &c. prove very good *anemoſcopes*; ſeldom failing, by the turning of the *index* about, to foretel the ſhifting of the wind. See an account of two different *anemoſcopes*; one by Mr. Pickering. Phil. Tranſ. vol. xliii. part 2. p. 9. the other by Mr. Martin, in his Philoſ. Brit. vol. ii. p. 211.

The *anemoſcope* uſed by the ancients ſeems, by Vitruvius's deſcription of it, to have been intended rather to ſhew which way the wind actually blew, than to fortel into which quarter it would change.

Otto de Gueric alſo gave the title *anemoſcope* to a machine invented by him, to foretel the change of the weather, as to fair and rain.

It conſiſted of a wooden little man, who roſe and fell in a glaſs tube, as the atmoſphere was more or leſs heavy.—Accordingly, M. Comiers has ſhewn, that this *anemoſcope* was only an application of the common BAROMETER. See WIND.

The *anemoſcope* of Vœroe is famous. It is made of the bird *lunde*, whoſe feathers are picked, the ſkin ſtripped off, *viſcera* taken out, and the ſkin in this ſtate drawn anew over the bones, this being hung up in the chimney, is ſaid always to direct its bill to the point from whence the wind is like to blow. Ephem. Acad. N. C. Dec. 3. An. 9. App. p. 245.

ANETHUM, in *Botany*. See DILL.

ANETHUM, *aſhes of*, *cinis anethi*, are procured by mere conflagration. They are commended by Galen in humid ulcers, eſpecially about the *pudenda*.

ANETHUM, *water of*, *aqua anethi*, is procured from the leaves, while in flower, by diſtillation in *balneo mariæ*. It is accounted ſtomachic, carminative, and anodyne.

ANETHUM, *oil of*, is either procured by infuſion, or diſtillation. The former kind is preſcribed by Dioſcorides, as a proper emollient for diſorders of the privities; alſo a warm diſcutient, digeſtive, &c. The latter is held to be aromatic, ſtomachic, &c.

ANEURYSM, ANEURYSMA, in *Medicine*, a ſoft, throbbing, ruddy tumour, occaſioned by a dilatation, or by a wound of an artery.

The word comes from *ανευρυνω*, *dilato*, *I dilate*.

Surgeons diſtinguiſh two kinds of *aneuriſm*, which they call the true and the ſpurious. The true *aneuriſm* is formed by a dilatation only of the artery, either all round, or only on one ſide, much in the manner of the *varices* or tumours of the veins; this has always a pulſation.

This kind of *aneuriſm* is ſeldom fatal; though reckoned, when large, incurable; the chief inconveniencies are, the magnitude of the tumour, and the pulſation.

Mr. Littre gives us the hiſtory of an *aneuryſma* of this kind, in the *aorta*; the cauſe whereof he attributes to an extraordinary diminution of the cavity of the axillary and ſubclavian arteries. Hiſt. de l'Acad. Roy. an. 1712.

Another hiſtory of an *aneuryſma* of the ſame part we have, by Mr. Laſage, in the Philoſophical Tranſactions. It was occaſioned by ſome violent ſhocks the patient received on the breaſt, which threw him into ſpitting of blood, and ſoon after formed the tumour, whereof he died. Upon diſſection, the *aneuryſma* was found ſo big, that it filled the whole cavity of the thorax on the right ſide.

There is another remarkable hiſtory of an *aneuriſm*, in the London Medical Obſervations. There is alſo a remarkable caſe of the ſame kind, with an account of the uncertainty of diſcovering the ſymptoms of the diſeaſe, by Joſ. Warner, F. R. S. Phil. Tranſ. vol. l. part 1. N° 44. an. 1757.

The ſpurious *aneuriſm* is, when the artery having been opened by puncture or inciſion, or other accident, the blood is extravaſated between the muſcles and integuments, and the limb appears ſwelled and livid, and there is little or no pulſation. The moſt common ſeat of an *aneuriſm* is in the brachial artery, and its moſt common occaſion a puncture of that artery in bleeding; but the ſame accident may happen to any artery, and from various cauſes, and is often the caſe in the internal arteries, from falls, blows, and violent ſtrains; in the arm it often happens from the outer coat only of the artery having been cut in bleeding, and the inner one giving way by degrees, as not of ſtrength to bear the impulſe of the blood. Theſe are at firſt very ſmall, and diſregarded by the patient, but they grow at length to the ſize of an egg, and ſometimes even to that of a man's head.

The *aneuriſms* of the great internal arteries are the moſt fatal of all; thoſe of their external branches are often remedied, but thoſe in the arm frequently after the operation are attended with a waſting of the arm, and an amputation becomes neceſſary. The natural burſting of an *aneuriſm* is very dangerous, as the patient may be loſt in a minute's time, if the artery be not compreſſed above; ſometimes ſurgeons have alſo opened the larger *aneuriſms*, miſtaking them for abſceſſes.

The method of curing a ſlight *aneuriſm* in the arm, or elſewhere, is either by deligation and compreſſion, or by inciſion; the firſt ought always to be firſt tried, and is done either by ſtrait bandages with compreſſes, or by an engine invented for that purpoſe. Small *aneuriſms* are often thus cured; but when large and dangerous the operation by the knife muſt be uſed. In this the firſt care is to ſtop the courſe of the blood by the tournequet, the ſecond to denudate the artery, and free it from the adjacent integuments, and the laſt to contract or conſtringe it either by medicine or ligature.

The ſpurious *aneuriſm* is often produced by the burſting of the true kind, under the integuments, and in this caſe is to be treated as the true, and cured by the operation with the knife, and by ligature, or cauſtics; but in all theſe caſes, the ligature ſeems the beſt method.

When any part of an artery has loſt its ſpring, it is leſs capable than before to reſiſt the impulſe of the blood. This part of a canal, which is continually puſhed by the blood, muſt therefore become gradually more and more dilated; and by degrees there becomes formed in the part that ſort of tumour which ſurgeons and anatomiſts call an *aneuriſm* by dilatation, or the true *aneuriſm*; and this dilated part of the veſſel is, properly ſpeaking, a kind of bag through which the blood that firſt formed it is continually paſſing.

When an artery has been by any means wounded, the blood which eſcapes through the orifice cauſes another ſort of tumour; and this is called an *aneuriſm by wounding*, or a ſpurious *aneuriſm*. Heiſter.

The moſt common *aneuriſms* by wound happen from bleeding in the arm; in theſe, if the artery be but ſlightly wounded, and the bandage and compreſs properly applied, the cure is often performed, ſo that no farther miſchief enſues; but if the wound is larger, or the compreſſion leſs regular, bad ſymptoms come on ſooner or later, and there often is a neceſſity at laſt of ſubmitting to the operation of opening the ſkin, diſperſing the blood, and cloſing the veſſel. Mem. Acad. Scienc. Par. 1736.

Dr. Hunter, who has treated largely on this ſubject, divides *aneuriſms* into four kinds, the *true*, the *falſe*, the *mixed*, and the *varicoſe*. The *true aneuriſm* is formed by a dilatation of the artery, and may happen in any part of the body. The *falſe aneuriſm* is formed by a rupture, or wound, in the coats of the artery, and may be either *diffuſed* or *circumſcribed*. The *mixed aneuriſm* is formed partly by wound, or rupture, in the artery, and partly by dilatation.

The *varicoſe aneuriſm* is owing to the wound of an artery through a vein, ſo that the blood paſſes from the trunk of the artery into the trunk of the vein, and ſo back to the heart. See Lond. Med. Obſ. and Inq. vol. i. art. 26. vol. ii. art. 30 and 36. vol. iii. art. 37. 12.

If an artery happens to be cut, the blood guſhes out impetuouſly, by ſtarts, and is not eaſily ſtopped; and an inflammation and diſcoloration of the part ſucceeds, with a tumour, and inability to move the part. The ſymptoms are nearly the ſame in caſe of a corroſion of the coats of the artery; only in this caſe they are leſs violent.

If the blood ceaſe to flow from the wounded artery, and pour itſelf between the interſtices of the muſcles, recourſe is had to manual operation; which being neglected, the extirpation of the limb frequently becomes unavoidable. See caſes of *aneuriſms*, with remarks, by Dr. Donald Monro, in the third volume of Eſſ. Phyſ. and Liter. Edinb. 1771. art. 12. p. 178.

ANFELDTYHDE, or Anfealthile, in *Law*, a ſimple accuſation; for the Saxons had two ſorts of accuſation, viz. *ſimplex* and *triplex*. That was called ſingle, when the oath of the criminal, and of two more, were ſufficient to diſcharge him: but his own oath, and the oaths of five more, were required to free him *a triplice accuſatione*.

ANGARI, or Angarii, in *Antiquity*, denote public couriers, appointed for the carrying of meſſages.

The ancient Perſians, Budæus obſerves, had their αγγαρειον δρομημα, which was a ſet of couriers on horſeback, poſted at certain ſtages or diſtances, always in readineſs to receive the diſpatches from one, and forward them to another, with wonderful celerity, anſwering to what the moderns call poſts, q. d. *poſiti*, as being poſted at certain places or ſtages.

The *angari* were alſo called by the Perſians *aſtandæ*; by the Greeks ἡμεροδρομοι, on account of the long journies they made in one day, which according to Suidas amounted not to leſs than 1500 ſtadia.

Angari is alſo applied figuratively to porters, and others employed in laborious offices, as bearing burdens.

ANGARIA is uſed, in a general ſenſe, for any burden, or incumbrance, forcibly impoſed on perſons.

Some define *angariæ*, by perſonal ſervices, which a party is compelled to diſcharge in his own perſon, or to ſerve at his own expence.—Or, ſuch ſervices impoſed on lands, whereby a perſon is obliged to work for another, either with his horſe, his aſs, or the like.

Angaria, in the *Civil Law*, denotes a duty required of the ſubjects to furniſh out horſes and carriages for conveying of corn for the ſoldiers, and ſuch things as belonged to the *fiſcus*.

This duty goes by the name of *curſus publicus*, *angariæ*, *parangariæ*, *tranſlatio*, and *evectio*. The horſes uſed in this ſervice are particularly called *paraveredi*, and *equi curſuales*.

Angariæ are generally underſtood as excluſive of ſhip though on ſome occaſions theſe were preſſed into the ſervice for tranſporting proviſions and the like.

Angariæ differs from *parangariæ*, in that the former are confined to public or main roads, the latter to oblique or croſs-roads.

In the book of feuds, the performance of *angariæ* and *parangariæ* is ranked in the number of royal ſervices. Lib. ii. tit. 56.

Angaria is alſo uſed, in *Ancient Military Writers*, for a guard of ſoldiers poſted in any place for the ſecurity of it.

ANGEIOGRAPHIA, the knowlege, or deſcription, of all kinds of ancient inſtruments, veſſels, and utenſils, both domeſtic, military, and nautical.

The word is compounded of αγγειον, *vas*, *veſſel*, and γραφω, *ſcribo*, *I deſcribe*.

Angeiography alſo includes the conſideration of the weights, measures, &c. uſed by the ſeveral nations.

ANGEIOLOGY, Angeiologia, in *Anatomy*, the hiſtory, or deſcription, of the veſſels in a human body; e. gr. the nerves, veins, and lymphatics.—See *Tab. Anat.* part II.

The word is derived from αγγειον, a *veſſel*, and λογος, *diſcourſe*.

Angeiology is a branch of sarcology.

ANGEIOTOMY, in *Surgery*, is uſed by ſome to denote an artificial ſection of the veſſels, as in bleeding.

The word is formed of αγγειον, *veſſel*, and τεμνω, *ſeco*, *I cut*.

In this ſenſe *angeiotomy* may be divided into phlebotomy and arteriotomy.

ANGEL, a ſpiritual, intelligent ſubſtance; the firſt in rank and dignity among created beings.

The word *angel* is not properly a denomination of nature, but of office; denoting as much as *nuntius*, *meſſenger*, a perſon employed to carry one's orders, or declare his will.—Thus it is St. Paul repreſents *angels*, Heb. i. 14. where he calls them *miniſtring ſpirits*; and yet cuſtom has prevailed inſomuch, that *angel* is now commonly taken for the denomination of a particular nature.

The exiſtence of *angels* is ſuppoſed in all regions, though it is incapable of being proved *a priori*.—Indeed, the ancient Sadducees are repreſented as denying all ſpirits; and yet the Samaritans and Caraïtes, who are reputed Sadducees, openly allow them: witneſs Abuſaid, the author of an Arabic verſion of the Pentateuch; and Aaron, a Caraïte Jew, in his comment on the Pentateuch; both extant in manuſcript in the king of France's library.

In the Alcoran, we find frequent mention of *angels*.—The Muſſulmen believe them of different orders or degrees, and to be deſtined for different employments both in heaven, and on earth. They attribute exceeding great power to the angel Gabriel; as, to be able to deſcend in the ſpace of an hour from heaven to earth; to overturn a mountain with a ſingle feather of his wing, &c. The *angel* Aſrael, they ſuppoſe, appointed to take the ſouls of ſuch as die; and another angel, named Eſraphil, they ſay, ſtands with a trumpet ready in his mouth to proclaim the day of judgment.

The heathen philoſophers and poets were alſo agreed as to the exiſtence of intelligent beings, ſuperior to man; as is ſhewn by St. Cyprian, in his treatiſe of the vanity of idols, from the teſtimonies of Plato, Socrates, Triſmegiſtus, &c.

Authors are not ſo unanimous about the nature as about the exiſtence of *angels*.—Clemens Alexandrinus believed they had bodies; which was alſo the opinion of Origen, Cæſarius, Tertullian, and ſeveral others. Athanaſius, St. Baſil, St. Gregory Nicene, St. Cyril, St. Chryſoſtom, &c. hold them to be mere ſpirits.

Eccleſiaſtical writers make an hierarchy of nine orders of *angels*.

By the ancient councils, men are forbid to frame or give particular names to *angels*; the only names owned by the church are Michael, Gabriel, and Raphael, to which is ſometimes added Uriel.

Before the Babyloniſh captivity the Jews did not know the name of any *angel*; at leaſt we find none mentioned in the books written before this event.

Authors are divided as to the time of the creation of *angels*; ſome will have it to have been before the creation of our world, or even before all ages, that is, from eternity; this was Origen's opinion, who, according to Leontius, held that all ſpirits, *angels*, devils, and even human ſouls, were from eternity.

Others hold *angels* to have been created before the world, yet not from eternity; of which opinion are Nazianzen, and others. Others again maintain that they were created at the ſame time with our world, but on what day is diſputed. Theodoret and Epiphanius fix their date from the firſt day.

Good *angels* are called *angels of light*, and *guardian angels*; and thoſe on the contrary, who are the *devil's* miniſters, *angels of darkneſs*, and *fallen angels*.

Angel is more particularly underſtood of a ſpirit of the ninth and loweſt claſs, or order of the HIERARCHY, or heavenly choir.

There was an officer of the Synagogue, among the Jews, who had the name of *angel*; and he was called חזן, or *epiſcopus*, becauſe he overlooked the reader of the law.

In the Apocalypſe, the denomination *angel* is alſo given to the paſtors of ſeveral churches; who are called, the *angel* of the church of Epheſus; the *angel* of the church of Smyrna, &c. Du Cange adds, that the ſame name was anciently given to certain popes, and biſhops; by reaſon of their ſingular ſanctity, &c.

Angel is alſo uſed, in *Commerce*, for an ancient gold coin ſtruck in England; ſo called from the figure of an *angel* impreſſed upon it.

Its value in 1 Hen. VI. was 6*s.* 8*d.* in 1 Hen. VIII. 7*s.* 6*d.* in 34 Hen. VIII. 8*s.* in 6 Edw. VI. it was 10*s.* in 2 Eliz. it was 10*s.* and in 23 Eliz. the ſame.—And the *half angel*, or, as it was ſometimes called, the *angelet*, was the moiety of this; and the *quarter angelet*, proportionable.

The *angel* now ſubſiſts no otherwiſe than as a money of account; denoting 10*s.*

The French have alſo had their *angels*, *demi-angels*, and *angelets*; but they are now diſuſed.

Angel-*fiſh*, in *Ichthyology*, the Engliſh name of the fiſh called by the generality of authors the SQUATINA, and by ſome the SQUATUS and RHINE. It is alſo called the MONK-*fiſh*, and is, according to the Artedian ſyſtem, a ſpecies of the *ſqualus*, diſtinguiſhed from the others of that genus by the name of the *ſqualus* with no *pinna ani*, and with the mouth placed in the top of the head.

ANGELIC, or Angelical, ſomething belonging to, or that partakes of the nature of *angels*.

We ſay an *angelical* life, &c.—St. Thomas is ſtyled the *angelical doctor*.—The *angelical* ſalutation is called by the Romaniſts *Ave Maria*; ſometimes ſimply *angelus*.

Angelic *garment*, Angelica *veſtis*, among our *Anceſtors*, was a monkiſh garment, which laymen put on a little before their death, that they might have the benefit of the prayers of the monks.

It was from them called *angelical*, becauſe they were called *angeli*, who by theſe prayers *animæ ſaluti ſuccurrebant*.—Hence, where we read the phraſe *monachus ad ſuccurrendum* in our old books, it muſt be underſtood of one who had put on the habit when he was at the point of death.

ANGELICA, in *Botany*, of the *pentandria digynia*, a medicinal plant, of which the characters are, that it is umbelliferous, the greater umbel being compoſed of many ſmall ones; the empalement of the flowers is indented into five parts; the flowers of the whole umbel are uniform. The germen is ſituated below the flower, which afterward becomes a roundiſh fruit, ſplitting into two, and compoſed of two ſeeds, which are plain on one ſide, and convex on the other, and are bordered.

Mr. Miller enumerates five ſpecies.

It grows in gardens, and flowers and ſeeds in June and July; the root periſhing after the ripening of the ſeed, which is in the ſecond year of its growth. It is of a ſweet ſmell, of an aromatic taſte, and is loaded with a highly exalted oil, and volatile ſalt.

The roots of the garden *angelica* are of conſiderable uſe in medicine; the leaves alſo are ſometimes uſed, and the ſeeds. It is a ſtomachic, a cordial, and ſudorific; it is good in flatulencies, and is by many ranked among the vulnerary herbs. It is preſcribed in malignant diſeaſes of all kinds, againſt the effects of poiſon, and in the plague.

It has been a cuſtom with ſome phyſicians, in the times of contagion of this kind, to make a paſte of the freſh roots beaten with vinegar, and to carry this in a box about them readily to be applied to the noſe occaſionally; others prefer the holding a piece of the dry root in the mouth, and others the drinking a glaſs of ſtrong vinegar, in which it has been infuſed, faſting.

It has alſo been a cuſtom to ſprinkle the powder of the root over the cloaths of perſons who go among the infected, through an opinion that it preſerves them from imbibing the effluvia, which otherwiſe they might carry elſewhere.

A dram of the powder of the root alone, or half that quantity with a dram of venice treacle, are recommended to be given as a remedy in the plague, to be repeated every ſix hours, and a gentle ſweat to be kept up all the time.

The root is uſed in many of our ſhop compoſitions, as in the plague-water, &c. and the dried leaves are a principal ingredient in the ladies red-powder, famous in England for the cure of fevers.

The Laplanders are extremely fond of *angelica*, and uſe it in great abundance both in meat and medicine. They uſe only the ſtalks, never meddling with the roots or ſeed, in which we find the higheſt flavour, and greateſt virtue. They gather the large ſtalks before the plant is run to ſeed, and roaſt them or bake them till they are thoroughly tender, and then eat them as a delicate diſh.

When they are ſick, they boil either theſe ſtalks or the roots of the moſs, which they call *jerth*, in water, and in worſe caſes in whey made of rein-deer milk, and give large draughts of this decoction to keep up a breathing ſweat.

Angelica, *berry bearing*. See Aralia.

Angelica, *wild*. See Ægopodium.

Angelica-*water* is one of the compound waters of the ſhops; thus called from the *angelica* root, which is the chief ingredient in the compoſition, and the moſt active part of that plant. Neumann.

Angelica *grana*, a technical name given to Anderſon's Scots pills.

Angelica was alſo a celebrated dance among the ancient Greeks, performed at their feaſts.

It was thus called, from αγγελος, *nuntius*, *meſſenger*; becauſe, as Pollux aſſures us, the dancers were dreſſed in the habit of meſſengers.

ANGELICI, an ancient order of knights, inſtituted in 1191, by Iſacius Angelus Flavius Comnenus, emperor of Conſtantinople.

They were divided into three claſſes; but all under direction of one grand maſter.—The firſt were called *torquati*, from a collar which they wore, and theſe were fifty in number.—The ſecond were called the *knights of juſtice*, and were eccleſiaſtics.—And the third were called *knights ſervitors*.

Juſtiniani will have this order to have been inſtituted in the year 313, by Conſtantine; and ſuppoſes the occaſion thereof to have been the appearance of an angel to that emperor, with the ſign of a croſs, and theſe words, *In hoc ſigno vinces*; but, that there was ſuch a thing as any military order in thoſe days, is a mere fable.

Angelici were alſo a ſect of ancient Chriſtians.—St. Auguſtine ſuppoſes them thus called from their yielding an extravagant worſhip to angels, and ſuch as tended to IDOLATRY; though Epiphanius derives the name from their holding, that the world was created by angels.

ANGELINA *zanoni acoſtæ*, in *Botany*. This is a tree of vaſt ſize, ſometimes above ſixteen feet thick, growing on rocky and ſandy places in Malabar, in the Eaſt Indies. It bears ripe fruit in December, and continues bearing for a whole century.

The dried leaves heated, alleviate pains and ſtiffneſs in the joints, and diſcuſs an intumeſcence of the *teſtes* occaſioned by a contuſion, or any external violence; as alſo an *hydrocele*, or *pneumatocele*. It is efficacious likewiſe in ſome venereal complaints, and hæmorrhoidal fluxes.

ANGELITÆ, *Angelites*, in *Eccleſiaſtical Hiſtory*, certain Chriſtians, thus denominated from *Angelium*, the name of a place in Alexandria, where their firſt aſſemblies were held.

The *Angelites* appear to have been the ſame with what are otherwiſe called *Severites*, ſometimes *Theodoſiani* and *Damianiſti*, from the names of their leaders. Sometimes alſo *Tabellioniſtæ*.

They made their firſt appearance in the time of the emperor Anaſtaſius, and pope Symmachus, about the year of Chriſt 494.

The diſtinguiſhing tenets of the *Angelitæ* were, that the ſeveral perſons of the Trinity had no diſtinct eſſence, ſubſtance, or deity; but only a ſubſiſtence or deity in common, or indiviſible among them.

ANGELOLATRIA, the ſuperſtitious worſhip, or adoration of angels.

ANGELOLOGIA, the doctrine or ſcience of angels, their natures, office, &c.

Gerhard has publiſhed a ſacred *Angelologia*, Muſæus an apoſtolical *Angelologia*.

Some uſe the term *angeloſophia* in a ſenſe much the ſame. A. Varenius has given an *Angeloſophia*.

ANGELOGRAPHIA, a deſcription of angels, their orders, names, diſcipline, &c.

This amounts to much the ſame with what others call *angelologia.*

Caſmannus and Manitius have publiſhed *Angelographies.*

ANGELOT, an ancient Engliſh gold coin, ſtruck at Paris, while under ſubjection to the Engliſh.

It was thus called from the figure of an angel ſupporting the ſcutcheon of the arms of England and France.

There was another coin of the ſame denomination ſtruck under Philip de Valois.

ANGELOT is alſo uſed in commerce to denote a ſmall, fat, rich ſort of cheeſe, brought from Normandy.

Skinner ſuppoſes it to have been thus called from the name of the perſon who firſt made it up in that form, and perhaps ſtamped it with his own name. Menage takes it to have been denominated from the reſemblance it bears to the Engliſh coin called *angelot.*

It is made chiefly in the Pays de Bray, whence it is alſo denominated *angelot de Bray.*

It is commonly made in vats, either ſquare or ſhaped like a heart.

ANGELUS, in the *Church Hiſtory* of France, denotes a prayer to the Holy Virgin, to be rehearſed three times a day, at the ſound of a bell rung for that purpoſe.

The *angelus* is the ſame with what is otherwiſe called *Ave Maria*, or the angelic ſalutation.

ANGER.—Hutcheſon defines *anger*, a propenſity to occaſion evil to another, ariſing upon an apprehenſion of an injury done by him.

Anger is either deliberative or inſtinctive; and the latter kind is raſh and ungovernable, becauſe it operates blindly, without affording time for deliberation or foreſight. Biſhop Butler very juſtly obſerves, that *anger* is far from being a ſelfiſh paſſion, ſince it is naturally excited by injuries offered to others, as well as to ourſelves; and was deſigned by the Author of nature not only to excite us to act vigorouſly in defending ourſelves from evil, but to intereſt us in the defence or reſcue of the injured and helpleſs, and to raiſe us above the fear of the proud and mighty oppreſſor. Butler's Sermons, Serm. viii.

Anger is of ſuch a nature, that it quickly throws the whole nervous ſyſtem into preternatural commotions; by a violent ſtricture of the nervous and muſcular parts; and ſurpriſingly augments not only the *ſyſtole* of the heart, and of its contiguous veſſels, but alſo the tone of the fibrous parts in the whole body. It is alſo certain, that this paſſion, by the ſpaſmodic ſtricture it produces in the parts, exerts its power principally on the ſtomach and inteſtines, which are highly nervous and membranous parts; whence the ſymptoms are more dangerous, in proportion to the greater conſent of the ſtomach and inteſtines, with the other nervous parts, and almoſt with the whole body.

The unhappy influence of *anger* likewiſe, on the biliary and hepatic ducts, is very ſurpriſing; ſince by an intenſe conſtriction of theſe, the liver is not only rendered ſchirrhous, but ſtones alſo are often generated in the gall-bladder, and biliary ducts: theſe accidents have ſcarcely any other origin, than an obſtruction of the free motion and efflux of the bile, by means of this violent ſtricture. From ſuch a ſtricture of theſe ducts likewiſe proceeds the jaundice, which in proceſs of time lays a foundation for calculous concretions in the gall-bladder. Laſtly, by increaſing the motion of the fluid, or the ſpaſms of the fibrous parts, by means of *anger*, a larger quantity of blood is propelled with an *impetus*, to certain parts; whence it happens, that they are too much diſtended, and the orifices of the veins diſtributed there, opened. It is evident from experience that *anger* has a great tendency to excite enormous hæmorrhages, either from the noſe, the aperture of the pulmonary artery, the veins of the anus; or in women, from the uterus; eſpecially in thoſe previouſly accuſtomed and diſpoſed to ſuch evacuations.

For the influence of this paſſion on the perſpiration and urine of human bodies, ſee PERSPIRATION, &c.

ANGERONALIA, in *Antiquity*, ſolemn feaſts, held by the Romans, the 21ſt of December, in honour of Angerona, or Angeronia, the goddeſs of patience and ſilence.

Feſtus and Julius Modeſtus, quoted by Macrobius, Saturn. lib. i. cap. 10. derive the name from *angina*, *ſquinancy*; and ſuppoſe the goddeſs to have been thus denominated, becauſe ſhe preſided over that diſeaſe.—Others ſuppoſe it formed from *anger*, *grief*, *pain*; to intimate that ſhe gave relief to thoſe afflicted therewith. Others deduce it from *angeo*, *I preſs*, *I cloſe*; as being reputed the goddeſs of ſilence, &c.

ANGETENAR, in the *Arabian Aſtronomy*, denotes a fixed ſtar of the fourth magnitude, in the body of CETUS, or the WHALE.

ANGIGLOSSII denotes thoſe who ſpeak with difficulty, heſitation, or even ſtammering.

ANGILDUM, in our *Old Writers*, denotes a ſimple gild, that is, the ſimple value of the man, or other thing.

The word is compounded of the Saxon *an*, *one*, and *gild*, *payment*, *price*, or *compenſation.*

In this ſenſe, *angildum* ſtands contradiſtinguiſhed from *twigildum*, a *double compenſation*; *trigildum*, a *triple compenſation.*

ANGINA, in *Medicine*, an inflammation about the muſcles of the *larynx*, or *pharynx*, attended with an acute fever, difficulty of ſwallowing, and danger of ſuffocation.

The word is derived immediately from the Latin *ango*, *I vex*, formed of *αγχω*, *ſuffoco*, *ſtrangulo.*

The *angina* is the ſame with what we popularly call QUINZY, or *ſquinancy.* It is an inflammation in the parts of the throat ſubſervient to reſpiration, ſpeech, and deglutition. When the diſorder is epidemic, it is uſually between ſpring and ſummer, after a long continuance of cold and rainy weather. The true *quinzy* is an acute inflammatory diſorder; the baſtard *quinzy* is a lymphatic, catarrhal diſorder; and the fever that accompanies it is not acute, but rather chronical.

ANGINA *gangrena*, or *aquoſa*, the ulcerated, malignant, putrid, *ſore* THROAT; on which there are various treatiſes by Fothergill, Huxham, Northcote, &c.

ANGINA *lini*, in *Botany*, a name uſed by ſome of the later Greek writers, to expreſs what the more ancient writers of this nation called *linozoſtis*, and the Latins *epilinum*; this was the *cuſcuta* or *dodder* growing on the flax, as that on the thyme was called *epithymum.* It was called *angina lini*, the quinzy of flax, from its choaking that plant.

ANGINA *pectoris*, in *Medicine*, a name given to a diſeaſe, dangerous, and not extremely rare, firſt deſcribed by Dr. W. Heberden, and ſo called from the ſeat of the diſorder, and the ſenſe of ſtrangling and anxiety with which it is attended. The doctor's account of it is in the ſecond volume of the London Medic. Tranſ. p. 59, &c. See alſo Medic. and Phil. Comment. vol. ii. p. 95. The patient while walking, eſpecially if ſoon after eating, is affected with a painful ſenſation in his breaſt; at firſt, it is removed by his ſtanding ſtill, but afterwards it does not go off ſo ſuddenly; it comes on in bed, obliges the patient to get up, and continues for an hour or more; ſometimes, though rarely, it attacks the patient ſtanding or ſitting ſtill. It is brought on by trivial accidents, coughing, &c. or any ſlight diſturbance. In ſome it is worſt in winter, in others in ſummer. The pulſe, ſometimes at leaſt, is not diſturbed, conſequently the heart is not affected by the pain. People affected with it often die ſuddenly, but ſome continue ſubject to it for twenty and odd years. The ſeat of it ſeems to be in or about the *os ſternum*, towards the left ſide, and a pain in the middle of the left arm ſometimes accompanies it. The cauſe is probably a ſpaſm or cramp, or an ulcer, or both. Wine, or other cordials, taken at bed-time, prevent or weaken night fits, but opium is the moſt effectual relief; ten, fifteen, or twenty drops of the thebaic tincture, taken at bed-time, may be ſafely continued as long as requiſite.

This diſeaſe has been ſince accurately deſcribed, and ſuitable preventives or remedies propoſed, by Dr. Fothergill. Med. Obſ. and Inq. vol. v. p. 233. 252.

ANGIOSPERMIA, in *Botany*, a term uſed by Linnæus, to expreſs a certain ſeries of the DIDYNAMIÆ or plants of the verticillate kind, which have their ſeeds not lodged naked within the cup. They are by this diſtinguiſhed from the *gymnoſpermia*, which have them ſo; whereas the *angioſpermia* have them incloſed in a capſule, and adhering to a *placenta* placed in the middle of that capſule. The claſs of DIDYNAMIA contains the labiated and perſonated plants. The *angioſpermia* are the perſonated, the others the labiated kinds. This order, or ſeries, contains ſixty-three genera, comprehending thoſe that have a ſimple ſtigma, and perſonate corollæ; thoſe with a ſimple ſtigma, and ſpreading corollæ; thoſe with a double ſtigma, and ſuch as have many petals.

ANGLE, ANGULUS, in *Geometry*, the aperture or mutual inclination of two lines, which meet, and form an *angle* in their point of interſection.

Such is the *angle* BAC (*Tab. Geometry*, *fig.* 91.) formed by the lines AB and AC, meeting in the point A.—The lines AB, and AC, are called the *legs* of the *angle*; and the point of interſection, the VERTEX.

Angles are ſometimes denoted by a ſingle letter affixed to the *vertex*, or angular point, as A; and ſometimes by three letters, that of the vertex being in the middle, as BAC.

The meaſure of an *angle*, whereby its quantity is expreſſed, is an ARCH, DE, deſcribed from its vertex A, with any radius at pleaſure, between its legs, AC and AB. See MEASURE.

Hence *angles* are diſtinguiſhed by the ratio of the arches which they thus ſubtend, to the CIRCUMFERENCE of the whole CIRCLE.—And thus, an *angle* is ſaid to be of ſo many degrees, as are the degrees of the arch DE.

Hence alſo, ſince ſimilar arches, AB and DE, *fig.* 87. have the ſame ratio to their reſpective circumferences; and the circumferences contain each the ſame number of degrees; the arches AB and DE, which are the meaſures of the two *angles* ACB, and DCE, are equal; and therefore the *angles* themſelves muſt be ſo too.—Hence, again, as the quantity of an *angle* is eſtimated by the ratio of the arch, ſubtended by it to the periphery, it does not matter what radius that arch is deſcribed withal: but the meaſures of equal *angles* are always either equal arches, or ſimilar ones; and contrarily.

It follows, therefore, that the quantity of the *angle* remains ſtill the ſame, though the legs be either produced or diminiſhed.—And thus in ſimilar *angles*, and in ſimilar figures, the homologous or correſponding *angles* are alſo equal.

The *taking of angles* is an operation of great uſe and extent in ſurveying, navigation, geography, aſtronomy, &c. The inſtruments chiefly uſed for this purpoſe are quadrants, theodolites, circumferentors, &c.

Mr. Hadley has invented a new and excellent inſtrument for taking *angles*, uſeful where the motion of the object, or any circumſtance cauſing an unſteadineſs in the common inſtruments, renders the making obſervations difficult or uncertain. Phil. Tranſ. N° 420, and N° 425.

Mr. Dollond has likewiſe contrived an inſtrument for meaſuring ſmall *angles*. Phil. Tranſ. vol. xlviii. N° 74. See MICROMETER.

In the practice of ſurveying, no *angles* of leſs than thirty degrees ſhould be taken: nor ſhould any be aſſumed but ſuch as are actually meaſured. See Hiſt. Acad. Scienc. 1740.

ANGLE, *to meaſure the quantity of an.*—1. On paper. Apply the centre of a protractor on the vertex of the *angle* O (*Tab. Surveying*, *fig.* 29.) ſo that the radius OB lie on one of the legs: the degree ſhewn in the arch, by the other leg of the *angle*, will give the *angle* required.—To do the ſame with a line of chords, ſee SECTOR.

2. On the ground.—Place a ſurveying inſtrument, e. gr. a ſemicircle (*fig.* 16.) in ſuch a manner as that a radius thereof CG may lie over one leg of the *angle*, and the centre C over the vertex.—The firſt is obtained by looking through the ſights F and G, towards a mark fixed at the end of the leg; and the latter, by letting fall a plumbet from the centre of the inſtrument.—Then, the moveable index HI being turned this way and that, till through its ſights you diſcover a mark placed at the extreme of the other leg of the *angle*; the degree it cuts in the limb of the inſtrument ſhews the quantity of the *angle*.

To take the angle with a QUADRANT, THEODOLITE, PLAIN TABLE, CIRCUMFERENTOR, COMPASS, &c. ſee the ſeveral articles.

To plot or lay down any given *angle*, i. e. the quantity of the *angle* being given, to deſcribe it on paper. See PLOTTING, and PROTRACTOR.

To biſect a given angle, as HIK (*Tab. Geometry*, *fig.* 92.) from the centre I, with any radius at pleaſure, deſcribe an arch LM. From L and M, with an aperture greater than half LM, ſtrike two arches, mutually interſecting each other in N. Then, drawing the right line IN, we have HIN=NIK.

To triſect an *angle*, ſee TRISECTION.

ANGLES are of various kinds and denominations.

With regard to the form of their legs, they are divided into *rectilinear*, *curvilinear*, and *mixed*.

ANGLE, *rectilinear*, or *right lined*, is that whoſe legs are both right lines: as BAC (*Tab. Geometry*, *fig.* 91.)

ANGLE, *curvilinear*, is that whoſe legs are both of them curves.

ANGLE, *mixt*, or *mixtilinear*, is that, one of whoſe ſides is a right line, and the other a curve.

With regard to their quantity, *angles* are again divided into *right*, *acute*, *obtuſe*, and *oblique*.

ANGLE, *right*, is that formed by a line falling perpendicularly on another; or that which ſubtends an arch of 90 degrees.—Such is the *angle* KLM (*fig.* 93.)

The meaſure of a right *angle*, therefore, is a quadrant of a circle; and conſequently all right *angles* are equal to each other.

ANGLE, *acute*, is that which is leſs than a right *angle*, or than 90°—as AEC (*fig.* 86.)

ANGLE, *obtuſe*, is that greater than a right *angle*, or whoſe meaſure exceeds 90°—as AED.

ANGLE, *oblique*, is a common name both for acute and obtuſe *angles*.

With regard to their ſituation in reſpect of each other, *angles* are divided into *contiguous*, *adjacent*, *vertical*, *alternate*, and *oppoſite*.

ANGLES, *contiguous*, are ſuch as have the ſame vertex, and one leg common to both.—Such are FGH and HGI (*fig.* 94.)

ANGLE, *adjacent*, is that made by producing one of the legs of another *angle*.—Such is the *angle* AEC (*fig.* 86.) made by producing a leg ED, of the *angle* AED, to C.

Two *adjacent angles*, *x* and *y*, or any other number of *angles* made on the ſame point E, over the ſame right line CD, are together equal to two right ones; and conſequently to 180°.—And hence, one of two adjacent *angles* being given, the other is likewiſe given; as being the complement of the former to 180°.

Hence alſo, to meaſure an inacceſſible *angle* in a field, taking an adjacent acceſſible *angle*, and ſubtracting the quantity thereof from 180°, the remainder is the *angle* required.

Again, all the *angles* *x*, *y*, *o*, E, &c. made around a given point E, are equal to four right ones; and therefore all make 360°.

ANGLES, *vertical*, or *oppoſite*, are thoſe whoſe legs are continuations of each other.—Such are the *angles* *o* and *x* (*fig.* 86.)

If a right line AB, cut another, CD, in E, the vertical *angles* *x* and *o*, as alſo *y* and E, are equal.—And hence, if it be required to meaſure, in a field, or any other place, an inacceſſible *angle*, *x*; and the other vertical *angle*, *o*, be acceſſible; this latter may be taken in lieu of the former.

ANGLE, *alternate.*—See ALTERNATE.—Such are the *angles* *x* and *y* (*fig.* 36.)

The alternate *angles* *y* and *x* are equal.

ANGLES, *external*, are the *angles* of any right-lined figure made without it, by producing all the ſides ſeverally.

All the external *angles* of any figure, taken together, are equal to four right *angles*; and the external *angle* of a triangle is equal to both the internal and oppoſite ones, as is demonſtrated by Euclid, lib. i. prop. 32.

ANGLES, *internal*, are the *angles* made by the ſides of any right-lined figure within.

The ſum of all the internal *angles* of any right-lined figure is equal to twice as many right *angles* as the figure hath ſides, excepting four. This is eaſily demonſtrated from Euclid, prop. 32. lib. i.

The external *angle* is demonſtrated to be equal to the internal oppoſite one; and the two internal oppoſite ones are equal to two right ones.

ANGLES, *homologous*, are ſuch *angles* in two figures, as retain the ſame order from the firſt, in both figures.

ANGLE *at the periphery* is an *angle* whoſe vertex and legs do all terminate in the periphery of a circle.—Such is the *angle* EFG (*fig.* 95.)

ANGLE *in the* SEGMENT, is the ſame with that at the periphery.

It is demonſtrated by Euclid, that all the *angles* in the ſame ſegment are equal to one another; that is, any *angle* EHG, is equal to any *angle* EFG in the ſame ſegment EFG.

The *angle* at the periphery, or in the ſegment, is comprehended between two chords EF and FD, and ſtands on the arch ED. See CHORD, &c.

The meaſure of an *angle* without the periphery X (*fig.* 96.) is the difference between half the concave arch LM, whereon it ſtands, and half the convex arch NO intercepted between its legs.

ANGLE *in a ſemicircle*, is an *angle* in a ſegment of a circle, whoſe baſe is a diameter thereof.

It is demonſtrated by Euclid, that the *angle* in a ſemicircle is a right one; in a ſegment greater than a ſemicircle, it is leſs than a right one; and in a ſegment leſs than a ſemicircle, is greater than a right one.

Since an *angle* in a ſemicircle ſtands on a ſemicircle, its meaſure is a quadrant of a circle; and therefore is a right *angle*.

ANGLE *of a ſemicircle*, in *Geometry*, the *angle* which the diameter of a circle makes with the circumference. The chief property of this *angle* is, that it is leſs than a right *angle*, and greater than any acute right-lined *angle*.

ANGLE *at the centre* is an *angle* whoſe vertex is in the centre of a circle, and its legs terminated in the periphery thereof.—Such is the *angle* CAB (*fig.* 95.)

The *angle* at the centre is comprehended between two radii, and its meaſure is the arch BC.

Euclid demonſtrates, that the *angle* at the centre BAC is double of the *angle* BDC, ſtanding on the ſame arch BC.—And hence, half of the arch BC is the meaſure of the *angle* at the periphery.

Hence, alſo, two or more *angles* HLI, and HMI (*fig.* 97.) ſtanding on the ſame or equal arches, are always equal.

ANGLE *without the centre*, HKL, is that whoſe vertex K is not in the centre, but its legs HK and IK are terminated in the periphery.

The meaſure of an *angle* without the centre is half of the arches HI and LM, whereon it and its vertical K do ſtand.

ANGLE *of contact* is that made by the arch of a circle and a tangent in the point of CONTACT.—Such is the *angle* HLM, (*fig.* 43.)

The *angle* of contact, in a circle, is proved by Euclid to be leſs than any right-lined *angle*; but from hence it does not follow, that the *angle* of contact is of no quantity, as Peletarius, Wallis, and ſome others, have imagined. V. Wall, Algeb. p. 71, &c. Sir Iſaac Newton ſhews, that if the curve HAE (*fig.* 97.) be a cubic parabola, where the ordinate DF is in the ſubtriple ratio of the abſciſſe AD, the *angle* BAF, contained under the tangent AB in its vertex, and the curve, is infinitely greater than the circular *angle* of contact BAC; and that, if other parabolas of higher kinds be deſcribed to the ſame axis and vertex, whoſe abſciſſes AD are as the ordinates DF^4, DF^5, DF^6, &c. you will have a ſeries of *angles* of contact going on infinitely, of which any one is infinitely greater than that next before it.

ANGLE *of a ſegment* is that made by a chord with a tangent, in the point of contact.—Such is the *angle* MLH (*fig.* 43.)

It is demonſtrated by Euclid, that the *angle* MLH is equal to any angle M *a* L in the alternate ſegment M*a*L.

ANGLES, *for the effects, properties, relations, &c. of, when combined into triangles, quadrangles, and polygonous figures,* ſee TRIANGLE, QUADRANGLE, SQUARE, PARALLELOGRAM, POLYGON, FIGURE, &c.

ANGLES are again divided into PLANE, SPHERICAL, and SOLID.

ANGLES, *plane*, are thoſe we have hitherto been ſpeaking of; which are defined by the inclination of two lines in a plane, meeting in a point.

ANGLE, *ſpherical*, is the inclination of the planes of two great circles of the ſphere.

For the properties of ſpherical *angles*, ſee SPHERICAL *Angle*.

ANGLE, *ſolid*, is the mutual inclination of more than two planes, or plane *angles*, meeting in a point, and not contained in the ſame plane.—For the meaſure, properties, &c. of ſolid *angles*, ſee SOLID *Angle*.

We alſo meet with other leſs uſual ſorts of *angles* among ſome geometricians; as,

ANGLE, *horned*, *angulus cornutus*, that made by a right line, whether a tangent or ſecant, with the periphery of a circle.

ANGLE, *lunular*, *angulus lunularis*, is that formed by the interſection of two curve lines; the one concave, and the other convex.

ANGLE, *ciſſoid*, *angulus ciſſoides*, is the inner *angle* made by two ſpherical convex lines interſecting each other. See CISSOID.

ANGLE, *ſiſtroid*, *angulus ſiſtroides*, is that in figure of a SISTRUM.

ANGLE, *pelecoid*, *angulus* PELECOIDES, is that in figure of a hatchet.

ANGLE, in *Trigonometry*. See TRIANGLE, and TRIGONOMETRY.

For the ſines, tangents, and ſecants of *angles*, ſee SINE, TANGENT, and SECANT.

ANGLE, in *Mechanics*.—*Angle of* DIRECTION, is that comprehended between the lines of direction of two conſpiring forces.

ANGLE *of* ELEVATION is that comprehended between the line of direction of a projectile, and a horizontal line.—Such is the *angle* RAB (*Tab. Mechanics*, *fig.* 47.) which is comprehended between the line of direction of the projectile AR, and the horizontal line AB.

ANGLE *of incidence* is that made by the line of direction of an impinging body, in the point of contact.—Such is the angle DCA (*fig.* 66).

ANGLE *of reflexion* is that made by the line of direction of the reflected body, in the point of contact from which it rebounds.—Such is the *angle* ECF.

ANGLE, in *Optics*.—*Viſual*, or *optic angle*, is the *angle* included between the two rays drawn from the two extreme points of an object to the centre of the pupil.—Such is the *angle* ABC (*Tab. Optics*, *fig.* 69.) comprehended between the rays AB, and BC.

Objects ſeen under the ſame, or an equal *angle*, muſt always appear equal.

The leaſt *viſible angle*, according to Dr. Hook, is one minute; though Dr. Jurin ſhews, that at the time of his debate with Hevelius on this ſubject, the latter could probably diſcover a ſingle ſtar under ſo ſmall an *angle* as 20″. Dr. Jurin ſtates the grounds of this controverſy, and diſcuſſes the queſtion at large in his Eſſay upon diſtinct and indiſtinct Viſion, publiſhed in Smith's Optics, p. 148, &c.

ANGLE *of the interval*, of two places, is the *angle* ſubtended by two lines directed from the eye to thoſe places.

ANGLE *of incidence*, in *Catoptrics*, is the leſſer *angle*, made by an incident ray of light, with the plane of a ſpeculum; or, if the ſpeculum be concave or convex, with a tangent in the point of incidence.—Such is the *angle* ABD (*fig.* 26). Or, as ſome define it, it is the *angle* which a ray of light makes with a perpendicular to that point of the ſurface of any *medium* on which it falls.

Every incident ray, AB, makes two *angles*, the one acute, ABD, the other obtuſe, ABE; though ſometimes both right.—The leſſer of ſuch *angles* is the *angle* of incidence. See INCIDENCE.

ANGLE *of incidence*, in *Dioptrics*, is the *angle* ABI (*fig.* 56.) made by an incident ray, AB, with a lens, or other refracting ſurface, HI.

ANGLE *of inclination* is the *angle* ABD, contained between an incident ray, AB, and the axis of incidence, DB. See AXIS, &c.

ANGLE *of reflexion*,
ANGLE, *reflected*, } in *Catoptrics*. See REFLECTION.

ANGLE *of refraction*,
ANGLE, *refracted*, } in *Dioptrics*. See REFRACTION.

ANGLE, in *Aſtronomy*.—ANGLE *of commutation*. See COMMUTATION.

ANGLE *of elongation*, or, ANGLE *at the earth*. See ELONGATION.

ANGLE, *parallactic*. See PARALLACTIC *angle*.

ANGLE *at the Sun*, is the *angle* RSP (*Tab. Aſtronomy*, *fig.* 25.) under which the diſtance of a planet P, from the ecliptic PC, is ſeen from the ſun.

ANGLE *of the Eaſt*. See NONAGESIMAL.

ANGLE *of obliquity*, of the ecliptic, or the *angle* of inclination of the *axis* of the earth, to the *axis* of the ecliptic, is 23° 30′; and remains the ſame in all points of the earth's annual orbit. By means of this inclination, ſuch inhabitants of the earth as live beyond 45° of latitude have more of the ſun's heat, taking all the year round; and thoſe who live within 45° have leſs of his heat, than if the earth always moved in the equinoctial. See OBLIQUITY, and ECLIPTIC.

ANGLE *of longitude* is the *angle* which the circle of a ſtar's longitude, makes with the meridian, at the pole of the ecliptic.

ANGLE *of right aſcenſion* is the *angle* which the circle of a ſtar's right aſcenſion makes with the meridian at the pole of the world. See *Right* ASCENSION.

ANGLE, in *Navigation*.—ANGLE *of the rhumb*, or *loxodromic* ANGLE. See RHUMB, and LOXODROMY.

ANGLES, in *Fortification*, are underſtood of thoſe formed by the ſeveral lines uſed in fortifying, or making a place defenſible.

Theſe are of two ſorts; *real*, and *imaginary*.—*Real angles* are thoſe which actually ſubſiſt and appear in the works.—Such are the *flanked angle*, the *angle of the epaule*, *angle of the flank*, and the *re-entering angle of the counterſcarp*.—*Imaginary*, or *occult angles*, are thoſe which are only ſubſervient to the conſtruction, and which ſubſiſt no more after the fortification is drawn.—Such are the *angle of the centre*, *angle of the polygon*, *flanking angle*, *ſaliant angle of the counterſcarp*, &c.

ANGLE *of*, or *at*, *the centre*, is the *angle* formed at the centre of the polygon, by two ſemidiameters drawn thither from the two neareſt extremities of the polygon.—Such is the *angle* CKF (*Tab. Fortificat. fig.* 1).

ANGLE *of the circumference* is the mixt *angle* made by the arch drawn from one gorge to the other.

ANGLE *of the counterſcarp* is that made by the two ſides of the counterſcarp, meeting before the middle of the CURTIN.

ANGLE *of the curtin*, or *of the flank*, is that made by, or contained between, the curtin and the flank; ſuch is the *angle* BAE.

ANGLE *of the complement of the line of defence*, is the *angle* ariſing from the interſection of the two complements one with another.

ANGLE, *diminiſhed*, is the *angle* which is made by the meeting of the exterior ſide of the polygon with the face of the BASTION.—Such is the *angle* BCF.

ANGLE *of the polygon* is the *angle* GHM, intercepted either between the two internal ſides GH, and HM, or the two external ſides.

ANGLE *of the epaule*, or *ſhoulder*, is that formed by the flank and the face of the baſtion.—Such is the *angle* ABC.

ANGLE *of the interior figure* is the *angle* GHM, made in H, the centre of the baſtion, by the meeting in the innermoſt ſides of the figure GH and HM.

ANGLE *of the tenaille*, or *flanking* ANGLE *outward*, is that made by the two raſant lines of defence, i. e. the two faces of the baſtion when prolonged.

ANGLE *flanking inward*, is the *angle* CIH, made by the flanking line with the curtin.

ANGLE, *flanked*, by ſome called the **ANGLE** *of the baſtion*, is the *angle* BCS, made by the two faces of the baſtion, BC, CS; being the outermoſt part of the baſtion, and that moſt expoſed to the enemy's batteries, and therefore by ſome called the *point of the baſtion*.

ANGLE *of the flank* is that formed by the *flank* and the *curtin*.

ANGLE *forming the flank* is that conſiſting of one flank, and one DEMI-*gorge*.

ANGLE *forming the face*, is that compoſed of one flank and one face.

ANGLE *of the triangle*, in *Fortification*, is half the *angle* of the *polygon*.

ANGLE *of the moat* is that made before the *curtin*, where it is interſected.

ANGLE, *re-entering*, or *re-entrant*, is that whoſe vertex is turned inwards, towards the place.

ANGLE, *ſaillant*, is that which advances its point toward the field.

ANGLE *of the tenaille*, or *the outward flanking angle*, called alſo *the angle of the moat*, or *the dead angle*, is made by the two lines *fichant* in the faces of the two baſtions, extended till they meet in an *angle* towards the *curtin*.—This always turns its point in towards the work.

ANGLE *of a wall*, in *Architecture*, is the point or corner where the two ſides or faces of a wall meet.

ANGLES *of a battalion*, in the *Military Art*, are thoſe ſoldiers placed where the ranks and files terminate. See BATTALION.

The *angles* of a battalion are ſaid to be *blunted*, when the ſoldiers at the four corners are removed, ſo that the ſquare battalion becomes octagonal: this was an evolution very common among the ancients, though now diſuſed.

ANGLES, in *Anatomy*, are underſtood of the *canthi*, or corners of the eye, where the upper eye-lid meets with the under.

That next the noſe is called the *great* or *internal*, and that towards the temples, the *leſs*, or *external angle*, or CANTHUS.

ANGLES, in *Aſtrology*, denote certain houſes of a figure, or ſcheme of the heavens.—Thus the *horoſcope* of the firſt houſe is termed *the angle of the eaſt*.

ANGLER, a fiſherman, or other perſon, who practiſes ANGLING.

Anglers are to be diſtinguiſhed from poachers. Some make the ſame difference between them, that is between the fair trader and ſmuggler. Accordingly the legiſlature has made the latter penal, but laid no reſtraint on the former. *Angling* can do no prejudice to the fiſh of a river. Anglers fiſh for their recreation, not for lucre; whereas poachers make it their livelihood.

The tackle neceſſary for an *angler* is various, according to the branch of the art he applies himſelf to. He muſt be equipt with variety of hooks, and a competent quantity of every ſort; he muſt not be without wax, ſilk, a pair of ſciſſars or pen-knife, a baſket, or bag and landing-net, plummets, ſhot, and floats of every kind, needles and thread, lines, hair, Indian-graſs, variety of feathers, more particularly thoſe taken from the neck of a mallard, the wing of a partridge, a capon's neck, the top of a plover, or the hackle of a red cock. He muſt likewiſe be furniſhed with twiſt, and bedding for dubbing his artificial flies; he muſt have a landing-hook, reels for his ſilk lines, a pouch or book for his hair-lines, a convenient place wherein to repoſit his ſmall craft, viz. flies, hooks, wax, ſhot, ſilk, &c. a bag for his worms, a tin-box for his gentles.

When he takes his ſtand, he is to ſhelter himſelf under ſome buſh, or tree, or ſtand ſo far from the brink of the river that he can only diſcern his float; becauſe fiſh are timorous, and eaſily frighted. The beſt way of *angling* with the fly is down the river, and not up; neither need the *angler* ever make above half a dozen of trials in one place, either with fly or ground bait, when he angles for trout: by that time the fiſh will either offer to take, or refuſe the bait and not ſtir at all.

ANGLICANÆ *guttæ*. See GUTTÆ.

ANGLICANUS *ſudor*. See SUDOR.

ANGLICISM, a word, or phraſe, in the Engliſh IDIOM; or a manner of ſpeech peculiar to the Engliſh tongue.

ANGLING, the art of catching fiſh, by means of a rod, with a line, hook, and bait, fitted thereto.

There are ſeveral prudential rules obſerved by thorough anglers; ſuch as, not to wear any white or ſhining apparel, but be cloathed in a dark ſky colour: to invite the fiſh to the place intended for *angling*, by caſting in, from time to time, proper foods, as boiled corn, worms, and garbage: to keep them together in the time of *angling*, by throwing in grains of ground malt; or ſinking a box of worms, with ſmall holes for them to creep ſlowly out at, &c. To draw ſalmon or trout together, *anglers* uſe a compoſition of fine clay incorporated with blood, and ground malt.

To learn what bait is beſt for any fiſh at any time; after having caught one, they ſlit his gills, and take out the ſtomach; and thus find what he laſt fed on.

The ſeveral methods of *angling* for ſalmon, trout, carp, tench, perch, pike, dace, gudgeons, roach, flounder, &c. ſee under *Salmon*-FISHING, *Trout*-FISHING, &c.

The angler's firſt buſineſs is to prepare for catching the fiſh by inviting them about him; the method of doing this in ſtanding waters, by throwing in grains, chopped worms and the like, is well known: but the chief difficulty is in running rivers and brooks. The method in this caſe, is to prepare a tin box capable of holding ſome hundred of worms, bored on all ſides, and full of holes of ſuch a ſize as they may be juſt able to crawl out at; there muſt be a plummet faſtened to this box to ſink it, and a line to draw it back at pleaſure; in this caſe it is to be thrown into the water at a proper place, above which the angler may ſtand under cover. The worms will ſlowly and gradually crawl out of this box, and the fiſh will be gathered about to feed on them; the baited hook is to be thrown in higher up and carried down by the ſtream. If this method does not bring the fiſh about the place in a little time, there is reaſon to ſuſpect that ſome pike lies lurking thereabout, and deters them; in this caſe, it is proper to throw out a baited hook, and he will generally be taken: after this the attempt will ſucceed.

The *angling* rod muſt be kept in a moderate ſtate neither too dry nor too moiſt, in the firſt caſe it will be brittle, in the other rotten. When paſtes are uſed, it is proper to mix a little tow with them, and rub them over with honey; finally a ſmall anointing them with butter is of great uſe to keep them from being waſhed off the hook. The eyes of any fiſh that is taken are an excellent bait, for almoſt any other kind of fiſh.

In a pond, the beſt place for the *angler* to take his ſtand is uſually that where the cattle go into the water; in rivers, if breams are fiſhed for, it ſhould be in the deepeſt and moſt quiet places; if eels, under the banks of rivers that hang over; pearch are to be expected in clean places, where the ſtream is ſwift; and chub in deep ſhaded holes: roach are moſtly found where the pearch are, and trout only in ſwift and clear ſtreams. Places where there are many weeds, or old ſtumps of trees, harbour fiſh in great numbers, and they uſually bite freely there, but there is danger of entangling the line, or faſtening the hook to the weeds.

In caſe of this accident, recourſe is to be had to a ring of lead, of about ſix inches round, faſtened to a ſmall pack-thread, this ring is to be thruſt over the rod, and let to fall into the water. It will deſcend to the place where the hook is intangled, and then by pulling the pack-thread gently, the hook will be ſoon diſengaged, or at the worſt it can only be broke off near the end of the line; whereas when this is not employed, the rod itſelf is ſometimes broken, or the line nearer its upper end.

Deep waters are beſt for *angling* in, for the fiſh do not love to be diſturbed by wind and weather.

The beſt ſeaſon is from April to October, for in very cold ſtormy weather the fiſh will not bite; the beſt times of the day are from three till nine in the morning, and from three in the afternoon till ſun-ſet.

In an eaſterly wind there is never much ſport for the angler; the ſoutherly winds are the beſt for his purpoſe, and a warm but lowering day is moſt of all to be choſen; a gentle wind after a ſudden ſhower to diſturb the water makes a very good opportunity for the *angler*; the cooler the weather in the hotteſt months, the better, but in winter on the contrary the warmer the day the better. A cloudy day after a bright moon-light night is always a good day for ſport, for the fiſh do not care to go after prey in the bright moon-ſhine, and are therefore hungry the next morning.

The openings of ſluices and mill-dams always bring fiſh up the current, to ſeek for the food which is brought with the ſtream, and *angling* in theſe places is uſually ſucceſsful.

Thoſe who are fond of *angling* might ſave themſelves ſome fruitleſs trouble, by obſerving when ſmall fiſh in a jar take or refuſe food.

It is very good *angling* a little before the fiſh ſpawn, for then their bellies being full, they frequent ſandy fords, to rub and looſen their bellies; at which time they will bite freely. In waters which ebb and flow, it is beſt *angling* at the ebb; but if the tide be not ſtrong, the flood is to be preferred.

ANGLING, *ground*, the art of catching fiſh under water without a float, only with a plumb of lead, or a bullet.

This method is moſt expedient in cold weather, when the fiſh ſwim low. The bullet is to be placed nine inches from the baited hook; the top of the rod is to be very gentle, that the fiſh may more eaſily run away with the bait, and not be ſcared with the ſtiffneſs of it. The angler in this way is not to ſtrike as ſoon as he feels the fiſh bite, but ſlacken his line a little, to give the fiſh an opportunity to ſwallow the hook.

The tackle here is to be fine and ſlender, ſtrong and big lines being apt to fright the fiſh. Morning and evening are the chief ſeaſons for the *ground*-line for trout, but in a cloudy day, or a muddy water, you may fiſh at *ground* from morn to night.

ANGLING, *night*, a method of catching large and ſhy fiſh in the night. Trout, and many other of the better ſorts of fiſh, are naturally ſhy, and fearful; they therefore prey in the night, as the ſecureſt time.

The method of taking them on this plan is thus: the tackle muſt be ſtrong, and need not be ſo fine as for day-fiſhing, when every thing is ſeen; the hook muſt be baited with a large earthworm, or a black ſnail, and thrown out into the river; there muſt be no lead to the line, ſo that the bait may not ſink, but be kept drawling along, upon, or near, the ſurface.

Whatever trout is near the place will be brought thither by the noiſe, and motion of the water, and will ſeize the worm, or ſnail. The angler will be alarmed by the noiſe which the fiſh makes in riſing, and is to give him line, and time to ſwallow the hook; then a ſlight twitch ſecures him. The beſt and largeſt trouts are found to bite thus in the night, and they riſe moſtly in the ſtill and clear deeps, not in the ſhallow ſwift currents. Sometimes though there are fiſh about the place, they will not riſe at the bait; in this caſe, the angler muſt put on ſome lead to his line, and ſink it to the bottom.

ANGLING *fly*. See FISHING *fly*.

ANGLING *hook*. See FISHING *hook*.

ANGLING *line* is either made of hair, twiſted, or of ſilk, or of the Indian weed.—The beſt colours are the ſorrel, white and grey; the two laſt for clear waters, the firſt for muddy ones. Nor is the pale watry green deſpiſable: this colour is given artificially, by ſteeping the hair in a liquor made of alum, ſoot, and the juice of walnut-leaves boiled together.

ANGLING *rod*. See FISHING *rod*.

In *angling*, they obſerve, after having ſtruck a large fiſh, to keep the rod bent; which will hinder him from running to the utmoſt length of the rod-line, by which he would be enabled to break his hold, or the hook.

ANGLO-CALVINISTS, a name given by ſome *Eccleſiaſtical Hiſtorians* to the members of the church of England, becauſe their doctrinal articles are built on the ſyſtem of Calvin; though ſome modern writers, without ſufficient reaſon, pretend that the doctrinal ſyſtem of the Engliſh church is Arminian.

The *Anglo-Calviniſts* make one of the four branches or diviſions of Calviniſm; and as ſuch ſtand diſtinguiſhed from the pure CALVINISTS, the PISCATORIANS, and the ARMINIANS.

ANGLO-SAXON *language*, that ſpoke by the ancient Angli or Saxons, who ſettled in England.

It was thus called from the people, who were partly Angli, partly Saxon.

It is otherwiſe denominated ſimply *Saxon*.

The *Anglo-Saxon*, or Engliſh-Saxon, is properly the original Engliſh; being the language which our Saxon anceſtors firſt eſtabliſhed in this iſland.—It is now called *Anglo-Saxon*, to diſtinguiſh it from the modern or preſent Engliſh.

ANGON, in the *Ancient Writers on Mechanics*, denotes a military engine of the bow-kind. Others again ſpeak of it as a kind of javelin uſed by the French, the iron head of which reſembled a *fleur de lys*. It is the opinion of ſome writers, that the arms of France are not *fleurs de lys*, but the iron points of the *angon*, or *javelin* of the ancient French.

ANGONÆUS, in *Anatomy*, a name given by Riolanus, and others, to a muſcle called by the generality of other writers *anconæus*, and *cubitalis minor*.

ANGOR is uſed by ſome phyſicians to denote a ſhrinking inwards of the native heat of the body, or its retiring to the center; upon which enſues a pain, and palpitation of the heart, attended with ſadneſs and melancholy.

In this ſenſe, *angor* amounts to much the ſame with what the Greeks call *agonia*.

The *angor* is reputed a bad ſymptom, when it happens in the beginning of an acute fever.

ANGSANA, or ANGSAVA, in *Botany*, names by which ſome authors have deſcribed the DRACO *arbor*, or *dragon-tree*; one of the trees ſaid to afford the *ſanguis draconis*, or *dragon's blood* of the ſhops.

It is eſteemed an aſtringent, and an excellent remedy in the *aphthæ*.

ANGUELLA, in *Zoology*, a name given by ſome authors to the fiſh more uſually called HEPSETUS, and ATHERINA, a ſmall fiſh caught about the ſhores of the Mediterranean, and ſome other places, and eſteemed a delicate taſted one.

ANGUILLA, in *Zoology*. See EEL.

ANGUILLIFORM, *anguilliformis*, in *Zoology*, the term for a very large claſs of fiſhes, which are ſoft and lubricous like the eel, and have no ſcales.

The word is derived from *anguilla*, an *eel*, and *forma*, *ſhape*, or *appearance*. Moſt of the fiſh compriſed in this claſs are long bodied alſo like the eel. Some of them have neither fins at their gills nor belly, as the *murus* and *lampetra*; others have fins at their gills, but none on their bellies, as the *ſea-ſerpent*, *eel*, *conger*, *ophidion*, and *ammodytes*. And others have both, as the *tæniæ*, *muſtelæ*, *alaudæ*, and the like.

ANGUILLIFORM is ſometimes alſo applied to land animals, which bear a reſemblance to eels, but do not properly belong to that claſs.

In this ſenſe, we read of *anguilliform* worms. G. Elſerus maintains that eels are viviparous; having found in ſome of them certain membranes full of *anguilliform* worms.

ANGUINA, in *Botany*, the name of a genus of plants deſcribed by Micheli, and mentioned by Plumier, and in the Malabar garden. It is the ſame genus with the TRICHOSANTHES of Linnæus, deſcribed in his *Genera Plantarum*, p. 466.

ANGUINEAL *hyperbola*. See HYPERBOLA, and CURVE.

ANGUINEI *verſus*, in *Poetry*, thoſe which may be read backwards.

Theſe are otherwiſe called recurrent verſes. Such, e. g. are

Optimum jus, lex amica, vox diſerta.
Diſerta vox, amica lex, jus optimum.

ANGUINUM *ovum*, among *Ancient Writers*, denotes an extraordinary ſort of an egg, ſaid to be produced by the joint *ſaliva* of a cluſter of ſnakes; being toſſed up on high by the hiſs, and thus caught in the air by the druids. It was endued, they ſaid, with many marvellous virtues.

ANGUIS, the SNAKE, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct and large genus of the order of ſerpents, and claſs of amphibious animals; the character of which is, their having no feet, and a ſcaly body of a cylindric figure. See SNAKE.

ANGUIS *Æſculapii*, ſee COLUBER.

ANGUIUM *lapis*, a name given to a ſuppoſed ſtone in Germany, which is of a cylindric figure, and has a cavity capable of admitting a finger, and of a yellow colour, with a great many variegations. The vulgar call it *duchaneck*, and have an idle opinion of its having its origin in ſome manner from a ſerpent ant. De Boot, who had ſeen many of them, declares them to be fictitious, and made of glaſs tinged with two or three colours.

ANGULAR, ſomething that relates to, or hath, *angles*.

Angular objects at a diſtance appear round; the little inequalities diſappearing at a much leſs diſtance than the bulk of the body.

ANGULAR *motion* is a compound kind of motion, wherein the moveable both ſlides and revolves at the ſame time. Such is the motion of the wheel of a coach, or other vehicle.

The *phænomena*, &c. of ſuch motion, ſee accounted for under the article ROTA *Ariſtotellica*.

ANGULAR, *acute*, *ſection*, ſee ACUTE.

ANGULAR *capital*, ſee CAPITAL.

ANGULAR *column*, ſee COLUMN.

ANGULAR *niche*, ſee NICHE.

ANGULAR *motion*, in *Aſtronomy*, is the increaſe of the diſtance between any two planets, revolving round any body as the common centre of their motion.

The quantity of this motion is expreſſed by two right lines, drawn from the ſaid centre to the revolving bodies; which will open wider, and conſequently the angle will grow greater, as the revolving bodies part farther and farther from one another.

ANGULARIS *ſcapulæ*, in *Anatomy*, a name given by Winſlow, and ſome others, to the muſcle of the ſhoulder generally called the LEVATOR *ſcapulæ*.

ANGURIA, in *Botany*, ſee *Water*-MELON.

ANGUSTICLAVIA, or ANGUSTUS CLAVUS, in *Antiquity*, a *tunica*, embroidered with little purple ſtuds, worn by the knights.

The word is compounded of *anguſtus*, *ſmall*; and *clavus*, *ſtud*; becauſe thoſe ornaments were ſmaller in this garment than in the *laticlavia*, which was worn by the ſenators.

ANHALDIN, *anhaldinum*, an epithet given to various medicines, formerly kept as ſecrets in the family of Anhalt. Three of the moſt celebrated medicines under this denomination are a corroſive, a water, and a ſpirit.

The corroſive, as deſcribed by Burggrave, is compounded of calcined antimony, ſublimate mercury, ſal ammoniac, and calcined tartar, diſtilled and rectified.

The deſcription of the *Anhaltin* water is given in the common diſpenſatories, and that of the ſpirit may be found in De Spina.

ANHELITUS ſignifies a ſhortneſs and thickneſs of breath; as in an ASTHMA. See RESPIRATION.

The word is Latin, formed of the verb *anhelo*, *I breathe with difficulty.*

ANHIMA, in *Zoology*, the name of a Braſilian bird, ſomewhat reſembling the crane-family, but not regularly of it. It is diſtinguiſhed in a very ſingular manner from all other birds, having a long ſingle horn on its head, inſerted a little above the origin of the beak, and ſtanding forwards, and a little bent downwards. This is of two or three fingers breadth long, and is ſlender and round, as if nicely turned, and is of a bony ſubſtance, and ſine white colour; and on the front of each wing it has two other ſuch horns growing from the ſubſtance of the bone. It is found about waters, and is a very voracious bird, but feeds only on vegetables. It is longer than a ſwan; and is of a mixed colour of black, grey, and white, with a very little yellow in ſome places. It is always ſeen male and female together; and the male is twice as large as the female, which is here deſcribed, and is larger than our ſwan. It makes a very loud noiſe, often repeating the notes, *vyhu*, *vyhu*. Marcgrave's Hiſt. Braſil.

ANHINGA, in *Zoology*, the name of a very elegant Braſilian water fowl. It is about the ſize of our common duck; its beak is ſtraight, very ſharp, not thick, and about three fingers breadth long, and has all along the middle, as well above as below, a long ſeries of hooked prickles all bending backwards. Its head is ſmall, and its neck ſlender and long, not leſs than a foot in length; its legs are ſhort, and its toes connected by a membrane, as in the cormorant and duck-kind. Its tail is ten fingers breadth long; its wings, when folded, reach not more than half the length of the tail; its head and neck are yellowiſh, and covered with extremely ſoft velvet-like feathers; its breaſt, belly, and thighs, are of a ſilvery white. The upper part of its back is brown ſpotted with yellow, and the reſt all black. It is common on the Braſilian ſhores, and feeds on fiſh. Marcgrave's Hiſt. Braſil.

ANHLOTE, in *Law*, a ſingle tribute or tax. The words *anhlote*, and *anſcot*, are mentioned in the laws of William the Conqueror; and their ſenſe is, that every one ſhould pay, according to the cuſtom of the country, his part and ſhare, as ſcot and lot, &c. Leg. W. I. cap. 64.

ANHUIBA, in *Botany*, a name by which ſome authors call the SASSAFRAS tree, the wood of which is ſo much uſed in medicine.

ANHYDROS, in *Botany*, a name given by the ancient Greeks, and from them copied by the Romans in the time of Pliny, to expreſs one of thoſe kinds of the STRYCHNA, or night-ſhades, which when taken internally cauſed madneſs.

ANI, in *Zoology*, the name of a Braſilian bird, ſomewhat allied to the PAROQUETTE kind. It is about the ſize of a thruſh, and is all over black. It is very common in the woods, but is not eaten. Marcgrave's Hiſt. Braſil.

ANIL, in *Natural Hiſtory*, the ſhrub from whoſe leaves and ſtalks INDIGO is prepared. It is alſo called NIL. For the method of preparing *indigo* from it, ſee INDIGO.

ANIMA, a SOUL; whether rational, ſenſitive, or vegetative.

The word is pure Latin, formed of *ανεμος*, *breath.*

ANIMA is ſometimes uſed by phyſicians to denote the principle of life in the body.

In which ſenſe Willis calls the blood *anima brutalis.*

ANIMA is alſo figuratively uſed by chemiſts for the volatile principles in bodies, whereby they are capable of being raiſed by the fire.

In which ſenſe, we meet with *anima jaſpidis*, the ſoul of JASPER, &c. Phil. Tranſ. N° 74. p. 2233.

ANIMA is more peculiarly applied to ſimple medicines, artfully exalted by ſolution and extraction to a high degree of power.

In which ſenſe, we meet with *anima aloes*, *anima rhabarbari*, *anima veneris*, &c.

Sometimes alſo it denotes *medicines* which are peculiarly ſalutary to particular parts of the body. Thus we meet with

ANIMA *articulorum*, which is a denomination ſometimes given to HERMODACTYLS; on account of their efficacy in diſorders of the joints.

ANIMA *hepatis*, ſoul of the liver; a term applied by the chemiſts to the *ſal martis*, ſalt of iron or ſteel; on account of its uſe in diſtempers of that part.

It is more uſually preſcribed under the name of *vitriolum martis.*

ANIMA *pulmonum*, uſed for *crocus*, or ſaffron; by reaſon of its ſuppoſed great uſe in diſeaſes of the lungs.

ANIMA *mundi*, q. d. *ſoul of the world*, or *of the univerſe*, denotes a certain pure ethereal ſubſtance or ſpirit, diffuſed, according to many of the ancient philoſophers, through the maſs of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal.

Plato treats at large of the *ψυχη τȣ κοσμȣ*, in his *Timæus*; and is even ſuppoſed to be the author of the *dogma*; yet are interpreters much at a loſs about his meaning. Ariſtotle, however, taking it in the common and obvious ſenſe, ſtrenuouſly oppoſes it.

The modern Platoniſts explain their maſter's *anima mundi* by a certain univerſal ethereal ſpirit, which in the heavens exiſts perfectly pure, as retaining its proper nature; but on earth, pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it aſſumes ſomewhat of their nature, and becomes of a peculiar kind.—So the poet:

Spiritus intus alit, totoſque infuſa per artus
Mens agitat molem, & magno ſe corpore miſcet.

They add, that this *anima mundi*, which more immediately reſides in the celeſtial regions as its proper ſeat, moves and governs the heavens in ſuch manner, as that the heavens themſelves firſt received their exiſtence from the fecundity of the ſame ſpirit: for that this *anima*, being the primary ſource of life, every where breathed a ſpirit like itſelf, by virtue whereof various kinds of things were framed conformable to the divine ideas.

The notion of an *anima mundi* is rejected by moſt of the modern philoſophers; though M. du Hamel thinks, without any great reaſon, ſince the generality of them admit ſomething very much like it. Thus the Peripatetics have recourſe to celeſtial influxes, in order to account for the origin of forms, and the ſecret powers of bodies.

The Carteſians have their ſubtile matter, which anſwers to moſt of the uſes and intentions of Plato's *anima mundi*; being ſuppoſed to flow from the ſun, and the other heavenly bodies, and to be diffuſed through all the parts of the world, to be the ſource or principle of all motion, &c.

Some later philoſophers in the place of theſe ſubſtitute fire; and others a ſubtle elaſtic ſpirit, or *medium*, diffuſed through all parts of ſpace.

The principal thing objected, on the Chriſtian ſcheme, againſt Plato's doctrine of the *anima mundi*, is, that it mingles the Deity too much with the creatures; confounds, in ſome meaſure, the workman with his work, making this, as it were, a part of that, and the ſeveral portions of the univerſe ſo many parts of the godhead.— Yet is the ſame principle aſſerted by Seneca, Epiſt. 92. *Totum hoc quo continemur, & unum eſt, & Deus. Et ſocii ejus ſumus, & membra*——

ANIMA *gemmarum*, a term uſed by Becher, and ſome others, to expreſs that principle, to which the gems, and other beautiful ſtones, owe their colours.

This *anima lapidum* is no more than the metalline ſulphur to which theſe ſtones and gems, naturally colourleſs, owe their tinges; and, like other metalline ſulphurs, it may be raiſed and evaporated by fire. Becher, Phyſ. Subt.

ANIMA *ſaturni*, *the ſoul of lead*, a preparation of lead, ſerving to many purpoſes in the enamel work. The method of making it is this: put litharge, powdered fine, into a glazed earthen veſſel, and pour diſtilled vinegar upon it to the height of four fingers; let it ſtand till the vinegar is of a white or milky hue: pour off this coloured vinegar, and put on freſh, and ſo do till the vinegar will no longer be coloured by the litharge; then ſet theſe liquors together in open glazed earthen veſſels, that the white powder may ſubſide, and the vinegar be poured off clear. This white ſubſtance is the *anima ſaturni*. Sometimes this white matter will not precipitate without the addition of water; and ſometimes it is neceſſary to evaporate the liquors; but, by that means, it is always prepared. Neri's Art of Glaſs, p. 184.

ANIMADVERSION ſometimes ſignifies *correction*; and ſometimes remarks or obſervations made on a book, &c. and ſometimes, a ſerious conſideration and reflection on any ſubject, by the rules of criticiſm.

The word is formed of *animus*, the *mind*; and *adverto*, *I turn to.*

ANIMAL, a being, which, beſides the power of growing, increaſing, and producing its like, which vegetables likewiſe have, is further endowed with ſenſation, and ſpontaneous loco-motion.

The word is derived from *anima*, *ſoul*; and literally denotes ſomething endued with a ſoul.

An *animal*, reſpect being only had to the body not the ſoul, may be defined with Boerhaave to be an organical body, conſiſting of veſſels and juices, and taking in the matter of its nutriment by a part called a *mouth*; whence it is conveyed into another called the *inteſtines*, into which it has roots implanted, whereby it draws in its nouriſhment, after the manner of plants.

Some have defined *animals* from their loco-motion, as being capable of ſhifting from place to place; and plants, from their ſticking faſt to the ſame ſubject: but on this principle, oyſters, muſſels, cockles, &c. would be almoſt excluded from the claſs of *animals*, inaſmuch as they uſually adhere, or grow to rocks, &c. yet it is certain, that thoſe creatures are real *animals*, as they have mouths and ſtomachs to take in their food, and lacteals and meſenteric veins to receive it, and ſometimes can even move from place to place on occaſion.—Indeed, muſſels ſeem an exception from the former definition: if, as is ſaid, that anomalous creature breathes, and receives its nouriſhment, not at the mouth, but by the *anus*; the part which we account its head, though without either eyes, ears, or tongue, or any other *apparatus*, ſave a hole, which we may call its mouth, is an immoveable part; being faſtened to one of the ſhells, ſo that it cannot ſeek for food, but the food muſt come to ſeek it. This food is water, which, as the ſhell opens, enters in at the *anus* of the muſſel, which opens at the ſame time; and paſſing thence into certain canals, between the inner ſurface of the ſhell, and the outer ſurface of the *animal*, is ſaid to be conveyed thence into its mouth, by a certain motion, which the *animal* can produce at pleaſure.

We may, therefore, with Dr. Tyſon, fix the *criterion* of an *animal* in a *ductus alimentalis*, i. e. a *gula*, ſtomach, and inteſtines: all which make but one continued canal.

All *animals*, according to the moſt probable and received opinion, come from eggs, and are there incloſed, as it were, in *epitome*, till the ſeed of the male penetrate their covering, and ſtretch them ſo that they become ready for hatching.

There then enters into their veſſels a chylous juice; which, being puſhed forwards by the ſpirits, circulates through the whole habit of the little body, nouriſhes and dilates it by little and little, and thus produces what we call *growth*.

This circulation, repeated ſeveral times, refines and attenuates the juices, till at length they become of a red colour, and are converted into what we call *blood*.—This natural operation bears a great reſemblance to ſeveral chemical proceſſes, by which, in attenuating and diſſolving oily or ſulphureous ſubſtances, they aſſume a red colour.

The philoſophers comprehended man under the ſpecies of *animals*; and define him, a reaſonable *animal*; though among naturaliſts, &c. the term *animal* is uſually reſtrained to irrationals.

Man, ſays Liſter, is as very an *animal* as any quadruped of them all; and moſt of his actions are reſolvable into inſtinct, notwithſtanding the principles which cuſtom and education have ſuperinduced.

Animals are ordinarily divided into *terreſtrial*, *aquatic*, *volatile*, *amphibious*, *inſects*, &c.

Terreſtrial animals, are either *quadrupeds*, or *reptiles*.—Quadrupeds have either the feet cloven, as the bullock; or entire, as the horſe; or divided into ſeveral toes or claws, as the dog, lion, &c. The other diviſions will be found under the words Fish, Bird, &c.

For a general account of the various kinds of *animals*, we ſhall here ſubjoin Mr. Ray's ſcheme.

Animals are either,

- *Sanguineous*, that is, ſuch as have blood, which breathe either by
  - Lungs, have either
    - Two ventricles in their heart, and thoſe either
      - Viviparous.
        - Aquatic, as the whale-kind. See Whale.
        - Terreſtrial, as quadrupeds.
      - Oviparous, as birds.
    - But one ventricle in the heart, as frogs, tortoiſes, and ſerpents.
  - Gills, as all ſanguineous fiſhes, except the whale-kind.
- *Exanguineous*, or without blood, which may be divided into
  - Greater; and thoſe either
    - Naked,
      - Terreſtrial, as naked ſnails.
      - Aquatic, as the poulp, cuttle-fiſh, &c.
    - Covered with a tegument, either
      - Cruſtaceous, as lobſters and cray-fiſh.
      - Teſtaceous, either
        - Univalve, as limpets.
        - Bivalve, as oyſters, muſſels, cockles, &c.
        - Turbinate, as periwinkles, ſnails, &c.
  - Leſſer, as inſects of all ſorts.

Viviparous hairy *animals*, or quadrupeds, are either

- Hoofed, which are either
  - Whole-footed, or hoofed, as the horſe and aſs:
  - Cloven-footed, having the hoof divided into
    - Two principal parts, called *biſulca*, either
      - Such as chew not the cud, as ſwine.
      - Ruminant, or ſuch as chew the cud, divided into
        - Such as have perpetual and hollow horns:
          - Beef-kind,
          - Sheep-kind,
          - Goat-kind,
        - Such as have ſolid, branched, and deciduous horns, as the deer-kind.
    - Four parts, or *quadriſulca*, as the rhinoceros and hippopotamus.
- Clawed or digitate, having the foot divided into
  - Two parts or toes, having no nails, as the camel-kind,
  - Many toes or claws, either
    - Undivided, as the elephant.
    - Divided, which have either
      - Broad nails, and an human ſhape, as apes.
      - Narrower and more pointed nails, which, in reſpect of their teeth, are divided into ſuch as have
        - Many fore-teeth or cutters in each jaw:
          - The greater, which have
            - A ſhorter ſnout, and rounder head, as the cat-kind.
            - A longer ſnout and head, as the dog-kind.
          - The leſſer, the vermin or weazel-kind.
        - Only two large and remarkable fore-teeth, all which are phytivorous, and are called the hair-kind.

Some have objected to Ray's diviſion of *animals*, that all *animals* are ſanguineous, ſince all have a vital fluid circulating through veins and arteries, though it be not of a red colour in all, the eſſential character of the blood lying not in its crimſon colour, but in its office: in which view every fluid, by whoſe motion through veſſels the life of an *animal* is ſuſtained, may be denominated Blood.

But this is rather a diſpute about words than things.

The celebrated Linnæus has diſtributed *animals* into ſix claſſes, viz. *mammalia*, *aves*, *amphibia*, *piſces*, *inſecta*, *vermes*. Each claſs is divided into a certain number of orders, and each order is again ſubdivided into *genera* or kinds, each of which contains a variety of ſpecies. The ſyſtem of this ingenious naturaliſt includes 354 kinds, and near 6000 known ſpecies. *Syſtema Naturæ*.

For particulars relating to animals, their numbers, analogous ſtructure, ſagacity, inſtinct, &c. ſee Creation, Ark, Head, Neck, Tail, Foot, Horn, Hoof, Storge, Instinct, &c.

Animals conſiſt of *ſolids*, or firm parts, as fleſh, bones, membranes, &c. and *fluids*, as blood, &c.—Of an intermediate kind may perhaps be reckoned fat, &c.

The ſolids are mere earth, bound together by ſome oily humour; and accordingly they are reducible by fire into ſuch earth again.

Thus a bone, being perfectly purged of all its moiſture by calcination, is found a mere earth, which the leaſt force will crumble into duſt, for want of the natural gluten: yet the ſame bone, by immerging it in water or oil, becomes firm and ſtrong again; and more ſo in oil than in water. And thus cupels are made of animal earth, which will ſuſtain the utmoſt effect of fire.

The fluid parts of *animals* are the cruder as they are leſs diſtant from the lacteals, and abſorbent veſſels.—Thus chyle is little elſe but a vegetable juice; but in its farther progreſs, it gradually lays aſide its vegetable characters, till after a number of circulations it becomes a perfect animal juice under the denomination of blood, from whence the other humours are all derived.

Animal ſubſtances have been diſtinguiſhed from thoſe of vegetables by two circumſtances: the firſt, that when burnt they are found perfectly inſipid; all animal ſalts being volatile, and flying off with heat: the contrary of which is found in vegetables, which conſtantly retain ſome fixed ſalt in all their aſhes.

The ſecond, that no pure acid is contained in any animal juice; nor can any acid ſalt be extracted from the ſame: the contrary of which is found in all vegetables. See Acid.

Yet are *animals* reconverted into their vegetable nature, by putrefaction.

Animals, *oviparous*, ſee Oviparous.

Animals, *rapacious*, ſee Rapacious.

Animals, *generation of*, ſee Generation.

Animals make the ſubject of that branch of natural hiſtory called *Zoology*.

The ſtructure of *animals*, with their diſorders, remedies, &c. make the ſubject of anatomy, medicine, &c.

Animals make the principal figures in heraldry; both as bearings, and as ſupporters, &c.

ANIMAL is alſo uſed adjectively, to denote ſomething that belongs to, or partakes of, the nature of an *animal* body. Thus we ſay *animal* food, *animal* œconomy, &c.

Moraliſts frequently oppoſe the *animal* part, which is the ſenſible, fleſhy part of man, to the rational part, which is the underſtanding.

ANIMAL *actions* are thoſe peculiar to *animals*; or which belong to *animals*, as ſuch.

Such are SENSATION, and *muſcular* MOTION.

ANIMAL *flower*, in *Zoology*, a name given by Mr. Griffith Hughes to an *animal*, or *zoophyton*, ſomewhat reſembling the flower of the marygold, but of a paler yellow.

This name ſeems well adapted to the *animal*; for its *claws*, or *tentacles*, being diſpoſed in regular circles, and tinged with a variety of bright lively colours, very nearly repreſent the beautiful petals of ſome of our moſt elegantly fringed and radiated flowers: ſuch as the carnation, marygold, and anemone. Phil. Tranſ. abr. vol. ix. p. 110.

ANIMAL *functions*, among *Phyſicians*. See FUNCTION.

ANIMAL *glue*, ſee GLUE.

ANIMAL *gods*, *dii animales*, in *Mythology*, thoſe into which human ſouls were converted by means of certain religious ceremonies.

Labeo has written expreſly on the *animal gods*.

ANIMAL *heat*, ſee HEAT.

ANIMAL *hunger*, ſee HUNGER.

ANIMAL *liquors*.—The common opinion is, that all the *animal liquors*, excepting chyle and milk, are of an alcaleſcent nature; but M. Queſnay, in his book *Sur l'Oeconomie Animale*, affirms, that our gelatinous liquors contain a very aceſcent ſalt, capable of reſiſting a heat of two hundred degrees. The proof of which, ſays he, offers itſelf daily to every one. Who is it that has not remarked, that broth made with fleſh well freed from fat, when corrupted, becomes as ſour as verjuice? The foundation on which M. Queſnay builds his doctrine concerning *animal liquors*, is the ſeparation of milk into its oily, cheeſy, and watery ſubſtances. Med. Eſſ. Edinb.

ANIMAL *motion* is the ſame with what we call *muſcular motion*.

It is divided into two branches; natural or involuntary, and ſpontaneous.

ANIMAL *oeconomy*, ſee OECONOMY.

ANIMAL *oil*, ſee OIL.

ANIMAL *ſecretion* is the act whereby the divers juices of the body are ſecreted or ſeparated from the common maſs of blood, by means of the glands. See SECRETION.

ANIMAL *ſpirits* are a fine ſubtile juice or humour in animal bodies; ſuppoſed by many to be the great inſtrument of muſcular motion, ſenſation, &c.

The ancients diſtinguiſhed ſpirits into three kinds, viz. *animal*, *vital*, and *vegetative*: but the moderns have reduced them to one ſort, viz. *animal*; about the nature of which, and the matter whence they are formed, great diſputes have ariſen among anatomiſts, though their very exiſtence has never been fairly proved.

In the Hiſtory of the Royal Academy of Sciences at Paris, an. 1759, there is an ingenious memoir on this ſubject by M. Bertin. He undertakes to prove that the nervous fluid, or *animal ſpirits*, circulate; that if they depart from the brain they return to it by the nerves. In ſhort, he propoſes to form the courſe of this fluid into a ſyſtem of circulation, leſs demonſtrable, indeed, to the ſenſes, than that of the circulation of the blood, but, in other reſpects, grounded on equally ſolid reaſons.

As it is hard to define what could never yet be brought under the judgment of our ſenſes, all that we ſhall here offer concerning them, is, that they muſt needs be extremely ſubtile bodies, which eſcape all manner of examination by the ſenſes, though ever ſo well aſſiſted; and pervade the tracts of the nerves, which yet have no diſcoverable cavity or perforation; nor could ever by any experiment be collected; yet are conſtantly moving in vaſt quantities, as they muſt of neceſſity be, to perform all thoſe mighty operations which are aſcribed to them.—However, the antiquity of the opinion claims ſome reverence.

By the help of theſe ſpirits we are furniſhed with a vaſt number of precarious ſolutions of great *phænomena*; and without them we muſt leave a great chaſm in the philoſophical hiſtory of *animal* bodies; but after all, the *phænomena* that would in this caſe be unexplained, are, it may be, to us inexplicable.

They are ſuppoſed to be ſeparated in the brain, from the ſubtileſt parts of the blood; and thence carried, by the nerves, to all the parts of the body, for the performance of all *animal* and vital functions.

ANIMAL *ſubſtances* comprehend all the component parts of *animals*, of what uſe or intention ſoever they may be.

ANIMAL *foſſile ſubſtances*, thoſe found buried in the earth, at various depths, and embodied among various *ſtrata*. Theſe are principally of four kinds: 1. Sea-ſhells. 2. The teeth, bony palate, and bones of fiſhes. 3. The bones of land *animals*. And, 4. Complete fiſh. See *Foſſile* BONES, *Foſſile* SHELLS, MARINE *remains*, and *Foſſile* IVORY.

ANIMAL *ſubſtances, fermentative quality of*. See FERMENT, and FERMENTATION.

ANIMAL *ſyſtem* imports the whole claſs of beings endowed with *animal life*.

In which ſenſe *animal ſyſtem* amounts to the ſame with what chemiſts, and others, call the *animal kingdom*.

ANIMAL is alſo ſometimes applied, in a figurative ſenſe, to artificial or moral things.

Hobbes conſiders government as a huge complex *animal*, under the denomination of *Leviathan*.

The reaſon of the appellation is founded on the analogy between an *animal*, and a political body. The ſovereign or legiſlative power anſwers to the ſoul; the magiſtrates to the limbs or members; rewards and puniſhments are the nerves; riches, the ſtrength; counſellors, the faculty of memory; equity, reaſon; ſedition, ſickneſs; civil war, death.

ANIMALCULE, **ANIMALCULUM**, a diminutive of animal; expreſſing ſuch a minute creature as is either ſcarce, or not at all, diſcernible by the naked eye.

Such are thoſe numerous inſects which croud the water in the ſummer months; changing it ſometimes of a deep or pale-red colour, ſometimes of a yellow, &c. Theſe often ſeem to be of the ſhrimp-kind, and the moſt common one is called by Swammerdam, *pulex aquaticus arboreſcens*. The cauſe of their concourſe, at this time, Mr. Derham obſerves, is to perform their *coit*. He adds, that they afford a comfortable food to many water animals.—The green ſcum, on the top of ſtagnant waters, is often nothing elſe but prodigious numbers of another ſmaller order of *animalcules*; which, in all probability, ſerve for food to the *pulices aquatici*.

The MICROSCOPE diſcovers legions of *animalcules* in moſt liquors, as water, wine, vinegar, beer, dew, &c. In the Philoſophical Tranſactions, we have obſervations of the *animalcules* in rain water, in ſeveral chalybeat waters, infuſions of pepper, bay-berries, oats, barley, wheat, &c. The human ſeed has been obſerved by divers authors to contain great numbers of *animalcules*.

Thoſe who have made the moſt minute reſearches, and the moſt accurate inquiries, into the natures of the ſeveral objects ſubjected to their ſenſes, have found that the ſubſtances upon which they employed their curioſity, were often quite different from what at firſt view they appeared to be. Thus, for inſtance, the whole earth has been found repleniſhed with an inexhauſtible ſtore of what we ſhould leaſt of all ſuſpect; that is, an infinite number of *animalcules* floating in the air we breathe, ſporting in the fluids we drink, or adhering to the ſeveral objects we ſee and handle. The conjectures and hypotheſes relating to the production, generation, ſtructure, and uſes of theſe *animalcules*, have been as various as were ever contrived by caprice, or embraced by credulity. Not to bewilder ourſelves, however, in theſe labyrinths, but to confine our aſſertions to actual diſcoveries; by the aſſiſtance of the MICROSCOPE we not only perceive that ſuch *animalcules* exiſt, but are alſo enabled, in ſome degree, to determine their ſhapes, and the various peculiarities of their motion.

This contemplation of *animalcules* has made the ideas of infinitely ſmall bodies extremely familiar to us. A mite was anciently thought the limit of littleneſs; but we are not now ſurpriſed to be told of animals twenty-ſeven millions of times ſmaller than a mite.

Minute animals are found proportionably much ſtronger, more active and vivacious than large ones. The ſpring of a flea in its leap, how vaſtly does it out-ſtrip any thing greater animals are capable of? A mite, how vaſtly faſter does it run than a race-horſe? M. de l'Iſle has given the computation of the velocity of a little creature ſcarce viſible by its ſmallneſs, which he found to run three inches in half a ſecond; ſuppoſing now its feet to be the fifteenth part of a line, it muſt make 500 ſteps in the ſpace of three inches; that is, it muſt ſhift its legs 500 times in a ſecond, or in the ordinary pulſation of an artery. Hiſt. Acad. Scienc. 1711. p. 23.

Dr. Hill, in his Hiſtory of Animals, has arranged *animalcules* under three claſſes: 1. Such as have no tails, nor any viſible limbs. 2. Thoſe which have tails, but no viſible limbs. And, 3. Thoſe which have viſible limbs; and each claſs is ſubdivided into ſeveral diſtinct *genera*. Hiſt. Anim. p. 1, &c.

ANIMALCULES, *viſible*, thoſe which may be diſcerned by the naked eye.

Such, e. gr. are mites, divers ſpecies of inſects, reptiles, and other vermin.

Animalcules, *inviſible.*—Naturaliſts ſuppoſe another ſpecies or order of inviſible *animalcules*, viz. ſuch as eſcape the cognizance even of the beſt microſcopes, and give many probable conjectures in relation to them. Reaſon and analogy give ſome ſupport to the exiſtence of infinite imperceptible *animalcules.*

The naked eye, ſay ſome, takes in from the elephant to the mite; but there commences a new order reſerved only for the microſcope, which comprehends all theſe from the mite, to thoſe twenty-ſeven millions of times ſmaller; and this order cannot be yet ſaid to be exhauſted, if the microſcope be not arrived at its laſt perfection.

Animalcules, *microſcopical*, thoſe only diſcoverable by the help of a large magnifier. Theſe, according to ſome, come under the denomination of *inviſible animalcules.*

The exceſſive minuteneſs of theſe *animalcules* conceals them from the human eye unarmed. One of the wonders of the modern philoſophy is, to have invented means for bringing creatures, to us ſo imperceptible, under our cogniſance and inſpection. An object a thouſand times too little to be able to affect our ſenſe, ſhould ſeem to have been very ſafe. Yet we have extended our views over animals, to whom theſe would be mountains. In reality, moſt of our microſcopical *animalcules* are of ſo ſmall a magnitude, that through a lens, whoſe focal diſtance is the tenth part of an inch, they only appear as ſo many points; that is, their parts cannot be diſtinguiſhed, ſo that they appear from the vertex of that lens under an angle not exceeding a minute. If we inveſtigate the magnitude of ſuch an object, it will be ſound nearly equal to $\frac{3}{100000}$ of an inch long. Suppoſing therefore theſe *animalcules* of a cubic figure, that is, of the ſame length, breadth, and thickneſs, their magnitude would be expreſſed by the cube of the fraction $\frac{1}{100000}$, that is, by the number of $\frac{27}{1000,000,000,000,000}$, that is, ſo many parts of a ſquare inch is each *animalcule* equal to. It is ſtrictly true of theſe *animalcules*, that many thouſands of them may dance on the point of a ſmall needle.

There are in ſome liquors *animalcules* ſo ſmall, as upon calculation the whole magnitude of the earth is not found large enough to be a third proportional to theſe minute floating animals, and the whales in the ocean.

With regard to their ſtructure and œconomy, *animalcules* are found of divers ſorts; ſome formed like fiſh, others reptile, others hexapedal, ſome horned, &c. In ſeveral kinds, however ſmall, it is eaſy to diſcover the form of their mouths, their proboſcides, horns, &c. the motions of their hearts, lungs, and other parts.

Every *animalcule* being an organized body, how delicate and ſubtile muſt the parts be, that are neceſſary to conſtitute it, and to preſerve its vital actions! It is hard to conceive, how in ſo narrow a compaſs, there ſhould be contained a heart to be the fountain of life, muſcles neceſſary to its motions, glands for the ſecretion of its fluids, ſtomach and bowels to digeſt its food, and other innumerable members, without which an *animalcule* cannot ſubſiſt. But ſince every one of theſe members is alſo an organical body, they muſt have likewiſe parts neceſſary to their actions. For they conſiſt of fibres, membranes, coats, veins, arteries, nerves, and an almoſt infinite number of fine tubes like thoſe, whoſe ſmallneſs ſeems to exceed all efforts of imagination. But there are ſome parts that ought almoſt to be infinitely leſs than theſe, as the fluids that flow along theſe fine tubes, the blood, lymph, and animal ſpirits, whoſe ſubtilty, even in large animals, is incredible.

Leewenhoeck calculates that a thouſand million of *animalcula*, which are diſcovered in common water, are not altogether ſo large as a common grain of ſand. This author, upon examining the male ſperm of various animals, diſcovered in many, infinite numbers of *animalcule*, not larger than thoſe abovementioned. In the milt of a ſingle cod-fiſh, there are more animals than there are men upon the whole earth; and yet a grain of ſand is bigger than four millions of them. The white matter alſo, which ſticks to the teeth, abounds with *animalcules* of various figures, to which vinegar is fatal; and it is known that vinegar contains *animalcules* in the ſhape of eels. In ſhort, according to this author, there is ſcarce any thing which corrupts, without producing *animalcules.*

Animalcula are ſaid to be the cauſe of various diſorders. The itch, from ſeveral experiments, is affirmed to be a diſorder ariſing from the irritations of a ſpecies of *animalcula* found in the puſtules of that ailment; whence the communication of it by contact from one to another is eaſily conceived, as alſo the reaſon of the cure being effected by cutaneous applications. On this foundation ſome have attributed the ſmall-pox and meaſles, and infectious diſeaſes; others the epilepſy, &c. to *animalcules.* Langius goes farther, and pretends to reduce all diſeaſes in general to the ſame principle. A late writer at Paris, who aſſumed the title of an Engliſh phyſician, has done more. He not only accounts for all diſeaſes, but for the operations of all medicines, from the hypotheſis of *animalcules.* He has peculiar animals for every diſeaſe: ſcorbutic *animalcules*, podagrical *animalcules*, variolous *animalcules*, &c. all at his ſervice.

But as moſt diſcoveries in natural philoſophy have laid a foundation for the warm imaginations of ſome men to form viſionary theories, to the great prejudice of real knowlege; ſo thoſe relating to *animalcula* have been drawn in, however improperly, to ſupport the moſt whimſical and chimerical ſyſtems.

See a variety of microſcopical objects, *animal*, *vegetable*, and *mineral*, delineated in table, Microscopical Objects *and* Discoveries.

ANIMATE, **Animated**, ſomething endued with life, or a living ſoul.

In mechanics, *animate power* is uſed to denote a man, or brute; in contradiſtinction to *inanimate power*, as ſprings, weights, &c.

Naturaliſts and philoſophers vary extremely in aſſigning the characters, ſubjects, and ſpecies of *animate* bodies.—Some include ſtocks and ſtones in this rank; others exclude brutes themſelves.

Some of the philoſophers have held all nature to be *animated*; that the ſun, the earth, the planets, rivers, trees, ſtones, &c. are ſo many animals; others, that the whole ſyſtem is only one huge animal, informed with a ſoul, or *anima mundi.*

Animated *horſe hairs.* See Horse *hairs.*

Animated is alſo uſed to denote a thing impregnated with vermin or Animalcules.

In this ſenſe the whole earth may be ſaid to be *animated*; ſince in every part of it we meet with an infinite number of animals, either viſible or inviſible; they are found in air, water, earth, plants, and even in the hardeſt ſtones; and there is perhaps no animal known, which does not breed numbers of others in the different parts of its body.

Animated *mercury*, among *Chemiſts*, ſignifies quickſilver, impregnated with ſome ſubtile and ſpirituous particles, ſo as to render it capable of growing hot when mingled with gold.

Animated *needle*, a needle touched with a load-ſtone, or Magnet.

ANIMATION ſignifies the informing of an animal body with a ſoul.

Thus the *fœtus* of the womb is ſaid to come to its *animation*, when it begins to act as a true animal: or after the female that bears it is *quick*, as the common way of expreſſion is.

The learned are not agreed about the time when the female becomes quick; ſome compute it at forty days after conception; others fix it about the middle of the term of Gestation.

T. Fienus Gardinius, Verde, Fort. Licetus, F. de Bononia, have written expreſly on the *animation* of the Foetus; Fr. Zanellis on the *animation* of the Seed.

Animation is alſo uſed by ſome *mechanical philoſophers*, for the act of ſoliciting the deſcent of a body, ſo as to give it continually new degrees of Acceleration.

Animation is alſo uſed by *Alchemiſts* for the operation of fermenting a white foliated earth, with a kind of philoſophical or celeſtial water or ſulphur.

Animation is alſo uſed in a moral or figurative ſenſe, for the act of giving life and force to a diſcourſe, or the like.

Animation is alſo uſed by *hermetic philoſophers*, to denote a certain ſtate of perfection to which a body is brought by ſome appropriate proceſs, in virtue whereof it becomes capable of producing ſome extraordinary *phænomena.*

ANIME, **Amine** & *cancamum* in *Pharmacy*, a kind of reſin, whereof there are two kinds, the *weſtern*, and *eaſtern.* This reſin is the produce of an American tree, of which we have no certain account.

The *weſtern* flows from an inciſion of a tree in New Spain, called *courbaril*; it is tranſparent, and of a colour like that of frankincenſe; its ſmell is very agreeable, and it eaſily conſumes in the fire.

The *eaſtern* gum *anime* is diſtinguiſhed into three kinds: the firſt is white; the ſecond blackiſh, in ſmell like myrrh; the third pale, reſinous, and dry.

Anime, according to Neumann, is a reſin totally ſoluble in ſpirit of wine. It is called improperly *gum animæ.* Other authors mention two ſubſtances, to which this name is given, one of which is brought from India, and is reſinous; the other is brought from Braſil, and is ſimilar in appearance and inſolubility in ſpirit of wine, or in water, to the ſubſtance called *gum copal.* All the *anime* which is to be found in ſhops of druggiſts is of this latter kind; and if it does not proceed from the ſame tree as *gum copal*, is ſcarcely diſtinguiſhable from it.

The ſmall tears are the pureſt; it has little taſte, but an agreeable ſmell; it eaſily breaks between the teeth; but if chewed for ſome time it ſoftens and becomes adheſive. Laid on red-hot iron, it melts immediately, catches flame, and burns quickly away, leaving a little white aſhes. In our ſhops, we have only the American ſorts of this reſin.

The beſt *gum anime* ought to be white, dry, friable, clean, of a good ſmell, that ſoon conſumes when thrown into the fire; and that contains a great deal of oil and eſſential ſalt.

It is proper to diſcuſs, to ſoften and diſſipate cold humours, and is therefore good for the head-ach; to ſtrengthen the brain they apply it to the top of the head, and perfume night-caps with it: it is alſo uſed for cleanſing and cicatriſing wounds.

Its principal uſe in medicine is external; in cold, painful, rheumatic, flatulent affections of the head, nerves, and joints; palſies, contractions, relaxations, contuſions, &c. It is an ingredient in plaſters, and cerates, for theſe purpoſes.

ANIME, in *Heraldry*, is where the eyes, &c. of a rapacious creature are born of a different colour from the reſt of the creature.

The French ſay *anime*, the Engliſh *incenſed*, the Latins *inſenſus*, of ſuch or ſuch a colour.

ANIMELLÆ, the glands under the ears, &c. called alſo *lacticinea*.

ANIMETTA, in *Eccleſiaſtical Writers*, denotes the pall or cloth wherewith the cup is covered in the euchariſt.

ANIMI *deliquium*, ſee LIPOTHYMIA and SWOONING.

ANINGA, in *Commerce*, a root growing in the Caribbee iſlands, of uſe in the refinement of ſugar,

The decoction of this root is found a more certain, as well as more innocent means of clarifying ſugar, than the ſublimate and arſenic uſed for this purpoſe, before the diſcovery of the *aninga*.

ANISATUM, a name given to ANISE-SEED water.

ANJOU *cabbage*, in *Botany*, ſee CABBAGE.

ANISCALPTOR, in *Anatomy*, a muſcle, otherwiſe called LATISSIMUS *Dorſi*.

ANISE-SEED, a medicinal ſeed, produced by an umbelliferous plant of the ſame name, common in ſome gardens, of the *pentandria digynia* claſs.

The outer thin ſkin of the ſeeds of this plant contains an eſſential oil; and the kernel itſelf contains an inodorous expreſſible oil. It can only operate as a mere reſinous ſubſtance, and may therefore be, not improperly, ſupplied by cheaper reſins. Neumann, p. 397.

The plant which produces it, is a ſpecies of APIUM or PARSLY, called by Tournefort *apium aniſum dictum, ſemine ſuaviolenti majori*, parſly with large ſweet-ſcented ſeeds, commonly called aniſe. It is a ſmall tender plant, producing one ſtalk, ſeldom ariſing above two feet high. It flowers and ſeeds in July, the root dying every year after it has yielded ſeed. It is cultivated in Germany; but the beſt ſeed, which is a ſmaller ſort, comes from Spain. The ſeed only is uſed, being one of the four greater hot ſeeds.

Aniſeed is carminative, expelling wind out of the ſtomach and bowels, both given at the mouth, and in clyſters. It is frequently put into children's victuals for the gripes and wind. It is very uſeful againſt cold affections of the lungs, difficulty of breathing, and aſthma. Some commend it much to be taken frequently by nurſes to increaſe their milk. It is often uſed as a corrector of the ſtronger purgative medicines. The oil diſtilled from the ſeed is uſed for the ſame purpoſes; and is often applied outwardly in carminative and anodyne liniments; particularly for the pleuriſy, and other pains in the ſide.

ANISE-SEED, *ſtarry*, *aniſum ſtellatum*, is a ſeed brought chiefly from Tartary; thus called from the affinity it bears in ſmell to the common *aniſe-ſeed*, and the ſtar-like figure of its *capſula ſeminalis*.

It was firſt brought into Europe from the Philippine iſlands by an Engliſh mariner, named Thomas Candy, in his return from a voyage round the world in the year 1601.—The natives call it *damor* and *zingi*; the Europeans ſometimes FOENICULUM *Sinenſe*, or Chineſe FENNEL; botaniſts, ANISUM *Indicum*, ANISUM *peregrinum*, ANISUM *exoticum Philippinarum inſularum*, CARDAMOMUM *Siberienſe*, BADIANUM, &c.

Its virtues are of the ſame kind with thoſe of the common *aniſe-ſeed*, only that it is ſweeter, more grateful, penetrating, and aromatic. It is reputed a general cordial and ſtrengthener.

The Chineſe uſe it in the preparation of their tea; and after their example the Dutch alſo uſe it in this liquor, pretending it makes it more pleaſant.

The wood is alſo imported into Europe, where it is employed in works of marquetry and moſaic.—It is alſo called ANIL.

In diſtilling the *aniſe-ſeed* for the oil, there is procured a limpid water called *aniſe-ſeed* water, which has much the ſame virtues with the oil.

See Neumann's chemical hiſtory of theſe plants, and his account of their chemical differences from each other, and of the peculiarities of the eſſential oil of *aniſe-ſeeds*, in his works, p. 393, & ſeq.

ANKER, ANCHOR, a liquid meaſure chiefly uſed at Amſterdam, &c.

The *anker* is the fourth part of the *awn*, and contains two *ſtekans*; each *ſtekan* conſiſts of ſixteen *mengles*; the *mengle* being equal to two Paris pints.

ANNALE, in ſome *Middle Age Writers*, denotes a day held every year in commemoration of the dead.

In which ſenſe *annale* amounts to the ſame with what is otherwiſe called *anniverſarium*.

ANNALE is more particularly applied to the maſſes celebrated during the ſpace of a year for the dead.

ANNALIS *actio*, in the *Civil Law*, denotes an action which may be put in practice any time within the year.

In the like ſenſe we meet with *annale decretum*, or *negatum*, *annalis reſciſio*, &c.

ANNALIS *clavus*, in Roman *Antiquity*, the nail which the prætor, conſul, or dictator, fixed every year in the wall of Jupiter's temple, on the ides of September, to ſhew the æra or number of years from the building of Rome. This cuſtom was afterwards changed, and the years were reckoned by the CONSULS.

ANNALIS *exceptio*, a kind of privilege anciently granted the people of Italy, that whoever had made a contract, could not be compelled to the performance, or payment of what had been agreed on within the year. Some extend this privilege ſo as to render it ſtill more grievous, by computing the year excluſive of all holydays.

ANNALES *libri*, in the *Civil Law*, denote books wherein the acts, and proceedings of a whole year, were contained.

In which ſenſe *annales* ſtand oppoſed to *ſemeſtres libri*, wherein the acts and conſtitutions of ſix months were contained.

ANNALES *baculi*, denote a kind of wooden almanacs uſed among our anceſtors, called alſo *runſtocks* or *clogs*.

ANNALES, in *Middle Age Writers*, denote yearlings, or young cattle of a year old, or under two.

ANNALES alſo denote a kind of rent, or annual revenue.

ANNALS, an hiſtorical account of the affairs of a ſtate, digeſted in the order of years.

The difference between *annals* and *hiſtory* is variouſly aſſigned by various authors.—Some ſay that *hiſtory* is properly a recital of things which the author has ſeen, or been a by-ſtander to. What they build upon is, the etymology of the word; *hiſtory*, in the Greek, ſignifying the knowlege of things preſent, and, in effect, ἱϛορεῖν properly ſignifies *to ſee*. On the contrary, *annals*, ſay they, relate to the tranſactions of others, and ſuch as the writer never ſaw.

Of this opinion the great *annaliſt*, Tacitus himſelf, ſeems to have been; becauſe the firſt part of his work, which treats of former times, he calls *annals*; but when he comes down to his own times, he changes his title, and calls it *hiſtory*.

According to Sempronius Aſellio, *annals* are a bare relation of what paſſes each year; whereas *hiſtory* relates not only to the tranſactions themſelves, but alſo the cauſes, motives, and ſprings of them. The *annaliſt* merely ſtates his facts, but the *hiſtorian* reaſons and deſcants on them.

Of this laſt opinion ſeems Cicero to be, when, ſpeaking of *annaliſts*, he ſays, *Unam dicendi laudem putant eſſe brevitatem, non exornatores rerum, ſed tantum narratores.* He adds, that *hiſtory*, in its original, was the compoſition of *annals*.

Cicero relates the origin of *annals*: to preſerve the memory of tranſactions, the *pontifex maximus*, ſays he, wrote what paſſed each year; and expoſed it on a table, in his own houſe, where every one was at liberty to read it.—This they called *annales maximi*; and this cuſtom was kept up till the year of Rome 620.

Annales maximi conſiſted of eighty books. They were moſt of them deſtroyed in the burning of the city by the Gauls.

The like *annals* were kept from the earlieſt ages by the Egyptians, Babylonians, Perſians, Chaldeans, &c.

Several other writers, in imitation of theſe, adopted this ſimple and naked way of relating facts; and were hence denominated *annaliſts*.—Such were Cato, Pictor, Piſo, Antipater, &c.

The *Annals* of Grotius is a book finely written, and contains excellent materials. He is not ſo particular as Strada, but more profound, and comes much nearer to Tacitus.

ANNATES, ANNATA, in *Eccleſiaſtical Writers*, denotes a year's income, due anciently to the pope upon the death of any biſhop, abbot, or pariſh-prieſt; and to be paid by his ſucceſſor.

Annates are alſo called from the Latin *annus*, *year*, becauſe their rate is after the value of one year's purchaſe.

Annates are the ſame with what of later days are called *primitiæ*, or *firſt-fruits*: with this only difference, that firſt-fruits with us are paid to the king.

The invention of *annates* is aſcribed, by a late writer, to Anthonin, biſhop of Epheſus, who exacted from all biſhops conſecrated by him, a ſum proportionate to the annual revenues of their ſees. The council of Epheſus held in 400, condemned this exaction, but not till Anthonin was dead. It was long after that *annates* got footing in the weſtern church. The time when they were firſt introduced is very obſcure; ſome refer it to the pontificate of Alexander IV. others to that of John XXII. who, in the firſt year of his papacy, obtained a year's revenue of all the cathedral benefices. Clement V. is ſaid to have been the firſt pope who impoſed *annates* on England. In 1399, during the ſchiſm of the antipopes, Benedict IX. exacted a year's revenue of all the archbiſhopricks, biſhopricks, and abbies. But in the time of theſe popes, the *annates* were not fixed; and the clergy often refuſed to pay them. There were even popes who condemned *annates*; and the ſecular princes frequently objected to the payment of them, forbidding any money to be carried out of their dominions on this account.

Nic. de Clemangis, A. Maſſa, Galleſius, Campegius, and Fernandus Cordubenſis, have written expreſly concerning *annates*.

Matthew Paris, in his Hiſtory of England, for the year 746, relates, that the archbiſhop of Canterbury, in virtue of a grant or conceſſion of the pope, received *annates* of all the benefices that became vacant in England. Before this time, among the laws of king Ina, who began his reign in the year 712, there is an order for the payment of them. But, in after times, the holy ſee thought fit to take theſe away from the biſhops and archbiſhops, and appropriate them to themſelves. And from the popes the parliament under Henry VIII. took them, and gave them to the crown, 25 H. VIII. cap. 20. Finally queen Anne reſtored them to the church, by appropriating them to the augmentation of poor livings.

ANNEALING, as it is popularly called, *nealing*, ſee NEALING.

ANNEXATION, in a legal ſenſe, the act of joining or uniting ſome leſs conſiderable thing to a greater.

ANNEXED, ſomething joined to, or dependent on another.—Thus we ſay, ſuch a farm, ſuch an advowſon, is *annexed* to ſuch a fee, ſuch a manor, &c. Charles VIII. in the year 1486, *annexed* Provence to the crown of France.

ANNIENTED, or rather ANIENTED, a term ſometimes uſed in law-books, in the ſenſe of fruſtrated, or annulled.

It is formed of the verb *aneantir*, *to bring to nothing*, or *to annihilate*.

ANNIHILATION, the act of reducing a ſubſtance into nothing; or of totally deſtroying and taking away its exiſtence.

The word is compounded of *ad*, *to*, and *nihil*, *nothing*.

Annihilation ſtands oppoſed to creation: the one ſuppoſes ſomething made out of nothing, the other nothing made out of ſomething.

All *annihilation* muſt be metaphyſical or ſupernatural: bodies naturally admit of changes and alterations in their form; but not of *annihilation*.

The ancient philoſophers in effect denied all *annihilation* as well as creation, reſolving all the changes in the world into new modifications, without ſuppoſing the production of any thing new, or deſtruction of the old.

By daily experience they ſaw compounds diſſolved, and in their diſſolution nothing periſhed, but their union, or connection of parts; when in death the body and ſoul were ſeparated, the man they held was gone, but the ſpirit remained in its original, the great ſoul of the world, and the body in its earth from whence it came; theſe were again wrought by nature into new compoſitions; and entered new ſtates of being, which had no relation to the former.

According to ſome, nothing is ſo difficult as *annihilation*; it requires the infinite power of the Creator to effect it; ſome go further, and ſeem to put it out of the power of God himſelf. According to others, nothing ſo eaſy; exiſtence is a ſtate of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all; nay, what is more, it requires an infinite power to prevent it.

The Talapoins hold it the ſupreme degree of happineſs to have the ſoul totally *annihilated*, and freed from the burden and ſlavery of tranſmigrations.

ANNIHILATION is alſo uſed, in *Political Arithmetic*: thus, when the capital ſtock of any public fund is reduced, ſo much as is reduced is ſaid to be *annihilated*.

ANNI *nubiles*, among *Law Writers*, the legal age, at which a maid becomes fit for marriage; which is at twelve years.

ANNIS *communibus*. See COMMUNIBUS.

ANNISEED. See ANISE-SEED.

ANNIVERSARY, is properly the yearly return of any remarkable day: anciently alſo called a *year-day*, or *mind-day*, that is, a memorial-day.

The word is formed from *annus* and *verto*, on account of its returning every year.

ANNIVERSARY *days*, *dies anniverſarii*, among our anceſtors more particularly denote thoſe days wherein the martyrdoms of the ſaints were yearly celebrated in the church; as alſo days whereon, at every year's end, men were wont to pray for the ſouls of their deceaſed friends.—*Anniverſaria dies ideo repetitur defunctis, quoniam neſcimus qualiter eorum cauſa habeatur in alia vita.*—This was the reaſon given by Alcuinus in his Divine Offices.

ANNIVERSARY *winds* are thoſe, which blow conſtantly at certain ſeaſons of the year.

Theſe are otherwiſe called Eteſian winds: ſuch are the TRADE *winds*, and MONSOONS.

ANNIVERSARY is more particularly uſed for the *annale*, or maſs, rehearſed daily for the ſpace of a year after a perſon's death.

ANNO *Domini*, q. d. in the *year of our Lord*; the computation of time from the EPOCHA of the incarnation of Jeſus Chriſt.

ANNOISANCE, in *Law*. See NUSANCE.

ANNOMINATION, *annominatio*, in *Rhetoric*, the ſame with what is otherwiſe called PARONOMASIA.

ANNONA, in *Botany*. See *Cuſtard* APPLE.

ANNONA, in *Ancient Writers*, denotes victuals or proviſion of corn for a year.

ANNONA *civilis*, the corn with which the granaries of cities were filled every year, for the ſubſiſtence of the citizens.

ANNONA *militaris*, the corn and other proviſion laid up in the magazines, for the ſubſiſtence of an army during the campaign.

In ancient writers we alſo meet with the phraſes *ſingulæ annonæ*, *binæ annonæ*, *ternæ annonæ*; with regard to which Salmaſius lays down this rule, that when *annona* occurs in the ſingular number, it includes not only corn, but fleſh, wine, oil, and other neceſſaries; whereas, when it is uſed in the plural number, it imports bread alone. Aquinus is not contented with this rule, but inſtead of it advances another, viz. that *annona* in the ſingular number includes all kinds of proviſion; and, in the plural, imports ſo many rations or pittances of bread, fleſh, and the like, diſtributed to ſo many men.

In this ſenſe, ſoldiers are ſometimes ſaid to have riſen to the benefit of five or more *annonæ*, that is, were entitled to ſo many rations. The emperors Arcadius and Honorius took great pains to reduce this profuſion.

ANNONAGE, *annonagium*, a tax on corn.

ANNONAGE is much the ſame with *frumentage*.

ANNOTATION, a ſuccinct commentary, or remark on a book, or writing; in order to clear up ſome paſſages, or to draw ſome induction, or conſequence from it.

The word is formed of *ad*, and *nota*, *note*.

ANNOTATION, in *Medicine*, denotes the very beginning of a febrile paroxyſm, when the patient grows chill, ſhudders, yawns, is drowſy, and the like.

It is alſo uſed for a ſymptom peculiar to hectic fevers, when the patient, an hour or two after eating, finds himſelf hot, his pulſe quickened, &c. without any ſhuddering.

ANNOTATION, in the *Civil Law*, denotes a kind of reſcript or grant of the emperor, ſigned with his own hand. But this *annotation* differed from a mere reſcript, and a pragmatic ſanction.

It took its name from the note or ſubſcription at the bottom, which was in red letters.

ANNOTTO, in *Commerce*, a kind of red dye, brought from the Weſt Indies. This is otherwiſe denominated *anate* and *attole*.

It is procured from a red flower, produced by a ſhrub, which grows ſeven or eight feet high. This flower being thrown into tubs or ciſterns, for the purpoſe, is treated much after the manner of INDIGO; and the red maſs is extracted by this infuſion and fermentation from the pellicles of the tree.

The *annotto* is now only prepared by the Spaniards. The Engliſh had formerly a manufacture at St. Angelo now ruined. The drug is preferred by the dyers to indigo, and ſold one fourth dearer. The double Glouceſter cheeſe is coloured with this dye, not with marygolds. To water it gives only a pale browniſh-yellow colour, and is very little ſoluble in that liquid. It readily diſſolves in ſpirit of wine, and gives a bright orange colour; hence it is uſeful as an ingredient in varniſhes and lacquers. Wool and ſilk boiled in a ſolution of it, by alkaline ſalts in water, acquires a deep, but not a durable orange dye; for though it is not changed by alum or acids, it is diſcharged by ſoaps, and deſtroyed by expoſure to the air. It is ſaid to be an antidote to the poiſonous juice of *manihot*, or *caſſada*.

See more of this artificial preparation, and the manner of making it, in Dr. Lewis's Commercium Phil. Techn. p. 224, &c. or Neumann's Works, p. 433, &c.

ANNUAL, ſomething which returns every year, or cloſes at the end of the year.

Thus we ſay, an *annual*, or yearly feaſt, office, commiſſion, rent, revenue, income, &c.

The *annual* motion of the earth, ſee proved under EARTH.

ANNUAL is ſometimes uſed for the yearly rent, or income of a prebendary, &c.

In which ſenſe *annuale* amounts to the ſame with what we otherwiſe call *annat*.

ANNUAL is alſo uſed, in *Eccleſiaſtical Writers*, to denote a yearly office, ſaid for the ſoul of a perſon deceaſed on the day of his obit, or anniverſary.

ANNUAL, in the Scottiſh *Law*, denotes any yearly revenue, or due, paid at certain terms, either legal, as Martinmaſs and Whitſuntide, or conventional, as the parties agree.

In the acts of parliament, made by queen Mary, mention is made of *ground-annuel*, *fue-annuel*, and *top-annuel*; the meaning whereof is ſomewhat uncertain.

ANNUEL, *ground*, according to Skene, is, when the property of any land, whether built or unbuilt, is let or ſold for a yearly rent, to be paid either to the proprietor, or to ſome chaplain, or prieſt.

ANNUEL, *fue*, is either when the mail or due is diſpoſed of, as a yearly revenue; or, when the land or tenement is let in fee-farm hereditary, for a certain yearly ſum to be paid under the denomination of *feuda firma*.

ANNUEL, *top*, is a due given or aſſigned out of houſes or buildings, where the property remains with the former owner, only with the condition of his paying the ſaid *annuel*.

ANNUEL *of Norway*, of which mention is made in the acts of parliament of king James the third, was an *annuel* payment of an hundred marks ſterling, which the kings of Scotland were obliged to pay to the kings of Norway, in ſatisfaction for ſome pretenſions which the latter had to the Scottiſh kingdom, by virtue of a conveyance made thereof by Malcolm Kanmoir, who uſurped the crown after his brother's deceaſe.

This *annuel* was firſt eſtabliſhed in 1266; in conſideration whereof the Norwegians renounced all title to the ſucceſſion of the iſles of Scotland. It was paid till the year 1468, when the *annuel*, with all its arrears, was renounced in the contract of marriage between king James the third, and Margaret daughter of Chriſtian the firſt, king of Norway, Denmark, and Sweden. See Skene de Verb. Signif.

ANNUAL *argument of longitude*. See ARGUMENT.

ANNUAL *epacts*. See EPACT.

ANNUAL *equation* of the mean motion of the ſun and moon, and of the moon's apogee and nodes. See EQUATION.

ANNUAL *leaves*, are ſuch *leaves* of plants, as come up afreſh in the ſpring, and periſh in winter.—Theſe ſtand oppoſed to *ever-greens*.

ANNUAL *plants*, called alſo ſimply *annuals*, are ſuch as only live their year, i. e. come up in the ſpring, and die again in autumn; and accordingly are to be recruited every year.

ANNUAL *meadow graſs*, called in ſome parts of England Suffolk graſs, is a ſpecies of graſs, which makes the fineſt turfs, and ſeems well adapted to dairy-farms.

ANNUALIA, yearly oblations anciently made by the relations of deceaſed perſons, on the day of their death.

This day they called *year-day*, &c. and on it maſs was celebrated with great ſolemnity.

ANNUENTES *muſculi*, in *Anatomy*, a pair of tranſverſe muſcles, at the root of the *vertebræ* of the back, called alſo by Mr. Cowper, RECTI *interni minores*, becauſe they lie under the RECTI *majores*.

They are called *annuentes*, from *annuere*, *to nod towards*, becauſe they help to nod the head, or draw it directly downwards and forwards.

ANNUITIES ſignify any intereſts of money, rents, or penſions, payable from time to time, at particular periods.

The moſt general diviſion of *annuities* is into *annuities certain*; and *annuities*, the payment of which depends on a *contingency*; ſuch, in particular, as the continuance of a life.

Annuities have been alſo divided into *annuities* in *poſſeſſion*, and *annuities* in *reverſion*; the former meaning ſuch as either *have* commenced, or are to commence *immediately*; and the latter ſuch as will not commence till ſome particular future event has happened, or till ſome given period of time has expired.

Annuities may be farther conſidered, as *payable yearly*, *half yearly*, or *quarterly*.

The preſent value of an *annuity* is that ſum which, being improved at intereſt, will be ſufficient to pay the *annuity*.

The preſent value of an *annuity certain*, payable yearly, and the firſt payment of which is to be made at the end of a year, is calculated in the following manner.

Let the *annuity* be ſuppoſed to be 100*l.* the preſent value of the firſt payment of it, or of a hundred pounds to be received a year hence, is that ſum in hand, which being put out to intereſt, will increaſe to 100*l.* in a year. In like manner, the preſent value of the ſecond payment, or of 100*l.* to be received two years hence, is that ſum in hand, which being put out to intereſt, will increaſe to 100*l.* in two years. The like is true of the value of the 3d, 4th, 5th, &c. payments; and the ſum of the values of all the payments is the value of the *annuity*.

Let the intereſt be ſuppoſed to be 4 *per cent.* The ſum which improved at 4 *per cent.* intereſt for a year will produce 100*l.* at the end of the year, is the ſum which bears the ſame proportion to 100*l.* that 100*l.* bears to 100*l.* with 4 added to it, that is, to 104*l.* Say then as 104*l.* is to 100*l.* ſo is 100*l.* to a fourth proportional, which will be 96.15, or 96*l.* 3*s.* which is the value of the firſt payment.

Again, the ſum which improved at 4 *per cent.* for two years will produce 100*l.* at the end of *two* years, is the ſum which being now put out to intereſt, will produce in a year that ſum which in one year more will produce 100*l.* that is, it is the ſum that will produce in a year 96*l.* 3*s.*; for it has been juſt ſhewn, that 96*l.* 3*s.* will in a year produce 100*l.* Say then as 104*l.* is to 100*l.* ſo is 96*l.* 3*s.* or 96.15 to a fourth proportional, which will be 92.45, or 92*l.* 9*s.* The value therefore of the ſecond payment is 92*l.* 9*s.*

By proceeding in this method it will be found, that the values of the 3d, 4th, 5th, &c. payments, are £88.89, £85.48, £82.19, &c. The ſum of 10, 20, or 100 of theſe values, is £811, £1359, £2450, reſpectively, or the preſent value of an *annuity* of 100*l.* payable for 10, 20, or 100 years. The ſum of an infinite number of theſe values is 2500*l.* or the value of a perpetual *annuity* of 100*l.* at 4 *per cent.*

In general: ſuppoſe r to denote 1*l.* increaſed by its intereſt for a year, or the amount of 1*l.* in a year. Then $\frac{1}{r}$ will be the preſent value of 1*l.* to be received a year hence; for r is to 1 as 1 is to $\frac{1}{r}$. Alſo $\frac{1}{r^2}$ will be the value of 1*l.* to be received at the end of two years; for r is to 1, as $\frac{1}{r}$ is to $\frac{1}{r^2}$. In like manner, $\frac{1}{r^3}$, $\frac{1}{r^4}$, $\frac{1}{r^5}$, &c. will be the value of 1*l.* to be received at the end of 3, 4, 5, &c. years reſpectively; and $\frac{1}{r^n}$ will be the value of 1*l.* to be received at the end of n years. The value, therefore, of an *annuity* of 1*l.* for n years is $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}+\frac{1}{r^4}$, &c. continued to n terms.

And the value of the perpetuity is this ſeries continued *in infinitum*.

In order to find the ſum of n terms of this ſeries, put S equal to it, or $S=\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, &c. $+\frac{1}{r^n}$.

Then,

$Sr=1+\frac{1}{r}+\frac{1}{r^2}$, &c. $+\frac{1}{r^{n-1}}$. And

$Sr-1=\frac{1}{r}+\frac{1}{r^2}$, &c. $+\frac{1}{r^{n-1}}=S-\frac{1}{r^n}$. Therefore

$Sr-1=S-\frac{1}{r^n}$. And conſequently

$Sr-S=1-\frac{1}{r^n}$, and $S=\frac{1}{r-1}-\frac{1}{r-1}\times\frac{1}{r^n}$.

This is the general theorem for finding the ſum of any given number of the firſt terms of the ſeries $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, &c. that is, for finding from the rate of intereſt given, the value of an *annuity certain*, payable yearly for any number of years. If the *annuity* is a perpetuity, it is plain, that $\frac{1}{r^n}$, or the laſt term vaniſhing, $\frac{1}{r-1} \times \frac{1}{r^n}$, alſo vaniſhes; and, conſequently, that the expreſſion becomes $S = \frac{1}{r-1}$: from whence it reſults that the value of a perpetuity is always unity divided by the intereſt of 1*l.* for a year, or 100*l.* divided by the rate of intereſt.

The value of the *reverſion* of a perpetual *annuity*, to be entered upon after a particular term, is "the value of the *annuity* for the given term ſubtracted from the perpetuity." For example: the value of an *annuity* to be entered upon ten years hence is (reckoning intereſt at 4 *per cent.*) 8.11, i. e. the value of an *annuity* certain for ten years, ſubtracted from 25 the perpetuity, or 16.89; that is, 16 $\frac{9}{10}$ years purchaſe nearly. If the *annuity* is to be entered upon at the end of 18 years, the value will be 12.34.

If the reverſion is not a perpetuity, but an *annuity* certain for a given term, to be entered upon after another given term, the value will be the value of the perpetuity after both terms ſubtracted from the value of the perpetuity after the firſt term; that is, ſuppoſing the reverſion an *annuity* for 8 years, to be entered upon after 10 years, the value is (reckoning intereſt at 4 *per cent.*) the difference between 16.89, and 12.34, or 4.55; that is, 4½ years purchaſe nearly.

Annuities certain differ in value, as they are made payable *yearly*, *half-yearly*, or *quarterly*. The following theorems, founded on the general theorem juſt given, will ſufficiently explain this ſubject. Let r denote, as before, 1*l.* increaſed by its intereſt for a year, and n the term or number of years during which any *annuity* is to be paid. Let P denote the perpetuity, or $\frac{1}{r-1}$: let y denote the value of an *annuity* for n years, ſuppoſing it paid *yearly*, or $\frac{1}{r-1} - \frac{1}{r-1} \times \frac{1}{r^n}$; h its value payable *half yearly*; and q its value payable *quarterly*.

THEOREM I.

$$y = P - P \times \frac{1}{r^n}$$

THEOREM II.

$$h = P - P \times \frac{1}{\overline{1+\frac{r-1}{2}}\Big|^{2n}}$$

THEOREM III.

$$q = P - P \times \frac{1}{\overline{1+\frac{r-1}{4}}\Big|^{4n}}$$

Example I.

Let the rate of intereſt be 4 *per cent.* and the term five years; and conſequently $r = 1.04$, $n = 5$, $P = 25$, and $\frac{1}{r^n}$, or the value of 1*l.* payable at the end of five years, .8219.

Then
$y = 25 - 25 \times .8219 = 4.4518$
$h = 25 - 25 \times .82034 = 4.4913$
$q = 25 - 25 \times .8196 = 4.5120$

Example II.

Let the rate of intereſt be the ſame, and the term for which the *annuity* is payable 25 years.

Then,
$y = 15.6220$
$h = 15.7118$
$q = 15.7694$

Example III.

Intereſt being the ſame, let the term be 50 years.

Then,
$q = 21.4822$
$h = 21.5491$
$q = 21.5820$

Example IV.

Intereſt being the ſame, let the term be 100 years.

Then,
$y = 24.505$
$h = 24.523$
$q = 24.532$

TABLES for finding the values and amounts of ſums and *annuities* for any number of years not exceeding a hundred, at any rates of compound intereſt from 3 to 6 *per cent.*

TABLE I.

Shewing the amount of 1*l.* principal.

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Conſtruction of Table I.

The numbers in this table are the powers of 1*l.* increaſed by its intereſt for a year: that is, they are the powers of the *amount* of 1*l.* in a year, at the ſeveral rates of intereſt: ſuppoſing r to be that amount, they are r, r^2, r^3, r^4, &c.

Uſe. *To find the amount of any ſum in any number of years, not exceeding* 100. Anſ. Oppoſite to the given number of years, and under the rate of intereſt, is the amount of 1*l.* in that time, which, multiplied by the given ſum, produces the required amount.

Examples.

1. What will 10*l.* amount to in 100 years at 4 *per cent. per ann.* compound intereſt? *Anſ.* 50.504948, multiplied by 10, is 505*l.* 1*s.*
2. What will 250*l.* amount to in 50 years, at 5 *per cent. per ann.* compound intereſt? *Anſ.* 11.467400, multiplied by 250, is 2886*l.* 17*s.*

TABLE II.

Shewing the principal that will amount to 1*l.* in any number of years not exceeding 100; or the preſent value of 1*l.* to be received at the end of any number of years not exceeding 100; diſcounting at any rate of compound intereſt from 3 to 6 *per cent.*

Years	At 3per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Conſtruction of Table II.

The numbers in this table are the reciprocals of the correſponding numbers in the laſt, or the quotients of unity divided by thoſe numbers; that is, $\frac{1}{r}$, $\frac{1}{r^2}$, $\frac{1}{r^3}$, × $\frac{1}{r^4}$, &c. Suppoſing r to denote 1*l.* with its intereſt for a year.

Uſe. *To find what the preſent value is of any ſum payable in any future time; and alſo what principal will amount to a given ſum in any number of years.* Anſ. Oppoſite to the given number of years, and under the rate of intereſt, is the preſent value of 1*l.* to be received at the end of the given time, or the ſum that will amount to 1*l.* in that time, which, multiplied by the given ſum, produces the required value or principal.

1. What is the preſent value of 1000*l.* to be received 10 years hence, reckoning compound intereſt at 5 *per cent?* *Anſ.* .613913, multiplied by 1000, is 613*l.* 18*s.* 3*d.* nearly.
2. What principal will amount to 1000*l.* in 10 years at 5 *per cent. per ann.* compound intereſt? *Anſ.* .613913, multiplied by 1000*l.* is 613*l.* 18*s.* 3*d.*
3. What ſum put out for 25 years, at 4½ *per cent.* intereſt, will clear a debt of 4000*l.*? *Anſ.* .332731, multiplied by 4000, is 1320*l.* 18*s.* 6*d.*

TABLE III.

The preſent value of an *annuity* of 1*l.* for any number of years not exceeding 100, at any rate of compound intereſt from 3 to 6 *per cent.*

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Conſtruction of Table III.

The 2d, 3d, 4th, &c. numbers in this table are the ſums of the firſt 2, 3, 4, &c. numbers in the ſecond; that is, the ſums of $\frac{1}{r}+\frac{1}{r^2}$, of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}+\frac{1}{r^4}$, &c.

Uſe. *To find the preſent worth of any annuity.* Multiply the preſent value oppoſite to the given number of years, and under the rate of intereſt, by the given *annuity*, and the product will be the anſwer. If the *annuity* is in reverſion, multiply the number oppoſite to the time of reverſion in the 2d table, the number oppoſite to the time of continuance in this table, and the *annuity* together: or, when the ſum of both theſe times does not exceed 100, from the number in this table oppoſite to that ſum take the number oppoſite to the reverſionary time, and multiply the remainder by the *annuity*.

Examples.

1. What is the preſent value of an *annuity* of 40*l.* to continue 20 years at 4 *per cent.?* *Anſ.* 13.590326, multiplied by 40, is 543*l.* 12*s.* nearly.
2. What is the preſent value of an *annuity* of 40*l.* to continue 20 years, but not to commence till the end of 5 years, at 4 *per cent.?* *Anſ.* .821927, multiplied by 13.590326, multiplied by 40, is 446*l.* 16*s.* Or, 4.451822, ſubtracted from 15.62208, and the remainder multiplied by 40, is 446*l.* 16*s.* as before.

TABLE IV.

The amount of an *annuity* of 1*l.* at compound intereſt.

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Conſtruction of Table IV.

The firſt number of each column in this table, is unity. The ſecond is the firſt number in this table added to the firſt number in the firſt table. The third number is the ſecond in this table added to the ſecond in the firſt table, and ſo on: that is, the numbers in this table are 1, $1+r$, $1+r+r^2$, $1+r+r^2+r^3$, &c.

Uſe. *To find the amount of an annuity forborn any number of years not exceeding* 100. Multiply the amount in the table oppoſite to the given number of years, and under the rate of intereſt, by the given *annuity*. The product is the anſwer.

Examples.

1. What will an *annuity* of 50*l.* amount to in 15 years, at 3½ *per cent.* compound intereſt? *Anſ.* 19.295681, multiplied by 50*l.* is 964*l.* 15*s.* 8*d.*
2. What is the amount of an *annuity* of 20*l.* in 28 years at 4 *per cent?* *Anſ.* 49.9675, multiplied by 20, is 1000*l.* nearly.

3. A perſon is poſſeſſed of a 1000*l.* principal, bearing 4 *per cent.* intereſt, and in order to increaſe his income, reſolves to take out of his principal 20*l.* the firſt year, and afterwards as much more as will be neceſſary to make a conſtant income of 60*l. per ann.* in what time will he reduce his principal to nothing? *Anſ.* In the ſame time that an *annuity* of 20*l.* would increaſe at 4 *per cent.* compound intereſt to 1000*l.* that is, in 28 years, by the preceding queſtion.

The preceding obſervations, rules, and tables, contain all that is moſt important in the doctrine of *annuities certain.* He that would gain farther information ſhould conſult Malcolm's Arithmetick, from page 595 to the end; Simpſon's Algebra, ſect. 16; Mr. Dodſon's Mathematical Repoſitory, p. 298, &c. Jones's Synopſis, ch. 10. Phil. Tranſ. vol. lxvi. p. 109, &c.

For an explanation of the doctrine of *annuities on lives,* ſee ASSURANCE, COMPLEMENT, EXPECTATION, LIFE *Annuities,* REVERSIONS.

ANNULAR, ANNULARIS, ſomething that relates to, or reſembles a ring, by the Latins called *annulus.*

ANNULAR *cartilage,* or ANNULARIS, is the ſecond cartilage of the *larynx,* being round, and inveſting the whole *larynx;* called alſo *cricoides.*

ANNULAR *ligament, ligamentum* ANNULARE, is a ſtrong ligament, encompaſſing the CARPUS or wriſt; after the manner of a bracelet.

Its uſe is to connect or bind the two bones of the arm together; and alſo to reſtrain the tendons of the ſeveral muſcles of the hand and fingers, and prevent their flying out of their places, when in action.

The ligament of the TARSUS is alſo denominated *annular* ligament.

Add, that the ſphincter muſcle of the *anus* is alſo called *annularis,* or *annular* muſcle, from its figure.

ANNULAR *proceſs,* or *protuberance,* is a proceſs of the MEDULLA *oblongata;* thus called by Dr. Willis, becauſe it ſurrounds the ſame, much like a ring.

ANNULAR is alſo an epithet given the fourth finger; popularly called the *ring* FINGER.

ANNULATA, in *Zoology,* ſee COLUBER.

ANNULET, *little ring,* in *Heraldry,* is a DIFFERENCE or mark of diſtinction, which the fifth brother of any family ought to bear in his coat of arms.

Annulets are alſo part of the coat armour of ſeveral families. They were anciently reputed a mark of nobility and juriſdiction; it being the cuſtom of prelates to receive their inveſtiture *per baculum & annulum.*

ANNULETS, in *Architecture,* are ſmall ſquare members, in the Doric capital, placed under the quarter round.—See *Tab. Architect. fig.* 25. *lit. q.* and *fig.* 24. *lit. n.* and *fig.* 1. They are alſo called *fillets, liſtels,* &c.

ANNULET is alſo uſed for a narrow flat moulding, common to other parts of a column; viz. the baſes, &c. as well as the capital; ſo called, becauſe it encompaſſes the column around.—In which ſenſe *annulet* is frequently uſed for *baguette,* or little *aſtragal.*

ANNULUS, a ſpecies of the VOLUTA.

ANNULLING, the aboliſhing of an act, procedure, ſentence, or the like.

The word is compounded of *ad* and *nullus, none;* q. d. *undoing.*
